Preface: On the Uses of Biographies

The preface to a scholarly work should place the book in a context by indicating its relationship to other publications. My first task is thus to relate this biographical supplement both to the 17 volumes of the *Encyclopedia* published in 1968 and to the 15-volume *Encyclopaedia of the Social Sciences* published by The Macmillan Company between 1930 and 1935.

Alvin Johnson, the economist who served as associate editor (and *de facto* editor) of the 1930–1935 *Encyclopaedia*, was nearly ninety years old when I knew him in the early 1960s, but he had forgotten little of what he had learned as an encyclopedist thirty years earlier. One of his bits of advice to me in 1962 was not to listen to people who would say that it is “too early” to produce a new encyclopedia of the social sciences; some one will always say that, he told me, and such advice should be ignored. Searching for a way to tell us to “do it now,” he invoked a bit of country advice he had learned in his youth: “Prune when your knife is sharp!” I am delighted that The Free Press has decided that its knife is now sharp, and that this is an appropriate time to publish a supplementary volume. For reasons given below, I think it is particularly important that this supplement is devoted to new biographies.

Another bit of Alvin Johnson’s advice which we followed in 1962 was to be more selective than he had been in commissioning biographical articles. The earlier encyclopedia contains some four thousand biographies; although many are still useful today, it is easy to imagine that many more have been read by only a handful of scholars during the last five decades.

Since my colleagues and I were aiming at a conceptual rather than a descriptive encyclopedia, we at first considered having no biographies at all. Luckily, we rejected this notion, and in retrospect we are pleased with our decision to include some six hundred biographies. This supplementary volume contains an additional 215 biographies.

Barbara A. Chernow served as full-time managing editor for the duration of the project, and her “Introduction” describes the criteria for selecting subjects and contributors. In these remarks, I note some ways in which biographies can be used.

Most obviously, biographies are useful for finding answers to factual questions about people: when was so-and-so born? where edu-

cated? major publications? when was the famous book published? Information of this kind is often difficult if not impossible to find in a library, and an encyclopedia that includes biographical articles is thus an essential reference work.

A second use of biographies of scientists is to help us understand their ideas and their methods. Particularly in the social sciences, the substance of scholarly work is to some degree a reflection of the lives of those who produced it, and the more we know of their lives, the more we know of their work. This relationship of course varies a great deal from scientist to scientist, and it is certainly not implied here that reading biographies is a substitute for reading original sources.

The relationship between a writer's life and his work is the focus of a continuous argument in the humanities. Some scholars assert that the publications of a writer should alone be the basis for critical analysis (the so-called New Criticism), and others object to biographical analysis on invasion-of-privacy grounds. *Telling Lives: The Biographer's Art*, edited by Marc Pachter (1979), contains eight useful essays that describe these and other opinions about biographies as data.

Biographies, and particularly collections of biographies, can clearly contribute a great deal both to intellectual history and to the history and sociology of science. Collections of biographies provide information about the historical and social context in which new ideas emerge; they provide data useful in determining the sequences of ideas and what else we need to know about the priority of discovery; they help us to understand the influence of social and cultural origins and of generational membership upon scientific development; they tell us of particularly influential teachers and colleagues; they describe the "invisible colleges" to which scientists belonged, and thus their networks of exchange and influence; and they indicate the ways that ideas become (or fail to become) institutionalized by their creators or by succeeding generations, either in terminology or in research institutes. The present volume joins not only the 17 volumes that preceded it; it also joins such collections of biographies as Charles C. Gillispie's 15-volume *Dictionary of Scientific Biography* (1971–1978) and Gardner Lindzey's *A History of Psychology in Autobiography* (1974), which is itself an extension of the 5 volumes that preceded it.

An eighteenth century word—prosopography—has been used to describe the method of systematically studying collections of biographies, a method that historians have called "collective biography" and that other social scientists might call "multiple career-line analysis" (Stone 1971, p. 46). Sociologists and historians of science are now giving more of their attention to this technique. One example is Steven Shapin's and Arnold Thackray's (1974) analysis of the British scientific community from 1700–1900. Another is Harriet Zuckerman's *Scientific Elite* (1977), an intensive analysis of the careers of 92 Nobel laureates which informs us about the familial and social origins of creative scientists in interaction with the system of recognition and reward in science. Robert K. Merton's review (1979) of new developments in the sociology of science stresses the usefulness for research of collections of biographies. Merton also provides a fascinating account of how Gillispie's *Dictionary of Scientific Biography* was almost prepared in such a way as to make systematic prosopographic analysis possible. It was proposed at one time that all the writers for the *Dictionary* would have to provide systematic data about their subjects,

so that computerized storage, retrieval, and analysis would be possible, but in the end the idea was judged to be premature (Merton 1979, pp. 41-47).

The biographies in the *International Encyclopedia of the Social Sciences* (including those in this supplementary volume), like those in the *Dictionary of Scientific Biography*, are of enormous use individually, but they are of uneven utility for prosopographical purposes. For example, some biographers do not provide sufficient data on employment and research activities to make systematic career-line analysis possible; others make almost exclusive use of the publications of their subjects as sources, and thus omit much of the information about the setting of their subjects' work which a historian or a sociologist of science would prefer. But they all provide a glimpse of one member of an important generation of social scientists.

Elsewhere in the front matter of this volume there is a list of the disciplines represented by the biographies. All of the social sciences are of course represented. Also represented are disciplines at the margins of the social sciences: philosophy and legal theory at one margin, human biology at the other. This selection of persons from the humanities and the natural sciences reflects a current trend within the social sciences to learn from people at the margin, and thus enhances the usefulness of the volume.

The generation of scholars represented in this volume was educated between the two World Wars, when there were relatively few social scientists of any kind. It is the generation whose members were the teachers of a substantial proportion of contemporary social scientists; it is the generation that came between the nineteenth century founders of the modern social sciences and the thousands of practicing social scientists today. For this reason alone, this supplementary volume of biographies should be a welcome addition to our personal and institutional libraries.

The volume speaks for itself. I would like only to record here my appreciation for the intelligence, the diligence, and the diplomacy of Barbara A. Chernow.

DAVID L. SILLS

Introduction

This *Biographical Supplement* to the *International Encyclopedia of the Social Sciences* is the third link in an encyclopedic chain that began in 1930. Between 1930 and 1935, The Macmillan Company published the 15-volume *Encyclopaedia of the Social Sciences*, edited by Edwin R. A. Seligman and Alvin Johnson. Never revised, this classic encyclopedia is now available only in microfiche. In the 1950s, Alvin Johnson and other members of the social science community considered the possibility of revising the *Encyclopaedia*, but they preferred the idea of publishing an entirely new reference work that would reflect the expanding and changing nature of the social sciences. Finally, in the early 1960s, The Macmillan Company and The Free Press decided to publish a completely new encyclopedia. Published in 1968, the 17-volume *International Encyclopedia of the Social Sciences*, edited by David L. Sills, is a comprehensive summary of the state of knowledge in the social sciences. Like its predecessor, the *International Encyclopedia of the Social Sciences* has never been revised, although an unabridged eight-volume edition was published in 1978.

Because an encyclopedia reflects a generation's contributions to and perspectives on knowledge, it must be revised, updated, or supplemented if it is to maintain its intellectual credibility. In order for the 1968 *International Encyclopedia of the Social Sciences* to remain a useful reference tool, subsequent developments in the social sciences have to be incorporated. This supplement is the first step toward meeting that need.

Of the various supplements considered, the favorite, perhaps because of its manageability, was one composed entirely of biographies of eminent social scientists who had been too young in the mid-1960s to qualify for inclusion in the original volumes. The Free Press prepared an initial list of approximately three hundred biographical subjects that was circulated among some fifty social scientists. Their reactions to the proposal were largely enthusiastic, and they returned the lists with suggestions for additions, deletions, and possible biographers. With this information and this support from the academic community, work on the supplement began in earnest early in 1977.

Selection of biographical subjects

The editors determined that a one-volume supplement should contain approximately two hundred biographies. As anticipated, the

selection of the subjects was the most sensitive phase of the project. Personal and professional alliances and friendships influenced the recommendations of all of the scholars who willingly advised the editorial staff. Even after the final list of biographies was established, the same sensitivities affected the question of the relative importance of the biographies, and thus the comparative length of the articles.

The criteria for inclusion in the supplement were the same as for the original 17 volumes, which had included biographies of deceased social scientists as well as biographies of living social scientists past the age of 70, that is, who were born prior to 1891. Thus, to be considered for a biography in the supplement, a social scientist had to have died since the preparation of the original volumes or to have been born no later than December 31, 1908. By searching obituary notices in newspapers and professional journals, and by consulting more than two hundred social scientists in the United States and abroad—including all of the associate and field editors who served on the staff of the encyclopedia in the 1960s—the original list grew to almost five hundred names. In November 1977, an ad hoc committee of scholars met with the editors to amend and refine the list. The Free Press, however, made the final decisions concerning the contents of the volume, which includes 215 biographies.

The advisers divided the biographies into three categories: major figures, who made pathbreaking and sustained contributions to the social sciences; important figures, whose work was essential to the growth of their disciplines; and influential figures, whose research offered a representative cross-section of developments in the social sciences. The third category is particularly subjective, and we cannot claim that our selections are the only appropriate choices.

In addition, the supplement includes three biographies of social scientists whose biographies were omitted, for different reasons, from the earlier volumes. In four other instances, husbands and wives, whose work overlapped to such a degree that separate biographies would have been repetitive, received joint biographies. Finally, because of an error in our initial information search, one scholar who did not meet the age criterion was included, and the editors judged it inappropriate to delete the entry after commissioning the biography.

Selection of contributors

The criteria for contributors were knowledge of the biographees' work, high intellectual standards, and institutional and geographical representation (the 217 contributors to this volume come from 13 different countries). Based on our advisers' recommendations, we had ranked lists of biographers for each biography. In reviewing the directory of contributors and the alphabetical list of biographies for the supplement, the continuity from the *Encyclopaedia of the Social Sciences* to the *International Encyclopedia of the Social Sciences* to this supplement is striking. For example, Talcott Parsons, to whose memory the supplement is dedicated, contributed to all three works and is also the subject of a biography in the supplement; 18 social scientists who contributed to both encyclopedias are biographees in the supplement; 52 contributors to the *International Encyclopedia of the Social Sciences* are biographees in the supplement; and 50 contributors to the supplement were also contributors to the original 17 volumes of the encyclopedia.

As with any project involving so many authors and a tightly

followed schedule, a handful of contributors failed to deliver the manuscripts they agreed to write. The editors are grateful to those individuals who accepted these assignments at the last minute so that deserving biographees would not be omitted.

Preparation of the manuscript

All of the articles in the supplement are original and conform to the style rules that were developed in the 1960s for the publication of the encyclopedia. Contributors received specific instructions concerning the tone and organization of the biographies. The editors tried to maintain a balance between insisting on total uniformity of the contents of the biographies and on allowing the contributors so much flexibility that the volume might lose its unity.

