

16.810 (16.682)

Engineering Design and Rapid Prototyping

Lecture 3

Computer Aided Design (CAD)

Instructor(s)

Prof. Olivier de Weck
deweck@mit.edu

Dr. Il Yong Kim
kiy@mit.edu

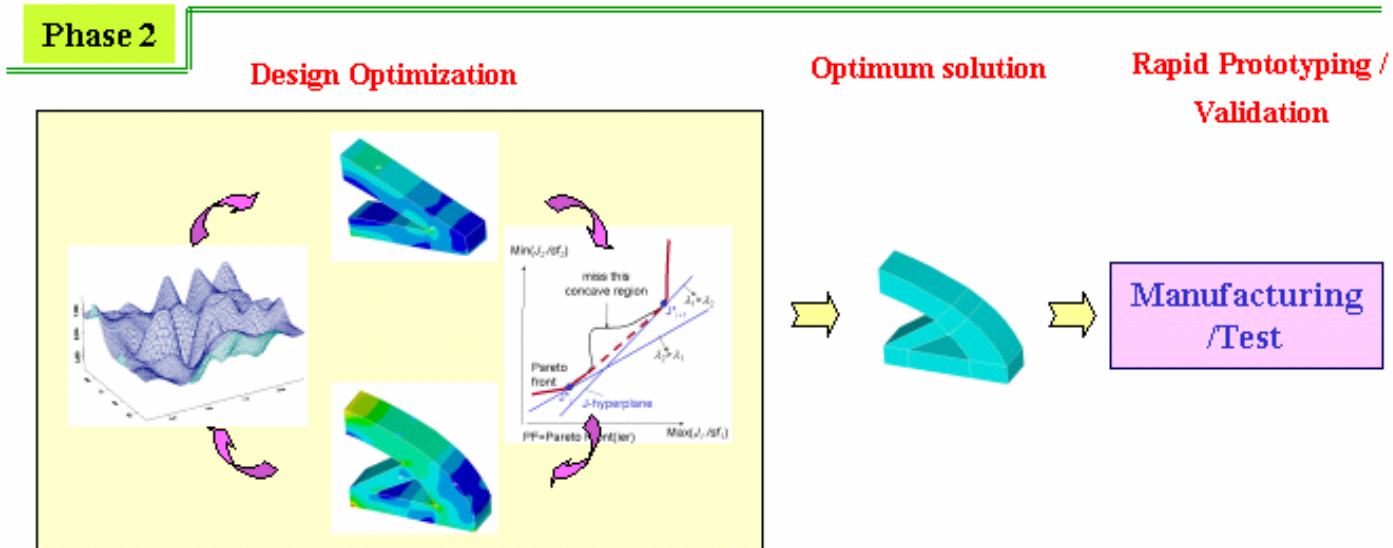

January 9, 2004

16.810 Plan for Today

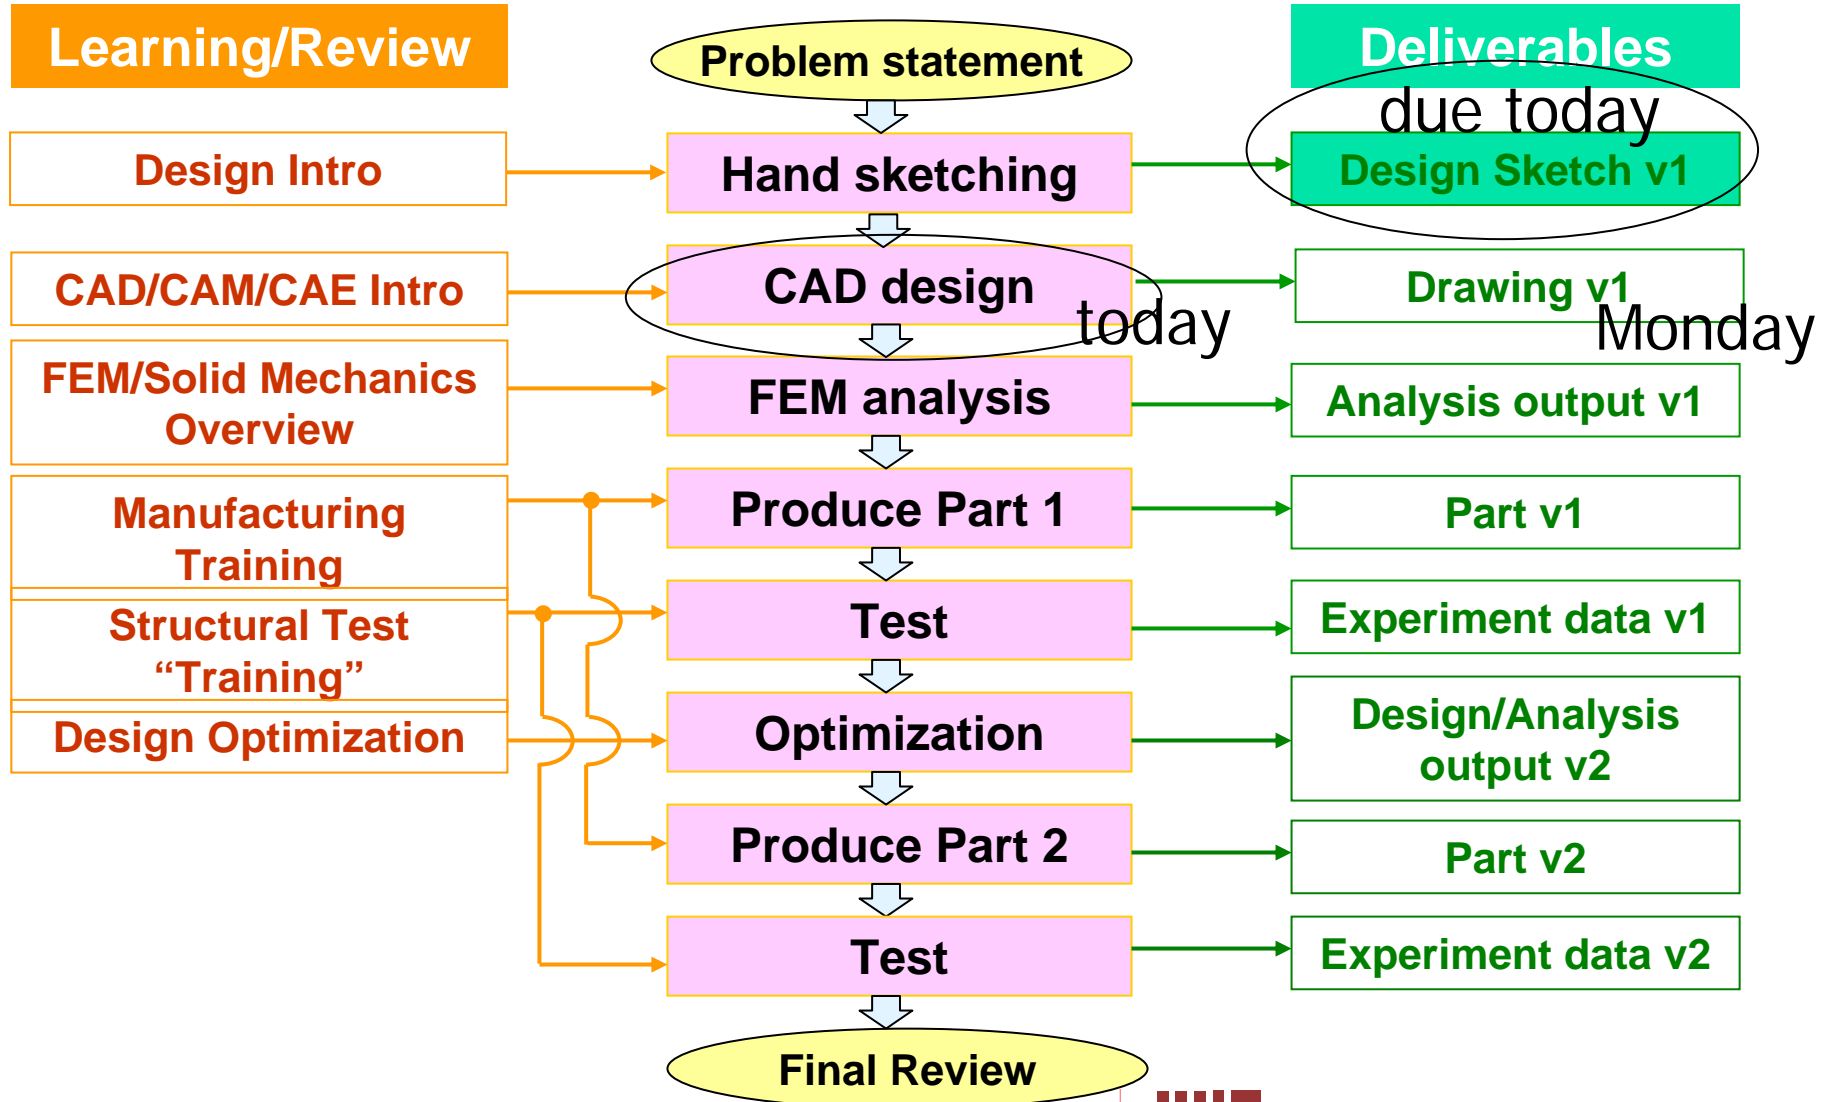

- CAD Lecture (ca. 50 min)
 - CAD History, Background
 - Some theory of geometrical representation
- SolidWorks Introduction (ca. 40 min)
 - Led by Bill Nadir (TA)
 - Follow along step-by-step
- Create CAD model of your part (ca. 90 min)
 - Work in teams of two
 - Use hand sketch as starting point

Course Concept

today

Course Flow Diagram

16.810 What is CAD?

- Computer Aided Design (CAD)
 - A set of methods and tools to assist product designers in
 - Creating a geometrical representation of the artifacts they are designing
 - Dimensioning, Tolerancing
 - Configuration Management (Changes)
 - Archiving
 - Exchanging part and assembly information between teams, organizations
 - Feeding subsequent design steps
 - Analysis (CAE)
 - Manufacturing (CAM)
 - ...by means of a computer system.

