

LECTURE #19 :
3.11 MECHANICS OF
MATERIALS F03

INSTRUCTOR : Professor Christine Ortiz

OFFICE : 13-4022 **PHONE :** 452-3084

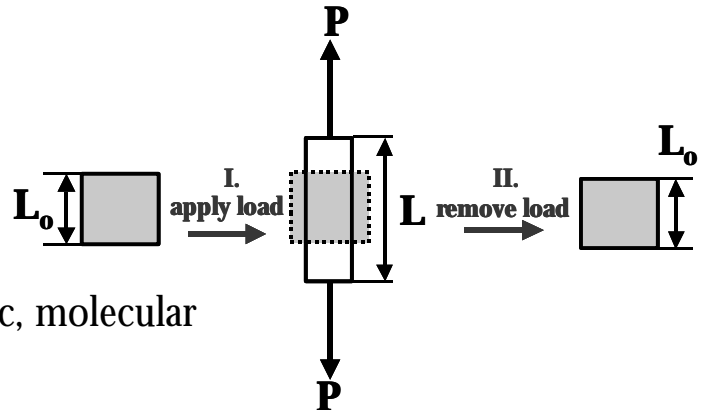

WWW : <http://web.mit.edu/cortiz/www>

- **REVIEW : INTRODUCTION TO THE MOLECULAR ORIGINS OF MECHANICAL PROPERTIES**
- **QUANTITATIVE TREATMENT OF INTERATOMIC BONDING : THE LENNARD-JONES POTENTIAL**

SUMMARY : LAST LECTURE

I. Basic Definitions :

- elasticity & elastic moduli
 - Young's modulus
 - shear modulus
 - bulk modulus
- *length scales* : macroscopic, microscopic, molecular

II. Questions :

- ⇒ 1. What is the molecular origin of the elastic moduli? i.e. What provides the internal resistance to external mechanical forces and deformations and allows materials to hold their shape?
- ⇒ 2. Why do different materials have vastly different elastic moduli?
- ⇒ 3. Why do some materials have one elastic moduli ($E = \text{constant}$, isotropic) while others have different ones in different directions (anisotropic, $E = E(\theta)$)?

III. Answers :

- ⇒ 1. The **TYPE** of internal “cohesive” forces/ bonding/ molecular structure holding the material together.
- ⇒ 2. How these forces are **ARRANGED** within the material (e.g the placement, packing, and location).
- ⇒ 3. The **NUMBER** of bonds/unit volume or unit area

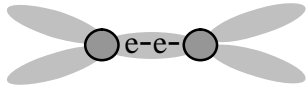

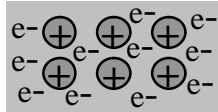

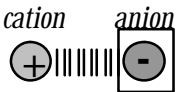

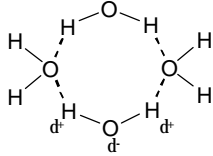

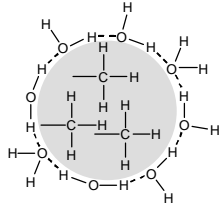

IV. Thermodynamic Contributions to Elastic Moduli :

Molecular Origin	(1) Energetic or Enthalpic	(2) Entropic
macroscopic result	linear elasticity \Rightarrow Hooke's Law $\sigma = E\epsilon$	nonlinear elasticity \Rightarrow Rubber Elasticity
strain range material	small strains metals, ceramics, crystalline materials	large strains polymers, rubber networks

V. Enthalpic Origin of Elastic Moduli:

- distortion of chemical and physical bonds : types
- lattice strain in crystalline materials