In keeping with the encyclopedia's policy, the emphases in the biographies are the subjects' intellectual development and contributions to the social sciences. Thus, comparatively little biographical data is included in many articles. We urged contributors to discuss the subjects' intellectual surroundings and to analyze the intellectual climate during their university and professional years. Whose ideas were dominant during their formative years? Whom have they taught and influenced? With whom among their colleagues have they collaborated? To present a balanced picture, we encouraged contributors to present any major criticisms of their biographees' work as well as to analyze any schools of thought that grew up in support of or in opposition to their findings. Contributors were free to divide their biographies topically or chronologically if it helped to present the material in a more organized format. Each biography was reviewed by at least one specialist in the biographees' field before it was accepted. All of the contributors saw the edited versions of their manuscripts and had the opportunity to read their articles in galley.

Bibliographies

Perhaps the most frequently consulted feature of any reference work is its bibliographies. The bibliographies in the supplement were prepared by the contributors, but a staff of three bibliographers verified each item for accuracy and, where necessary, updated the entry or added useful information in the annotation. The bibliographies are divided into works by the biographee, which range from highly selective to almost complete listings, and supplementary entries, including readings about the biographee and his or her work.

Following the precedent established in the *International Encyclopedia of the Social Sciences*, the date of first publication is given for all works, but the publishing information refers, where possible, to the most recent, readily available, English language edition of each work. In this way, the historical development of the biographees' intellectual growth is indicated. Where later editions or reprint editions of works are available, the date of first publication is given in parentheses in the bibliography. In the text, the date of first publication is given for all works cited; if a citation specifically refers to a later edition, the date of first publication is in brackets. Information concerning translations, changes in titles of publications, and forthcoming works is available in the annotations.

Acknowledgments

Above all, this volume is a product of the community of social scientists. During the past two and one-half years, the editors have incurred special obligations to those individuals named in the list of advisers.

No such project is successful, however, without a professional support staff. Their efforts must be well-coordinated, their work accurately and quickly performed, and their patience endless. The staff, whose specialized knowledge and skills made this volume possible, includes Evelyn Geller, the copy editor, and Nancy E. Schroeder, Patricia Maughan, and Susan Copeland, the bibliographers. A more general debt of gratitude is due to the Columbia University Libraries and the New York Public Library for use of their facilities.

David L. Sills deserves a special thanks for his constant support of the idea of a supplementary volume of biographies and for his frequent advice at every stage. He participated in the process of selecting subjects and contributors; he read all of the articles in galley, searching for substantive and editorial problems; he prepared the "Preface" to the volume; and he wrote one of the longest articles—on the sociologist Paul F. Lazarsfeld.

BARBARA A. CHERNOW

List of Advisers

The editors wish to thank the following individuals for their advice during the various stages of the preparation of the *Biographical Supplement* to the *International Encyclopedia of the Social Sciences*.

Acknowledgments by Contributors

The following contributors wish to extend their thanks for the special assistance they received in the preparation of their biographies for the supplement:

J. A. Barnes to Meyer Fortes, for his help in writing the biography of Fortes.

Henk C. Bos to P. de Wolff, whose article "Tinbergen's Contribution to the Business-cycle Theory and Policy." *De Economist* March/April 1970: 113-125, was helpful in preparing the section entitled "Economic business cycle research" in the biography of Jan Tinbergen.

G. C. Harcourt to Tom Asimakopulos, M. C. Bradbrook, John Burbidge, Jon Cohen, Phyllis Deane, Robert Dixon, John Eatwell, Peter Groenewegen, Donald Harris, John Hatch, Susan Howson, Bruce McFarlane, Ian McLean, Donald Moggridge, Mark Perlman, Lorie Tarshis, John Vaizey, David Vines, and Trevor Wilson, for their help and comments on the draft of the biography of Joan Robinson.

Steven Harnad to C. L. Brace, R. M. and C. H. Berndt, M. Goldstein, R. Gorney, W. LaBarre, and A. Lyons, for providing helpful information for the biography of Ashley Montagu.

J. Woodford Howard, Jr., to Idella Gwatkin Swisher, for information about Carl B. Swisher's education and bibliography.

Robert Kimber to Alice Kahler and Eva Engel, for biographical and bibliographical information on Erich Kahler.

William Labov to Beatrice Silverman-Weinreich, for help in the preparation of the biography of Uriel Weinreich.

David Laidler to Russell S. Boyer, Thomas Mayer, Lionel Robbins, Don Patinkin, John R. Hicks, and Abba P. Lerner, for helpful comments on early drafts of the biography of Lerner.

Herbert J. Landar to Dorothy Hoiyer, for biographical and bibliographical details on Harry Hoiyer.

Carl Pfaffmann to Pearl Carmichael, for her assistance in providing much of the material upon which the biography of Leonard Carmichael is based, and to Leonard C. Mead, for his assistance and particularly helpful biographical memoir.

Leon Radzinowicz to Mary Lou McGanney, his assistant while he was visiting distinguished professor of criminal justice at John Jay College, for assistance in the preparation of the biography of James F. Stephen.

David L. Sills to Richard D. Alba, Elinor G. Barber, Allen H. Barton, Leo Bogart, Terry N. Clark, James S. Coleman, Albert E. Gollin, Marie Jahoda, Charles Kadushin, Elihu Katz, Patricia L. Kendall, Herbert Menzel, Robert K. Merton, Paul M. Neurath, Anthony Oberschall, Ann K. Pasanella,

ACKNOWLEDGMENTS BY CONTRIBUTORS

Hanan C. Selvin, Yole G. Sills, Judith M. Tanur, and Hans Zeisel for bringing their personal knowledge of Paul F. Lazarsfeld to the task of commenting on various drafts of the Lazarsfeld biography; to Robert A. Gates, Peter B. Read, David Seidman, and David L. Szanton for their comments as readers who were previously unacquainted with Lazarsfeld; and to Leona Cohen, for her careful and patient typing and retyping of the manuscript.

Herbert J. Spiro to Klaus von Beyme of the University of Heidelberg, Lenore Friedrich, Paul Friedrich of the University of Chicago, and David Riesman of Harvard University for their help in preparing the biography of Carl J. Friedrich.

Walter C. Stanley to the faculty, graduate students, and staff of the Department of Psychology, the American University, Washington, D.C., for aid in the final stages of the preparation of his biography of B. F. Skinner.

Classification of Biographies

The classified list of biographies that follows offers readers a survey of the different fields represented by the social scientists discussed in the supplement. Every biography in the supplement has been classified at least once, despite the fact that not every biography fits easily into the categories listed below. It should be noted that the categories listed below do not correspond exactly to those listed in the "Classification of Articles" on pages 83–108 in volume 17.

Anthropology
Criminology
Demography
Economics
History and Philosophy of History
Human Biology
Linguistics

Philosophy
Political Science and Legal Theory
Psychiatry
Psychology
Religion
Sociology
Statistics

ABEL, THEODORE

Theodore Abel was born in Lodz, Poland, in 1896, to a prominent industrial family. After completion of his Gymnasium studies in 1914, he spent four years as a journalist, while also publishing poetry and philosophical essays. He served in the Polish Army during the Polish-Russian War, 1918-1920, and as liaison officer to the American Young Men's Christian Association, 1920, and later director of its activities in Poland. From 1920 to 1923 he studied law and philosophy under Leon Petrazycki at the University of Warsaw, and philosophy and sociology under Florian Znaniecki at the University of Poznan. He emigrated to the United States in 1923 and, as a Gilder fellow, studied sociology under Franklin H. Giddings and William Fielding Ogburn at Columbia University, from which he received his PH.D. in 1929.

Abel began his academic career at the University of Illinois, where he taught from 1925 to 1929, and then returned to Columbia University, where he stayed from 1929 to 1951. In the latter year he became professor and chairman of the department of sociology at Hunter College of the City University of New York, a post he retained until his retirement in 1967. He spent post-retirement years teaching at the University of Notre Dame, the University of Waterloo (Canada), and the University of New Mexico. For many years he was a member of the board of directors of the Institute of Immigrant Welfare and served also during World War II as a member of the Hoover Commission for Polish Relief.

He was president of the Eastern Sociological Society during the year 1957/1958, and received its merit award in 1969.

Although Abel is thought of primarily as a sociological theorist, he made several contributions to sociological research. The first of these was a study of Polish immigrants in a small New England farming community, in which he discovered that immigrants to this rural area were assimilated more rapidly than those who settled in such urban communities as Chicago and Detroit, and that they also exhibited, in the second generation, less delinquency and crime (1929a).

The second, a study conducted under the auspices of the Institute of Social and Religious Research, was entitled *Protestant Home Missions to Catholic Immigrants* (1933). Protestant church leaders (especially Presbyterian, Baptist, and Methodist) had come to fear that the influx of immigrants from Catholic countries—Czechoslovakia, Hungary, Italy, Poland, Russia, and Mexico—would alter the Protestant character of American culture. Accordingly, they set up, especially in the cities where these immigrants settled in large numbers, more than a thousand "missions," ostensibly designed for charitable, social, and civic purposes, but actually concerned with the conversion of Catholic immigrants to Protestantism. By means of interview, schedule, questionnaire, and life history, Abel studied some 150 of these missions and discovered that their successes were insignificant. Only one in three hundred was converted and Abel was able to explore the reasons for the failure of the

2 ABEL, THEODORE

movement. The ties of the ancestral Church were too strong, especially because religious affiliation also meant loyalty to an ethnic group.

In this study, following the method developed by W. I. Thomas and Florian Znaniecki in their *The Polish Peasant* (1918–1920), Abel also experimented with the life history of mission workers and converts as a source of sociological data, and published in the book the autobiography of an immigrant minister. He expanded and refined this method in *Why Hitler Came Into Power* (1938). By offering cash prizes for the best personal life histories of those who joined the National Socialist Party before 1933, he was able to collect more than six hundred of them and used them to answer the question posed by his title. Rejecting both psychoanalytic and Marxist explanations of the rise of the Hitler movement, Abel concluded that a combination of factors was involved, including discontent with the place of Germany in the world after World War I, an ideology (including anti-Semitism) which emphasized the unity of the German *Volk*, the organizational skill of the party leaders, and finally the charisma of Hitler himself. Abel's six hundred life histories, six of which appear in the book, were later subjected to statistical analysis by P. H. Merkl, who discovered that anti-Marxism was a more important motive for early members of the party than anti-Semitism (Merkl 1975).

Abel's doctoral dissertation at Columbia University, *Systematic Sociology in Germany* (1929b), undertook to introduce to the English reader the work of Georg Simmel, Alfred Vierkandt, Leopold von Wiese, and Max Weber. More than an introduction, it was an effort to judge the success of each of these writers in establishing sociology as an autonomous discipline with a subject matter of its own. He judged their work in terms of four criteria of the validity of a scientific system: (1) an adequately delimited subject matter; (2) justifiable tasks of investigation; (3) a basis for the systematization of the subject matter; and (4) adequate methods of investigation. Incidentally, he rejected as unreal the argument as to whether sociology was a general or a special social science on the ground that it was both.

With respect to Simmel, Abel concludes that the basic distinction between form and content was untenable and that Simmel's procedure was philosophical rather than scientific. Simmel himself was unable to treat form in abstraction from content, and furthermore, adequate analysis of

a social situation requires a consideration of its historical setting. There is, in fact, an incongruity between his theory and his practice, one that diminishes the significance of his contribution to sociology.