Basic Elements of a CAD System

Input Devices

Keyboard
Mouse

CAD keyboard
Templates
Space Ball

Main System

Computer
CAD Software
Database

Output Devices

Hard Disk
Network
Printer
Plotter

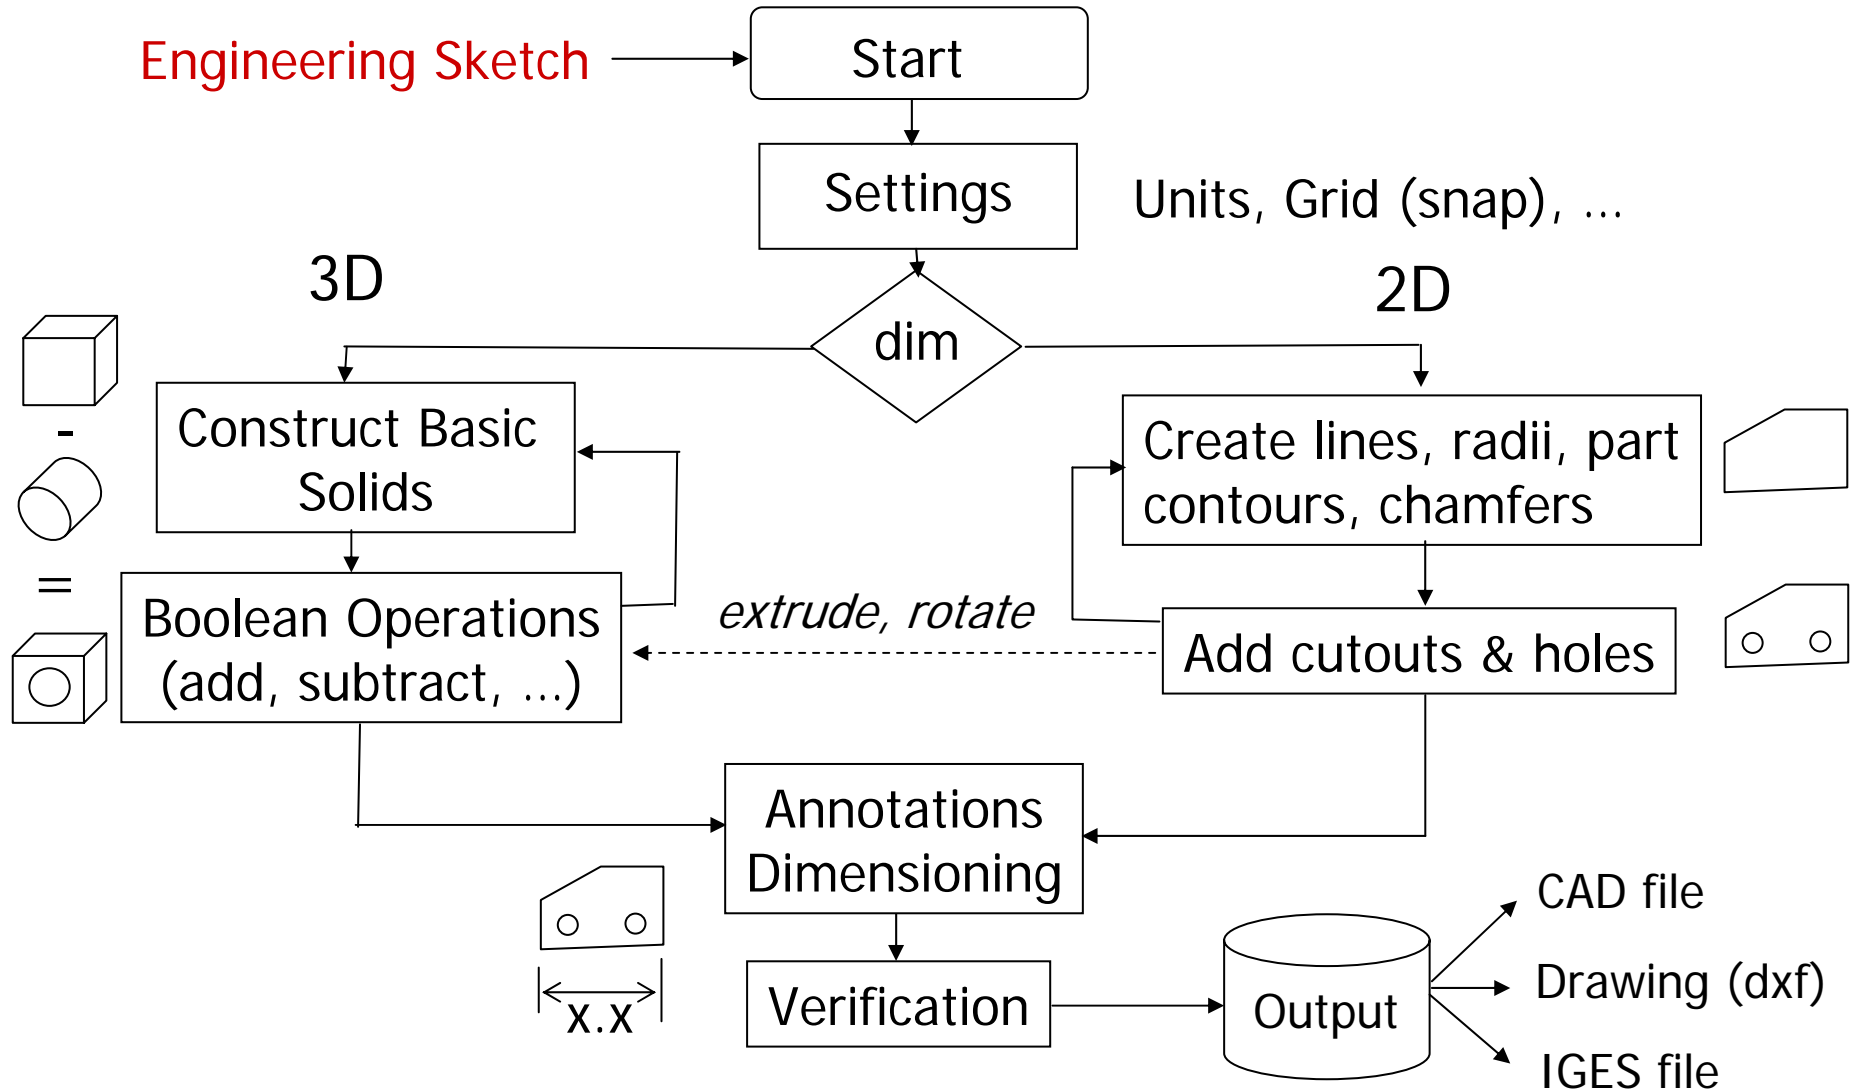

Human Designer

- 1957 PRONTO (Dr. Hanratty) – first commercial numerical-control programming system
- 1960 SKETCHPAD (MIT Lincoln Labs)
- Early 1960's industrial developments
 - General Motors – DAC (Design Automated by Computer)
 - McDonnell Douglas – CADD
- Early technological developments
 - Vector-display technology
 - Light-pens for input
 - Patterns of lines rendering (first 2D only)
- 1967 Dr. Jason R Lemon founds SDRC in Cincinnati
- 1979 Boeing, General Electric and NIST develop IGES (Initial Graphic Exchange Standards), e.g. for transfer of NURBS curves
- Since 1981: numerous commercial programs

■ Source: <http://mbinfo.mbdesign.net/CAD-History.htm>

16.810 Major Benefits of CAD

- Productivity (=Speed) Increase
 - Automation of repeated tasks
 - Doesn't necessarily increase creativity!
 - Insert standard parts (e.g. fasteners) from database
- Supports Changeability
 - Don't have to redo entire drawing with each change
 - EO – "Engineering Orders"
 - Keep track of previous design iterations
- Communication
 - With other teams/engineers, e.g. manufacturing, suppliers
 - With other applications (CAE/FEM, CAM)
 - Marketing, realistic product rendering
 - Accurate, high quality drawings
 - Caution: CAD Systems produce errors with hidden lines etc...
- Some limited Analysis
 - Mass Properties (Mass, Inertia)
 - Collisions between parts, clearances

Example CAD A/C Assembly

- Boeing (sample) parts
 - A/C structural assembly
 - 2 decks
 - 3 frames
 - Keel
 - Loft included to show interface/stayout zone to A/C
 - All Boeing parts in Catia file format
 - Files imported into SolidWorks by converting to IGES format

Raster Graphics

- Grid of pixels
 - No relationships between pixels
 - Resolution, e.g. 72 dpi (dots per inch)
 - Each pixel has color, e.g. 8-bit image has 256 colors