Summary of Types of Bonding

Type of Interaction	Classification	Characteristics	Schematic	
Covalent :	Primary or Chemical Bonds : <ul style="list-style-type: none"> usually characterized as individually "strong" outer orbital e- cooperatively shared between two or more atoms so that discrete nature of atoms is lost quantum mechanical in origin 	<ul style="list-style-type: none"> e- are localized directional (i.e. oriented at well-defined angles to each other) 		
Metallic :		<ul style="list-style-type: none"> only metals atoms are involved e- are completely delocalized and mobile throughout entire material non-directional 		
Ionic :		<ul style="list-style-type: none"> ion-ion 	<ul style="list-style-type: none"> coulombic in origin, occurs between oppositely charged species electron transfer from one atom to another 	
Polar Interactions :	Secondary or Physical Interactions : <ul style="list-style-type: none"> usually characterized as individually "weak" no e- sharing, more subtle attraction between (+) and (-) charges, discrete nature of atoms preserved typically exhibits : <ul style="list-style-type: none"> lack of specificity lack of directionality lack of stoichiometry 	<ul style="list-style-type: none"> force between an ion and a dipole or two dipoles where the (+) charge attracts the (-) charge (purely electrostatic) <ul style="list-style-type: none"> <i>H-bonding</i> : a special type of dipole-dipole interaction that results from the bonding between a H atom which is partially (+) charged and a highly electronegative atom such as O, F, N, Cl, (directional) 	  	
Polarization Interactions :		<ul style="list-style-type: none"> charge-nonpolar (induced or instantaneous dipole) dipole-nonpolar (induced dipole) 	<ul style="list-style-type: none"> an ion or dipole in the vicinity of a nonpolar atom or molecule causes instantaneous polarization and electrostatic attraction 	 
Dispersion or London Interactions :		<ul style="list-style-type: none"> charge-fluctuation, electrodynamic, induced-dipole-induced dipole forces) nonpolar-nonpolar 	<ul style="list-style-type: none"> the (+) nucleus of a nonpolar atom attracts the (-) charged electrons of another nonpolar atom resulting in instantaneous, induced, dipoles and fluctuating electron clouds quantum mechanical in origin 	
Hydrophobic :		Special Interactions : <ul style="list-style-type: none"> not really true "bonds" non-directional 	<ul style="list-style-type: none"> attraction between nonpolar molecules in aqueous solution caused by their inability to form H-bonds with HOH so as to minimize the disruption of H-bonds in HOH entropy-driven 	
Entropic Elasticity :	<ul style="list-style-type: none"> attractive, recoiling force produced via extensional deformation macromolecules 			

Atomistic Basis for Elasticity: One Example : Crystalline Materials

Atomistic Basis for Elasticity: One Example : Crystalline Materials

Atomistic Basis for Elasticity:

covalent bond : outer orbitals cooperatively shared

lattice strain disturbs electronic configuration

Consider an Individual Bond

**interatomic
distance, r (nm)**

**interatomic
(bond)
energy, W
(kJ/mol)**

interatomic force, F (nN)