Abel was similarly critical of Vierkandt. The phenomenological method that he proposed does not advance the establishment of sociology as an autonomous science. A method that concerns itself exclusively with mental states and "inner experiences" can result only in a descriptive psychology and can have little to do with sociological analysis. In any case, Abel was skeptical of the scientific validity of the phenomenological method. Like Simmel, Vierkandt is leading sociology in a philosophical and speculative, not a scientific, direction. Vierkandt has made no contribution to the methodology of sociology and his work indicates the way that sociology must not—need not—go if it is to be a science.

Von Wiese, on the contrary, struck a new note in German sociology when he abandoned introspective and phenomenological methods and adopted behavioristic and quantitative ones. Abel approves of von Wiese's insistence upon association and dissociation as the *specificum sociologicum*. Although von Wiese's efforts at quantification did not succeed and although he had mistaken views on the nature of measurement, Abel nevertheless gives him high marks for his contributions to a sociology that can be objective and scientific.

Weber escapes Abel's strictures and indeed receives his highest praise. Of the four writers Abel gives rather higher rank to Weber and von Wiese than to Simmel and Vierkandt, an evaluation that he was to change. His own preferences for an objective scientific sociology are clear. His control—not to say mastery—of the German literature in both philosophy and sociology, and his lucid exposition of the ideas of his four writers, made his dissertation one of the most useful texts of its time—a time when few of the German works had been translated into English.

In 1970 Abel published another book on theory, *The Foundation of Sociological Theory*. By "theory" Abel means the concepts used in the analysis and interpretation of data. These concepts are of two kinds, those that serve to classify and those that serve as variables in general propositions. Theories thus are the conceptual schemes designed to explain sociological laws. They vary greatly in generality, precision, testability, elegance, and predictive power, and they arrange themselves on a continuum with respect

to these attributes. After suggesting that the founders of the discipline in the nineteenth century had been either synthetic or clinical in their interests, he discovers a new approach, an analytical approach, in the writings of Durkheim, Simmel, and Weber, which complement one another. Accordingly, he devotes half of his book to a treatment of the analytical contributions of these three writers. He does not, however, treat the corpus of their work, but only those aspects of it that contribute to the growth of sociological theory. Abel contends that historians who consign them to different schools are wrong, and that, on the contrary, they were "collaborators" in the development of sociological theory and provided for it a single foundation. In order to reach this conclusion, Abel has to minimize the differences between them and emphasize the agreements.

Weber's nominalistic view of collective reality, for example, does not differ greatly from Durkheim's realistic view, especially when the more moderate statements of both authors are closely examined. Weber's *verstehende* sociology is not necessarily incompatible with Durkheim's positivistic sociology. Weber's *Wertfreiheit* is almost a paraphrase of Durkheim's admonition to treat social facts as things. Durkheim's forms of solidarity are Weberian ideal types, as are also his types of suicide. In the same way, similarities can be found between Durkheim and Simmel and between Weber and Simmel. All three thus shared a community of ideas which became, in turn, the foundation of modern sociological theory.

In the latter half of his book Abel returns to his distinction between the synthetic, the clinical, and the analytical approaches to sociology, and shows that writers commonly associated with the first of these—Auguste Comte, Herbert Spencer, Ferdinand Tönnies, Franklin H. Giddings, and Charles H. Cooley—anticipated, or made contributions to, the third. He goes on to offer brief discussions of the analytical contributions of such other writers as Vilfredo Pareto, Florian Znaniecki, Talcott Parsons, Pitirim A. Sorokin, George C. Homans, Robert K. Merton, and Leopold von Wiese, and in a different context, Paul F. Lazarsfeld, Stuart Dodd, and Robert M. MacIver. He is concerned, in a succeeding section, with the characteristics and types of sociological laws. In conclusion, he defends the status of sociology as a science.

Abel's contributions are not limited to his books. He published a number of separate papers

on sociological theory, the most influential of which was his paper on *Verstehen* (1948). Steeped in the tradition of German philosophical and sociological thought, and aware of the methodological significance of the latter, Abel was nevertheless attracted by the more objective and even behavioristic character of American sociology. Was there any way of reconciling the two? How are insight and "understanding" related to the "explanations" of the positive sciences? Abel addressed himself to these questions on a number of occasions.

In the paper mentioned, Abel first suggests that *Verstehen* by no means had its origin in such German writers as Wilhelm Dilthey and Weber. Indeed, traces of it are to be found in Giovanni Battista Vico and in Comte, the first of whom thought that men have a special kind of knowledge about themselves, and the second that we have a knowledge of human nature that is somehow different from our knowledge of the nature of the physical world. American writers too, such as Cooley with his "emphatic" knowledge, Znaniecki with his "humanistic coefficient," Sorokin with his "logicomeaningful method," and MacIver with his "imaginative reconstruction," all suggest that some special method or approach, denied to students of the natural universe, has been conferred upon those who inquire into the social universe. These writers, and others, have given it different names but all suggest that there is something there that attains the status of a method.

Unfortunately, these writers failed to specify in detail the operations to be performed in using the method, and this is a defect that Abel proposes to remedy. By specifying the operations involved, as he does with the help of illustrations, he shows how one is able to internalize observed behaviors and apply behavior maxims to them derived from general and personal experience. If statistical technique, for example, discloses a high correlation between crop yields and marriage rates, we say we understand the relationship because we have a behavior maxim which tells us that when people feel prosperous they are more willing to make commitments than when they do not. The "understanding" is the process of connecting the observation with the maxim. In other words, *Verstehen* brings to awareness and makes explicit the maxim that intervenes between our perceptions of stimulus and response. This is especially necessary when the observed behavior is neither routine nor commonplace and when the connections are

other than those we would expect. The steps involved in *Verstehen* are therefore three: (1) internalizing the stimulus; (2) internalizing the response; and (3) applying behavior maxims. The techniques by which we do this, however, are not themselves specified. They are matters of sympathetic imagination and of introducing our own personal experience into the situation. This is what happens generally in the imputation of motives. The source of behavior maxims is not in science but in personal experience. Thus, the operation of *Verstehen* is the application of personal experience to observed behavior.

The method, however, has certain limitations. Personal experience is variable and its quality depends upon the introspective capacity of the interpreter. The method suggests connections, but is unable to verify them. Furthermore, the connection is only possible. To determine its probability we need to utilize the more positivistic methods of experiment and comparison. *Verstehen* may give us an increment of personal satisfaction, but it adds nothing to the validity of the propositions we entertain. Abel concludes, therefore, that *Verstehen* cannot serve as a method of scientific analysis and cannot add to our store of knowledge.

Abel's conclusion was unanticipated. His title induced one to believe that by "operationalizing" *Verstehen* he would also validate it as a method. Although willing to concede that it relieves us of a sense of apprehension when confronted by the unfamiliar, he insisted nevertheless that it was merely a device for using knowledge that we have already acquired by personal experience. Responses by several critics induced Abel, in replies to them, to clarify his position, to distinguish between several different meanings of *Verstehen*, to emphasize again that the method was the chief source of hypotheses, and to underscore its role as an indispensable instrument in the study of social phenomena.

Although Abel did not himself construct a systematic sociological theory, his exposition and criticism of the theories of others—and especially his work on *Verstehen*—won him a recognized place in the history of the discipline.

ADORNO, T. W.

Theodor Wiesengrund Adorno, Marxist philosopher, social theorist, and aesthetician, was born in Frankfurt am Main, Germany, in 1903. In the 1930s he joined the Institut für Sozialforschung (Institute for Social Research) which, under the direction of Max Horkheimer, developed what became known as the Frankfurt School of Critical Theory. After World War II, Adorno returned to Frankfurt from exile in the United States, and as codirector and later director of the institute, he was a leading theoretician of the German New Left until his death in 1969.

Adorno was the only child of a Jewish wine merchant and his Catholic, Corsican wife (née

Calvelli-Adorno), a professional musician. As a youth he studied piano with Bernhard Sekles (who also taught Paul Hindemith) and spent weekends reading Immanuel Kant with Siegfried Kracauer, his mentor. At 18, already the author of 2 published articles on musical criticism, he entered Frankfurt's new, liberal Johann Wolfgang Goethe University, receiving a degree in philosophy 3 years later. His dissertation (*Gesammelte Schriften*, vol. 1) criticized Edmund Husserl's phenomenology from the position of his idiosyncratic Kantian professor, Hans Cornelius, whose assistant, Max Horkheimer, became Adorno's lifelong friend.

In 1925 Adorno went to Vienna to study musical composition with Alban Berg, a disciple of Arnold Schönberg. The heyday of the Schönberg circle was over, but Berg brought Adorno into contact with Vienna's artistic avant garde. Adorno wrote (under the name Wiesengrund-Adorno) for radical aesthetic journals like *Musikblätter des Anbruch* (later *Anbruch*) and *Pult und Taktstock* in defense of Schönberg's atonal music. His early articles were not yet Marxist. They reflected Schönberg's theory of composing as a cognitive activity, a search for "truth" which proceeded by developing the potential of musical material and techniques as they evolved historically. They were also indebted to György Lukács' pre-Marxist study, *Die Theorie des Romans* (1920), which argued that aesthetic developments were closely connected to historical transformations of the structure of lived experience.

Adorno returned to Frankfurt in 1927 to prepare for an academic career in philosophy. He wrote quickly a *Habilitationsschrift* (the prerequisite) which made an academically daring attempt to legitimate Sigmund Freud's new psychoanalytic method on the basis of Cornelius' Kantianism. The conclusion contained a Marxist critique of the ideological function of non-Freudian theories of the unconscious which was philosophically incompatible with the idealism of the rest of his analysis. The study was not accepted.

Adorno needed a new philosophical base that would support both Freud and Karl Marx, and his friend Horkheimer shared his problem. They learned from the psychoanalyst Wilhelm Reich's Marxian argument that the social structure was reflected in "character structures." They were aided immensely by the dialectical interpretation of Marx provided by Lukács in *Geschichte und Klassenbewusstsein* (1923), which stressed

the relation between consciousness and society. The new "sociology of knowledge" formulated by Max Scheler, and by Karl Mannheim, who taught at Frankfurt, dealt with similar concerns, but because it maintained the bourgeois, idealist goal of absolute, unchanging truth, the social relativity of knowledge to which it pointed led them to cognitive despair. Adorno and Horkheimer rejected the idealist goal. Adopting Lukács' method of *Ideologiekritik* (critique of ideology), they argued that bourgeois idealism (including Adorno's own earlier Kantianism) bore the structural flaws of the capitalist mode of production: the concept of the "object" was fetishized and reified like a commodity; the predilection for abstract universals reflected the abstract formalism of market exchange; the separation of form from content paralleled the alienated conditions of wage labor that only the overthrow of class relations could eliminate. They considered critical awareness of this connection to be historically specific truth, which both logically and morally compelled a commitment to the revolutionary transformation of society.

Adorno and Horkheimer frequented a left-wing literary circle in Berlin, whose undogmatic reception of Marx was much like their own. The group included Walter Benjamin, Bertolt Brecht, Ernst Bloch, Laszlo Moholy-Nagy, and Gretel Karplus (whom Adorno married in 1937). Adorno was particularly impressed by Benjamin's highly original, esoteric, cognitive theories. He attempted to translate them into a "dialectical," "materialist" method of exegesis (*Gesammelte Schriften*, vol. 1) which he applied in a study of Kierkegaard (*Gesammelte Schriften*, vol. 2). As a critique of the founder of modern existentialism (the bourgeois alternative to rational idealism), this study was an oblique attack on Martin Heidegger, whose *Sein und Zeit* (1927) was hotly debated among Frankfurt academicians.

