### 2.2 Similarity Parameters (from governing equations)

Non-dimensionalize and normalize basic equations by scaling:

Identify characteristic scales for the problem

velocity	$U$	$\vec{v} = U\vec{v}^*$
length	$L$	$\vec{x} = L\vec{x}^*$
time	$T$	$t = Tt^*$
pressure	$p_o - p_v$	$p = (p_o - p_v)p^*$

All (\*) quantities are dimensionless and normalized (i.e.  $O(1)$ ), e.g.  $\frac{\partial \vec{v}^*}{\partial x^*} = O(1)$ .  
Apply to governing equations: (also internal constitution, boundary conditions)

- Continuity (incompressible flow):

$$\nabla \cdot \vec{v} = \frac{U}{L} \nabla^* \cdot \vec{v}^* = 0, \quad \nabla^* \cdot \vec{v}^* = 0$$

- Navier-Stokes:

$$\frac{\partial \vec{v}}{\partial t} + (\vec{v} \cdot \nabla) \vec{v} = -\frac{1}{\rho} \nabla p + \nu \nabla^2 \vec{v} - g \hat{j}$$

$$\frac{U}{T} \frac{\partial \vec{v}^*}{\partial t^*} + \frac{U^2}{L} (\vec{v}^* \cdot \nabla^*) \vec{v}^* = -\frac{p_o - p_v}{\rho L} \nabla^* p^* + \frac{\nu U}{L^2} \nabla^{*2} \vec{v}^* - g \hat{j}$$

divide through by  $\frac{U^2}{L}$  (order of magnitude of the convective inertia term)

$$\frac{\widetilde{L}}{UT} \left( \frac{\partial \vec{v}}{\partial t} \right)^* + ((\vec{v} \cdot \nabla) \vec{v})^* = -\frac{\widetilde{p_o - p_v}}{\rho U^2} (\nabla p)^* + \frac{\widetilde{\nu}}{UL} (\nabla^2 \vec{v})^* - \frac{\widetilde{gL}}{U^2} \hat{j}$$

Since all (\*) terms are  $O(1)$ , the coefficients ( ) measure the relative importance of each term (as compared to the convective inertia term):

- $\frac{L}{UT} = S = \text{Strouhal number} \sim \frac{\text{Eulerian inertia } \frac{\partial \vec{v}}{\partial t}}{\text{convective inertia } (\vec{v} \cdot \nabla) \vec{v}}$

is a measure of transient behavior. For example e.g. if  $T \gg \frac{L}{U}, S \ll 1$ , ignore  $\frac{\partial \vec{v}}{\partial t} \rightarrow$  assume steady-state.

- $\frac{p_o - p_v}{\frac{1}{2} \rho U^2} = \sigma = \text{cavitation number (measures likelihood of cavitation)}$

If  $\sigma \gg 1$ , no cavitation. Alternatively, when cavitation is not a concern  $p = p_o p^*$ .

- $\frac{p_o}{\frac{1}{2} \rho U^2} = E_u = \text{Euler number} \sim \frac{\text{pressure force}}{\text{inertia force}}$ .

- $\frac{UL}{\nu} = R_e = \text{Reynold's number} \sim \frac{\text{inertia force}}{\text{viscous force}}$

If  $R_e \gg 1$ , ignore viscosity.

- $\sqrt{\frac{U^2}{gL}} = \frac{U}{\sqrt{gL}} = F_r = \text{Froude number} \sim \left( \frac{\text{inertia force}}{\text{gravity force}} \right)^{\frac{1}{2}}$

– Kinematic boundary conditions:  $\vec{v} = \vec{U}_b \rightarrow \vec{v}^* = \vec{U}_b^*$

– Dynamic boundary conditions:

$$p = p_a + \Delta p \quad \text{where} \quad \Delta p = \left( \frac{1}{R_1} + \frac{1}{R_2} \right) \Sigma$$

$$p^* = p_a^* + \frac{\Sigma}{(p_o - p_v) L} \left( \frac{1}{R_1^*} + \frac{1}{R_2^*} \right)$$

$$\text{where} \quad \frac{\Sigma}{(p_o - p_v) L} = \frac{2 \Sigma / \rho}{\sigma U^2 L}$$

