# *Reliability & Flow Control*

***Prof. Dina Katabi***

---

*Some slides are from lectures by Nick Mckeown, Ion Stoica, Frans Kaashoek, Hari Balakrishnan, and Sam Madden*

# *Previous Lecture*

*How the link layer delivers data over a link*

*How the network layer performs routing and forwarding*

*Hierarchical Routing and Addressing*

# Hierarchical Routing

*Internet: collection of domains/networks*

*Inside a domain: Route over a graph of routers*

*Between domains: Route over a graph of domains*

*Address: concatenation of "Domain Id", "Node Id"*

# Hierarchical Routing

## Advantage

scalable

*Smaller tables*

*Smaller messages*

Delegation

*Each domain can run its own routing protocol*

## Disadvantage

*Mobility is difficult*

*Address depends on geographic location*

*Sup-optimal paths*

*E.g., in the figure, the shortest path between the two machines should traverse the yellow domain. But hierarchical routing goes directly between the green and blue domains, then finds the local destination path traverses more routers.*

# *This Lecture*

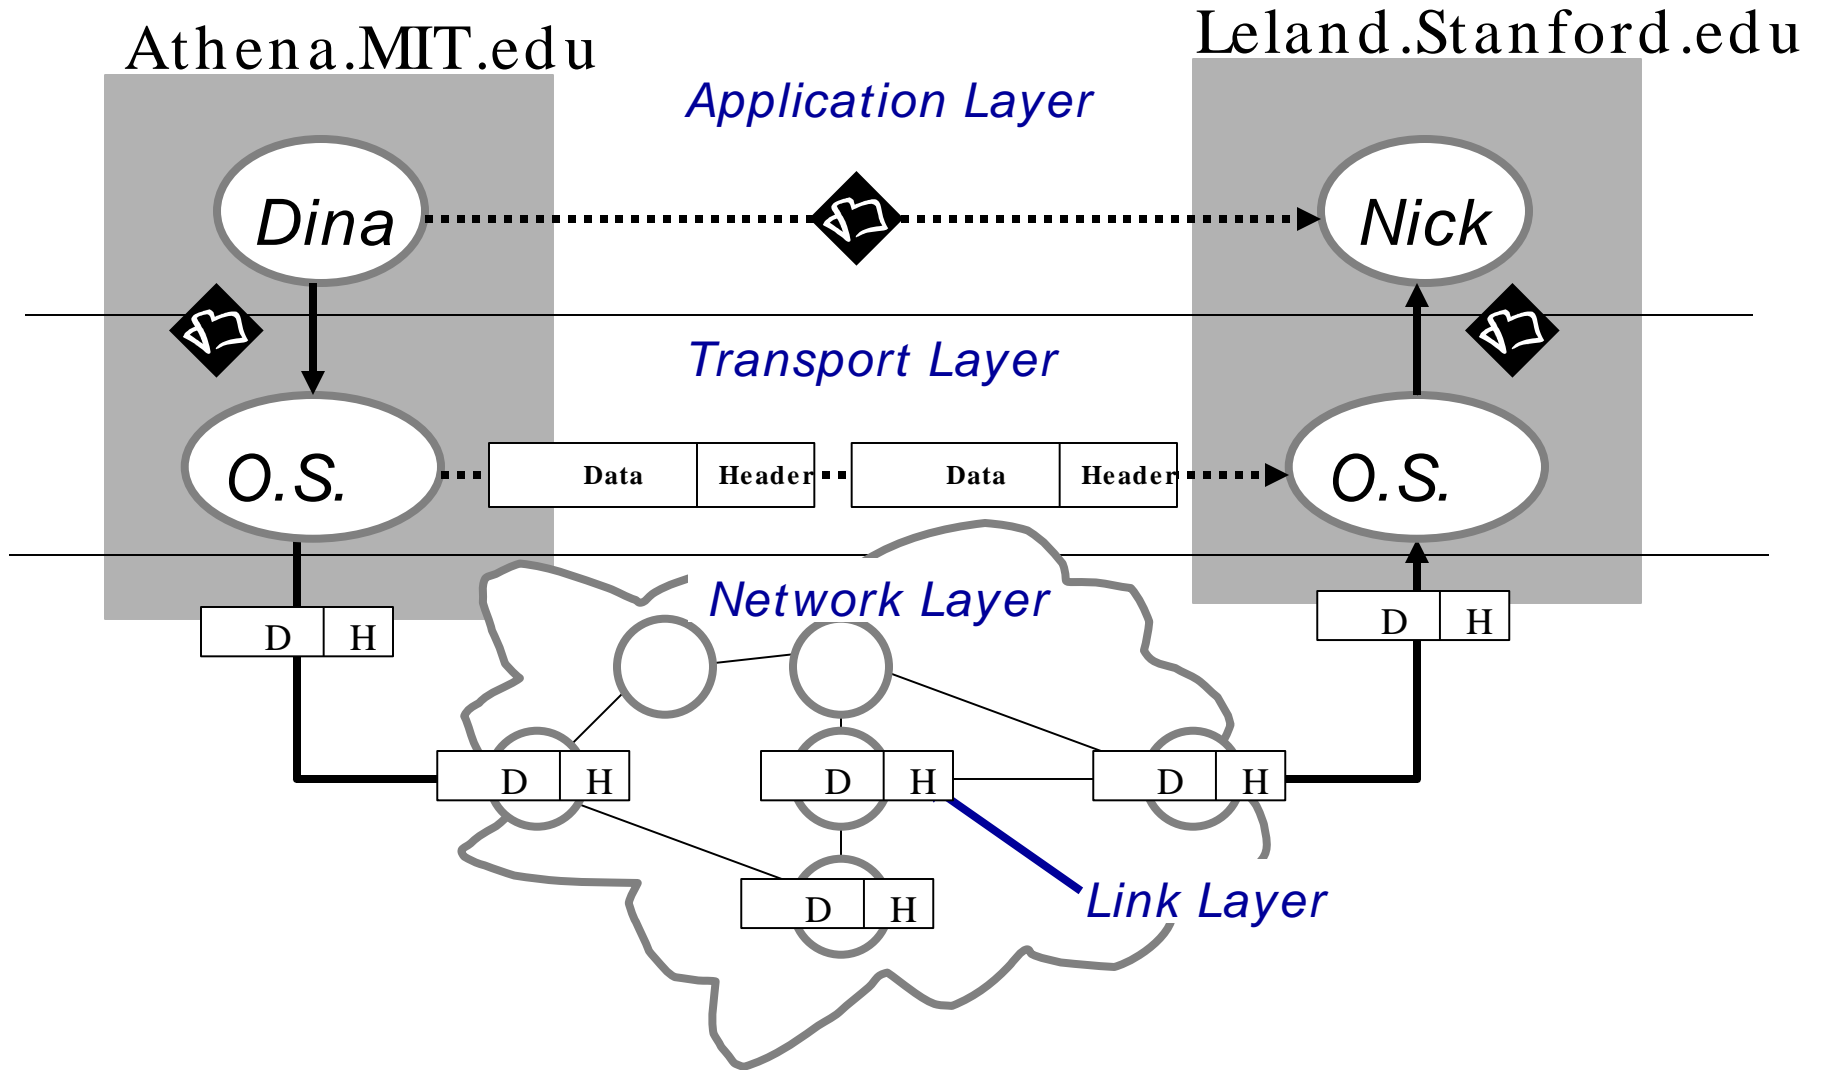

*Transport Layer*

*Reliable data transmission*

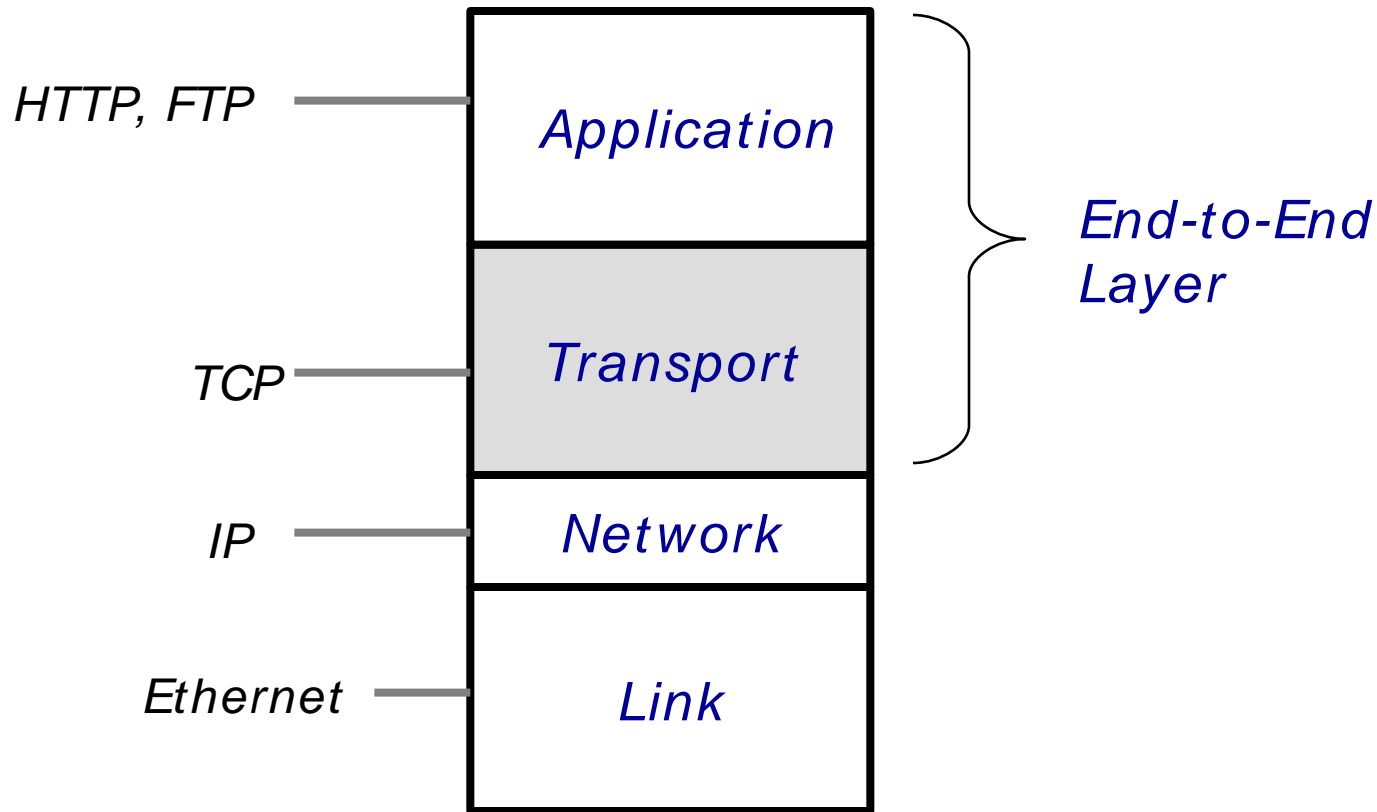

*Flow Control*

*Multiplexing*

# Review of the Transport Layer

# Layering

*The 4-layer Internet model*

# *Transport Layer*

*Network layer provides best-effort service*

*Loss, delay, jitter, duplicates, reordering, ...*

*Not convenient for applications*

*Transport layer builds on the best effort service to provide applications with a convenient environment*

