6.003: Signals and Systems

Fourier Transform

Last Time: Fourier Series

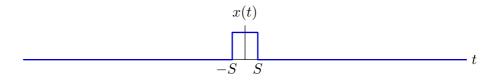

Representing periodic signals as sums of sinusoids.

 \rightarrow new representations for systems as **filters**.

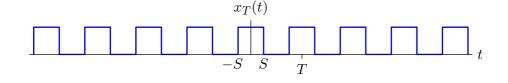

Today: generalize for aperiodic signals.

An aperiodic signal can be thought of as periodic with infinite period.

Let $\boldsymbol{x}(t)$ represent an aperiodic signal.

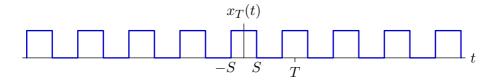

"Periodic extension":
$$x_T(t) = \sum_{k=-\infty}^{\infty} x(t+kT)$$

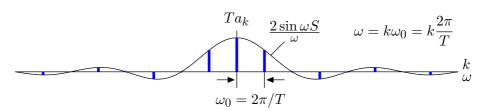

Then
$$x(t) = \lim_{T \to \infty} x_T(t)$$
.

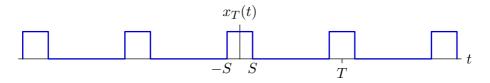

Represent $x_T(t)$ by its Fourier series.

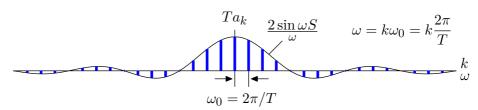

$$a_k = \frac{1}{T} \int_{-T/2}^{T/2} x_T(t) e^{-j\frac{2\pi}{T}kt} dt = \frac{1}{T} \int_{-S}^{S} e^{-j\frac{2\pi}{T}kt} dt = \frac{\sin\frac{2\pi kS}{T}}{\pi k} = \frac{2}{T} \frac{\sin\omega S}{\omega}$$

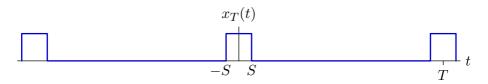

Doubling period doubles # of harmonics in given frequency interval.

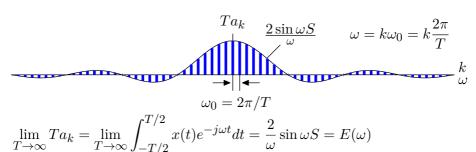

$$a_k = \frac{1}{T} \int_{-T/2}^{T/2} x_T(t) e^{-j\frac{2\pi}{T}kt} dt = \frac{1}{T} \int_{-S}^{S} e^{-j\frac{2\pi}{T}kt} dt = \frac{\sin\frac{2\pi kS}{T}}{\pi k} = \frac{2}{T} \frac{\sin\omega S}{\omega}$$

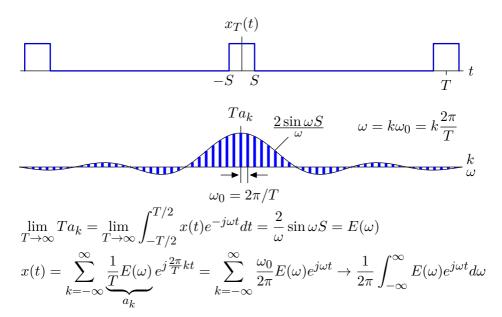

As $T \to \infty$, discrete harmonic amplitudes \to a continuum $E(\omega)$.

$$a_k = \frac{1}{T} \int_{-T/2}^{T/2} x_T(t) e^{-j\frac{2\pi}{T}kt} dt = \frac{1}{T} \int_{-S}^{S} e^{-j\frac{2\pi}{T}kt} dt = \frac{\sin\frac{2\pi kS}{T}}{\pi k} = \frac{2}{T} \frac{\sin\omega S}{\omega}$$

As $T \to \infty$, synthesis sum \to integral.

