

Computer Systems are Different!

6.033 Spring 2007

Static discipline

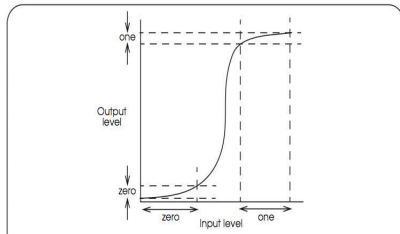

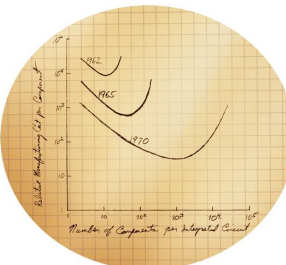

Figure 1-3: How gain and non-linearity of a digital component restore levels. The range of accepted inputs is much wider than the range of generated outputs.

- Be tolerant of inputs and strict on outputs

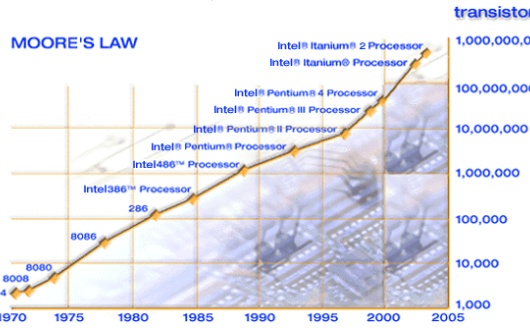

Moore's law

QuickTime™ and a TIFF (Uncompressed) decompressor are needed to see this picture.

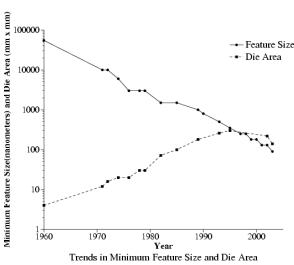

“Cramming More Components Onto Integrated Circuits”, *Electronics*, April 1965

Moore's Law: # transistors/die doubles every ~18 months

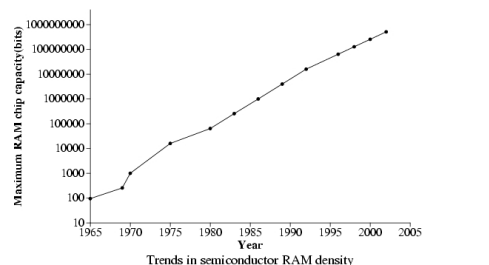

Year	Processor	Transistors
1970	Intel 4004	~23,000
1974	Intel 8080	~60,000
1976	Intel 8086	~290,000
1982	Intel 286	~1.2 million
1985	Intel 386	~2.75 million
1989	Intel 486	~12 million
1993	Intel Pentium	~3.1 million
1995	Intel Pentium II	~7.5 million
1997	Intel Pentium III	~9.5 million
1999	Intel Pentium 4	~42 million
2002	Intel Itanium	~200 million
2004	Intel Itanium 2	~200 million

Lithography: the driver behind transistor count

- Number of components scales $O(n^2)$ with feature size
- Switching time scales $O(n)$ with features size
- Number of components scale $O(n^2)$ with die area

RAM density

Year	Maximum RAM chip capacity (bits)
1965	~100
1970	~1,000
1975	~10,000
1980	~100,000
1985	~1,000,000
1990	~10,000,000
1995	~100,000,000
2000	~1,000,000,000
2005	~10,000,000,000

ENIAC

- 1st built in 1946
- 80 feet
- 20 10-digit registers
- 18,000 vacuum tubes
- 124,500 watts

UNIVAC (Universal Automatic Computer)

- Introduced in 1951
- 46 delivered in all, until 1958
- Predicted '52 election results based on early results (1%)
- 1,905 ops/sec, at 2.25 Mhz clock
- 1,000 words of 12 characters
- No monitor, only typewriter

IBM Systems/360

- 1960s
- Model 40
 - 1.6 Mhz
 - 32-64 Kilobyte
 - \$225,000

DEC PDP

- PDP-8, 1964
- 330,000 adds/s
- \$16-20K
- UNIX introduced on PDP-10

Cray 1: supercomputer

QuickTime™ and a
TIFF (Uncompressed) decompressor
are needed to see this picture.

- 1976
- Most expensive, fastest, best price/performance ratio
- \$5-8 Million
- 166 Million adds/s
- 32 Mbyte

Apple II

QuickTime™ and a
TIFF (Uncompressed) decompressor
are needed to see this picture.

- 1977
- 6502 microprocessor
- 4 to 48 Kilobyte

IBM's wrist watch

QuickTime™ and a
TIFF (Uncompressed) decompressor
are needed to see this picture.

- 2001
- Linux and X11
- 19Mhz ARM
- 8 Megabyte flash
- 8 Megabyte DRAM

Software system complexity

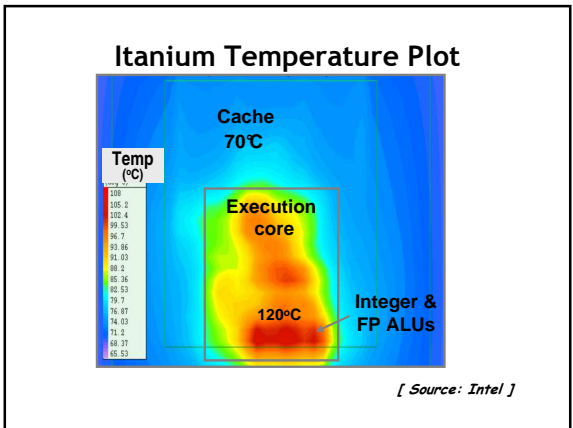

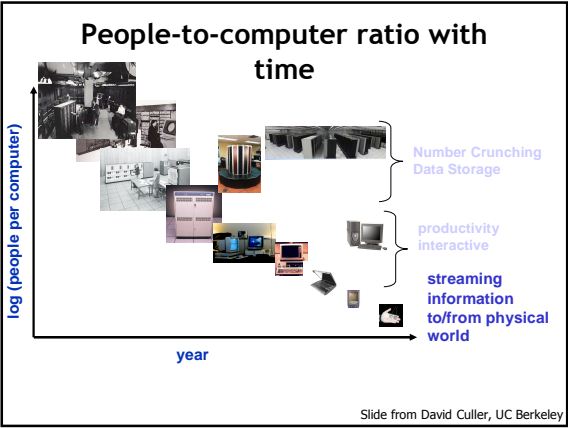

Computing is everywhere!

Internet hosts (names) with time: ~40% per year

Principles

Adopt sweeping simplifications

Avoid excessive generality

- Be explicit
- Decouple modules with indirection

Design for iteration

- End-to-end argument

Incommensurate scaling rule

Law of diminishing returns

- Open design principle
- Principle of least surprise

Robustness principle

Unyielding foundations rule
