

Tracking Sound

Joren Lauwers, Changping Chen

Goal:

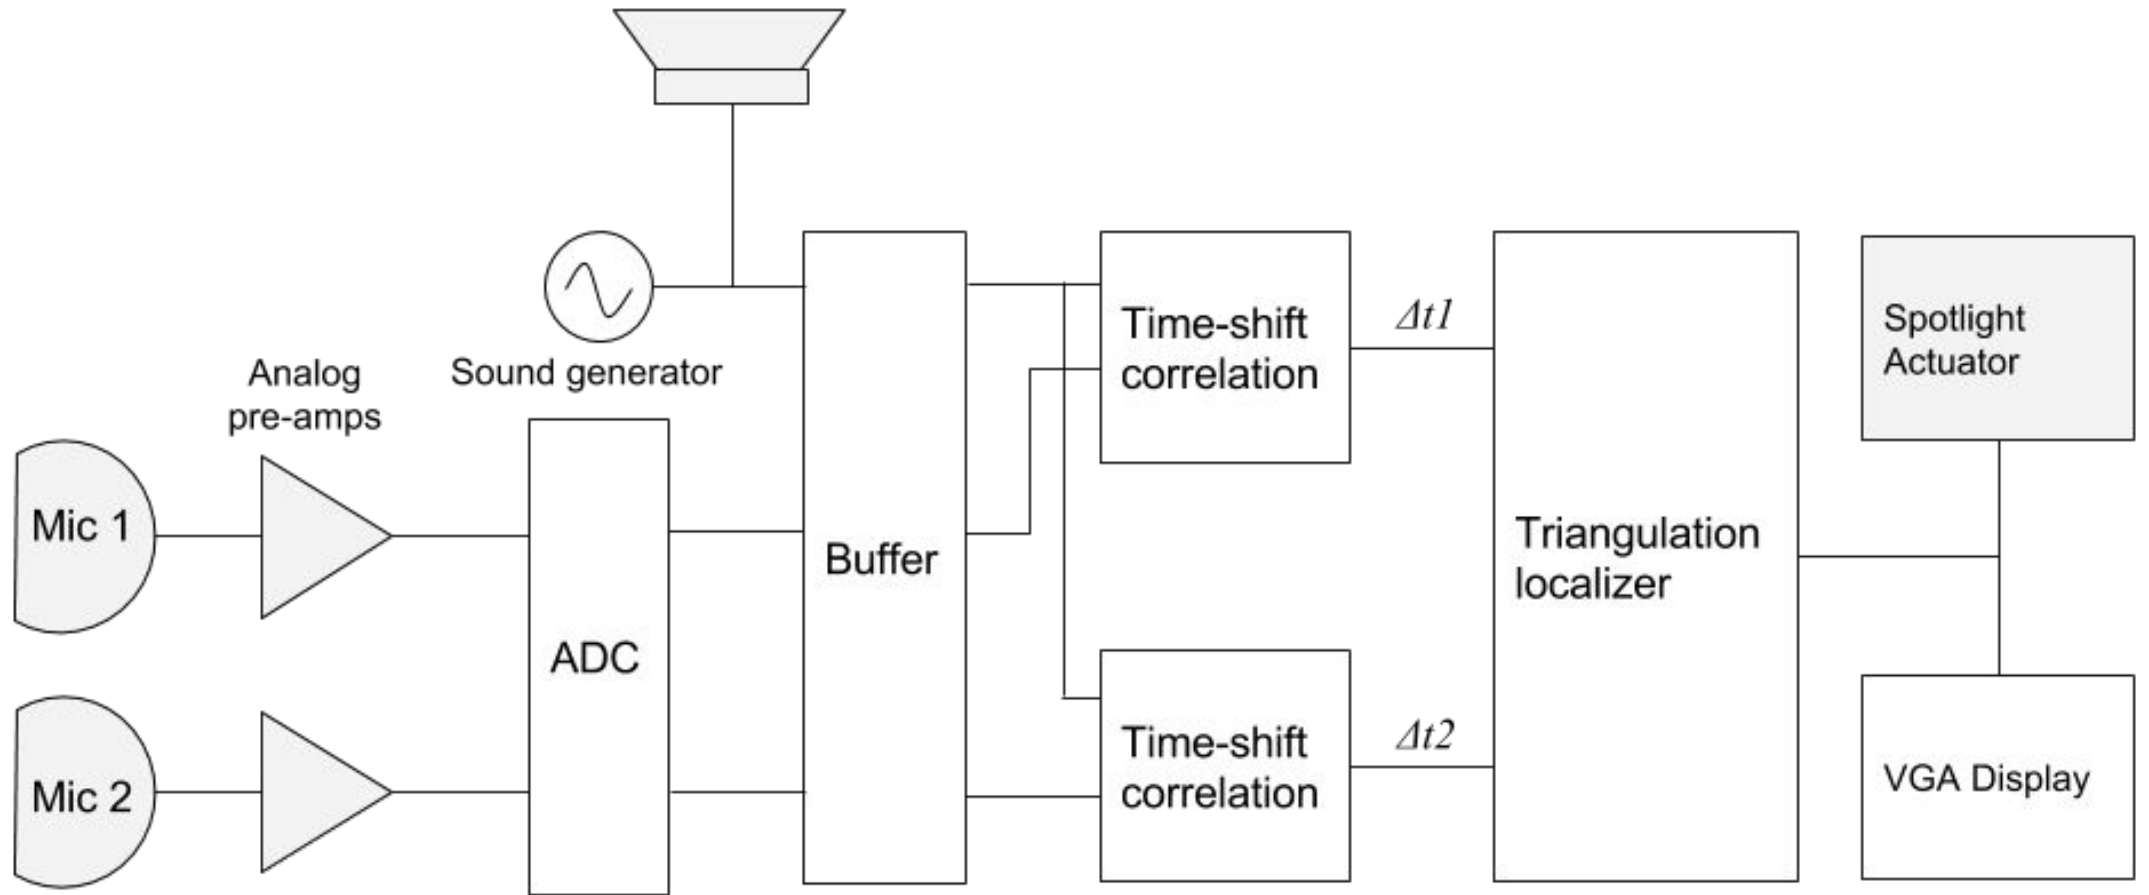

Locate the origin of a sound in the environment.