Adorno submitted the Kierkegaard study as a second *Habilitationsschrift*. It was accepted by Paul Tillich, and Adorno joined the philosophy faculty at Frankfurt. The same year (1931) Horkheimer became head of the Frankfurt Institut für Sozialforschung, a privately-funded, Marxist research institute founded in 1923, bringing to it a more dialectical, "Critical Theory." Erich Fromm, Leo Lowenthal, Herbert Marcuse, and Friedrich Pollock were then members; Adorno and Benjamin were closely connected. Scarcely two years later Hitler took power. In spring 1933, the institute was forced

into exile, eventually settling in New York. Adorno emigrated to England the following year. As a scholar at Merton College, Oxford, he again launched a major critique of Husserl, this time using the critical method he had developed in his Kierkegaard study.

Adorno's focus during the 1930s on the immanent critique of philosophy separated his efforts somewhat from the "Critical Theory" of Horkheimer's institute. The latter was primarily concerned with exposing the ideological function of bourgeois theory and replacing it with an innovative fusion of Marxian sociology and Freudian psychology. Adorno's articles for the institute's journal (*Zeitschrift für Sozialforschung*), "Zur Gesellschaftlichen Lage der Musik" (1932), "Über Jazz" (1936, under the pseudonym Hektor Rottweiler), and "Über den Fetischcharakter in der Musik und die Regression des Hörens" (1938) demonstrated that he was in full accord with the goals and assumptions of "Critical Theory." But his own program was not identical. His analysis of music as a bourgeois cultural phenomenon went beyond the critique of its ideological content. He insisted that bourgeois artists and thinkers, despite their personal politics (and against their own intent) expressed in the form of unresolved tensions in their work a veiled social criticism and latent utopian perspective which it was the task of the critical interpreter to uncover and illuminate.

In 1934 Adorno contributed to a pamphlet in honor of Schönberg's sixtieth birthday. His essay, "Der dialektische Komponist" (*Gesammelte Schriften*, vol. 16), argued that out of the immanent logic of the musical material, Schönberg had dialectically negated and transcended bourgeois tonality, and the resulting atonal revolution not only liberated music from its ideological social function, but provided a cognitive model for nondominative social structures. Adorno's goal was a parallel achievement in philosophy. His new study of Husserl aimed at transcending bourgeois idealism once and for all (written in 1934–1937, it was published in 1953 with a new introduction as *Zur Metakritik der Erkenntnistheorie* [*Gesammelte Schriften*, vol. 5]). He chose to attack Husserl's phenomenology as the most advanced stage of bourgeois idealism—in the sense of advancing decay. His tactic was to focus on the logical gaps, or "ruptures," of Husserl's phenomenology so that what first appeared as logical contradiction was seen as a reflection of social contradiction—not philosophic error, but material truth. By showing that socially con-

crete, historically specific reality permeated all Husserl's premises and categories—the autonomy of reason, the priority of thought, the ahistorical universality of truth—Adorno hoped to demonstrate as false the fundamental idealist assumption that such categories were independent of social history, and to prove that dialectical, materialist principles (the priority of matter, the necessity of a logic of contradictions) needed to be accepted in their place.

Adorno's debt to Benjamin. Adorno's interpretive method of making the social structure quite literally appear within the words of bourgeois texts was indebted to Walter Benjamin. The latter was inspired by an unlikely combination of sources: the romantic tradition of German literary criticism (Novalis, Schlegel, Jean Paul), the Jewish mystical tradition of the Kabbalah (to which he had been exposed by his close friend Gershom Scholem), a revolutionary but unorthodox Marxism, and an avant-garde aesthetics that drew on theories of cinematic montage, surrealism, and Bertolt Brecht's epic theater. In Benjamin's theory of cognition the extreme experiences of critical demystification and religious revelation converged. He focused on the seemingly insignificant details of historically transient, cognitively reified phenomena so that they provided "profane illumination" by being read as "ciphers" of social truth.

Neither Brecht nor Scholem appreciated the fusion of Marxist and mystical motifs. Only Adorno felt a strong appreciation for the philosophic power of what he called Benjamin's "negative" or "inverse theology." Yet the very affinities of their positions led to disagreement. Exiled in Paris during the period of the popular front, Benjamin adopted a political position close to the Communist party. Adorno, whose initial aversion to party control of intellectuals was greatly intensified by Stalin's purges, was dismayed by Benjamin's move, and he blamed Brecht's influence. They carried on a protracted debate by correspondence in the 1930s (Adorno 1970) which has come to be considered a major document of Marxist literary theory. Adorno argued that Benjamin was falling into philosophic as well as political error when he affirmed the actually existing consciousness of the working class and the mass culture that appealed to it, claiming it was as truncated as that of the bourgeoisie. Adorno held stubbornly to a position of "nicht mit-machen" (nonparticipation). He argued that because social antagonisms were embedded within cognitive problems, the

intellectual "labor" which unearthed them was a form of practice in itself.

Benjamin asserted that the new technologies of film production and mechanically reproduced art contained within themselves the power to transcend bourgeois cultural forms, because they robbed art of its uniqueness ("aura"), turned artists into technicians, and transformed the creation of art into a collective, directly political activity. Adorno complained that the static repetition of mechanical reproduction encouraged passivity, and stunted active, critical interpretation. He felt Benjamin's celebration of the new technological forces that liquidated art's aura was premature, given the distortions of class society. Art took the side of the oppressed, not by becoming directly political, but by positing, through its very autonomous existence, the possibility of a realm not identical to the given.

When Benjamin imitated the new technique of film montage in his own writings, juxtaposing literary fragments and historical images with the barest minimum of interpretive comment, Adorno warned that without the mediation of theory, the theological motif of "profane illumination" degenerated into magic, and the Marxist motif into positivism. He then turned his critical method on Benjamin, and claimed that these theoretical difficulties were themselves reflections of social antagonisms: Benjamin's fragmented style uncritically reproduced the general fragmentation of experience that made grasping the interconnectedness of reality so difficult.

Ultimately, Benjamin heeded Adorno's criticisms, and in fact documented Adorno's thesis of the disintegration of experience. He used historical evidence gathered for his study of nineteenth-century Paris (the *Passagenarbeit*) to argue (in ways later developed by Adorno) that the characteristics of modern urban life and factory labor (which *anticipated* the new technologies of film and arts reproduction)—fragmented, abrupt gestures, shocklike bombardment of the senses, collision of visual images, the disruption of spatial and temporal coherence—needed to be judged negatively because they weakened people's critical powers (Benjamin [1961] 1969, pp. 155–200).

Exile in the United States. In 1938 Adorno emigrated to New York, where the institute, despite limited funds, was a haven for German intellectual refugees. Adorno secured a position as director of music research for the Princeton "Office of Radio Research" headed by the Aus-

trian social scientist Paul F. Lazarsfeld. He began to analyze the "social physiognomy" of radio music, characteristically interpreting the antagonisms of the social whole from out of this particular detail of modern experience. It soon became evident, however, that the critical, theoretical nature of his approach was incompatible with the project's market-research concern for empirical data, such as the "likes and dislikes" of the listening audience, and funding for his work was terminated in 1939.

Adorno then joined Horkheimer in Los Angeles. The war years were their period of closest collaboration, and it marked a new, more pessimistic stage of "Critical Theory." They accepted the argument of institute economist, Friedrich Pollock, that "state capitalism" had developed in Soviet Russia, similar in bureaucratic structure to the interventionist state of Roosevelt's New Deal. They maintained such structures were inherently authoritarian. If, in the earlier period, they saw reification as the main ideological obstacle to critical consciousness and critical reason as the path to overcome it, now, in the dark years of Auschwitz and Hiroshima, their far greater concern was passive submission to authority, and they began to see reason itself as a form of domination. They saw their intellectual work not as an anticipation of social revolution, but as a struggle merely to keep critical consciousness alive.

Benjamin committed suicide in 1940, when he was denied exit from France at the Spanish border. His last text, written after his political disillusionment over Stalin's pact with Hitler, was a series of theses on the philosophy of history (Benjamin [1961] 1969, pp. 253–264) that argued that history did not equal progress, even on the level of culture. Instead, progress was subjective intervention in order to stop the historical course of events, an action that under current conditions was only a utopian and theological hope.

The new pessimism marked a break from the radical-liberal tradition. Adorno and Horkheimer worked closely to develop its implications for social theory. They analyzed the totalitarian tendencies common to political structures of fascism, late capitalism and state capitalism, and cognitive structures of authoritarianism, anti-Semitism, and cultural conformism, which, they argued, resulted in the "extinction of the ego," the impotency of subjects in a totally "administered world." They wrote a critical history of reason as a "dialectic of enlightenment." Its

thesis was that reason, which was meant to demythify the world and liberate human beings, had itself turned into myth. Tolerating nothing outside, or "nonidentical" to itself, it provided a new tool, not only for social oppression, but for the domination of nature, including the human body. It legitimated psychological, sexual, and physical repression.

As a method of positivist research that accepted "given" empirical data without question, but also as the ground for consensus rather than critical politics, reason had become an instrument of conformism. In this sense, its ideological function paralleled that of mass culture. *Dialektik der Aufklärung* (*Gesammelte Schriften*, vol. 3) included a theory of the "culture industry" which argued that, as a commodity, modern culture (high-brow and popular alike) was caught up in structures of domination and internalized their authoritarian forms. The new technologies of mass media were "enlightenment as mass deception": purporting to entertain, they promoted obedience among their passive audience; purporting to provide perpetual novelty, they supplied a repetition of the ever-identical. Adorno and Horkheimer argued that the phenomenon of anti-Semitism was closely linked to both dominative reason and mass culture because it manifested the same intolerance and fear of the "nonidentical," the same lack of imagination, the same inability for autonomous, critical cognitive experience.

Dialektik der Aufklärung was a departure from Marxist social theory. Nonetheless, for Adorno its very pessimism concerning the historical development of culture marked a concession to Marxist principles, as he no longer attempted to affirm revolutions in the superstructure which left the substructure of oppression unchanged. In a long essay (which provided Thomas Mann with the aesthetic theory for *Doktor Faustus*, *Philosophie der neuen Musik* [*Gesammelte Schriften*, vol. 12]), Adorno interpreted Schönberg's twelve-tone system of composing critically: the narrowness and rigidity of its rules had reenslaved music, a dialectical reversal of atonality's temporary liberation from bourgeois forms. Adorno strove in his own writings to avoid the systematizing tendency inherent in conceptual theoretical writing. In *Minima Moralia* (*Gesammelte Schriften*, vol. 4), he expressed social reflections in short, dialectical fragments.

The Authoritarian Personality. In the late 1940s, Adorno again became involved in a pro-

ject that necessitated translating his method into empirical social research, a task he compared to squaring a circle. As part of a series, *Studies in Prejudice*, edited by Max Horkheimer and funded by the American Jewish Committee, he worked in collaboration with social psychologists R. Nevitt Sanford, Daniel Levinson, and Else Frenkel-Brunswik (the "Berkeley Public Opinion Study Group") to develop an experimental method for investigating anti-Semitism. The results and their interpretation, published as *The Authoritarian Personality* (1949), became highly controversial (see Christie & Jahoda 1954).