.bmp - raw data format

```

16.810 Vector Graphics

.emf format

CAD Systems use
vector graphics

- Object Oriented

- relationship between pixels captured
- describes both (anchor/control) points and lines between them
- Easier scaling & editing

Most common interface file:
IGES

16.810 Major CAD Software Products

- AutoCAD (Autodesk) → mainly for PC
- Pro Engineer (PTC)
- SolidWorks (Dassault Systems)
- CATIA (IBM/Dassault Systems)
- Unigraphics (UGS)
- I-DEAS (SDRC)

Geometrical representation

(1) Parametric Curve Equation **vs.**

Nonparametric Curve Equation

(2) Various curves (*some mathematics !*)

- Hermite Curve

- Bezier Curve

- B-Spline Curve

- NURBS (Nonuniform Rational B-Spline) Curves

Applications: CAD, FEM, Design Optimization

Two types of equations for curve representation

(1) Parametric equation

x, y, z coordinates are related by a parametric variable (u or θ)

(2) Nonparametric equation

x, y, z coordinates are related by a function

Example: Circle (2-D)

Parametric equation

$$x = R \cos \theta, \quad y = R \sin \theta \quad (0 \leq \theta \leq 2\pi)$$

Nonparametric equation

$$x^2 + y^2 - R^2 = 0 \quad (\text{Implicit nonparametric form})$$

$$y = \pm \sqrt{R^2 - x^2} \quad (\text{Explicit nonparametric form})$$

Two types of curve equations

(1) **Parametric equation** Point on 2-D curve: $\mathbf{p} = [x(u) \quad y(u)]$

Point on 3-D surface: $\mathbf{p} = [x(u) \quad y(u) \quad z(u)]$

u : parametric variable and independent variable

(2) **Nonparametric equation** $y = f(x) : 2\text{-D}$, $z = f(x, y) : 3\text{-D}$

Which is better for CAD/CAE? : Parametric equation

$$x = R \cos \theta, \quad y = R \sin \theta \quad (0 \leq \theta \leq 2\pi)$$

$$x^2 + y^2 - R^2 = 0$$

$$y = \pm \sqrt{R^2 - x^2}$$

It also is good for calculating the points at a certain interval along a curve

1. Parametric equations usually offer **more degrees of freedom** for controlling the shape of curves and surfaces than do nonparametric forms.

e.g. Cubic curve

$$\text{Parametric curve: } x = au^3 + bu^2 + cu + d$$

$$y = eu^3 + fu^2 + gu + h$$

$$\text{Nonparametric curve: } y = ax^3 + bx^2 + cx + d$$

2. Parametric forms readily handle **infinite slopes**

$$\frac{dy}{dx} = \frac{dy/du}{dx/du} \Rightarrow dx/du = 0 \text{ indicates } dy/dx = \infty$$

3. Transformation can be performed directly on parametric equations

e.g. Translation in x-dir.

$$\text{Parametric curve: } x = au^3 + bu^2 + cu + d + x_0$$

$$y = eu^3 + fu^2 + gu + h$$