Replacing $E(\omega)$ by $X(j\omega)$ yields the Fourier transform relations.

$$E(\omega) = X(j\omega)$$

Fourier transform

$$X(j\omega) = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt \qquad \qquad \text{("analysis" equation)}$$

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega)e^{j\omega t}d\omega \qquad \qquad \text{("synthesis" equation)}$$

Replacing $E(\omega)$ by $X(j\omega)$ yields the Fourier transform relations.

$$E(\omega) = X(j\omega)$$

Fourier transform

$$X(j\omega) = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt \qquad \qquad \text{("analysis" equation)}$$

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega)e^{j\omega t}d\omega \qquad \qquad \text{("synthesis" equation)}$$

Form is similar to that of Fourier series \rightarrow provides alternate view of signal.

Relation between Fourier and Laplace Transforms

If the Laplace transform of a signal exists and if the ROC includes the $j\omega$ axis, then the Fourier transform is equal to the Laplace transform evaluated on the $j\omega$ axis.

Laplace transform:

$$X(s) = \int_{-\infty}^{\infty} x(t)e^{-st}dt$$

Fourier transform:

$$X(j\omega) = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt = X(s)|_{s=j\omega}$$

Relation between Fourier and Laplace Transforms

Fourier transform "inherits" properties of Laplace transform.

Property	x(t)	X(s)	$X(j\omega)$
Linearity	$ax_1(t) + bx_2(t)$	$aX_1(s) + bX_2(s)$	$aX_1(j\omega) + bX_2(j\omega)$

$$ax_1(t) + bx_2(t)$$
$$x(t - t_0)$$

x(at)

dx(t)

tx(t)

 $x_1(t) * x_2(t)$

Time shift

Time scale

Differentiation

Multiply by t

Convolution

$$\frac{1}{|a|}X\left(\frac{s}{a}\right)$$

 $e^{-st_0}X(s)$

sX(s)

 $-\frac{d}{ds}X(s)$

 $X_1(s) \times X_2(s)$

$$e^{-j\omega t_0}X(j\omega)$$

$$\frac{1}{|a|}X\left(\frac{j\omega}{a}\right)$$

$$-\frac{1}{j}\frac{d}{d\omega}X(j\omega)$$

 $X_1(j\omega) \times X_2(j\omega)$

 $j\omega X(j\omega)$

Relation between Fourier and Laplace Transforms

There are also important differences.

Compare Fourier and Laplace transforms of $x(t) = e^{-t}u(t)$.

Laplace transform

$$X(s)=\int_{-\infty}^{\infty}e^{-t}u(t)e^{-st}dt=\int_{0}^{\infty}e^{-(s+1)t}dt=\frac{1}{1+s}\ ;\ \operatorname{Re}(s)>-1$$
 a complex-valued function of **complex** domain.

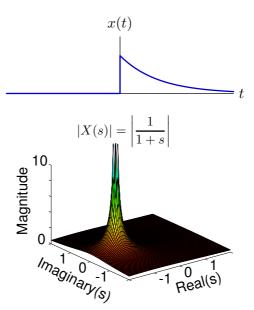

Fourier transform

$$X(j\omega) = \int_{-\infty}^{\infty} e^{-t}u(t)e^{-j\omega t}dt = \int_{0}^{\infty} e^{-(j\omega+1)t}dt = \frac{1}{1+j\omega}$$

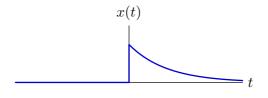

a complex-valued function of real domain.

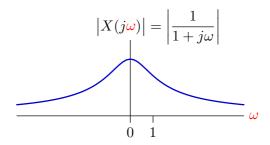

Laplace Transform

The Laplace transform maps a function of time t to a complex-valued function of complex-valued domain s.

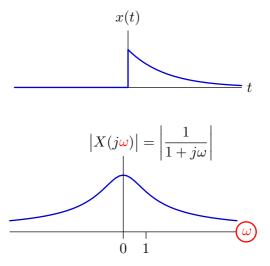

The Fourier transform maps a function of time t to a complex-valued function of real-valued domain ω .