The theoretical frame of the study drew heavily on *Dialektik der Aufklärung*, where Adorno and Horkheimer had argued that anti-Semitism, which misdirected protest against economic injustice by making Jews the scapegoat, was only one element of an "authoritarian character structure," and this in turn had its origins in objective social conditions. The characteristics of this authoritarian type included passivity, conformism, rigidity of thought, a tendency to stereotype, lack of critical reflection, sexual repression, and a fear and abhorrence of anything "nonidentical." The research problem was to design a questionnaire that would reveal the presence of these traits as an interconnected structure. The innovative solution bore great similarities to Adorno's "social physiognomics." The Berkeley group interpreted out of the details (in this case, the questionnaire items) the general character structure which was unintentionally revealed (the latent, rather than manifest meaning of the responses). The items were evaluated on an "F-scale," and clusters of high-scoring responses were read as symptomatic of "fascist tendencies." The antifascist character structure, which was critical, nonconformist, and open, had, predictably, more diverse characteristics, tending to elude the typing procedure altogether. As a counter to the quantitative results of the F-scale, some in-depth interviews were made for "content analysis." Adorno assumed the task of interpreting these interviews, using the close, textual analysis typical of his critical exegesis.

Return to Germany. In 1950, the city of Frankfurt invited Horkheimer to reestablish the institute at the university, and Adorno returned with him as codirector. For the next two decades he taught, guided institute research projects, and wrote prolifically on aspects of social theory, philosophy, and aesthetics. "Critical Theory"

played a significant role in the intellectual reconstruction of Germany, providing students with a Freudian–Marxist framework for the analysis of fascism, and with a critical rereading of the German Enlightenment tradition. The fact that the institute was anti-Soviet as well as antifascist allowed it to flourish in the cold war climate. “Critical Theory” remained committed to democratic ideals. However, it condemned as “pseudodemocracy” the superimposition of egalitarian forms onto a hierarchical, class-structured society. Moreover, due largely to Adorno’s American experience, the institute resisted “market research” methods of social science and Anglo–Saxon empiricism in philosophy, both of which were influential in Germany as the intellectual accompaniment to military occupation. Hence (and because of its critique of mass culture), “Critical Theory” resisted Allied hegemony as well.

The positivist dispute. “Critical Theory” remained revolutionary in its orientation no matter how great its distance from orthodox Marxism. A 1961 debate on method between Adorno and Karl Popper at the German Sociological Association meeting in Tübingen hinged precisely on this point. The debate, which was continued by Adorno’s younger colleague, Jürgen Habermas, and Popper’s German student, Karl Albert, in 1963, spread to academic circles generally, where it became known—Popper felt incorrectly—as the *Positivismusstreit* (“Positivist Dispute”; see Adorno et al. [1969] 1976). It was essentially a debate between a liberal and a radical critique of contemporary cognition.

On the surface, Adorno’s “Critical Theory” and Popper’s “critical rationalism” had much in common: both opposed specialization and bureaucratization of scientific inquiry; both criticized closed thought structures and total systems; both deplored the reduction of reason to an uncritical technical instrument. Their real differences were political. Popper felt that a free, competitive debate by a “community of scientists” was possible within Western society and would lead to theoretical coherence; Adorno felt that such debate was inevitably distorted by the dominant economic and social structures in which it took place, and theoretical coherence served an ideological function by masking social contradictions. Because Adorno considered social liberation the precondition for a reconciliation of theoretical contradictions, he believed his position was allied with the emancipatory interests of the exploited class. Ironically, Popper, in

attacking Adorno’s esoteric language and the abstruse Hegelian legacy in “Critical Theory,” saw himself as championing an antielitist, democratic position.

Negative dialectics. For Adorno, the key political problem was that reason was not applied critically, against the grain of given reality. Instead, thought either dominated reality (idealism), or reality dominated thought (empiricism), and when either pole was posited as a philosophic first principle, thought was led into complicity with the status quo. The key theoretical problem was to devise a method of dialectics without identity, in which the tension between thought and reality remained unresolved. In 1966, as the title of his major philosophic work, Adorno named this method *negative* dialectics, to distinguish it from Hegel’s idealism (*Gesammelte Schriften*, vol. 6). On the one hand, it was a *method of argument* based on the non-identity of concepts to their objective content (for example, of reason to reality) on several levels: (a) the object did not live up to its concept (“rationalized” society was irrational); (b) the concept did violence to the object it identified (reason grasped reality by dominating it); (c) only contradictory concepts (reason—myth) could define the object (reality) which was in fact contradictory. On the other hand, negative dialectics was a *method of exegesis* based on the nonidentity between the meaning of a text and the intent of its author: When texts were interpreted by dialectical argument they were made to bear witness against themselves, so that subjective, cultural, cognitive products could be read as ciphers of the objective, social totality.

The unresolved nature of negative dialectics prohibited “Critical Theory” from becoming a systematic social theory. Adorno did not, for example, attempt to reconcile Freud and Marx, as he believed such a synthesis mitigated the critical potential of both. Instead, Adorno used their theories contrapunctually: he interpreted psychological phenomena as reflections of the socioeconomic structure, but he analyzed the socioeconomic structure in terms of the mental phenomena (culture, cognition, character structure) that maintained it.

Adorno applied the same sophisticated method in interpreting the phenomena of mass culture. He has been criticized (Shils 1957) for failing to appreciate mass culture’s democratic characteristics. Yet he took jazz, radio listening, or newspaper horoscopes with the same philosophic seriousness as a Heideggerian text, and

believed that when they were read critically, they were no less capable of illuminating social truth.

In order to understand Adorno's "Marxism," it is necessary to realize that for him, always, dialectical materialism was an epistemological method compelled by the material, independent of any class viewpoint. Uniformity of critical insight resulted because of the uniformity of the social object, not the collective nature of the cognitive subject.

Adorno's stress on the individual rather than the class nature of experience, coupled with his contempt for existing working-class consciousness, brought him criticism from more orthodox Marxists of his generation. Lukács accused him of lamenting the decline of bourgeois culture from a Grand Hotel abyss replete with bourgeois comforts; Lucien Goldman protested that revolutionary art articulated, not domination or contradiction generally, but class oppression and class conflict specifically; Hans Eisler claimed that Adorno's aesthetic theory was metaphysical and ignored the fact that art was made by and for people.

Yet Adorno's fear of the authoritarian moment in collective mentality had historical justification, and if his language was elitist, his motive was radically democratic. Adorno's incessant negativity, which Kracauer criticized as infinite dialectics, aimed at escaping systematization for a political as well as a philosophical purpose. Each of his essays was a unique cognitive experience, a one-time-only configuration of elements that had a pedagogic goal of showing people what autonomous thinking was, and of encouraging them to think for themselves by frustrating attempts to pigeon-hole knowledge through easy categorizing and definitions. His insistence on the historical transiency of truth meant that interpretation needed constant revision, so that no texts could be treated as dogma, including his own. The open, nonauthoritarian, nonreified structure of negative dialectics was the antithesis of bourgeois cognition. It thus provided an anticipatory model for nondominative relations in a new society.

The German student movement responded to the events in Paris of May 1968 with a series of strikes and demonstrations. Adorno was skeptical of the objective possibility of revolution and maintained his stance of nonparticipation. Students disrupted his lectures, challenging him for not being radical enough. They accused "Critical Theory" of leading to a dead end, be-

cause it left no space for revolutionary praxis (Schoeller 1969). Adorno died in August 1969, at the height of the disturbances, and the institute dissolved shortly afterwards.

ALBRIGHT, WILLIAM F.

William F. Albright (1891-1971), a scholar of the twentieth century in ancient Near Eastern

and Biblical studies, was born May 24, 1891, in Coquimbo, Chile, the son of Methodist missionaries. He was handicapped by poor eyesight—a lifelong burden—and by a hand crippled in an accident, and suffered the prejudice against foreign Protestants in a regressively Catholic environment. When the family returned to the United States, he attended Upper Iowa University for formal instruction in Latin, Greek, and mathematics. He taught himself Biblical Hebrew and Akkadian, the language of the ancient Babylonians and Assyrians.

So far largely self-taught, Albright was able to undertake graduate study at the Johns Hopkins University in 1913. He remained six years, continuing Semitic languages, ancient history and Biblical studies, Egyptian, and especially Akkadian under Paul Haupt, who had come from Göttingen to teach at the newly-founded Hopkins in 1883 as the first Assyriologist in the United States. Haupt, whose later interest turned more and more to Biblical studies, also brought from Germany a particularly radical critical approach to Old Testament studies.

After this exposure to the broadest and most vigorous training on the German model available in his time, Albright entered a new phase, with concentration on field archeology, as fellow and then director of the new American School of Oriental Research in Jerusalem (1919–1929; 1933–1934). In the Near East, Albright traveled and explored tirelessly, studied Arabic and modern Hebrew, and excavated, especially at Tell Beit Mirsim, Tell el Ful, and Bethel. In 1927 he joined the faculty of the Johns Hopkins University, and headed its Oriental Seminary until his retirement in 1958. Under Albright, the department was a dominating influence, especially in American Biblical studies and Palestinian archeology. His students came to occupy posts at numerous American theological seminaries and universities, notably Harvard, which under Frank Moore Cross, Jr., in Old Testament studies, and G. Ernest Wright in Palestinian archeology and Biblical theology, together with other Albright students, colonized what Albright called the “Baltimore school” at Cambridge.

Although Albright worked throughout his life at a synthesis of the early history of human thought and belief, it is perhaps not unfair to say that his resolute efforts as a philosophical historian, whatever their ultimate value, had less to do with his contemporary influence than did a number of other factors. Albright impressed people because he knew and achieved

so much over so broad a span. His establishment of the ceramic chronology of ancient Palestine, the main means for dating archeological remains, survives, with modifications, to this day and will doubtless remain fundamental in its essentials. Frank Cross has characterized Albright as a master of typological method and has shown how the essentially scientific methods he used in classifying pottery types into groups and studying their change in regular fashion over time were successfully used by him elsewhere: in linguistics (e.g., 1934); in paleography (his study of the Nash papyrus in the *Journal of Biblical Literature* [1937] was a cornerstone in dating the Dead Sea Scrolls); in the typology of Hebrew poetic forms (1968); and so on. His memory for detail was fantastic and his self-confidence boundless. He was quick to grasp the significance of new discoveries and their impact on old syntheses. These qualities of erudition and imagination do more to account for the eagerness of Jewish and Christian students of all sorts to study with him than does his defined philosophical position. Moreover, his acquaintance with all kinds and conditions of men, his eager appreciation of Jewish scholars and their work, and the conversion of his wife, in Palestine, to Roman Catholicism, combined to give him a broad and deep sympathy with students and scholars of all religious persuasions.

Yet a portion of Albright's influence must be said to rest on a tendency to conservatism in religious matters that, in his own account, arose early in his career, and that is expressed in *From the Stone Age to Christianity* (1940) and *History, Archaeology and Christian Humanism* (1964).