$$\text{Nonparametric curve: } y = a(x - x_0)^3 + b(x - x_0)^2 + c(x - x_0) + d$$

- * Most of the equations for curves used in CAD software are of **degree 3**, because two curves of degree 3 guarantees 2nd derivative continuity at the connection point
→ The two curves appear to one.
- * Use of a higher degree causes small oscillations in curve and requires heavy computation.
- * Simplest parametric equation of degree 3

$$\begin{aligned} \mathbf{P}(u) &= [x(u) \quad y(u) \quad z(u)] \\ &= \mathbf{a}_0 + \mathbf{a}_1 u + \mathbf{a}_2 u^2 + \mathbf{a}_3 u^3 \quad (0 \leq u \leq 1) \end{aligned}$$

$\mathbf{a}_0, \mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3$: Algebraic vector coefficients

→ The curve's shape change cannot be intuitively anticipated from changes in these values

$$\mathbf{P}(u) = \mathbf{a}_0 + \mathbf{a}_1 u + \mathbf{a}_2 u^2 + \mathbf{a}_3 u^3 \quad (0 \leq u \leq 1)$$

Instead of algebraic coefficients, let's use the position vectors and the tangent vectors at the two end points!

Position vector at starting point: $\mathbf{P}_0 = \mathbf{P}(0) = \mathbf{a}_0$

Position vector at end point: $\mathbf{P}_1 = \mathbf{P}(1) = \mathbf{a}_0 + \mathbf{a}_1 + \mathbf{a}_2 + \mathbf{a}_3$

Tangent vector at starting point: $\mathbf{P}'_0 = \mathbf{P}'(0) = \mathbf{a}_1$

Tangent vector at end point: $\mathbf{P}'_1 = \mathbf{P}'(1) = \mathbf{a}_1 + 2\mathbf{a}_2 + 3\mathbf{a}_3$

$$\mathbf{P}(u) = [1 - 3u^2 + 2u^3 \quad 3u^2 - 2u^3 \quad u - 2u^2 + u^3 \quad -u^2 + u^3] \begin{bmatrix} \mathbf{P}_0 \\ \mathbf{P}_1 \\ \mathbf{P}'_0 \\ \mathbf{P}'_1 \end{bmatrix}$$

Blending functions

: Hermit curve

No algebraic coefficients

$\mathbf{P}_0, \mathbf{P}'_0, \mathbf{P}_1, \mathbf{P}'_1$: Geometric coefficients

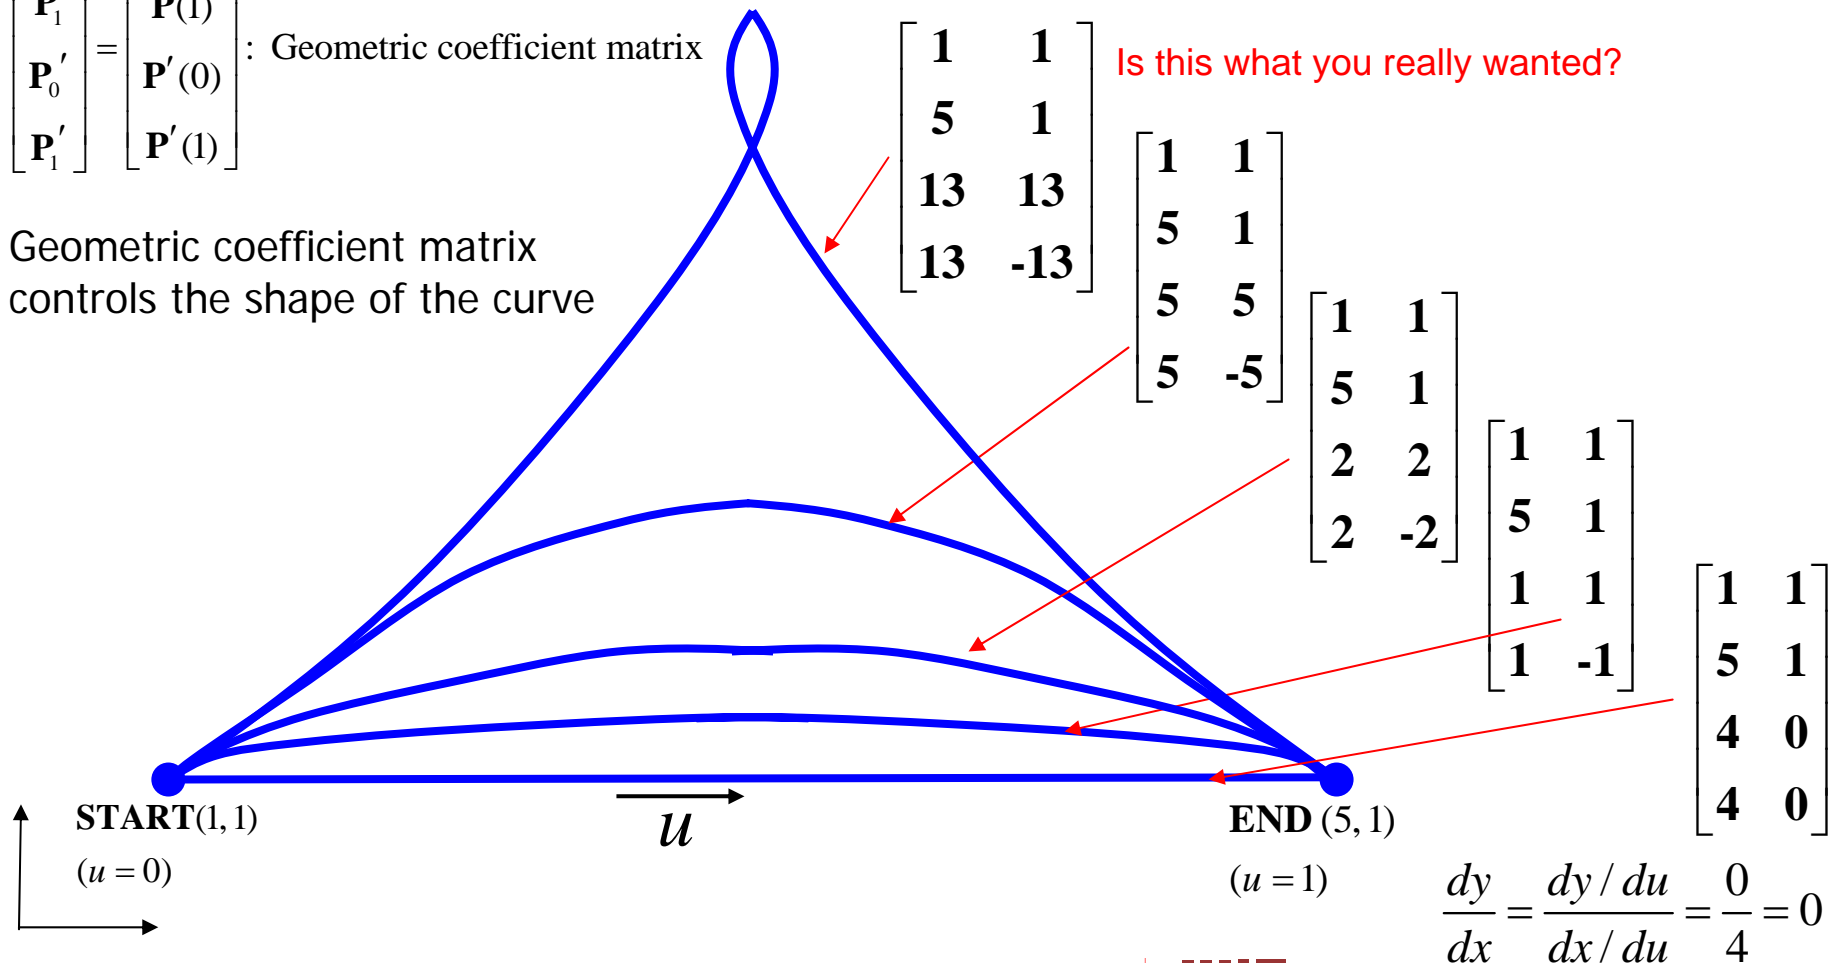

The curve's shape change can be intuitively anticipated from changes in these values

Effect of tangent vectors on the curve's shape

$$\begin{bmatrix} \mathbf{P}_0 \\ \mathbf{P}_1 \\ \mathbf{P}'_0 \\ \mathbf{P}'_1 \end{bmatrix} = \begin{bmatrix} \mathbf{P}(0) \\ \mathbf{P}(1) \\ \mathbf{P}'(0) \\ \mathbf{P}'(1) \end{bmatrix} : \text{Geometric coefficient matrix}$$

Geometric coefficient matrix controls the shape of the curve

* In case of Hermite curve, it is not easy to predict curve shape according to changes in magnitude of the tangent vectors, P_0' and P_1'

* Bezier Curve can control curve shape more easily using several control points (Bezier 1960)