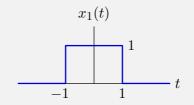

The Fourier transform maps a function of time t to a complex-valued function of real-valued domain ω .

Frequency plots provide intuition that is difficult to otherwise obtain.

Find the Fourier transform of the following square pulse.

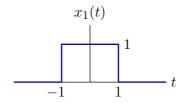

1.
$$X_1(j\omega) = \frac{1}{\omega} \left(e^{\omega} - e^{-\omega} \right)$$
 2. $X_1(j\omega) = \frac{1}{\omega} \sin \omega$

3.
$$X_1(j\omega) = \frac{2}{\omega} \left(e^{\omega} - e^{-\omega} \right)$$
 4. $X_1(j\omega) = \frac{2}{\omega} \sin \omega$

5. none of the above

Compare the Laplace and Fourier transforms of a square pulse.

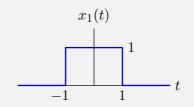

Laplace transform:

$$X_1(s) = \int_{-1}^1 e^{-st} dt = \left. \frac{e^{-st}}{-s} \right|_{-1}^1 = \frac{1}{s} \left(e^s - e^{-s} \right)$$
 [function of $s = \sigma + j\omega$]

Fourier transform

$$X_1(j\omega) = \int_{-1}^1 e^{-j\omega t} dt = \frac{e^{-j\omega t}}{-j\omega} \Big|_{-1}^1 = \frac{2\sin\omega}{\omega}$$
 [function of ω]

Find the Fourier transform of the following square pulse. 4

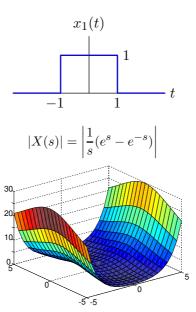

1.
$$X_1(j\omega) = \frac{1}{\omega} \left(e^{\omega} - e^{-\omega} \right)$$
 2. $X_1(j\omega) = \frac{1}{\omega} \sin \omega$

3.
$$X_1(j\omega) = \frac{2}{\omega} \left(e^{\omega} - e^{-\omega} \right)$$
 4. $X_1(j\omega) = \frac{2}{\omega} \sin \omega$

5. none of the above

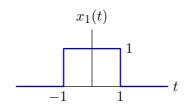

Laplace Transform

Laplace transform: complex-valued function of complex domain.

The Fourier transform is a function of real domain: frequency ω .

Time representation:

Frequency representation:

$$X_1(j\omega) = \frac{1}{\omega}$$

Signal $x_2(t)$ and its Fourier transform $X_2(j\omega)$ are shown below.

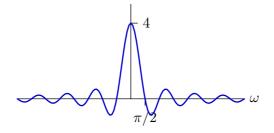

Which is true?

- 1. b = 2 and $\omega_0 = \pi/2$
- 2. b=2 and $\omega_0=2\pi$
- 3. b = 4 and $\omega_0 = \pi/2$
- 4. b = 4 and $\omega_0 = 2\pi$
- 5. none of the above

Find the Fourier transform.

$$X_2(j\omega) = \int_{-2}^2 e^{-j\omega t} dt = \left. \frac{e^{-j\omega t}}{-j\omega} \right|_{-2}^2 = \frac{2\sin 2\omega}{\omega} = \frac{4\sin 2\omega}{2\omega}$$

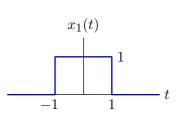

Signal $x_2(t)$ and its Fourier transform $X_2(j\omega)$ are shown below.

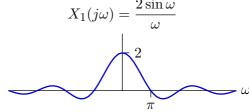

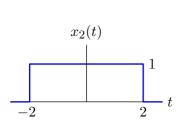

Which is true? 3

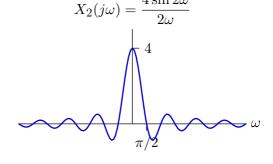

- 1. b = 2 and $\omega_0 = \pi/2$
- 2. b=2 and $\omega_0=2\pi$
- 3. b = 4 and $\omega_0 = \pi/2$
- 4. b = 4 and $\omega_0 = 2\pi$
- 5. none of the above

Stretching time compresses frequency.