Under the influence of his Assyriologist teacher, Paul Haupt, Albright was early led to a partial espousal of the “pan-Babylonian” point of view, according to which much of what is valuable in ancient and particularly Israelite civilization had its origin in Mesopotamia. Far from being led to discredit Israelite religion, however, Albright turned in a different direction. Nineteenth-century German Old Testament studies, culminating in the work of Julius Wellhausen, had led to a rewriting of Israel's religious history in which monotheism was held to have come late into Israelite thought. Albright felt strongly that Wellhausen had unjustly cut Israel off from the great civilizations of the ancient Near East, and, perhaps unfairly, he charged Wellhausen with imposing on Israel's religious development an arbitrary and impos-

sibly compressed evolutionary scheme. (Note, however, that Albright described himself, correctly, as an evolutionist, and, like Wellhausen, always held to a version of classic source-criticism of the Pentateuch.) Albright, instead, came to insist on the substantial historicity of Mosaic tradition and thus the antiquity of Israelite monotheism.

The epochal change from many gods to the one God who is over all was due, in Albright's mind, to the intuitive discovery that the incongruities of polytheism flouted the empirically recognized unity of nature. In praising the Old Testament as a masterpiece of "empirical logic," Albright was introducing a middle term between Lucien Lévy-Bruhl's "prelogical" and "logical" thought. Empirical logic, born of experience, Albright believed, enjoys some advantages over formal logical systems, and thus the achievement of ancient Israel is of permanent human significance. Albright's apparent return to conservative opinions, and his optimism that continued recovery of the ancient Near East would enhance the significance of the Bible, account for part of his fame and some of the misunderstanding and abuse of his pronouncements by fundamentalists. Through his published work and his many students, he remains an important influence, even if the synthesis he sought remains in the remote distance.

DELBERT R. HILLERS

WORKS BY ALBRIGHT

- 1932-1943 *The Excavation of Tell Beit Mirsim*. 4 vols. New Haven: American Schools of Oriental Research. → Volume 1 (1932) and Volume 1A (1933): *The Pottery of the First Three Campaigns*. Volume 2 (1938): *The Bronze Age*. Volume 3 (1943): *The Iron Age*. Each volume is also numbered as an annual publication of the American Schools of Oriental Research.
- 1934 *The Vocalization of the Egyptian Syllabic Orthography*. American Oriental Series, Vol. 5. New Haven: American Oriental Society. → A paperback edition was published by Kraus in 1966.
- 1937 A Biblical Fragment From the Maccabean Age: The Nash Papyrus. *Journal of Biblical Literature* 56:145-156.
- (1940) 1946 *From the Stone Age to Christianity: Monotheism and the Historical Process*. 2d ed. Baltimore: Johns Hopkins Press. → A paperback edition of the second edition, with a new introduction, was published in 1957. A reprint of the 1940 edition was published in 1970.
- (1942) 1968 *Archaeology and the Religion of Israel*. 5th ed. Baltimore: Johns Hopkins.

ALLPORT, GORDON W.

Gordon Allport is generally recognized as the chief pioneer in the development of a psychology of personality that emerged in the United States after World War I. His brother, Floyd H. Allport, was earlier acclaimed the founder of modern social psychology, establishing it as a scientific discipline distinct from social psychology as a branch of sociology. Eventually Gordon Allport also became preeminent in social psychology, devoting approximately half of his efforts to that field.

Beginning in the 1920s, the fields of personality and social psychology developed as one broad academic discipline with vague boundaries, rather than as two separate areas of study. When the American Psychological Association (APA) created special interest groups, the division of personality and social psychology soon became the largest branch. The Allports had much in common with Gardner Murphy, a third pioneer in personality and social psychology, during his early career. Although Murphy attended Harvard University, where the Allports studied, for only one year, all three were students of Hugo Münsterberg, Herbert S. Langfeld, and Edwin B. Holt. All were influenced, in one way or another, by William McDougall, the first psychologist after Wilhelm Wundt to write a major treatise on social psychology. Each worked first on personality; each was chairman of the Society for the Psychological Study of Social Issues; and each was awarded the gold medal of the American Psychological Foundation, which is presented annually to an American psychologist in recognition of an outstanding career.

Gordon Allport was a severe critic of Freudian theory, radical behaviorism, and theories of personality based largely on clinical observation of abnormal behavior. Yet in 1951, when the APA's

division of clinical and abnormal psychology asked practicing clinical psychologists to name the personality theorist who had influenced them most in their daily work, Gordon Allport was second only to Sigmund Freud (Schafer, Berg, & McCandless 1951).

Gordon W. Allport, the son of John Edward Allport and Nellie Wise Allport, was born in Montezuma, Indiana, November 11, 1897. His father was a physician, and his mother had been a schoolteacher. She provided a strong religious background, as did his maternal grandmother, who had been a "preacher" in a Free Methodist church. Gordon and Floyd Allport sometimes experienced inner conflicts as a result of revivals and religious conversions, but as adults they showed more interest than most psychologists in the role of religion in human life. After attending school in several small towns and graduating from a Cleveland, Ohio, high school, Gordon Allport entered Harvard in 1915, where Floyd Allport had received his bachelor's degree the previous spring (G. Allport 1967; F. Allport 1974).

Gordon Allport's first course in psychology was taught by Münsterberg, who also directed his brother's doctoral research. Langfeld trained him in experimental psychology, and Holt introduced him to epistemology and the history of psychology. James Ford in the department of social ethics interested him in social service and secured part-time employment for him working with foreign students, finding housing for industrial workers, acting as a probation officer, and supervising a boy's club. He served briefly in the Student Army Training Corps, but returned to his regular studies in time to graduate from Harvard in 1919.

Torn between his interests in teaching and social service, Allport taught for a year at Robert College in Constantinople [now Istanbul]. On the way home, while visiting his brother Fayette in Vienna, he called on Freud, who failed to make him a disciple.

At the age of 22, Allport began graduate work in psychology at Harvard. He received his PH.D. two years later for a thesis that he believed was "probably the first American dissertation written explicitly on the question of component traits of personality" (Allport 1967). While a graduate student, he assisted his brother, then an instructor at Harvard, in editing the *Journal of Abnormal Psychology*, and his first publication was a product of their joint efforts (Allport & Allport 1921).

A Sheldon traveling fellowship enabled Allport to spend two years in Germany and England, studying under Carl Stumpf, Max Dessoir, Max Wertheimer, Wolfgang Köhler, Eduard Spranger, Erich Jaensch, Heinz Werner, and William Stern. Thus he learned the personalistic and gestalt theories that characterized his later work, and established personal relationships that years later enabled him to assume leadership in bringing to the United States many European psychologists no longer able to pursue careers under the Nazi régime.

In the fall of 1924 he began teaching at Harvard, not in psychology proper, but in social ethics. It was in that department, encouraged by its chairman, Richard C. Cabot, that he first taught "Personality: Its Psychological and Social Aspects," which he claimed was probably the first course in this subject taught in an American college (Allport 1967). Cabot was also a professor of cardiology in the medical school and the principal pioneer in medical social work. His influence on Allport's life and career was at least as important as that of any of Allport's teachers. Since Langfeld had moved to Princeton University, and his brother, Floyd, to the University of North Carolina, Allport felt isolated from psychology. Fortunately, he overcame this handicap by volunteering to assist Edwin G. Boring, Langfeld's successor, and later McDougall, in their respective introductory courses.

In the spring of 1928, Allport married Ada Lufkin Gould, a graduate student at Radcliffe College, who became a clinical psychologist. A year later he accepted an assistant professorship at Dartmouth College, where he taught courses in personality and social psychology and made plans for a book on personality. In 1928, in collaboration with his brother, he published the *A-S Reaction Study*, an inventory designed to measure the trait of ascendance-submission. After that, the brothers seldom collaborated, though they corresponded frequently on professional matters.

In 1928, after McDougall had moved to Duke University, Boring invited Allport to return to Harvard as assistant professor of psychology, but it was not until 1930 that he returned to Cambridge. Several of his Dartmouth students came to Harvard for graduate work. Among them were Leonard Doob, Hadley Cantril, with whom he collaborated on *The Psychology of Radio* (1935), and Henry S. Odbert, with whom he published a list of nearly eighteen thousand terms used to describe personality and behavioral

characteristics (1936). Early in the 1930s, he and Philip E. Vernon designed *A Study of Values* (1931), a personality test, and conducted research that led to *Studies in Expressive Movement* (1933).

In 1935 Allport joined Cabot and others in establishing the Cambridge-Somerville youth study, of which Edwin Powers and P. S. deQ. Cabot were executive directors. Three hundred delinquent boys under various kinds of treatment for three to seven years were matched with an equal number of "control" delinquents not under treatment in an attempt to discover which treatments would be most effective in preventing delinquency. Unfortunately, World War II interfered with the project, and the results, though encouraging, were not conclusive.

In the mid-1930s, Allport devoted seminars to the use of personal documents and the question of the way life histories should be written. John Dollard had contended that the individual should be treated "as a specimen in a cultural series" (1935), but Allport countered that for psychological purposes, at least, every person should be regarded as unique (1942), and he interested many students in biographical studies.

Allport was also influenced by a study conducted in the late 1920s by Floyd Allport, Daniel Katz, and Margaret Jenness, in which they carried out the first major systematic program of research on social attitudes (Katz & Allport 1931). This led Gordon Allport to make *attitude* a fundamental concept in his theoretical system. In a chapter on attitudes in Carl Murchison's *Handbook of Social Psychology* (1935), he defined "attitude" as "a mental and neural state of readiness, organized through experience, exerting a directive or dynamic influence upon the individual's response to all objects and situations with which it is related." In discussing the genesis of attitudes, he postulated four common conditions for the formation of attitudes: (1) accretion of experience through the *integration* of numerous responses of a similar type; (2) *individuation, differentiation, or segregation* of action patterns that will supply him with adequate preparation for the direction of his adaptive conduct; (3) dramatic experience or *trauma*; (4) *imitation* of parents, teachers, or playmates (Allport 1935).

Personality: A Psychological Interpretation (1937), the book Allport had been planning since he was a graduate student, appeared in the same year as Ross Stagner's textbook, *Psychology of*

Personality. With these books available, courses in personality were introduced in colleges throughout the country. Allport defined personality as "the dynamic organization within the individual of those psychophysical systems that determine his unique adjustments to his environment." Though well aware of the general laws concerning the behavior of all hominids, he sought principles that would help in understanding the uniqueness of individuals (Allport 1968b; Hall & Lindzey 1957). "A general law," he wrote, "may be a law that tells how uniqueness comes about" (Allport 1937, pp. 194, 558). One of the best examples of such laws occurs in his treatment of motivation. Beginning with the motives of infants, he grants that any theory of motivation must take into account biological needs and innate patterns of behavior (e.g., reflexes). But, he argues, no listing of infantile behavioral tendencies is adequate to account for adult behavior: "The dynamic psychology proposed here regards adult motives as infinitely varied, and as self-sustaining contemporary systems growing out of antecedent systems, but functionally independent of them" (Allport 1937, p. 194). In essence, this is his principle of the functional autonomy of motives. A classical example concerns a sailor who in early life works hard to make a living, i.e., to buy food, shelter, clothing, etc. Thus he comes to love the sea. Later, after engaging in commerce in a large city, he returns to the seaside for recreation. The "biological" drives for food and shelter are no longer his principal motives. In discussing motivation, Allport emphasized aims, ambitions, and goals rather than postulating innate drives and their modification through learning and experience (Allport 1937; 1961; 1968b).

