

## PROOFS BY INDUCTION

---

**Goal: Prove some statement  $P[n]$  is true for all integers  $n \geq 1$**

**Step 1:** State the base case  $P[1]$  and prove it.

**Step 2:** State the inductive hypothesis  $P[m]$ .

**Step 3:** Prove the inductive case  $P[m+1]$ ,

*assuming that the inductive hypothesis  $P[m]$  is true for some  $m \geq n$*

*It's often helpful to write  $P[m+1]$  in terms of something recognizable from  $P[m]$*

**Example: Prove  $1 + 2 + 3 + \dots + n = \frac{1}{2} n \cdot (n+1)$  for all integers  $n \geq 1$ .**

The statement  $P[n]$  is: " $1 + 2 + 3 + \dots + n = \frac{1}{2} n \cdot (n+1)$ "

We want to show this is true for any integer  $n \geq 1$  using induction.

**Step 1: State the base case  $P[1]$  and prove it**

The base case  $P[1]$  is: " $1 = \frac{1}{2} \cdot 1 \cdot (1+1)$ "

This is obviously true (proof by "duh").

**Step 2: State the inductive hypothesis  $P[m]$ .**

$P[m]$  is: " $1 + 2 + 3 + \dots + m = \frac{1}{2} m \cdot (m+1)$ "

**Step 3: Assume the inductive hypothesis, and prove the inductive case:**

*Assume*  $P[m]$ :  $1 + 2 + 3 + \dots + m = \frac{1}{2} m \cdot (m+1)$  is true for some  $m \geq n$ .

Now show  $P[m+1]$ :  $1 + 2 + 3 + \dots + (m+1) = \frac{1}{2} (m+1) \cdot ((m+1)+1)$  is true:

Rewrite  $P[m+1]$  in terms of something recognizable from  $P[m]$ :

$$\begin{aligned} 1 + 2 + 3 + \dots + (m+1) &= 1 + 2 + 3 + \dots + m + (m+1) \\ &= \underline{(1 + 2 + 3 + \dots + m)} + (m+1) \end{aligned}$$

(Does the underlined first term look familiar?)

$$\begin{aligned} &= (m(m+1)/2) + m + 1 && \text{by induction hypothesis} \\ &= m(m+1)/2 + m + 1 \\ &= m(m+1)/2 + (m+1)(2/2) \\ &= m(m+1)/2 + 2(m+1)/2 \end{aligned}$$

(continued)

*(continued)*

$$\begin{aligned} &= (m+2)(m+1)/2 \\ &= (m+1+1)(m+1)/2 \\ &= ((m+1)+1)(m+1)/2 \\ &= (m+1)((m+1)+1)/2 \end{aligned}$$

So we've proven our base case  $P[1]$  (step 2) and our inductive case  $P[m+1]$  using the induction hypothesis  $P[m]$  (step 3).

Therefore,  $P[n]$  holds true for all  $n \geq 1$ .  $\square$
