# 2.094 <br> Finite Element Analysis of Solids and Fluids Spring 2008 

## Homework 2

| Instructor: | Prof. K. J. Bathe | Assigned: | $02 / 14 / 2008$ |
| :--- | :--- | :--- | :--- |
| TA: | Do-Nyun Kim | Due: | $02 / 21 / 2008$ |

Problem 1 (20 points):

Consider the disk with a centerline hole of radius 20 shown spinning at a rotational velocity of $\boldsymbol{\omega}$ radians/second.

Idealize the structure as an assemblage of 2 two-node elements and calculate the steady-state (pseudostatic) equilibrium equations. (Note that the strains are now $\boldsymbol{\partial} \boldsymbol{u} / \boldsymbol{\partial} \boldsymbol{x}$ and $\boldsymbol{u} / \boldsymbol{x}$, where $\boldsymbol{u} / \boldsymbol{x}$ is the hoop strain.)

Note: Assume linear analysis conditions.
