# Stability in the Sense of Lyapunov

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- We are concerned about the stability of the equilibrium of the system:

$$\dot{x} = f(x, t) \quad f(0, t) = 0$$

- So far we have discussed internal stability and  $\epsilon-\delta$  stability which is better known as stability in the sense of Lyapunov (i.s.L.)
- Now we would like to discuss a (direct!) test for stability using Lyapunov's second method.
- This method is very valuable and will show in much of the sequel including LQR.

# Motivation for Lyapunov's Indirect Method

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- We might not want to always solve the eigenvalue problem when assessing stability.
- We might not want to perform  $\epsilon - \delta$  calculations to assess stability, either.
- It might be helpful to have an “direct” method to assess stability.
- That method might have broad use

# Intuitive Argument for Lyapunov's Indirect Method

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- “If the time rate of change of energy of an isolated physical system is negative for every possible state, except for a single equilibrium state, then the energy will continually decrease until it assumes its minimum value at the equilibrium state.”
- The idea behind Lyapunov’s direct method is to construct an “energy” function and show that it decreases to zero along the flow of the system until it reaches a minimum at the equilibrium. This will prove stability.
- Now let’s tighten up this argument by building up the mathematical tools we need to pull off this program.

# Quadratic Forms

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- Quadratic Forms will often serve as our “energy” functions.
- Let the scalar  $Q$  be given by

$$Q = x^T A x = \langle x, A x \rangle$$

- $Q$  is called a quadratic form in  $x_1, x_2, \dots, x_n$ .
- Without loss of generality  $A$  can be taken to be symmetric ( $A = A^T$ ).
- For example:

$$Q = \begin{pmatrix} x_1 & x_2 \end{pmatrix} \begin{pmatrix} a_{11} & a_{12} \\ a_{12} & a_{22} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}$$

$$Q = a_{11}x_1^2 + 2a_{12}x_1x_2 + a_{22}x_2^2$$

# Definite Quadratic Forms

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- The quadratic form  $Q = \langle x, Ax \rangle$  is said to be **positive definite** if it is non-negative for all real values of  $x$ , and is zero only when  $x = 0$ .
- If the quadratic form  $\langle x, Ax \rangle$  is positive definite, the matrix  $A$  is also said to be positive definite.

Conditions:

- $A$  must be nonsingular and the eigenvalues of  $A$  are all positive.
- All the leading principal minors of  $A$  are positive.

$$\Delta_1 = a_{11} \quad \Delta_2 = \begin{vmatrix} a_{11} & a_{12} \\ a_{12} & a_{22} \end{vmatrix} \quad \cdots \quad \Delta_n = |A|$$

# Semidefinite Quadratic Forms

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- The quadratic form  $Q = \langle x, Ax \rangle$  is called **positive semidefinite** if it is non-negative. (It can be zero when  $x \neq 0$ ).
- Similarly, a quadratic form  $Q$  can be negative definite or negative semidefinite.

## Example 1

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

$$V(x) = (x_1 + x_2)^2 + x_3^2$$

$$V(x) = \langle x, Ax \rangle$$

$$V(x) = \begin{pmatrix} x_1 & x_2 & x_3 \end{pmatrix} \begin{pmatrix} 1 & 1 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$$

- $V(x)$  is positive semidefinite. It is positive except for  $x = 0$  and  $x_1 = -x_2$ , and  $x_3 = 0$ .

## Example 2

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

$$V(x) = x_1^2 + x_2^2$$

$$V(x) = \langle x, Ax \rangle$$

$$V(x) = \begin{pmatrix} x_1 & x_2 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}$$

- $V(x)$  is positive definite. It is positive except for  $x = 0$  where it is zero.

## Example 3

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

$$V(x) = -(x_1^2 + x_2^2 + \cdots + x_n^2)$$

$$V(x) = \langle x, Ax \rangle$$

$$V(x) = (x_1 \ x_2 \ \cdots \ x_n) \begin{pmatrix} -1 & 0 & \cdots & 0 \\ 0 & -1 & \cdots & 0 \\ \vdots & \vdots & \ddots & \\ 0 & 0 & \cdots & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$$

- $V(x)$  is negative definite. It is negative except for  $x = 0$  where it is zero.

# Lyapunov Functions

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- Let  $V(x)$  be a continuous scalar function of the state  $x$ .
- $V(x)$  is semidefinite if it is continuous, and has continuous first partial derivatives, and if it has the same sign except at points which it is zero. A  $V(x) \geq 0$  is **positive semidefinite**, while  $V(x) \leq 0$  is **negative semidefinite**.
- $V(x)$  is definite if it is continuous, and has continuous first partial derivatives, and if it has the same sign, and is nowhere zero, except possibly at the origin. For  $x \neq 0$ , a  $V(x) > 0$  is **positive definite**, while  $V(x) < 0$  is **negative definite**.
- Quadratic forms often make good Lyapunov functions.

## Time Rate of Change of $V(x)$

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

- We are now interested in the time rate of change of  $V(x)$ .
- We will use the chain rule to relate the time rate of change  $\dot{V}(x)$  to the flow of the system:

$$\dot{x} = f(x, t) \quad f(0, t) = 0$$

- Recall that the  $\dot{x} = f(x, t)$  is short hand for

$$\dot{x}_1 = f_1(x, t)$$

$$\dot{x}_2 = f_2(x, t)$$

⋮

$$\dot{x}_n = f_n(x, t)$$

# Time Rate of Change of $V(x)$

TODAY

Stability i.s.L.