- $\frac{U^2 L}{\Sigma / \rho} = W_e = \text{Weber number} \sim \frac{\text{inertial forces}}{\text{surface tension forces}}$

note:  $L \gg R_o$  usually

Alternatively, using physical arguments: forces acting on a fluid particle

1. inertial forces  $\sim \text{mass} \times \text{acceleration} \sim (\rho L^3) \left( \frac{U^2}{L} \right) = \rho U^2 L^2$

$$2. \text{ viscous forces } \sim \underbrace{\mu \frac{\partial u}{\partial y}}_{\text{shear stress}} \times \text{area} \sim \left(\mu \frac{U}{L}\right) (L^2) = \mu U L$$

$$3. \text{ gravitational forces } \sim \text{mass} \times \text{gravity} \sim (\rho L^3) g$$

$$4. \text{ pressure forces } \sim (p_o - p_v) L^2$$

For similar streamlines, particles must be acted on by forces whose resultant is in the same direction at geosimilar points. Therefore, forces must be in the same ratios:

$$\frac{\text{inertia}}{\text{viscous}} \sim \frac{\rho U^2 L^2}{\mu U L} = \frac{U L}{\nu} = Re$$

$$\left(\frac{\text{inertia}}{\text{gravity}}\right)^{1/2} \sim \left(\frac{\rho U^2 L^2}{\rho g L^3}\right)^{1/2} = \frac{U}{\sqrt{gL}} = Fr$$

$$\left(\frac{\frac{1}{2}\text{inertia}}{\text{pressure}}\right)^{-1} \sim \frac{(p_o - p_v) L^2}{\frac{1}{2} \rho U^2 L^2} = \frac{p_o - p_v}{\frac{1}{2} \rho U^2} = \sigma$$

### Importance of Various Parameters

- Govern flow similitude of different systems.
- Provide guidance and approximate the complex physical problem.

e.g.

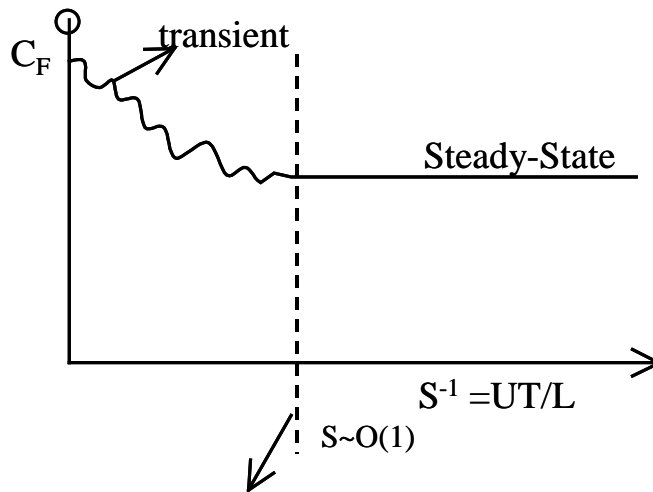

Parameters:

$$S = \frac{L}{UT}, \sigma = \frac{P_o - P_v}{\frac{1}{2}\rho U^2}, W_e = \frac{U^2 L}{\Sigma}, F_r = \frac{U}{\sqrt{gL}}, R_e = \frac{UL}{\nu}$$

Force coefficient on the foil:

$$C_F = \frac{F}{\frac{1}{2}\rho U^2 L^2} = C_F(S, \sigma^{-1}, W_e^{-1}, F_r, R_e^{-1})$$

1.  $S = L/UT$ , change  $S$  with  $\sigma, W_e, F_r, R_e$  fixed.

Exact position of the cut depends on the problem and the quantities of interest.

For  $S \ll 1$ , assume steady-state:  $\frac{\partial}{\partial t} = 0$

For  $S \gg 1$ , unsteady effect is dominant. For example:

$$\left\{ \begin{array}{l} L \approx 10\text{m} \\ U \approx 10\text{m/s} \end{array} \right. \Rightarrow T \approx 1 \text{ sec} \quad \text{gives } S \approx 1, \therefore \text{ for } T \gg 1 \text{ sec assume steady state since } S \ll 1$$

So, for steady-state problem:

$$C_F = C_F(\sigma^{-1}, W_e^{-1}, F_r, R_e^{-1})$$

2.  $\sigma = \frac{P_o - P_v}{\frac{1}{2}\rho U^2}$  (fixed  $R_e, F_r$  and  $W_e$ ).