In his *magnum opus* (1937) Allport insisted that a concept such as *self* or *ego* was essential in an adequate theory of personality. Years later he substituted *proprium*, a term proposed by Emanuel Swedenborg two hundred years earlier. For Allport, the word refers to "the aspects of personality that seem peculiarly one's own and make for individuality and inward unity." Kinesthetic, organic, and proprioceptive sensory processes are important components. To discriminate appropriate from nonappropriate behavior and awareness, Allport suggested that one first pay attention to swallowing one's saliva (appropriate), and then imagine expectorating saliva into a tumbler and drinking it, which is nonappropriate (Allport 1955; 1961; 1968b).

Allport saw himself as a social activist. At times this involved personal risk. During the depth of the depression of the 1930s, when many assistant professors were dropped from the Harvard faculty, Allport, who was being considered for a tenured appointment, publicly criticized the president's and fellows' action in some of the dismissals. He joined the American Federation of Teachers and actively recruited members.

During the 48 years when one or both of the Allports served on its staff, the *Journal of Abnormal and Social Psychology* played an important role in the development of personality and social psychology. Founded in 1906 by Morton Prince, its title was expanded to include social psychology while Floyd Allport, who was consulting editor from 1921 to 1949, was acting editor early in the 1920s. Under Gordon Allport's editorship (1938–1949), the journal soon became the leading scientific periodical in personality and social psychology, while still devoting considerable space to abnormal psychology. During many of the remaining 17 years of his life, Gordon Allport was its most active consulting editor, aiding and encouraging his former student, M. Brewster Smith, as well as Arthur Jenness and Daniel Katz, Floyd Allport's former students, in their editorial duties.

In 1938, when Gordon Allport became chairman of the department of psychology, he carried a heavy load of administrative responsibility and social action. He was chairman of the APA's committee on displaced foreign psychologists, which helped to bring many European psychologists to North and South America, among them William Stern, Kurt Lewin, Heinz Werner, and Egon and Else Brunswik. He was also concerned about "displaced" American psychologists who opposed the entry of the United States into World War II. When George Hartmann, vice chairman of the War Resisters' League, and later head of the militant Peace Now movement, was dismissed from Columbia University Teachers College, Allport arranged to have Hartmann appointed director of research at the Cambridge–Somerville youth study and visiting lecturer at Harvard.

Toward the end of World War II, Allport edited a statement by himself, Gardner Murphy, and others, signed by more than two thousand psychologists and social scientists, suggesting steps that should be taken to insure a just and lasting peace. Several of the items in this "Psy-

chologists' Manifesto" were adopted as official policy in military government—e.g., "liberated and enemy peoples must participate in planning their own destiny" (Allport 1945).

Allport was president of the APA in 1938. He was also a member of the division of anthropology and psychology of the National Research Council, as well as of the APA's emergency committee on psychology. During World War II, he and Henry A. Murray offered a morale research seminar. With Robert H. Knapp and Leo Postman, Allport conducted a syndicated "Rumor Clinic," sponsored by the *Boston Traveler*. The attempt was not only to "scotch" harmful rumors, but also to lessen prejudice and antagonism that might hinder the war effort and hurt individuals, particularly those in minority groups. Allport sponsored a pamphlet, *The ABC's of Scapegoating* (1944), that explained some prejudices as attempts to avoid responsibility for one's own faults by projecting the blame on others, particularly in the case of anti-Semitism. Floyd Allport, who had operated a rumor clinic at Syracuse University, questioned the importance of the scapegoat hypothesis, citing experiments by his student, Nancy Morse, that failed to support it (Morse & F. Allport 1952; F. Allport 1974).

In *The Psychology of Rumor* (1947), Allport and Postman proposed that "the amount of rumor in circulation will vary with the importance of the subject to the individuals concerned *times* the ambiguity of the evidence pertaining to the topic at issue." The formula for this is $R \sim i \times a$. To demonstrate what *might* happen in a rumor, though no *actual* rumor was involved, they would ask a subject to describe the details of a picture projected on a screen. A second person, listening but not seeing the picture, would repeat the details *as accurately as he could* to a third person, and so on, until six or seven subjects had passed the information orally without having seen the picture. Conclusions from some thirty of these demonstrations were that the "rumor" tended (1) to become shorter, more concise, more easily grasped and told (*leveling and sharpening*); (2) to be *assimilated* to the emotional state of the listener; and (3) to be *elaborated* or shifted in theme.

Allport also concluded that prejudice was an important element in many rumors. Allport agreed with Thomas Aquinas that the general nature of prejudice is "thinking ill of others without sufficient warrant," but he noted that

prejudice may also be favorable; nevertheless, it should seldom be condoned. Perhaps the most important finding of his many publications on the subject was that prejudice tends to diminish whenever members of different groups meet in terms of equal status in the pursuit of common objectives. Among the strategies and devices for reducing or eliminating prejudice to which he called attention were role playing, group retraining, exhortation, catharsis, and legislation to control or limit prejudiced behavior.

Later, when Allport realized that the concepts and techniques of psychology alone were too limited to provide adequate prediction and understanding of prejudice, he proposed that the "causes" be classified as (1) historical; (2) sociocultural; (3) character, personality, and perceptual; and (4) characteristics of the *victims* of prejudice (Allport 1950*b*; 1960*b*, chapters 14, 15; Evans 1970).

During the war, Allport developed closer relationships with sociologists and cultural anthropologists that led the social and clinical psychologists to leave the department of psychology in 1946 to join the sociologists and cultural anthropologists in a new department of social relations, chaired by Talcott Parsons. Allport was chairman of the committee on higher degrees, and with George C. Homans, he offered an introductory course on social relations. In 1966, having reached mandatory retirement age, Allport was appointed the first Richard Clarke Cabot professor of social ethics. After his death, many members of the staff retired or went elsewhere. Eventually, social relations ceased to exist as a separate department.

In 1956, Allport went to Durban, South Africa, to deliver a memorial lecture sponsored by the South African Institute of Race Relations in honor of Alfred Hoernlé, who had been his teacher at Harvard. While in Africa, he and Thomas F. Pettigrew carried on experiments that seemed to indicate that social factors were most effective in perception when the stimulus was ambiguous. Using the Ames rotating trapezoidal window apparatus, which in our civilization usually creates the illusion that a window frame is swaying back and forth instead of rotating, they found that Zulu children who lived in rectangular houses with rectangular windows responded much as do normal subjects in the United States. Zulu children who lived in round houses with no windows in remote areas did not experience the illusion. Other more complicated experiments with persons of differ-

ing ethnic characteristics demonstrated subtle differences in perceiving paired passport photographs of persons of different ethnic groups exposed briefly in a tachistoscope. Allport said that these demonstrations convinced him that "he who knows only his own culture does not know his own culture" (Allport & Pettigrew 1957; Allport, Pettigrew, & Barnett 1958).

By the time they were well-established professionally, the Allport brothers had overcome their earlier distaste for religion and were insisting that religion was more important in human life and civilization than most psychologists realized. In a widely quoted article, "The Religion of a Scientist" (1930), Floyd Allport, himself an agnostic, argued that science and religion were not antithetical. The real conflict, he said, was between science and theology. Gordon Allport, though concerned about psychologists' neglect of religion, published little on the subject until twenty years later. *The Individual and His Religion* (1950*a*) was devoted largely to "a portrayal of the place of subjective religion in the structure of personality whenever and wherever religion has such a place." In the preface, he wrote: "One underlying value judgment favors my writing. It is a value that to my mind every supporter of democracy must hold: the right of each individual to work out his own philosophy of life, to find his personal niche in creation as best he can" (pp. vii, viii). In *Becoming* (1955), he urged psychologists and other readers to approach religious behavior in terms of what the individual is trying to do, rather than to depend so much on the study of his past. "The final truths of religion are unknown," he said, "but a psychology that impedes understanding of the religious potentialities of man scarcely deserves to be called a logos of the human psyche at all" (p. 98).

Numerous psychologists, realizing that the study of religious behavior had become respectable, began to act as if they remembered that the two principal founders of the APA, William James and G. Stanley Hall, were interested in religion. Allport himself was active in founding the Society for the Scientific Study of Religion by psychologists, social scientists, and religious educators. Within five years of his death, the APA established a division of humanistic psychology, followed a few years later by a division of psychologists interested in religious issues. At times, however, it seemed that the excursions of Allport and others into the psychology of religion might lead to their own undoing. For

instance, Allport and Kramer (1946) found that, in general, church attenders were more intolerant of ethnic minorities than were non-attenders and those who claimed no religious affiliation. Several significant negative correlations of "religious ideology" or religious value with "intelligence" or scholastic aptitude were reported (Dittes 1968). The more research there was in the psychology of religion, the worse was the chaos. Shortly before he died, Allport himself discovered that criteria of religiosity such as church attendance and the religious value score on the *Study of Values* were not valid measures of the *kind* of religiosity he was writing about. When he employed new scales of *intrinsic* religiosity (the extent to which the person *serves* his religion) and of *extrinsic* religiosity (the extent to which he *uses* religious behavior to further his other needs and values), the research findings proved to be more orderly and valid (Allport & Ross 1967; Kahoe 1974).

During most of his career, Allport conducted an advanced course on the history and methods of social psychology. Much of the content is preserved in the *Handbook of Social Psychology*, edited by his former student and colleague, Gardner Lindzey (Allport 1954a).

Though he contributed abundantly to psychological theory, Allport disclaimed leadership of any particular school or limited system of psychology. With respect to personality, he advocated an "open and eclectic system." To be *open*, he stipulated, a system must meet four criteria: (1) constant intake and output of matter and energy; (2) maintenance of steady (homeostatic) states; (3) progressive internal organization over time, owing to an increase in complexity and differentiation of parts; (4) creative transaction with the environment (Allport 1960a). Because he could find no "simple and sovereign" system that dealt adequately with the whole field of personality, he maintained that eclecticism was the only acceptable means of encompassing the available knowledge about personality (for Allport's own comprehensive statement of his point of view, see Allport 1968b).

Gordon W. Allport died in 1967. Eleven years later there appeared *Waiting for the Lord*, a remarkable series of 33 of Allport's "meditations" delivered in Appleton Chapel in the Harvard Yard over a period of 29 years, edited by Peter Bertocci (Allport 1978).

ANGELL, ROBERT COOLEY

The life and work of Robert Cooley Angell mirrored, in many respects, the career of so-

ciology from its *nouveau* and ambiguous status in American universities during the first quarter of the twentieth century to its firm establishment and rapid expansion in the post-World War II era. Angell was born in 1899 in Detroit, Michigan, into an old and distinguished American family. One grandfather and an uncle had served as presidents of the University of Michigan and of Yale University, respectively. His other grandfather, his father, and his brother were lawyers, and Angell himself spent a semester at the Harvard Law School following service in the U.S. Army Air Corps and after graduation from the University of Michigan in 1921. The major influence in Angell's decision to do his graduate work in sociology, however, was his uncle, Charles Horton Cooley, then one of the leading American sociologists. It was under Cooley at the University of Michigan that Angell received his theoretical and research training, and in 1924, he received the first doctorate in sociology awarded by that institution.