$$P(u) = \sum_{i=0}^n \binom{n}{i} u^i (1-u)^{n-i} P_i, \quad \text{where } \binom{n}{i} = \frac{n!}{i!(n-i)!}$$

P_i : Position vector of the i th vertex (control vertices)

* Number of vertices: $n+1$
(No of control points)

* Number of segments: n

* Order of the curve: n

* The order of Bezier curve is determined by the number of control points.

n control points

Order of Bezier curve: $n-1$

Properties

- The curve passes through the first and last vertex of the polygon.
- The tangent vector at the starting point of the curve has the same direction as the first segment of the polygon.
- The n th derivative of the curve at the starting or ending point is determined by the first or last $(n+1)$ vertices.

(1) For complicated shape representation, higher degree Bezier curves are needed.

→ Oscillation in curve occurs, and computational burden increases.

(2) Any one control point of the curve affects the shape of the entire curve.

→ Modifying the shape of a curve locally is difficult.

(Global modification property)

Desirable properties :

1. Ability to represent complicated shape with **low order** of the curve
2. Ability to modify a curve's shape **locally**

➔ **B-spline curve!**

* Developed by Cox and Boor (1972)

$$\mathbf{P}(u) = \sum_{i=0}^n N_{i,k}(u) \mathbf{P}_i$$

where

\mathbf{P}_i : Position vector of the i th control point

$$N_{i,k}(u) = \frac{(u - t_i)N_{i,k-1}(u)}{t_{i+k-1} - t_i} + \frac{(t_{i+k} - u)N_{i+1,k-1}(u)}{t_{i+k} - t_{i+1}}$$

$$N_{i,1}(u) = \begin{cases} 1 & t_i \leq u \leq t_{i+1} \\ 0 & \text{otherwise} \end{cases}$$

$$t_i = \begin{cases} 0 & 0 \leq i < k \\ i - k + 1 & k \leq i \leq n \\ n - k + 2 & n < i \leq n + k \end{cases}$$

(Nonperiodic knots)

k : order of the B-spline curve

$n+1$: number of control points

The order of curve is independent of the number of control points!

Example

Advantages

- (1) The order of the curve is independent of the number of control points (contrary to Bezier curves)
 - User can select the curve's order and number of control points separately.
 - It can represent very complicated shape with low order
- (2) Modifying the shape of a curve locally is easy. (contrary to Bezier curve)
 - Each curve segment is affected by k (order) control points. (local modification property)

$$\mathbf{P}(u) = \frac{\sum_{i=0}^n h_i \mathbf{P}_i N_{i,k}(u)}{\sum_{i=0}^n h_i N_{i,k}(u)} \quad \left(\text{B-spline: } \mathbf{P}(u) = \sum_{i=0}^n \mathbf{P}_i N_{i,k}(u) \right)$$

\mathbf{P}_i : Position vector of the i th control point