$P_v$ : Vapor pressure

$P_o \leq P_v$ : State of fluid changes from liquid to gas ← CAVITATION

Mechanism:  $P_o < P_v \rightarrow$  Fluids cannot withstand tensions, the state of fluids changes.

Consequence: (1) Unsteady  $\rightarrow$  Vibration of the structures, which may lead to fatigue  
(2) Unstable  $\rightarrow$  Sudden cavity collapses  $\rightarrow$  huge force acting on the structure surface  $\rightarrow$  surface erosion.

For  $\sigma \ll 1$ , there is cavitation, and for  $\sigma \gg 1$ , there is *no* cavitation. For example:

$$\left\{ \begin{array}{l} p_0 \approx 10^5 \text{N/m}^2 \\ p_v \approx 2 \times 10^3 \text{n/m}^2 \\ \rho \approx 10^3 \text{kg/m}^3 \\ L \approx 100 \text{m} \\ U \approx 10 \text{m/s} \end{array} \right. \Rightarrow \sigma = 2. \text{ To have cavitation we need large } U \text{ or } p_o \sim p_v$$

Note:  $p_v$  is the pressure at which the water boils.

For steady non-cavitation flow ( $\sigma \gg 1$ )

$$C_F = C_F (W_e^{-1}, F_r, R_e^{-1})$$

3.  $W = \frac{U^2 L}{\Sigma}$  (fixed  $R_e$  and  $F_r$ ). For example, if  $U = 1 \text{m/s}$ ,  $\Sigma = 0.07 \text{N/m}$  (water-air  $20^\circ\text{C}$ ),  $\rho = 10^3 \text{kg/m}^3$  and  $L = 100 \text{m}$ , we end up with  $W_e \approx 10^8$ . If we want  $W_e \approx 1$ , we need  $L \approx 10^{-4} \text{m}$ . Then, for  $L \gg 10^{-4} \text{m}$ ,  $W_e \rightarrow \infty$  and  $W_e^{-1} \rightarrow 0$ , so neglect surface tension effect.

For steady, non-cavitation, non-surface tension effect,

$$C_F = C_F (F_r, R_e^{-1})$$

4.  $F_r = \frac{U}{\sqrt{gL}}$ , which measures the effect of gravity.

For problems without dynamic boundary conditions (i.e. if free surface is absent) or if the free-surface is far away or not displaced, gravity effects are irrelevant and  $F_r$  is not important  $\rightarrow F^* = C_F (R_e^{-1})$

e.g.

(i)

(ii) Low speed ( $F_r = 0$ ) (no wave)

(iii) Large U – No Wave

(iv) deeply submerged body

In general  $C_F = C_F(F_r, R_e^{-1}) = C_1(F_r) + C_2(R_e^{-1}) \leftarrow$  Froude's Hypothesis

Dynamic similarity requires:

$$(R_e)_1 = (R_e)_2,$$

$$(F_r)_1 = (F_r)_2.$$

For two geometrically similar systems  $\rightarrow U_1 = U_2, L_1 = L_2$  for the same  $\nu$  and  $g$ .

5.  $R_e = UL/\nu$ .

For steady, no  $\sigma$ , no  $W_e$ , no gravity effects,  $C_F = C_F(R_e^{-1})$

$Re \ll 1$ , Stokes flow (creeping flow)

$Re < (Re)_{cr}$ , Laminar flow

$Re > (Re)_{cr}$ , Turbulent flow

$Re \rightarrow \infty$ , Ideal flow

For example:

$$\left\{ \begin{array}{l} U = 10m/s \\ L = 10m \\ \nu = 10^{-6}m^2/sec \end{array} \right. \Rightarrow Re = 10^8 \text{ or } Re^{-1} = 10^{-8}$$

For steady, no  $\sigma$ , no  $W_e$ , no gravity effect and ideal fluid:

$$C_F = C_F(0, 0, 0, 0, 0) = \text{constant} = 0$$

→ D'Alembert's Paradox: No drag force on moving body.