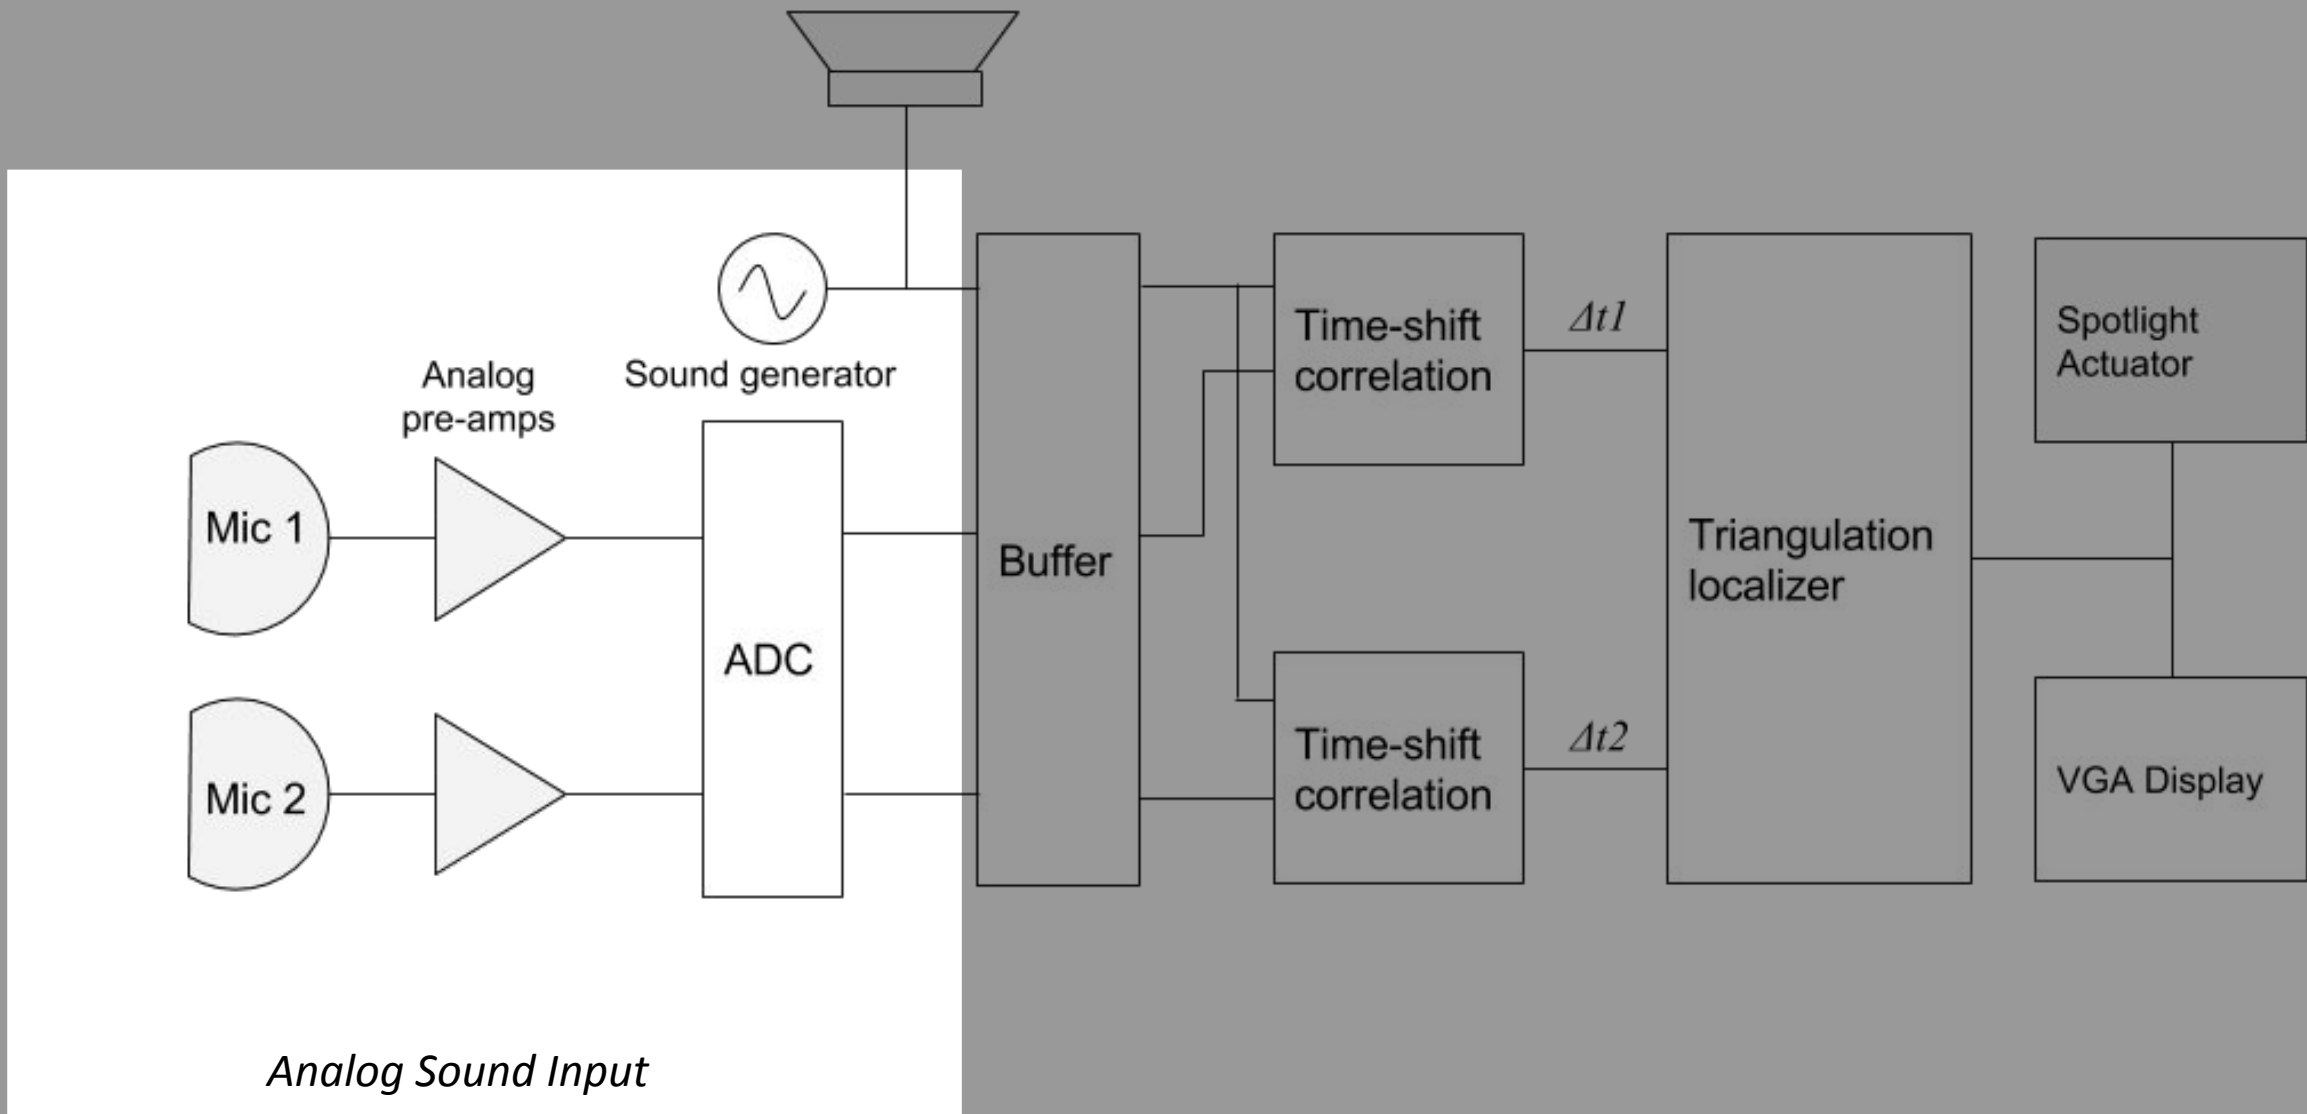

Output on 2D VGA display, or actuate a spotlight

Components

- Nexys4
- 2 microphones
- 1 speaker

Block Diagram