Stretching time compresses frequency.

Find a general scaling rule.

Let $x_2(t) = x_1(at)$.

If time is stretched in going from x_1 to x_2 , is a > 1 or a < 1?

Stretching time compresses frequency.

Find a general scaling rule.

Let
$$x_2(t) = x_1(at)$$
.

If time is stretched in going from x_1 to x_2 , is a > 1 or a < 1?

$$x_2(2) = x_1(1)$$

$$x_2(t) = x_1(at)$$

Therefore a = 1/2, or more generally, a < 1.

Stretching time compresses frequency.

Find a general scaling rule.

Let $x_2(t) = x_1(at)$.

If time is stretched in going from x_1 to x_2 , is a > 1 or a < 1? a < 1

Find a general scaling rule.

Let $x_2(t) = x_1(at)$.

$$X_2(j\omega) = \int_{-\infty}^{\infty} x_2(t)e^{-j\omega t}dt = \int_{-\infty}^{\infty} x_1(at)e^{-j\omega t}dt$$

Let $\tau = at \ (a > 0)$.

$$X_2(j\omega) = \int_{-\infty}^{\infty} x_1(\tau)e^{-j\omega\tau/a} \frac{1}{a} d\tau = \frac{1}{a}X_1\left(\frac{j\omega}{a}\right)$$

If a<0 the sign of $d\tau$ would change along with the limits of integration. In general,

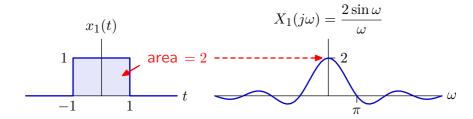

$$x_1(at) \leftrightarrow \frac{1}{|a|} X_1\left(\frac{j\omega}{a}\right)$$
.

If time is stretched (a < 1) then frequency is compressed and amplitude increases (preserving area).

Moments

The value of $X(j\omega)$ at $\omega=0$ is the integral of x(t) over time t.

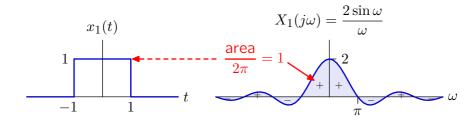

$$X(j\omega)|_{\omega=0} = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt = \int_{-\infty}^{\infty} x(t)e^{j0t}dt = \int_{-\infty}^{\infty} x(t)dt$$

Moments

The value of x(0) is the integral of $X(j\omega)$ divided by 2π .

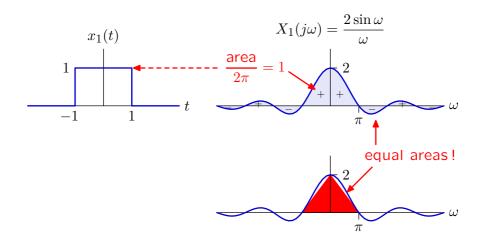

$$x(0) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega) e^{j\omega t} d\omega = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega) d\omega$$

Moments

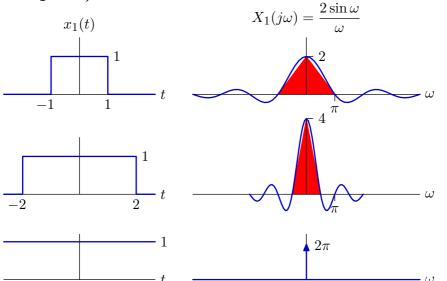

The value of x(0) is the integral of $X(j\omega)$ divided by 2π .

$$x(0) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega) e^{j\omega t} d\omega = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega) d\omega$$

Stretching to the Limit

Stretching time compresses frequency and increases amplitude (preserving area).

New way to think about an impulse!