Motivation

Intuitive Argument

Quadratic Forms

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

## ■ Calculating $\dot{V}(x)$

$$\begin{aligned}\dot{V}(x) &= \frac{\partial V}{\partial x_1} \frac{\partial x_1}{\partial t} + \frac{\partial V}{\partial x_2} \frac{\partial x_2}{\partial t} + \cdots + \frac{\partial V}{\partial x_n} \frac{\partial x_n}{\partial t} \\ &= \frac{\partial V}{\partial x_1} \dot{x}_1 + \frac{\partial V}{\partial x_2} \dot{x}_2 + \cdots + \frac{\partial V}{\partial x_n} \dot{x}_n \\ &= \frac{\partial V}{\partial x_1} f_1 + \frac{\partial V}{\partial x_2} f_2 + \cdots + \frac{\partial V}{\partial x_n} f_n \\ &= \langle \nabla V, f \rangle\end{aligned}$$

- If  $V(x)$  is strictly positive definite and  $W = \dot{V}(x)$  is negative definite then we are assured that the equilibrium  $x = 0$  is stable i.s.L.
- But let's state this more precisely.

# Lyapunov's Stability Theorems

NEXT

## Lyapunov's Stability Theorem

Given the system

$$\dot{x} = f(x, t) \quad f(0, t) = 0$$

the equilibrium  $x = 0$  is stable if it is possible to find a definite  $V(x)$  such that  $V(0) = 0$ , and  $W$  is semidefinite of sign opposite to  $V(x)$  or vanishes identically.

## Lyapunov's Asymptotic Stability Theorem

The equilibrium  $x = 0$  is asymptotically stable if it is possible to find a definite  $V(x)$  such that  $V(0) = 0$ , and  $W$  is definite of sign opposite to  $V(x)$ .

Summary of Tests  
NEXT

- Lyapunov analysis is useful for the study of the stability of controlled nonlinear systems, too.
- For example, the Euler equations governing the attitude dynamics of a rigid spacecraft are given by

$$\begin{aligned} I_x \dot{\omega}_x - (I_y - I_z) \omega_y \omega_z &= M_x \\ I_y \dot{\omega}_y - (I_z - I_x) \omega_x \omega_z &= M_y \\ I_z \dot{\omega}_z - (I_x - I_y) \omega_x \omega_y &= M_y \end{aligned}$$

- Assume that we would like to **stabilize** a space vehicle tumbling in orbit to the point  $\omega_x = \omega_y = \omega_z = 0$  using state feedback.

- We could apply the following control torques proportional to the angular velocities

$$\begin{pmatrix} M_x \\ M_y \\ M_z \end{pmatrix} = \begin{pmatrix} -k_x \omega_x \\ -k_y \omega_y \\ -k_z \omega_z \end{pmatrix}$$

- Choosing the state variables  $(x_1, x_2, x_3)^T = (\omega_x, \omega_y, \omega_z)$  we can write Euler's equations as  $\dot{x} = A(x)x$  where

$$A(x) = \begin{pmatrix} -\frac{k_x}{I_x} & \frac{I_y}{I_x}x_3 & -\frac{I_z}{I_x}x_3 \\ -\frac{I_x}{I_y}x_3 & -\frac{k_y}{I_y} & \frac{I_z}{I_y}x_1 \\ \frac{I_x}{I_z}x_2 & -\frac{I_y}{I_z}x_1 & -\frac{k_z}{I_z} \end{pmatrix}$$

## PROOF:

- Assume that a positive definite solution  $Q$  exists with some positive definite matrix  $P$
- Consider the Lyapunov function  $V(x) = x^T Q x$  for the equation  $\dot{x} = Ax$
- $V(x)$  is continuous and has a unique minimum at  $x = 0$
- Calculate  $W = \dot{V}(x(t))$

$$\begin{aligned}\dot{V}(x(t)) &= \dot{x}^T Q x + x^T Q \dot{x} = (Ax)^T Q x + x^T Q (Ax) \\ &= x^T (A^T Q + Q A) x = -x^T P x < 0\end{aligned}$$

- Therefore the equilibrium is asymptotically stable by Lyapunov's Theorem.

Definite Forms

Examples

Lyapunov Functions

$\dot{V}(x)$

Lyapunov's Theorems

Example

Direct Stability Test

Example

Summary of Tests

NEXT

PROOF:

- Suppose that  $u \neq 0$ , then

$$u^T Qu = \int_0^\infty u^T e^{A^T t} P e^{At} u dt > 0$$

since  $e^{At}$  is invertible and therefore  $e^{At}u \neq 0$

- $Q$  satisfies the Lyapunov matrix equation

$$\begin{aligned} A^T Q + Q A &= \int_0^\infty A^T e^{A^T t} P e^{At} dt + \int_0^\infty e^{A^T t} P e^{At} A dt \\ &= \int_0^\infty \frac{d}{dt} \left( e^{A^T t} P e^{At} \right) dt = \left[ e^{A^T t} P e^{At} \right]_0^\infty \\ &= 0 - P = -P \end{aligned}$$

since  $e^{A^T \cdot 0} = e^{A \cdot 0} = I$ , and both  $e^{A^T t}$  and  $e^{At}$  tend to zero as  $t \rightarrow \infty$