*Reliability:*

- at least once*
- at most once*

*Performance:*

- flow and congestion control*

*Ordering*

*Data integrity (checksum)*

*Timeliness (remove jitter)*

*Also transport provides multiplexing between multiple applications*

# *This Lecture*

*Transport Layer*

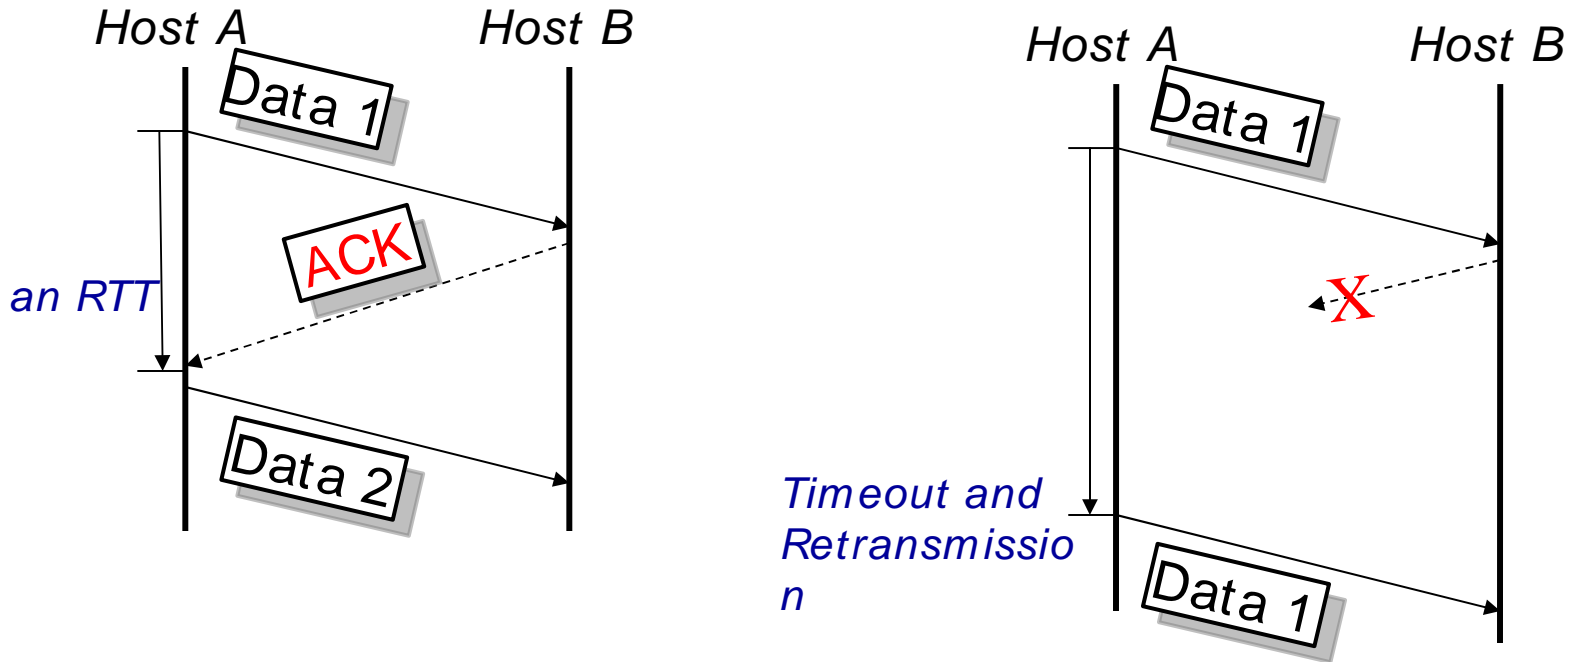

*Reliable data transmission*

*Flow Control*

*Multiplexing*

# At Least Once

Sender persistently sends until it receives an ack  
How long should the timeout be?

*Fixed is bad. RTT changes depending on congestion*

- Pick a values that's too big and it will wait too long to retransmit a packet,
- Pick a value too small, and it will unnecessarily retransmit packets.

