## $\frac{\theta \nabla}{m} \equiv{ }^{\text {sur }}$ д <br> - $\theta$

e) Another common definition of distance is angular size distance, determined
by measuring the apparent size of an object of known physical size. In a static,
Euclidean space, a small sphere of diameter $w$ at a distance $\ell$ will subtend an
angle $\Delta \theta=w / \ell$ :

 have different velocities, because each is at rest with respect to the matter in

 generally they are not equal to each other. One choice is called proper dis-
d) There are a number of different ways of defining distances in cosmology, and
 leave your answer in the form of a definite integral, which may be expressed in

 c) To estimate the number of galaxies that one expects to see in a given range on $t_{G}$, as well as $\psi_{G}$ or any property of the function $a(t)$.)

 the simple form

 Cosmologists therefore define the luminosity distance by

$g \cdot d$

(c) The observer uses his own clocks to measure the proper time interval $\Delta T_{r}$
 of each pulse. What is the coordinate time interval $\Delta t_{r}$ between the reception
(b) The pulses are received by an observer at $\vec{x}_{r}$, who measures the time of arrival emission of the next pulse.) time coordinate $t$ at the emission of one pulse and the time coordinate $t$ at the
 by a clock at the same location. What is the coordinate time interval $\Delta t_{e}$ pulses. The pulses are separated by a proper time interval $\Delta T_{e}$, as measured

 which describes a static gravitational field. Here $i$ runs from 1 to 3 , with the