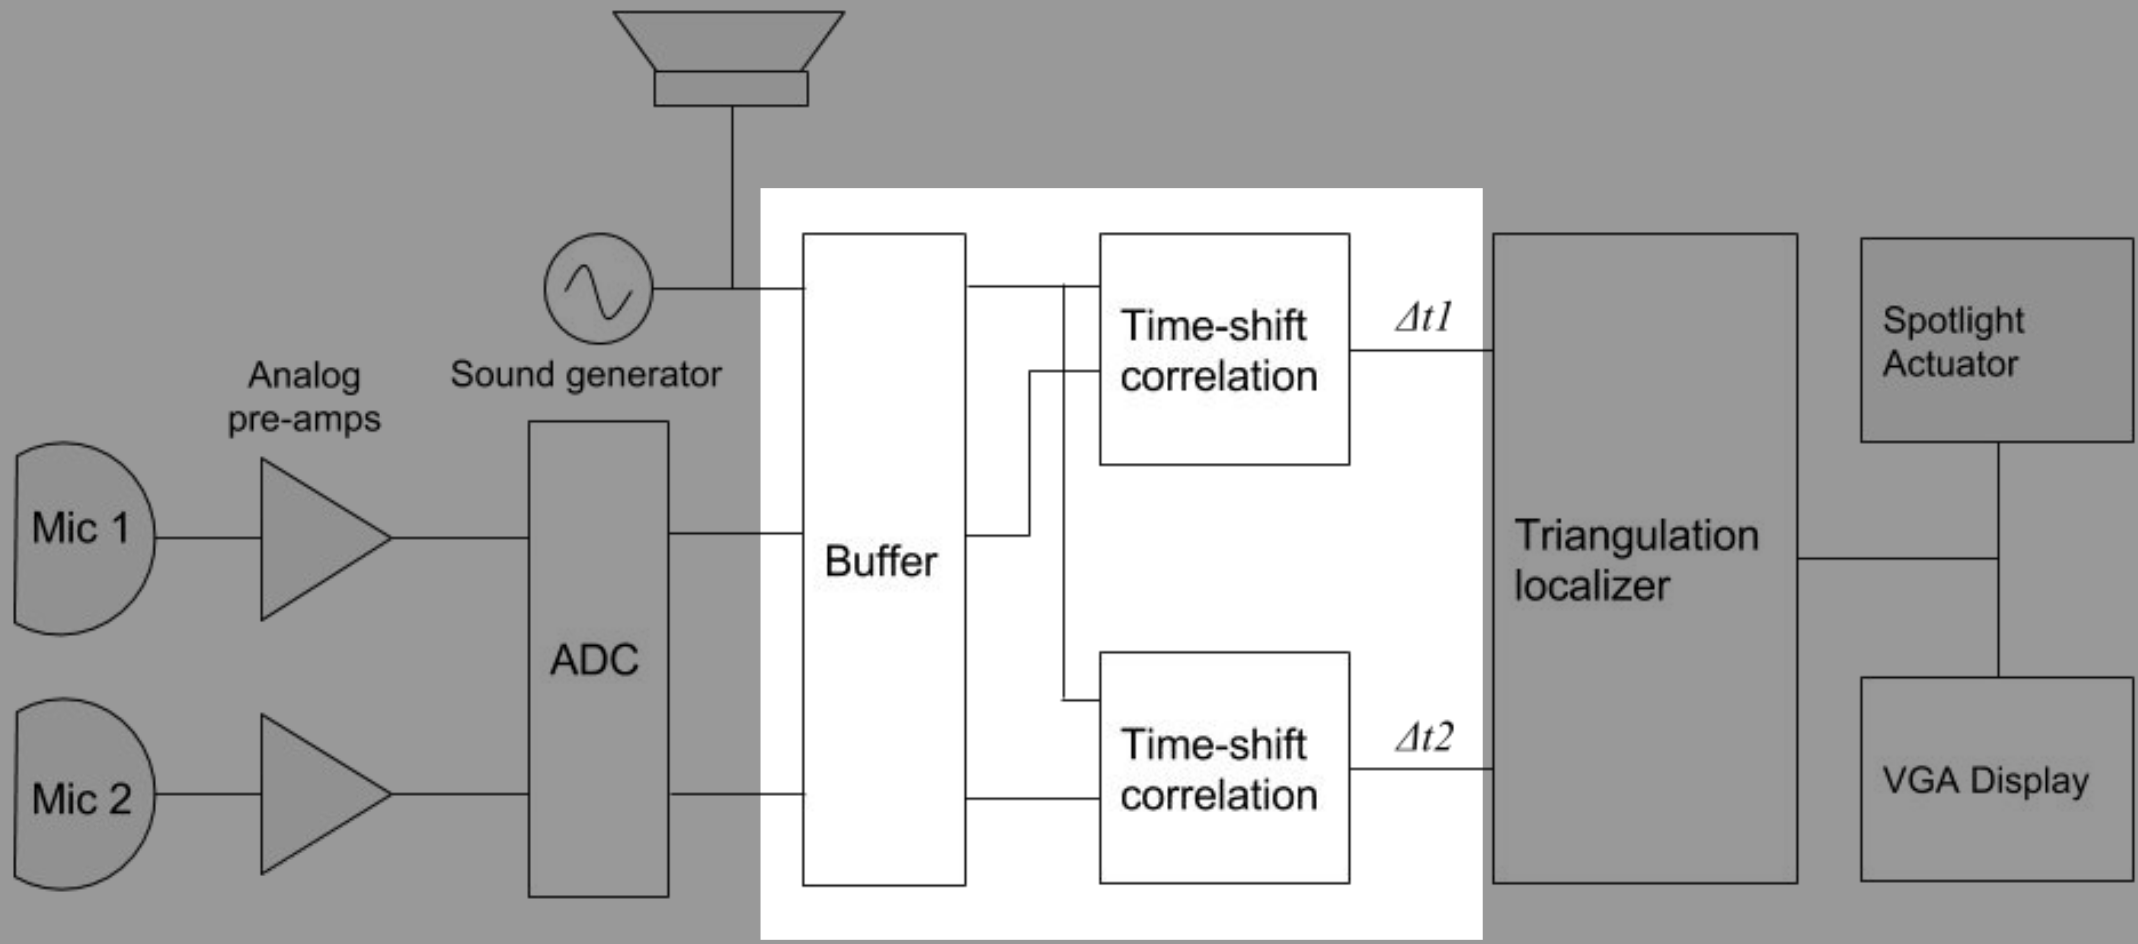

Pre-Amp w/ LM358

<https://lowvoltage.wordpress.com/2011/05/21/lm358-mic-amp/>

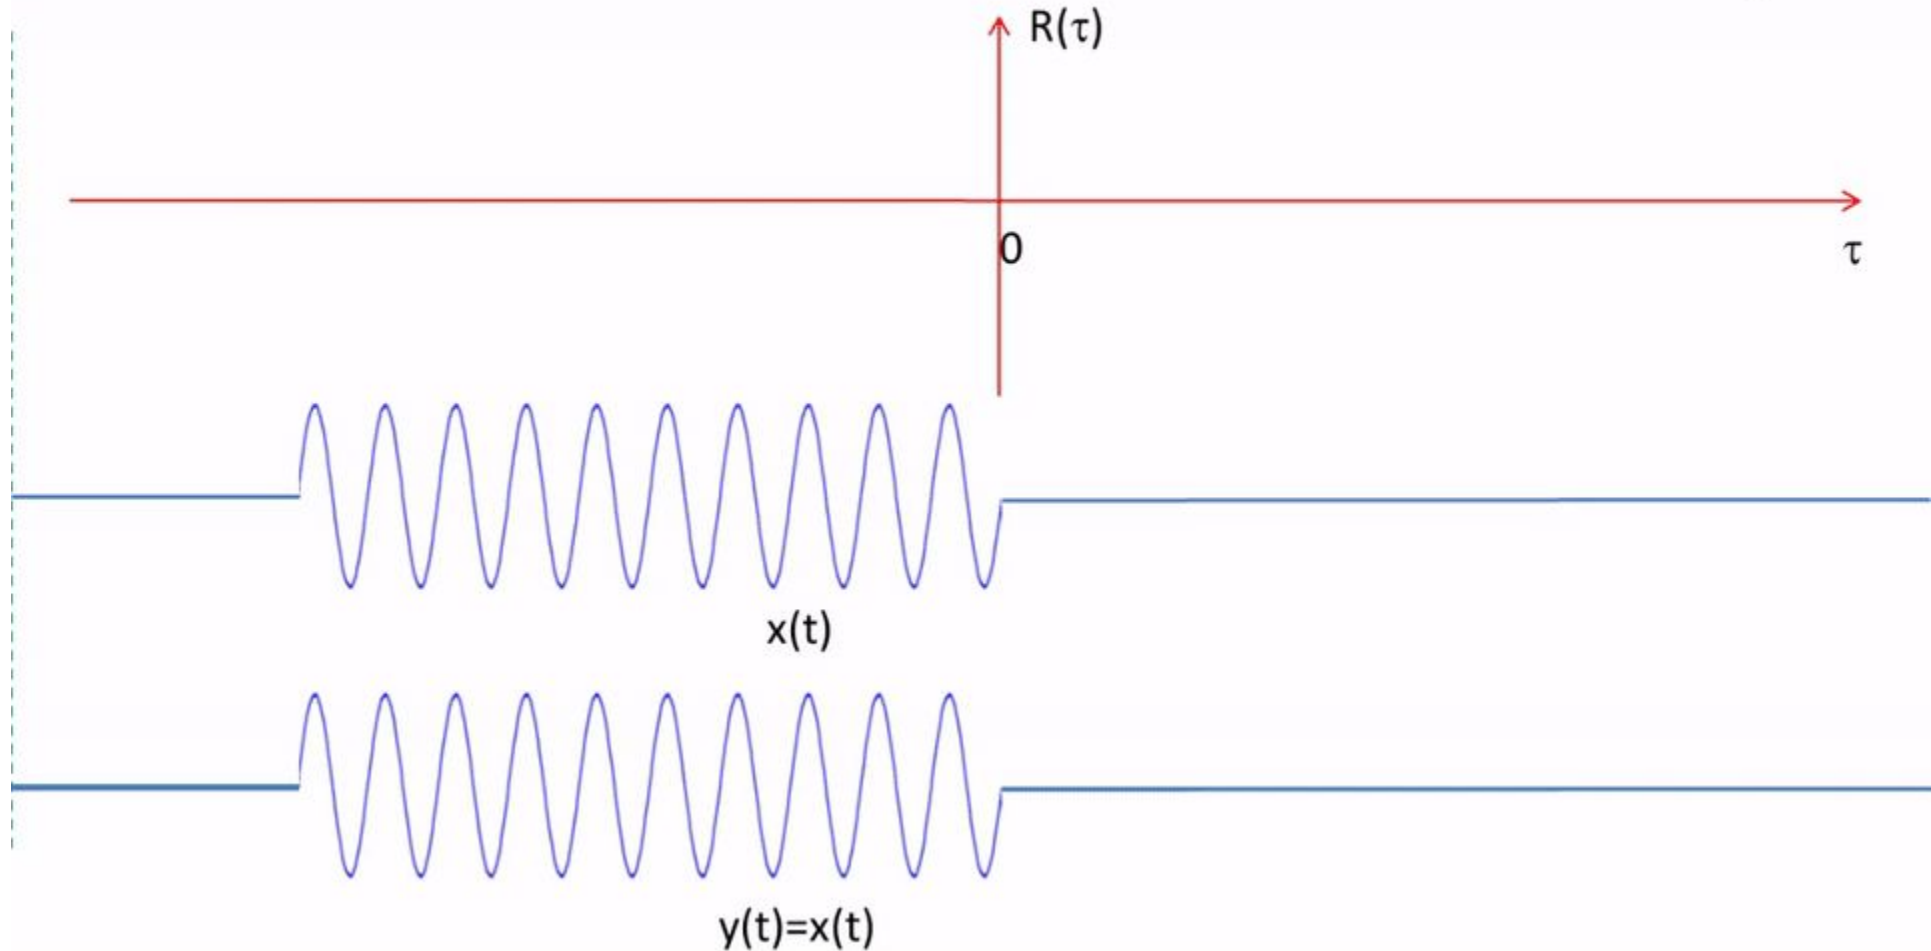

ADC

- 12-bit output
