The work of the study is done with understanding, beyond repair.

In the process, they may be nodes which are in preparation of the final proof of the structure. The larger the structure, the larger the number of nodes that are required to be understood and incorporated into the final proof.

However, this is not the case. The larger the structure, the smaller the number of nodes that are required to be understood. The number of nodes that are required to be understood is inversely proportional to the size of the structure.

This is due in part to the fact that the distance between nodes' understanding is not a consistent value.
