

# PROGRAMMING BASICS

Maslab '09

# Overview

- ▣ Design Principles
- ▣ Performance
- ▣ Ant

# Good Design Principles

- ▣ Stick to a Schedule
  - Have a contingency plan
- ▣ Keep It Simple Stupid (KISS)
  - Can you explain it to an audience?
- ▣ Be Consistent
  - Discuss team conventions

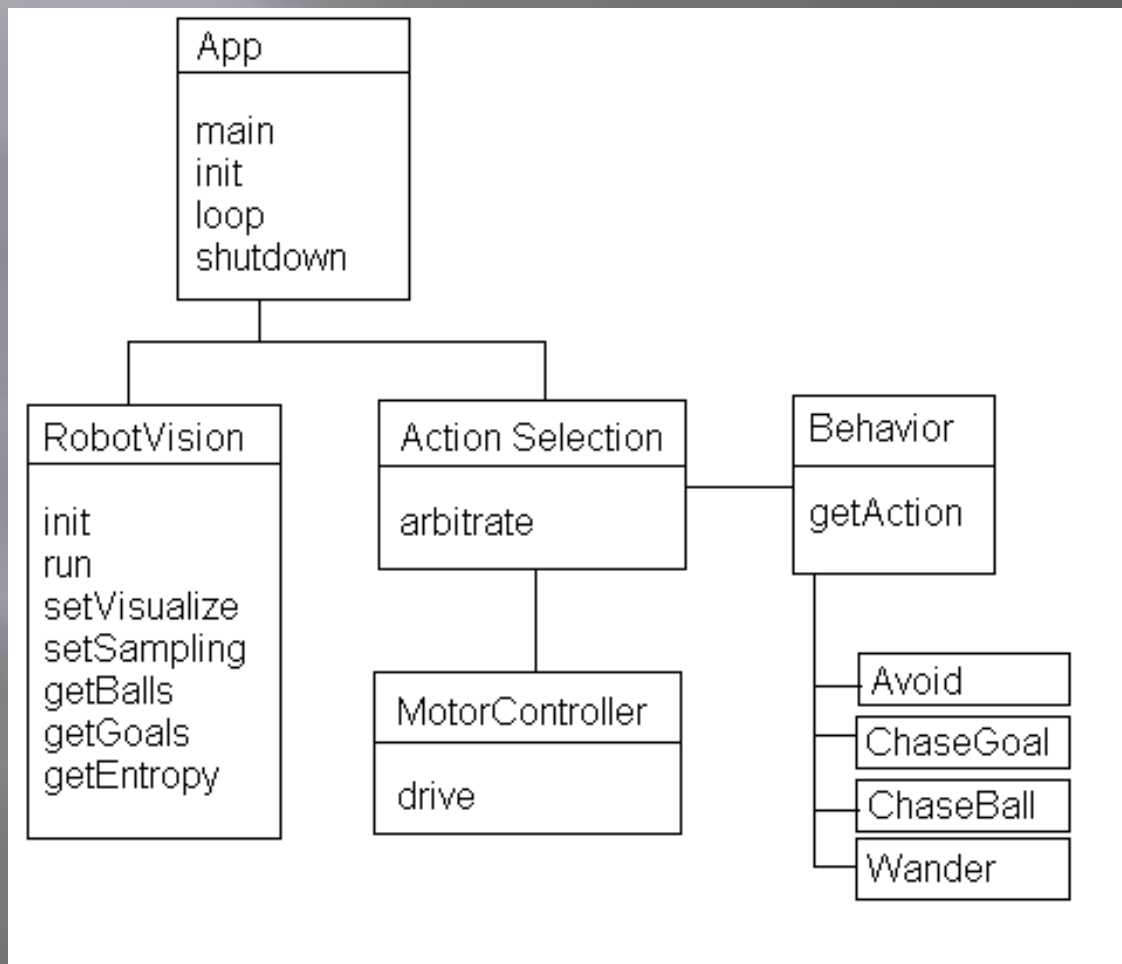

# Common Conventions

- ▣ Every word in a class name is capitalized
  - `ImageProcessor.java`
- ▣ Variables start with a lower case letter and every subsequent word is capitalized
  - `private int ballCount;`
- ▣ Functions start with a lower case letter and every subsequent letter is capitalized, typically the first word is a verb
  - `public int driveForward(int sec);`

# Modular Design

- ▣ Divide problems into chunks of work
  - Individual chunks are simple
  - Consistent interface between chunks
- ▣ Additional Benefits
  - Enables efficient individual work
  - Enables validity testing on each chunk

# Modular Design Example

# Packages

- ▣ Packages allow you to organize your code more cleanly
- ▣ Like folders to keep classes with some commonality grouped together
  - pegbot
  - finalbot

# Iterative Design

- ▣ Don't assume your initial design is perfect
- ▣ Prototype high risk problems first

# Testing

- ▣ Unit Testing
  - Every module should have one
- ▣ System Tests
  - Avert day-of-contest embarrassment with a complete test suite

# JUnit

- ▣ Test code from right inside Eclipse
- ▣ Good for code that doesn't need the uOrc to function
  - Image processing
  - Utility classes

# JUnit Example

# Source Control

- ▣ Always Keep A Working Copy
  - Keep teammates productive while you fix things
  - Undo mysterious changes made during 6 am binge programming sessions

# Documentation

- ▣ Javadocs are useful – use them.
- ▣ orc.jar API and maslab.jar API
- ▣ /\*\*
  - Description
  - @return
  - @throws
  - @param
  - ...
- ▣ \*/

# Overview

- ▣ Design Principles
- ▣ Performance
- ▣ Ant

# Software Performance

- ▣ CPU bottleneck: Image processing
  - $160 \times 120 = 19,200$  pixels to process every frame
- ▣ Minimize raw image passes
- ▣ Downsample
  - Skip lines if your feature detection can handle it

# Hardware Limitations

- ▣ Camera Capture Frequency
- ▣ Motor Slew Rate

# Threading

- ▣ Consider it very carefully
- ▣ Will learn more about it tomorrow

# Overview

- ▣ Design Principles
- ▣ Performance
- ▣ Ant

# Ant

- ▣ Another neat tool

# Ant

- ▣ Another neat tool
- ▣ Ant is a Java-based build tool. In theory, it is kind of like Make, without Make's wrinkles and with the full portability of pure Java code.
  - <http://ant.apache.org/>

# Components

- ▣ An XML file called build.xml
- ▣ targets
- ▣ commands
- ▣ properties

# Example

```
<target name="build" depends = "clean">  
  <!-- This compiles all the java -->  
  <javac srcdir="src"  
    destdir="bin" includes="**/*.java"  
    debug="true" classpath="lib/maslab.jar:" />  
</target>
```

- ▣ Run with:
  - ant build
  - Straight from Eclipse

# Cygwin

- ▣ Bash shell for your Windows machine
- ▣ Allows you to use the provided build.xml with a minimum of fuss
