

### 6.163: Lens selection guidelines

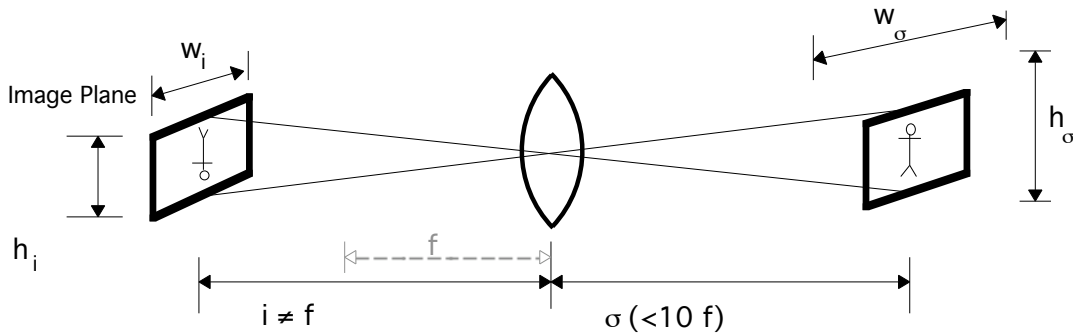

#### Case 1: Subject far from Camera (i.e., $\sigma > 10 f$ ).

$$\text{magnification } m = \frac{h_i}{h_\sigma} = \frac{w_i}{w_\sigma} = i/\sigma \approx f/\sigma \text{ (if } \sigma > 10 f \text{)}$$

Or, given  $h_i$  and  $w_i$  (24 mm for 35 mm film),  $\sigma = f \times h_\sigma / h_i$ .

#### Case 2: Subject close to Camera (i.e., $\sigma \leq 10 f$ )

$$\text{magnification } m = \frac{h_i}{h_\sigma} = \frac{w_i}{w_\sigma} = i/\sigma \quad \text{And, } \frac{1}{f} = \frac{1}{i} + \frac{1}{\sigma}$$

$$\text{Can also find: } \frac{1}{i} = \frac{1}{f} - \frac{1}{\sigma} = \frac{\sigma - f}{\sigma f} \quad \text{And } m = \frac{f}{\sigma - f}$$
