

INTRODUCTION TO BECS II
DIGITAL COMMUNICATION SYSTEMS

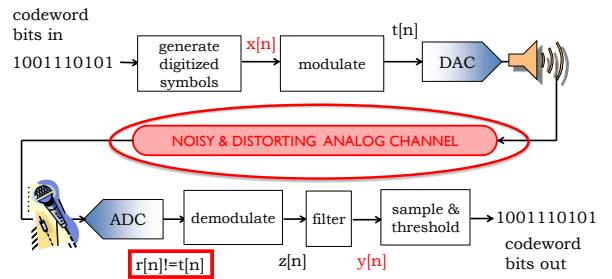

**6.02 Spring 2012
 Lecture #11**

- Acoustic channel
- Intersymbol Interference
- Convolution

6.02 Spring 2012

Lecture 11, Slide #1

**From Bits to Modulated Signal,
 and Back**

6.02 Spring 2012

Lecture 11, Slide #2

Let's explore acoustic transmission
 in this room

Many thanks to **Keith Winstein** for his extensive work on the acoustic channel platform for 6.02 and for today's demo!

Lecture 11, Slide #3

Transmission Over LTI Channel

6.02 Spring 2012

Lecture 11, Slide #4

Response of LTI Channel

Example of unit sample response $h[n]$ and corresponding unit step response $s[n]$ for a causal channel model:

6.02 Spring 2012

Lecture 11, Slide #5

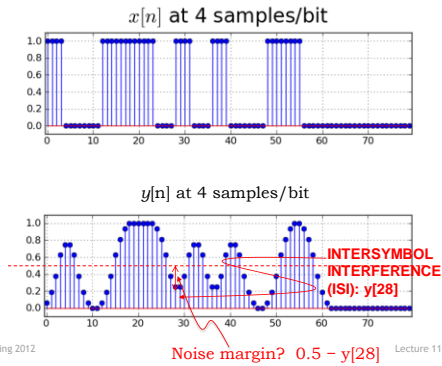

Receiving the Response

6.02 Spring 2012

Lecture 11, Slide #6

Faster Transmission

6.02 Spring 2012

Lecture 11, Slide #7

Eye Diagrams

Using same $h[n]$ as before and 4 samples per bit

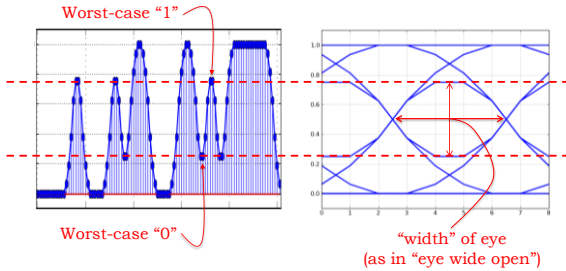

Eye diagrams make it easy to find the worst-case signaling conditions at the receiving end.

These are overlaid two-bit-slot segments of step responses, plotted without the 'stems' of the stem plot on the left.

6.02 Spring 2012

Lecture 11, Slide #8

“Width” of Eye

To maximize noise margins:
 Pick the best sample point → eye most open
 Pick the best digitization threshold → half-way across width

6.02 Spring 2012

Lecture 11, Slide #9

Constructing the Eye Diagram

1. Compute B, the number bits “covered” by $h[n]$. Let $N =$ samples/bit

$$B = \left\lfloor \frac{\text{length of active portion of } h[n]}{N} \right\rfloor + 2$$
2. Generate a test pattern that contains all possible combinations of B bits – want all possible combinations of neighboring cells. If B is big, randomly choose a large number of combinations.
3. Transmit the test pattern over the channel ($2^B N$ samples)
4. Instead of one long plot of $y[n]$, plot the response as an *eye diagram*:
 - a. break the plot up into short segments, each containing KN samples, starting at sample 0, KN, 2KN, 3KN, ... (e.g., $K=2$ or 3)
 - b. plot all the short segments on top of each other

6.02 Spring 2012

Lecture 11, Slide #10

Choosing Samples/Bit

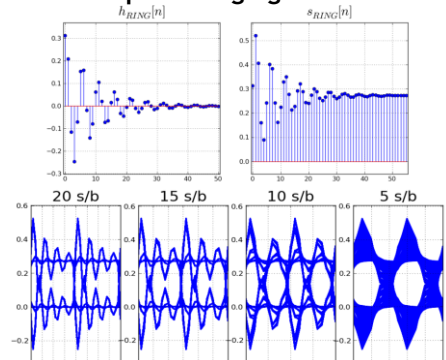

Given $h[n]$, you can use the eye diagram to pick the number of samples transmitted for each bit (N):

Reduce N until you reach the noise margin you feel is the minimum acceptable value.

6.02 Spring 2012

Lecture 11, Slide #11

Example: “ringing” channel

6.02 Spring 2012
