## 9,10-Dibromotriptycene

The molecule of the title compound, $\mathrm{C}_{20} \mathrm{H}_{12} \mathrm{Br}_{2}$, has high rigidity and approximate threefold symmetry, but no crystallographically imposed molecular symmetry.

## Comment

9,10-Dibromotriptycene, (I), along with other dihalotriptycenes, can be used for further functionalization of triptycenes (Adcock \& Iyer, 1988; Adcock et al., 2001). The bond distances and angles in (I) are consistent with those reported in analogous mono- and di-substituted triptycenes. The $\mathrm{C}-\mathrm{Br}$ distances, 1.933 (5) and 1.952 (5) $\AA$, and the $\mathrm{Br}-\mathrm{C}-\mathrm{C}$ angles, ranging from 111.7 (4) to $113.3(4)^{\circ}$, are similar to the corresponding values in 9-bromotriptycene $(1.97 \AA$ and $111.4^{\circ}$; Palmer \& Templeton, 1968). The structure supports the conclusion that triptycene derivatives are highly symmetrical and rigid molecules. It is interesting to note that the molecule exhibits pseudo-threefold symmetry (as shown by the interplanar angles between the benzene rings: 123.7 (2), 121.5 (1), and $\left.114.8(2)^{\circ}\right)$. Unlike 9 -bromotriptycene, which crystallizes in $R \overline{3}$, it does not crystallize in a space group with threefold symmetry. Also, despite the largely aromatic nature of the molecule, no $\pi$-stacking is observed in the crystal structure.

(I)

## Experimental

The title compound was prepared according to a previously published procedure (Bohm et al., 1974). Pale yellow crystals were grown by sublimation of the crude product and characterized by mass spectrometry and NMR.

## Crystal data

$\mathrm{C}_{20} \mathrm{H}_{12} \mathrm{Br}_{2}$
$M_{r}=412.12$
Monoclinic, $P 2_{\mathrm{d}} / a$