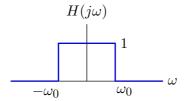

One of the most useful features of the Fourier transform (and Fourier series) is the simple "inverse" Fourier transform.

$$X(j\omega) = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt \qquad \qquad \text{(Fourier transform)}$$

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega)e^{j\omega t}d\omega \qquad \qquad \text{("inverse" Fourier transform)}$$

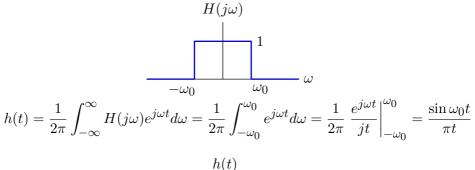

Inverse Fourier Transform

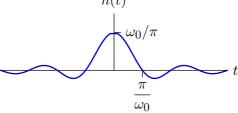

Find the impulse reponse of an "ideal" low pass filter.

Inverse Fourier Transform

Find the impulse reponse of an "ideal" low pass filter.

This result is not so easily obtained without inverse relation.

The Fourier transform and its inverse have very similar forms.

$$X(j\omega) = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt \qquad \qquad \text{(Fourier transform)}$$

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega)e^{j\omega t}d\omega \qquad \qquad \text{("inverse" Fourier transform)}$$

Convert one to the other by

- $t \to \omega$
- $\bullet \quad \omega \to -t$
- scale by 2π

Duality

The Fourier transform and its inverse have very similar forms.

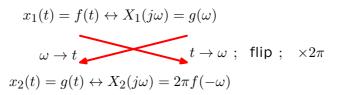

$$X(j\omega) = \int_{-\infty}^{\infty} x(t)e^{-j\omega t}dt$$
$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(j\omega)e^{j\omega t}d\omega$$

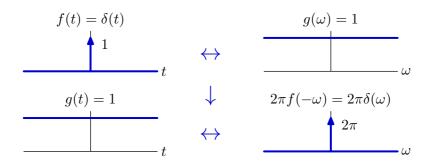

Two differences:

- minus sign: flips time axis (or equivalently, frequency axis)
- divide by 2π (or multiply in the other direction)

Duality

Using duality to find new transform pairs.

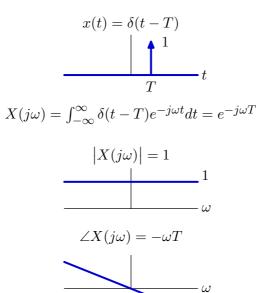

The function g(t) = 1 does not have a Laplace transform!

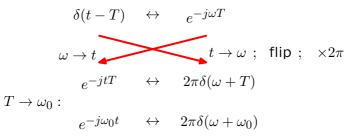

More Impulses

Fourier transform of delayed impulse: $\delta(t-T) \leftrightarrow e^{-j\omega T}$.

Eternal Sinusoids

Using duality to find the Fourier transform of an eternal sinusoid.

Eternal Sinusoids

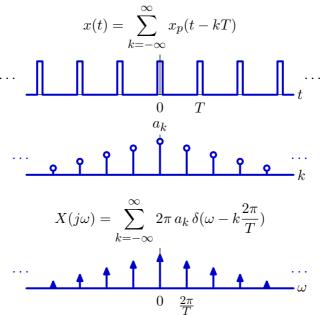

Using duality to find the Fourier transform of an eternal sinusoid.

$$\begin{split} x(t) &= x(t+T) = \sum_{k=-\infty}^{\infty} a_k e^{j\frac{2\pi}{T}kt} & \text{CTFS} \\ &\longleftrightarrow & \{a_k\} \end{split}$$

$$x(t) &= x(t+T) = \sum_{k=-\infty}^{\infty} a_k e^{j\frac{2\pi}{T}kt} & \text{CTFT} \\ &\longleftrightarrow & \sum_{k=-\infty}^{\infty} 2\pi a_k \delta\left(\omega - \frac{2\pi}{T}k\right) \end{split}$$

Relation between Fourier Transform and Fourier Series

Each term in the Fourier series is replaced by an impulse.

Summary

Fourier transform generalizes ideas from Fourier series to aperiodic signals.

Fourier transform is strikingly similar to Laplace transform

- similar properties (linearity, differentiation, ...)
- but has a **simple inverse** (great for computation!)

Next time – applications (demos) of Fourier transforms
