Fully simplified game tree

Michael Ernst, page 4

Questions about a game

- Who wins?
- By how much?
- What is the best move?
- How to combine games?

Combinatorial game theory (CGT) answers these questions precisely.

A game's value tells how many moves of advantage and can be compared, added, etc.

Michael Ernst, page 5

Applicability of CGT

- Complete information
- No chance
- Players moves alternately
- First player unable to move loses
- Game must end

Michael Ernst, page 6

CGT values (informally)

- Positive: Black wins $\circ\bullet\bullet$ has value $\underline{1}$
- Negative: White wins $\bullet\circ\bullet\circ\bullet$ has value $\underline{-2}$
- Zero: second player wins \square has value $\underline{0}$
 $\circ\bullet\circ\bullet$ has value $\underline{0}$
- Fuzzy: first player wins $\circ\bullet$ has value \ast
 \ast is less than any positive value
 greater than any negative value
 incomparable to zero

Michael Ernst, page 7

CGT values (formally)

A game's meaning is its simplified game tree, written $\{ \text{black-moves} \mid \text{white-moves} \}$

$$\begin{aligned}\square &= \{ \mid \} = \underline{0} \\ \circ\bullet\circ &= \{ \bullet\bullet\bullet\circ, \circ\bullet\bullet\bullet \mid \} \\ &= \{ \underline{0}, \underline{0} \mid \} = \{ \underline{0} \mid \} = \underline{1} \\ \bullet\circ\bullet\circ\bullet &= \{ \mid \circ\bullet\bullet\circ\bullet, \bullet\circ\bullet\bullet\bullet\circ \} \\ &= \{ \mid \underline{-1}, \underline{-1} \} = \{ \mid \underline{-1} \} = \underline{-2} \\ \circ\bullet &= \{ \bullet\bullet\bullet\mid, \bullet\bullet\circ \} \\ &= \{ \underline{0} \mid \underline{0} \} = \ast\end{aligned}$$

Michael Ernst, page 8

Arithmetic

Value of noninterfering combination of games
= sum of values

Example: $\underline{2} + \underline{-1} + \underline{0} = \underline{1}$

$$\circ\bullet\circ\bullet\circ + \bullet\circ\bullet + \circ\bullet\circ\bullet\circ = \circ\bullet\circ$$

$A = B$ means $A + -B = \underline{0}$

Michael Ernst, page 9

Fractions

$$\circ\bullet\circ\bullet\circ\bullet = \{ \underline{0}, \underline{-1} \mid \underline{1} \} = \{ \underline{0} \mid \underline{1} \} = \frac{1}{2}$$

In $\{ \text{left}, \text{right} \}$, choose the simplest number between left and right.

- integers are simpler than fractions
- among integers, smaller abs value is simpler
- among fractions, smaller denominator (always a power of 2)

$$\{ \underline{5} \mid \underline{22} \} = \underline{6} \quad \{ \underline{-22} \mid \underline{-7} \} = \underline{-8} \quad \{ \underline{-22} \mid \underline{3} \} = \underline{0} \quad \{ \ast \mid \ast \} = \ast$$

Why these rules?

Michael Ernst, page 10

Infinitesimals

$$\bullet\bullet\circ = \{ \underline{0} \mid \ast \} = -$$

Smaller than any positive number

Greater than zero

How does it compare to \ast ?

(There are even smaller infinitesimals.)

Michael Ernst, page 11

Simplifying a game

Delete dominated options: $\{ \underline{3}, \underline{6} \mid \dots \}$

Bypass reversible moves:

$$P = \{ \dots \mid R, \dots \}$$

$$R = \{ P', \dots \mid \dots \}$$

$$P' = \{ \dots \mid X, Y, Z \}$$

If $P' > P$, then $P = \{ \dots \mid X, Y, Z, \dots \}$

If Right moves to R, then Left will certainly move to P' (or something better), so Right's new options will be X, Y, Z.

Michael Ernst, page 12

Why CGT?

- Reduce the search space by summing subgames
- Simplify game values into equivalent but simpler games
- Provide vocabulary for talking about game values
- Tell which move is best, not just which one wins

Michael Ernst, page 13

Separating stone positions: how far can a stone move?

(To determine noninterfering subgames.)

Idea: potential function

Example: no stone can
get to the star

Potential function:

Initial potential is 20

Goal (star) potential is 21

No jump increases potential

2	3	5	8	13	21
1	2	3	5	8	13
1	1	2	3	5	8

Michael Ernst, page 14

CGT and competitive game-playing

CGT is useless in the opening and middle game

Analysis is tractable only for the endgame

CGT gives an exact answer

Do you need the best move, or just a good one?

CGT is a lot of work to program

CGT wins if you can separate a game into pieces

16 stones, branching factor of 4: $4^{16} = 4$ billion

2 groups, 8 stones each, branching 2: $2 * 2^8 = 512$
