**LM101A/LM201A/LM301A Operational Amplifiers**

**General Description**

The LM101A series are general purpose operational amplifiers which feature improved performance over industry standards like the LM709. Advanced processing techniques make possible an order of magnitude reduction in input currents, and a redesign of the biasing circuitry reduces the temperature drift of input current. Improved specifications include:

- Offset voltage: 3 mV maximum over temperature (LM101A/LM201A)
- Input current: 100 nA maximum over temperature (LM101A/LM201A)
- Offset current: 20 nA maximum over temperature (LM101A/LM201A)
- Guaranteed drift characteristics
- Offsets guaranteed over entire common mode and supply voltage ranges
- Slew rate: 10V/µs as a summing amplifier

This amplifier offers many features which make its application nearly foolproof: overload protection on the input and output, no latch-up when the common mode range is exceeded, and freedom from oscillations and compensation with a single 30 pF capacitor. It has advantages over internally compensated amplifiers in that the frequency compensation can be tailored to the particular application. For example, in low frequency circuits it can be over-compensated for increased stability margin. Or the compensation can be optimized to give more than a factor of ten improvement in high frequency performance for most applications.

In addition, the device provides better accuracy and lower noise in high impedance circuitry. The low input currents also make it particularly well suited for long interval integrators or timers, sample and hold circuits and low frequency waveform generators. Further, replacing circuits where matched transistor pairs buffer the inputs of conventional IC op amps, it can give lower offset voltage and a drift at a lower cost.

The LM101A is guaranteed over a temperature range of −55°C to +125°C, the LM201A from −25°C to +85°C, and the LM301A from 0°C to +70°C.

---

**Fast AC/DC Converter (Note 1)**

![Diagram](https://example.com/diagram.png)

**Note 1:** Feedforward compensation can be used to make a fast full wave rectifier without a filter.
Absolute Maximum Ratings (Note 2)
If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

**Note 2:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating ratings indicate for which the device is functional, but do no guarantee specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which guarantee specific limits. This assumes that the device is within the Operating Ratings. Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.

**Note 3:** For supply voltages less than \( \pm 15V \), the absolute maximum input voltage is equal to the supply voltage.

**Note 4:** Continuous short circuit is allowed for case temperatures to 125°C and ambient temperatures to 75°C for LM101A/LM201A, and 70°C and 55°C respectively for LM301A.

**Note 5:** Unless otherwise specified, these specifications apply for \( C_1 = 30 \text{ pF}, \pm 5V \leq V_S \leq \pm 20V \) and \(-55^\circ C \leq T_A \leq +125^\circ C \) (LM101A), \pm 5V \leq V_S \leq \pm 20V \) and \(-25^\circ C \leq T_A \leq +85^\circ C \) (LM201A), \pm 5V \leq V_S \leq \pm 15V \) and \( 0^\circ C \leq T_A \leq +70^\circ C \) (LM301A).

**Note 6:** Refer to RETS101AX for LM101A military specifications and RETS101X for LM101 military specifications.

**Note 7:** Human body model, 100 pF discharged through 1.5 kΩ.

### Typical Performance Characteristics

**LM101A/LM201A**

#### Input Voltage Range

- \(-55^\circ C \leq T_A \leq +125^\circ C\)
- \( 0^\circ C \leq T_A \leq +70^\circ C\)

#### Output Swing

- \(-55^\circ C \leq T_A \leq +125^\circ C\)
- \( 0^\circ C \leq T_A \leq +70^\circ C\)

#### Voltage Gain

- \(-55^\circ C \leq T_A \leq +125^\circ C\)
- \( 0^\circ C \leq T_A \leq +70^\circ C\)

### Guaranteed Performance Characteristics

**LM301A**

#### Input Voltage Range

- \( 0^\circ C \leq T_A \leq +70^\circ C\)

#### Output Swing

- \( 0^\circ C \leq T_A \leq +70^\circ C\)

#### Voltage Gain

- \( 0^\circ C \leq T_A \leq +70^\circ C\)

Typical Applications (Note 9) (Continued)

Application Hints (Note 9)

Although the LM101A is designed for trouble free operation, experience has indicated that it is wise to observe certain precautions given below to protect the devices from abnormal operating conditions. It might be pointed out that the advice given here is applicable to practically any IC op amp, although the exact reason why may differ with different devices.
Application Hints (Note 9) (Continued)

When driving either input from a low-impedance source, a limiting resistor should be placed in series with the input lead to limit the peak instantaneous output current of the source to something less than 100 mA. This is especially important when the inputs go outside a piece of equipment where they could accidentally be connected to high voltage sources. Large capacitors on the input (greater than 0.1 µF) should be treated as a low source impedance and isolated with a resistor. Low impedance sources do not cause a problem unless their output voltage exceeds the supply voltage. However, the supplies go to zero when they are turned off, so the isolation is usually needed.

The output circuitry is protected against damage from shorts to ground. However, when the amplifier output is connected to a test point, it should be isolated by a limiting resistor, as test points frequently get shorted to bad places. Further, when the amplifier drives a load external to the equipment, it is also advisable to use some sort of limiting resistance to preclude mishaps.

Precautions should be taken to insure that the power supplies for the integrated circuit never become reversed—even under transient conditions. With reverse voltages greater than 1V, the IC will conduct excessive current, fusing internal aluminum interconnects. If there is a possibility of this happening, clamp diodes with a high peak current rating should be installed on the supply lines. Reversal of the voltage between V+ and V− will always cause a problem, although reversals with respect to ground may also give difficulties in many circuits. The minimum values given for the frequency compensation capacitor are stable only for source resistances less than 10 kΩ, stray capacitances on the summing junction less than 5 pF and capacitive loads smaller than 100 pF. If any of these conditions are not met, it becomes necessary to overcompensate the amplifier with a larger compensation capacitor. Alternately, lead capacitors can be used in the feedback network to negate the effect of stray capacitance and large feedback resistors or an RC network can be added to isolate capacitive loads.

Although the LM101A is relatively unaffected by supply bypassing, this cannot be ignored altogether. Generally it is necessary to bypass the supplies to ground at least once on every circuit card, and more bypass points may be required if more than five amplifiers are used. When feed-forward compensation is employed, however, it is advisable to bypass the supply leads of each amplifier with low inductance capacitors because of the higher frequencies involved.

Typical Applications (Note 9)

![Standard Compensation and Offset Balancing Circuit](ds007752-29)

- **LM101A**
- R1: 10MΩ
- R2: 5.1MΩ
- R3: 50KΩ
- C1: 30 pF
- V+ is connected to the positive supply voltage (V+).
- V− is connected to the negative supply voltage (V−).

![Fast Voltage Follower](ds007752-31)

- **LM101A**
- R1: 10KΩ
- C1: 30 pF
- C2: 300 pF
- V_in is the input voltage.
- V_out is the output voltage.

**Power Bandwidth**: 15 kHz
**Slew Rate**: 1V/µs
Typical Applications (Note 9) (Continued)

**Fast Summing Amplifier**

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.