- Simultaneous dual channel sampling
- Up to 1MSPS

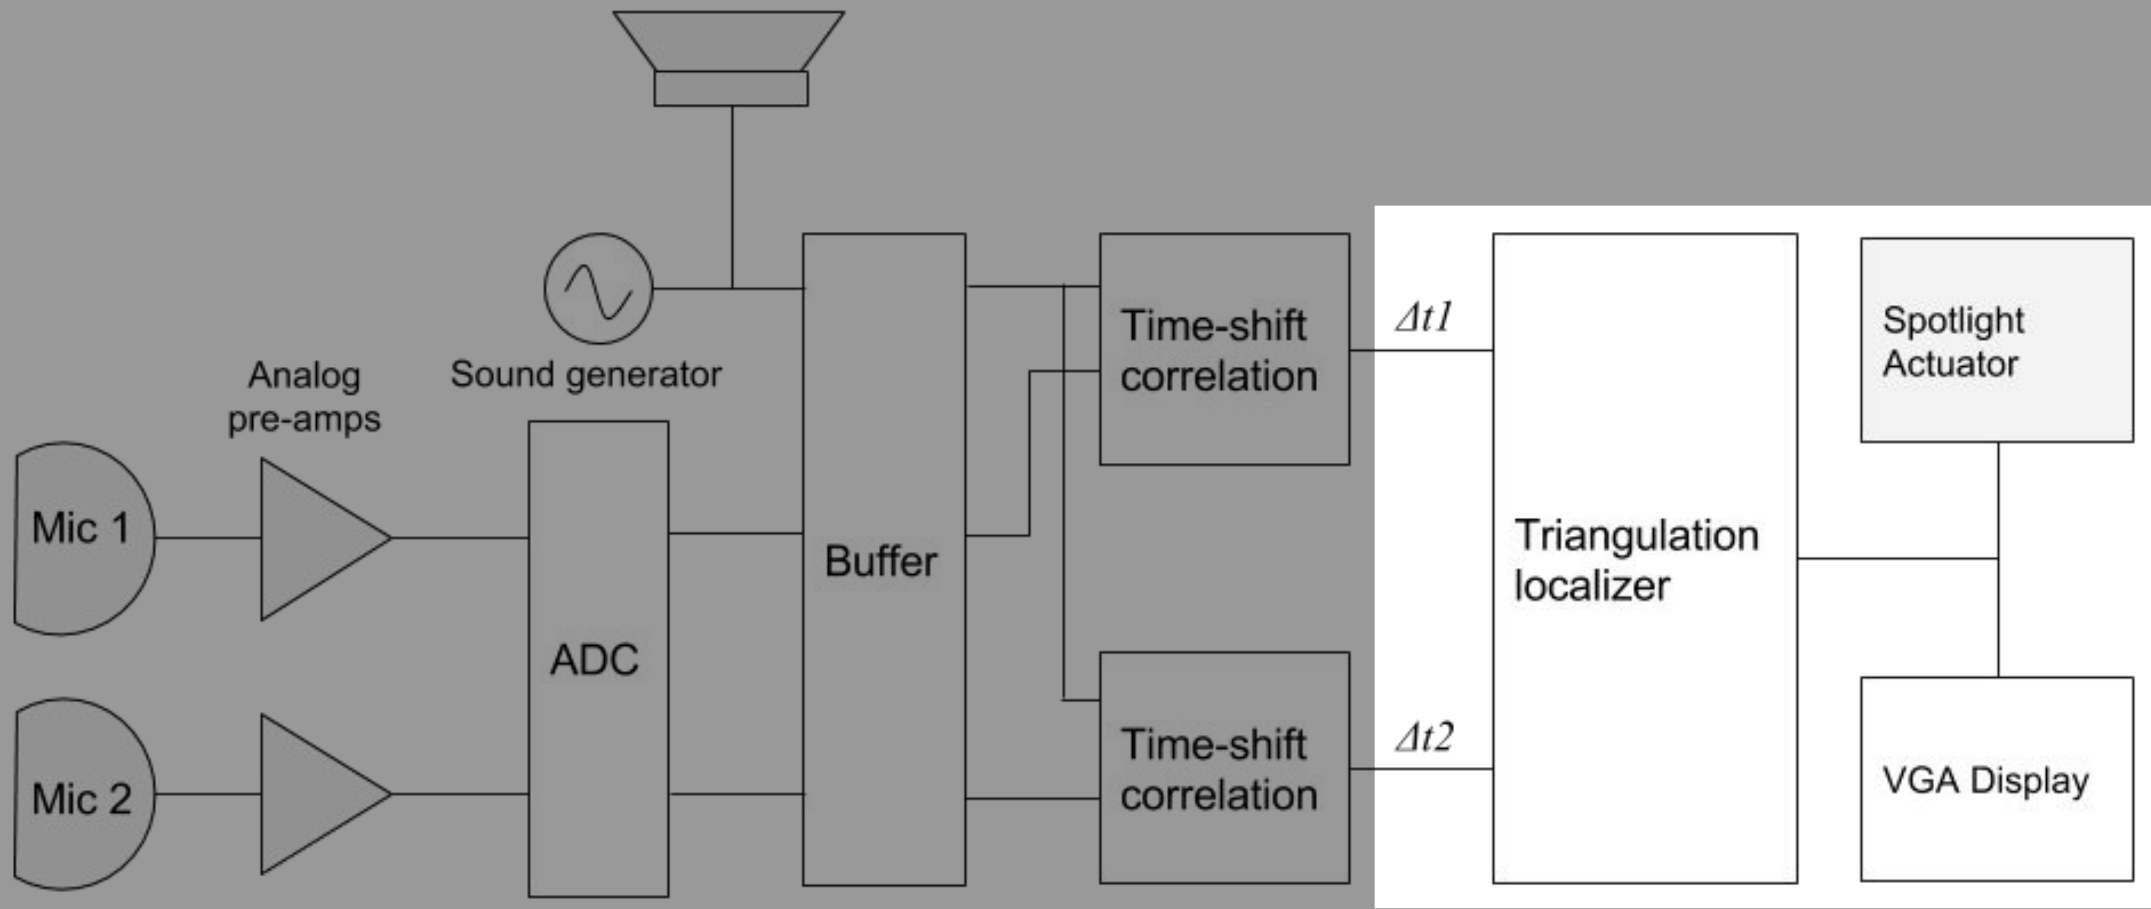

Find Time Delay through Cross Correlation

Auto Correlation Process of a Sine Wave with a Limited Length

Find Time Delay through Cross Correlation

- Calculate correlation score for each possible time delay
- Total of ~600 correlations
- Pick the delay with highest score
- Implement with running sum of multiplications

Triangulation Module

- Trigonometry is hard
- Precompute a lookup table of $(d_1, d_2) \rightarrow (x, y)$

Timeline

- 10/30 - 11/04: validate mic pre-amp circuit
- 11/07 - 11/11: create dual-channel ADC sampling module
- 11/14 - 11/18: implement speaker output, cross-correlation
- 11/21 - 11/25: implement triangulation module
- 11/28 - 12/02: tweaking accuracy and performance
- 12/05 - 12/09: visual effect