Interaction Parameters

**interatomic
distance, r (nm)**

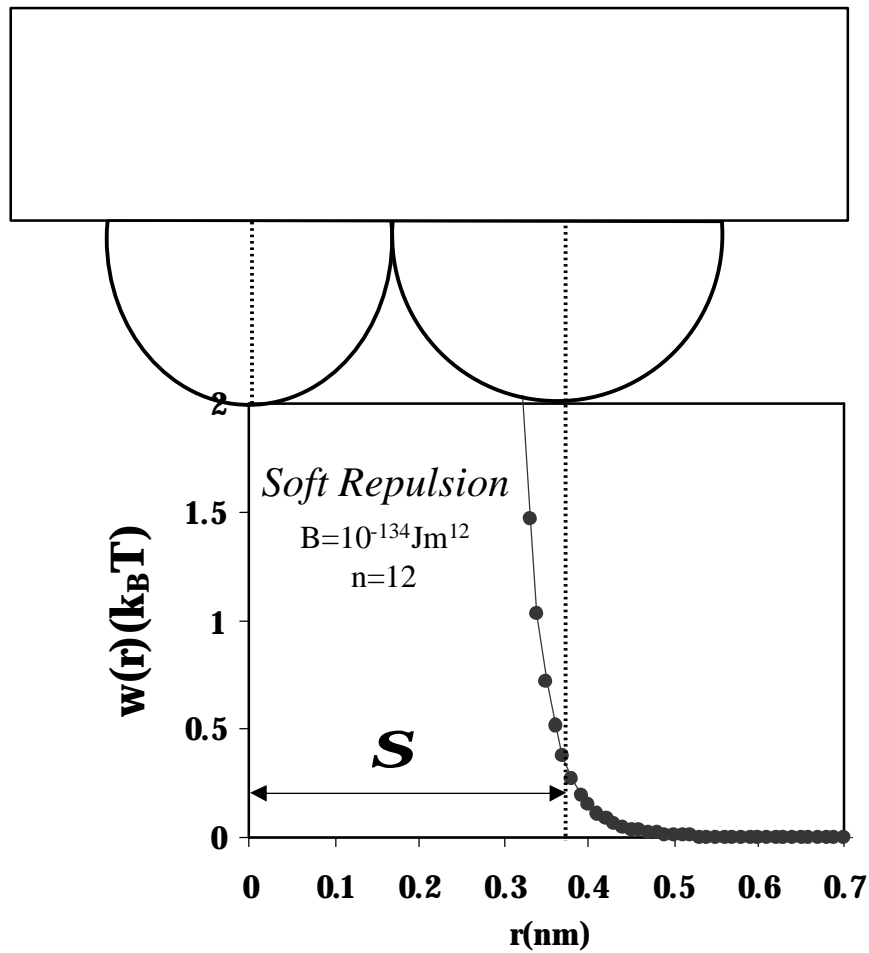

**interatomic
(bond)
energy, W
(kJ/mol)**

interatomic force, F (nN)

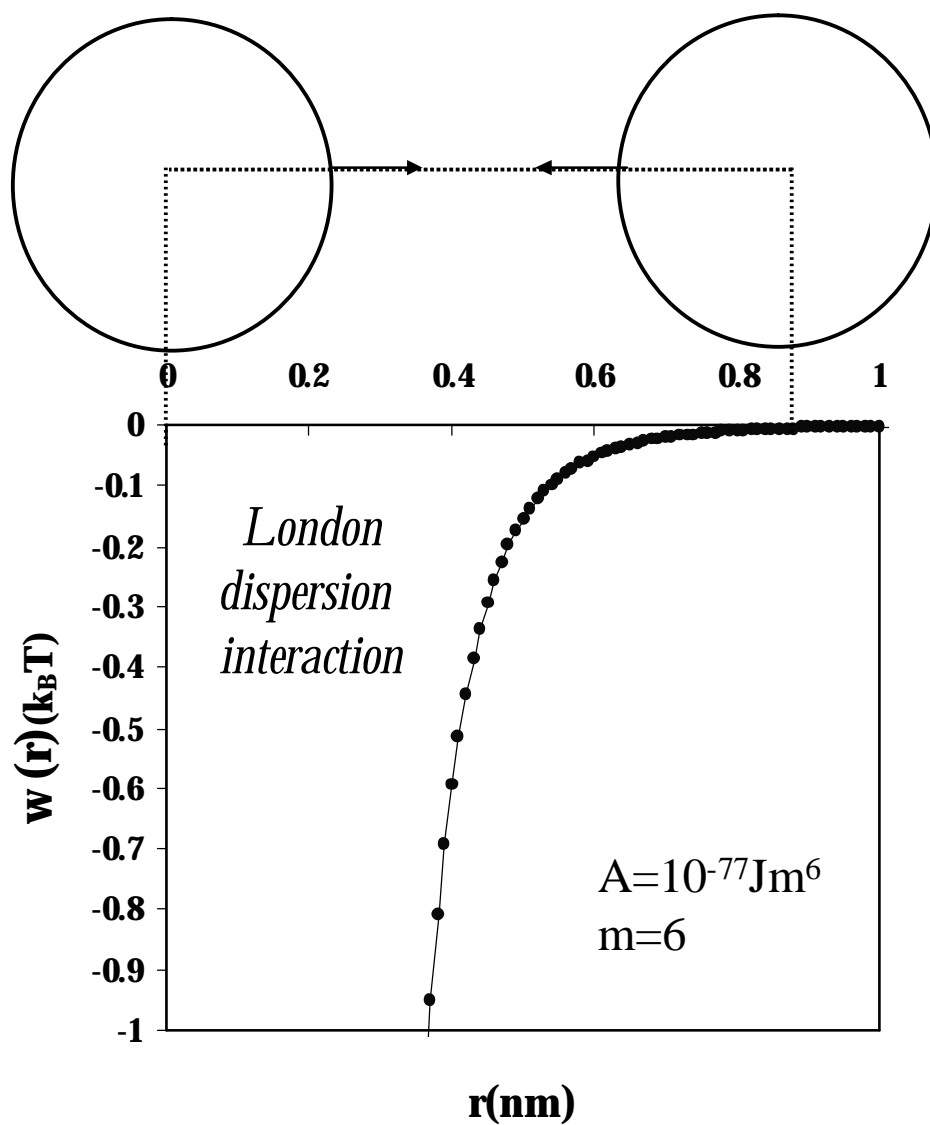

Molecular Origin of Repulsive Component
