

Poproconti	na a system	n hv a cin	alo cignol	
Representi	ng a system	n by a sing	gie signal.	

Responses to arbitrary signals

Although we have focused on responses to simple signals ($\delta[n], \delta(t)$) we are generally interested in responses to more complicated signals.

How do we compute responses to a more complicated input signals?

No problem for difference equations / block diagrams. \rightarrow use step-by-step analysis.

Lecture 8

Structure of Superposition

If a system is linear and time-invariant (LTI) then its output is the sum of weighted and shifted unit-sample responses.

Lecture 8

Convolution

Response of an LTI system to an arbitrary input.

$$x[n] \longrightarrow \texttt{LTI} \longrightarrow y[n]$$
$$y[n] = \sum_{k=-\infty}^{\infty} x[k]h[n-k] \equiv (x*h)[n]$$

This operation is called **convolution**.

Notation

Convolution is represented with an asterisk.

$$\sum_{k=-\infty}^{\infty} x[k]h[n-k] \equiv (x*h)[n]$$

It is customary (but confusing) to abbreviate this notation:

 $(x\ast h)[n]=x[n]\ast h[n]$

Lecture 8

Convolution Representing an LTI system by a single signal. $x[n] \rightarrow h[n] \rightarrow y[n]$ Unit-sample response h[n] is a complete description of an LTI system. Given h[n] one can compute the response y[n] to any arbitrary input signal x[n]: $y[n] = (x * h)[n] \equiv \sum_{k=-\infty}^{\infty} x[k]h[n - k]$

Convolution of CT signals is analogous to convolution of DT signals.

DT:
$$y[n] = (x * h)[n] = \sum_{k=-\infty}^{\infty} x[k]h[n-k]$$

CT: $y(t) = (x * h)(t) = \int_{-\infty}^{\infty} x(\tau)h(t-\tau)d\tau$

Convolution

Convolution is an important **computational tool.**

Example: characterizing LTI systems

- Determine the unit-sample response h[n].
- Calculate the output for an arbitrary input using convolution:

$$y[n] = (x * h)[n] = \sum x[k]h[n-k]$$

Hubble Space Telescope

Telescope blur can be respresented by the convolution of blur due to atmospheric turbulence and blur due to mirror size.

Hubble Space Telescope

The main optical components of the Hubble Space Telescope are two mirrors.

Impulse Response: Summary

The impulse response is a complete description of a linear, timeinvariant system.

One can find the output of such a system by convolving the input signal with the impulse response.

The impulse response is an especially useful description of some types of systems, e.g., optical systems, where blurring is an important figure of merit.