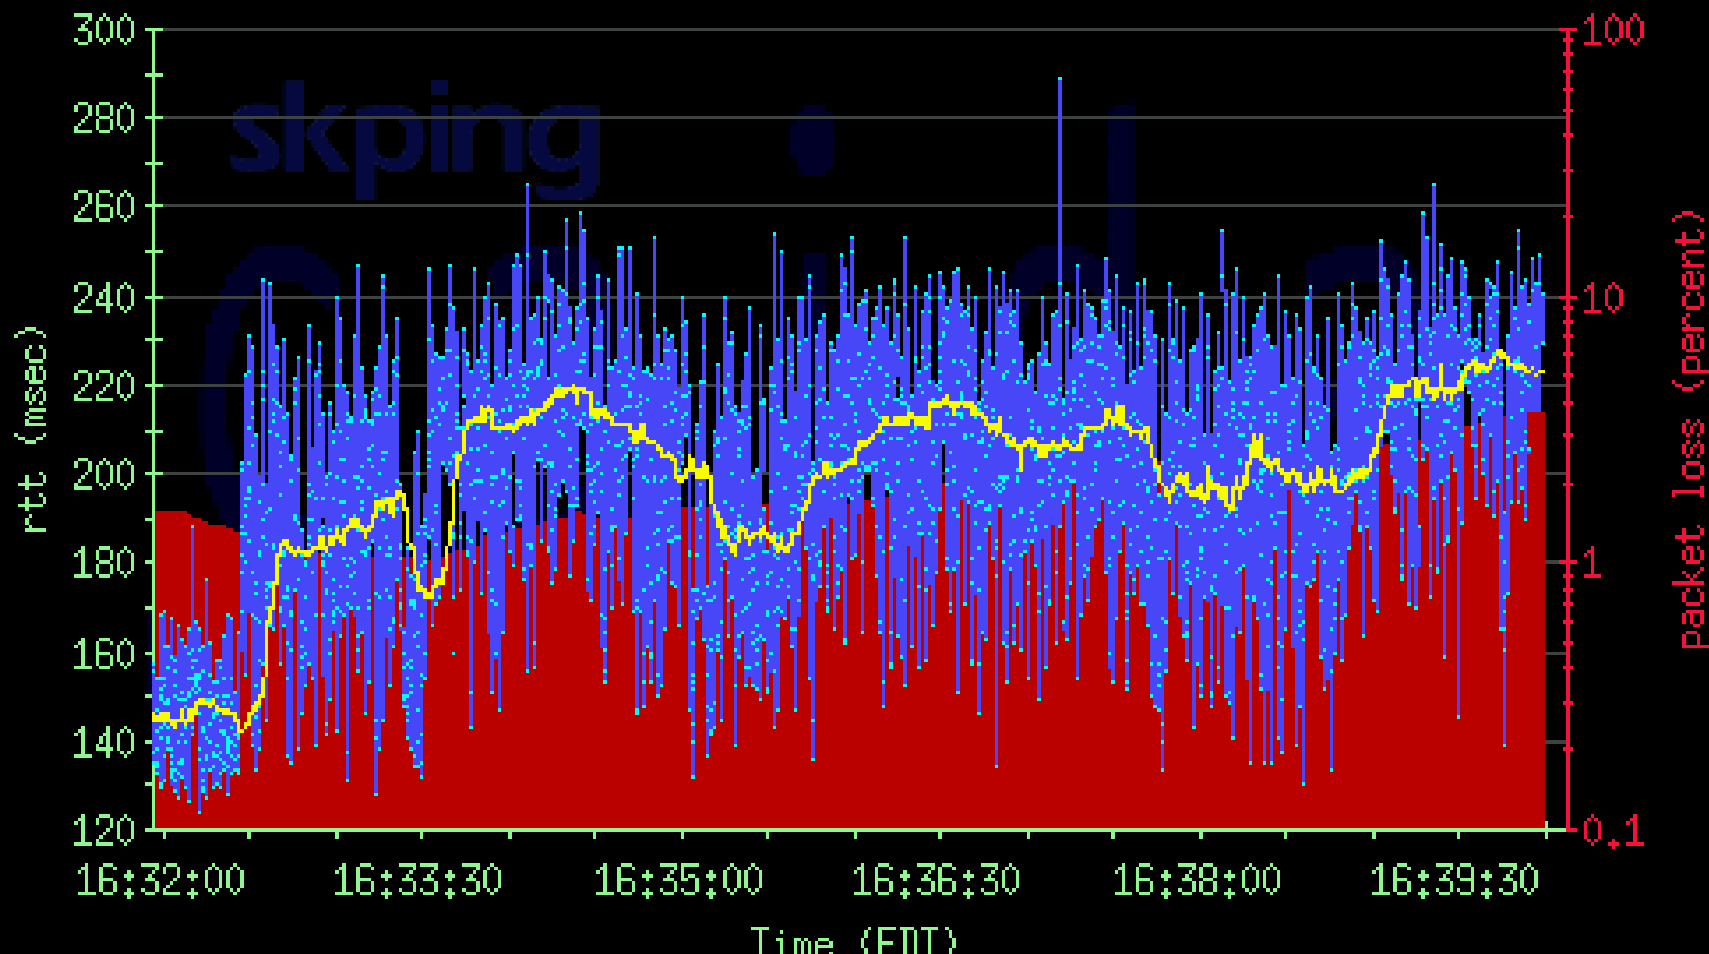

*Adapt the estimate of RTT    adaptive timeout*

# RTT Measurements

(collected by Caida)

lancelet.caida.org to anala

— rtt  
— rtt median-filtered  
█ packet loss

# *Adaptive Timeout*

*Samples  $S_1, S_2, S_3, ..$*

*Algorithm*

$$\text{EstimatedRTT} = T_0$$

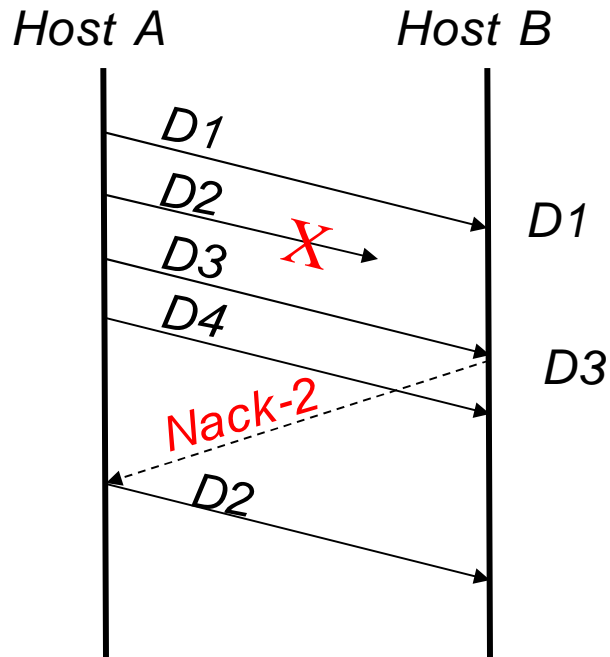

$$\text{EstimatedRTT} = \alpha S + (1 - \alpha) \text{EstimatedRTT}$$

*where  $0 \leq \alpha \leq 1$*

*What values should one pick for  $\alpha$  and  $T_0$ ?*

*Adaptive timeout is also hard*

# *Different Approach: NACK*

*Minimize reliance on timer*  
*Add sequence numbers to packets*

*Send a Nack when the receiver finds a hole in the sequence numbers*

*Difficulties*

*Reordering*

*Cannot eliminate acks, because we need to ack the last packet*

# *At Most Once*

*Suppress duplicates*

*Packets must have ids to allow the receiver to distinguish a duplicate from a new packet*

*Receiver should keep track of which packet ids have been delivered to applications*

*To simplify tracking, senders pick monotonically increasing packet ids, i.e., sequence numbers*

*Receiver delivers packets to application in order. It keeps track of the largest id delivered so far*

# *This Lecture*

*Transport Layer*

*Reliable data transmission*

*Flow Control*

*Multiplexing*

# How fast should the sender sends?

*Waiting for acks is too slow*  
*Throughput is one packet/RTT*

*Say packet is 500B*

*RTT 100ms*

*Throughput = 40Kb/s, Awful!*

*Overlap pkt transmission*

# Send a window of packets

Assume the receiver is the bottleneck

Maybe because the receiver is a slow machine

Receiver needs to tell the sender when and how much it can send

The window advances once all previous packets are acked

**too slow**

# *The Right Window Size*

*Note that*

*if  $W/RTT < \text{Bottleneck Capacity}$  under utilization*

*If  $W/RTT > \text{Bottleneck Capacity}$  Large queues*

# *This Lecture*

*Transport Layer*

*Reliable data transmission*

*Flow Control*

*Multiplexing*

# Multiplexing by Transport

Multiple applications run on the same machine but use different ports
