With six landscape architects on its faculty, the joint program in City Design and Development at the Massachusetts Institute of Technology's School of Architecture and Planning is exploring how landscape and design can redirect contemporary urbanization.

Landscape + Urbanism at MIT focuses on analyzing the forces that shape the built and natural environment and using that understanding to design strategic solutions to the most pressing environmental and social challenges of our time – including climate change, renewable energy, water conservation, landscape toxicity, deindustrialization, environmental justice, adaptive re-use and the design of cultural landscapes.

Architects, landscape architects, urban planners and those in related fields are encouraged to further their professional and academic career by engaging in this unique line of inquiry and practice.