h_i : Homogeneous coordinate

* **If all the homogeneous coordinates (h_i) are 1, the denominator becomes 1**

If $h_i = 1 \forall i$, then $\sum_{i=0}^n N_{i,k}(u) = 1$.

* **B-spline curve is a special case of NURBS.**

* **Bezier curve is a special case of B-spline curve.**

(1) More **versatile modification capacity**

- Homogeneous coordinate h_i , which B-spline does not have, can change.
- Increasing h_i of a control point \rightarrow Drawing the curve toward the control point.

(2) NURBS can exactly represent the **conic curves** - circles, ellipses, parabolas, and hyperbolas (B-spline can only approximate these curves)

(3) Curves, such as conic curves, Bezier curves, and B-spline curves can be converted to their corresponding NURBS representations.

(1) Parametric Equation vs. Nonparametric Equation

(2) Various curves

- Hermite Curve
- Bezier Curve
- B-Spline Curve
- NURBS (Nonuniform Rational B-Spline) Curve

(3) Surfaces

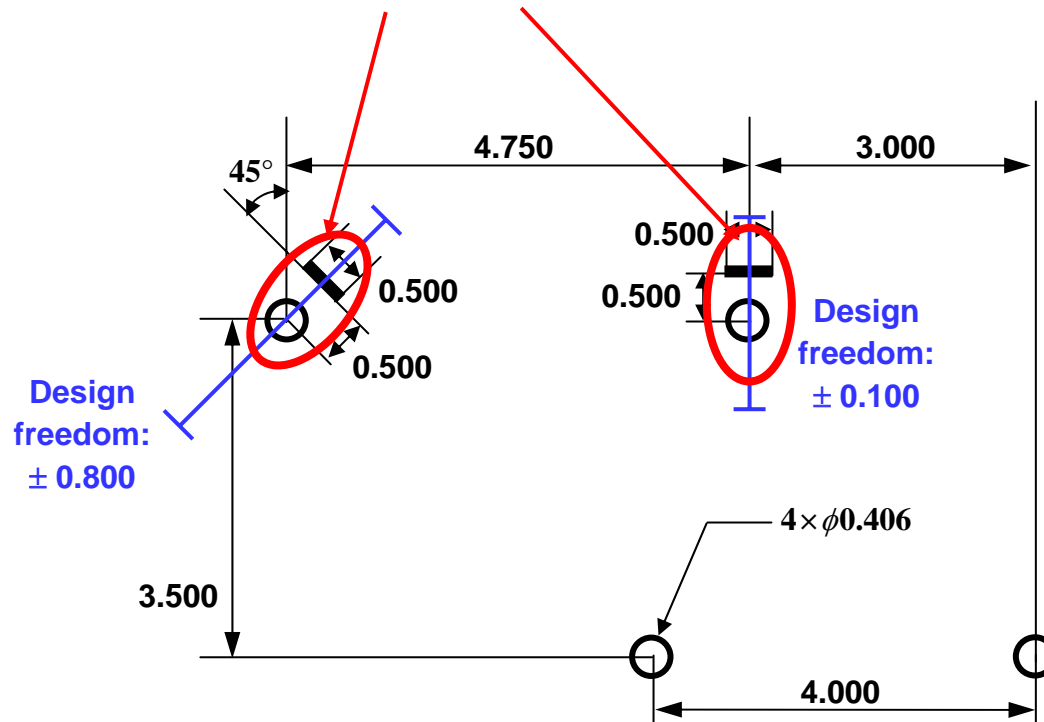

- Bilinear surface
- Bicubic surface
- Bezier surface
- B-Spline surface
- NURBS surface

Flat surface

Design Freedom

Both the flat surface and holes move together along the design freedom line

Order of applying loads

- For linear deformation, it does not matter.
- For nonlinear deformation (eg. buckling), it is important.

IAP 2004 Schedule

Week		Monday	Wednesday	Friday
1	Lecture	L1 – Introduction (de Weck)	L2 – Hand Sketching (Wallace)	L3 – CAD modeling (Kim, de Weck)
	Hands-on activities	Tour - Design studio - Machine shop - Testing area	Sketch Initial design	Make a 2-D CAD model (Solidworks) Nadir
2	Lecture	L4 – Introduction to CAE (Kim)	L5 – Introduction to CAM (Kim)	L6 – Guest Lecture 1 (Bowkett) Rapid Prototyping
	Hands-on activities	FEM Analysis (Cosmos)	Water Jet Intro machine shop Omax (Weiner, Nadir)	Make part version 1
3	Lecture	Martin Luther King Jr. Holiday – no class	L7 – Structural Testing (Kim, de Weck)	L8 – Design optimization (Kim)
	Hands-on activities		Test part ver. 1 (Kane)	Introduction to Structural Optimization Programs
4	Lecture			L9 – Guest Lecture 2 (Sobieski) Multidisciplinary Optimization
	Hands-on activities	Carry out design optimization	Manufacture part ver. 2 Test part ver. 2	Final Review (de Weck, Kim)

16.810 SolidWorks Introduction

- SolidWorks
 - Most popular CAD system in education
 - Will be used for this project
 - 40 Minute Introduction by Bill Nadir (TA)
 - <http://www.solidworks.com> (Student Section)