Cooley's emphasis on the fundamentally mental character of social life and on society as a "moral organism," held together and expanded by modern means of communication, became abiding themes in Angell's own life and work. Cooley's methodological injunction to carve out an area of study, to examine it intensively and empathetically, and to explain it on the basis of such an endeavor was also of influence. Taking this to heart while still a graduate student, Angell obtained a part-time appointment as assistant to the dean of students at Michigan and wrote his PH.D. dissertation on "The Student Mind." This led him to focus on the sociology of education and this research resulted in the publication of *The Campus* (1928) and *A Study in Undergraduate Adjustment* (1930b). He also devoted his energies to keeping Cooley's thought alive by editing a collection of the latter's major papers in *Sociological Theory and Social Research* (1930a) and coauthoring, after Cooley's death, an introductory text which incorporated large portions of the latter's previously published work (Cooley, Angell, & Carr 1933).

Angell was also in touch with the newer empirical and statistical approaches to sociology that were being developed in the sociology department at the University of Chicago, many of whose members were visitors in the Michigan department. As a result, Angell also attempted to wed the subjective and sympathetic qualities

of the case study approach to the statistical analysis of large numbers of cases in an effort to identify causal factors operating in a social situation. His programmatic "Memorandum Concerning a Proposed Research Technique" (1931) became the model for his classic methodological contribution, *The Family Encounters the Depression* (1936). In the latter, on the basis of student-written protocols, Angell sought to predict the type of adjustment made by the family to the impact of the depression through the measurement of two previously existing family characteristics, "integration" and "adaptability." The appendix to this study is generally considered to be a model of detailed honesty regarding the actual process of research. Some years later, Angell cooperated in a critical review of the use of personal documents in the social sciences. In connection with the use of such documents in sociology, he observed "a slow and steady, but not very impressive advance in method" (Gottschalk, Kluckhohn, & Angell 1945, p. 226). He emphasized (as Cooley might have) the greater promise they held in comparison to the current trend of studying "objective" variables in order "to probe the subtleties of human relationships" (*ibid.*, p. 232).

As a member of the department at the University of Michigan for 46 years, Angell early evidenced the cosmopolitan outlook and interests that were later to characterize his discipline. Before 1940, he had visited Europe three times, meeting with many of the prominent French and German sociologists. By this time, he had become more critical of Cooley's optimism regarding the future of modern democratic societies. Especially did Angell come to question Cooley's view of primary groups as the guarantors of those moral sentiments that would effectively integrate the larger society. Impressed by Parsons' (1937) treatment of Durkheim's concept of mechanical solidarity, Angell turned his efforts to the investigation of the larger question of social integration—an interest he continued to pursue throughout the rest of his career.

In *The Integration of American Society* (1941), Angell codified the sociological literature relevant to the question of whether the decline of the neighborhood and the local community was seriously impairing the integration of American society. He viewed the proliferation of "free-standing groups," which functioned beyond the family, as failing to assure the existence

and operation of the common values and institutions that he saw as the bases of societal social integration. He noted especially the tendency of such groups to take on a class character and thus to emphasize noncommon interests and to nullify common values. In the context of the economic depression, Angell concluded that the main task for American society was to foster understanding across class lines.

This effort was essentially descriptive and theoretical. His next step was to engage in a more analytically pointed study of the problem in an area where more relevant, empirical data were available: the large American city. In 1942 appeared the first of a series of papers and monographs that extended over a thirty year period in which Angell sought to identify the major determinants of social integration and to measure and compare the degree of such integration among selected samples of cities. Heterogeneity and horizontal mobility were discovered to explain 62 per cent of the variance in his initial effort. His work was interrupted when he became an officer in the U.S. Army Air Forces for the second time, during World War II, but another effort (1947) identified four cities representing the extremes of the social integration scores, unpredicted by his previous analyses. This provided him with an opportunity, in the Cooley tradition, to engage in four detailed case studies aimed at the identification of the social psychological determinants of social integration. Moreover, in the light of his positive and negative empirical indicators of integration—welfare effort and crime—he refined his use of the concept of integration, and in his 1949 study used it to refer only to the extent that a community constituted a *moral* order, apart from the question of the degree of solidarity in interpersonal relationships. Although an extensive report he published identified the optimal characteristics of community leadership groups, it found only the organizational activities of schools and churches related to the degree of moral integration of a city (1951a). In his theoretical statement on social integration, Angell reiterated his view of the centrality of the concept to the discipline, differentiated among three subtypes (normative, functional, and communicative), yet was forced to conclude that it was a concept that "so far has borne little fruit" (1968b, p. 386). Finally, in his last study, Angell concluded that "the moral integration of large American communities . . . was seriously impaired during the period 1940

to 1970; these communities are becoming more alike in moral integration; city population size above 100,000 has become a significant independent variable . . . ; the difficulties of studying moral integration in such communities have increased" (1974, p. 628).

Undoubtedly Angell's second war experience sensitized him further to the larger problem of international peace. Although he continued his work on moral integration in American cities and on the question of the future of democracy (1958), his growing interest in international order was sparked into activity by his selection in 1949 as director of the Tensions Project for the Social Science Program of the United Nations Educational, Scientific and Cultural Organization. Stationed in Paris for a year, this experience probably helped lead to his appointment by President Harry Truman in 1951 as one of the at-large members of the U.S. National Commission to UNESCO. His six years of service included a stint as chairman of the Committee on the UNESCO Program.

In the meantime, Angell's contributions and leadership skills were increasingly recognized by his peers through his editorship of *The American Sociological Review*, his presidency of the American Sociological Society in 1951, and his presidency of the International Sociological Association in 1953. As chairman of the department of sociology at the University of Michigan from 1940 to 1952, he recruited to the faculty Theodore M. Newcomb, Horace M. Miner, Ronald Freedman, Guy E. Swanson, Morris Janowitz, and Gerhard E. Lenski. Finally, in line with his interest in the problem of international order and world peace, Angell played a major role in the founding and direction of the Center for Research on Conflict Resolution and *The Journal of Conflict Resolution*. In this latter connection he was drawn into research and consulting roles with the U.S. Navy and the Institute for Defense Analysis in the early sixties. His involvement in the latter led to a month's stay in Russia and visits to a number of Russian universities, all of which contributed to the publication of his *Peace on the March* (1969), a book that considered the impact that transnational contacts have on participants and policy makers.

Just before his retirement in 1968, Angell became the director of the American Sociological Association's project on "Sociological Resources for Secondary Schools," which was oriented to the development of teaching and learning materials in sociology for high schools. The circle

of his original interest in the sociology of education was rounded.

ARENDT, HANNAH

In the preface to *The Origins of Totalitarianism*, Hannah Arendt, a major political thinker of the twentieth century, defined her ambition: "Comprehension, in short, means the unpremeditated, attentive facing up to, and resisting of, reality—whatever it may be" ([1951] 1958, p. viii). Such comprehension is manifest not only in this book but in all her work. The phrase "facing up to" suggests clearly her judgment that the mind naturally recoils from much of political reality, which is so complex and so morally offensive. Courage lies in steady perception, the readiness to endure intellectually the almost unendurable. Yet she injected resistance to reality in the very definition of "comprehension." Holding that the act of comprehension was incomplete if it lacked an articulation of moral response—indeed, that without moral interest, in the first place, the energy required for comprehension would be deficient—she insisted on giving as adequate a moral response as possible to political reality. It is this combination of trying to know the worst while remaining unparalyzed by knowledge that is her defining characteristic. She was fortified in her comprehension by a certain understanding of political excellence. In the life of Athenian democracy, the Roman republic, the New England towns, and in the experience of modern people in revolutionary conditions or the circumstances of organized dissent, she saw a saving reality, the reality of freedom.

Arendt was born in Hanover on October 14, 1906, of German Jewish parents. She studied at the universities of Marburg, Freiburg, and Heidelberg, and received her doctorate in philosophy in 1928 at Heidelberg for her thesis *Der Liebesbegriff bei Augustin* (1929). Among her teachers was Karl Jaspers, whose philosophical interest in human freedom is reflected in

Arendt's work. More generally, Arendt's thought shows a strong resemblance in everything but doctrine to other German philosophers of the modern age, including Martin Heidegger. Her work displays the same intellectual audacity, passion to interpret and reconstruct, impatience with conventional opinion, and intimate acquaintance with classical thought and the classical sources of modern thought. She left Germany in Hitler's first year, 1933, and went to live in Paris. She moved to New York in 1941 and lived and worked there for the rest of her life. In 1967, after teaching for a few years at the University of Chicago, she joined the faculty of the New School for Social Research, where she held a university professorship until her death on December 4, 1975.

Knowing the worst was Arendt's philosophically first aim. *The Origins of Totalitarianism* contains her most extended investigation into the worst, the phenomenon of totalitarianism. She was persuaded that the phenomenon had not been understood. Though she made full use of an extensive bibliography, her book is dominated by the insistence that totalitarianism is "a novel form of government" that differs essentially "from other forms of political oppression known to us such as despotism, tyranny, and dictatorship" ([1951] 1958, p. 460). Her analysis is basically psychological in nature. She tries to make an inhuman phenomenon intelligible. Her categories are "mob," "elite," and "mass"; and though she means her analysis to apply equally to Nazism and Stalinism, it is most richly suggestive in the case of the Nazis.

The Origins of Totalitarianism is divided into three main parts. The first two, "Antisemitism" and "Imperialism," concern the "shadowy forebodings" of totalitarianism in the nineteenth century. The decomposition of the old European order, of its class system and traditional beliefs, set free social movements that were marked by an effort to make sense of an increasingly senseless world or to exploit new opportunities for action in behalf of indefinite or limitless purposes. World War I, in its horror, was the culmination of the unchained tendencies of the nineteenth century as well as the further impetus to totalitarianism. Totalitarianism was hardly the inevitable outcome of preceding events and conditions; yet without them the very raw material of totalitarianism would have been lacking. It was thus a phenomenon of the twentieth century, of the chaos produced by war, the decline of stable polities, economic disorder,

the transfer of millions of people, and an overwhelming feeling of lostness. The concentrated psychological condition of the masses was loneliness, "the experience of not belonging to the world at all, which is among the most radical and desperate experiences of man" ([1951] 1958, p. 475). This widespread loneliness, related as it was to feelings of uprootedness and hence superfluousness, prepared human beings for totalitarian domination. For the masses, the totalitarian organization of all life was a "suicidal escape" from a reality that was oppressive in itself and that became all the more oppressive for not being amenable to the understanding of those who suffered. With grimness she says that totalitarianism became "this century's curse only because it so terrifyingly took care of its problems" (1951, p. 430).

But the masses did not spontaneously devise their own suicidal escape. Their susceptibility was one thing; quite another was the mentality of those who created totalitarian movements and later exercised totalitarian domination. Arendt mentioned the "hysterical fanaticism" of Hitler and the "sensual vindictive cruelty" of Stalin, but her general analysis was not given over to the rhetoric of demonology; nor, on the other hand, to the clinical language of any technical psychology (toward which disciplines, in any case, she had an invincible antipathy). She used the Kantian concept of radical or absolute evil to designate totalitarianism and suggested that its commission defied even the most pessimistic ordinary understanding. The "evil motives of self-interest, greed, covetousness, resentment, lust for power, and cowardice" could not account for totalitarian action ([1951] 1958, p. 459). What, then, did it take for the totalitarian movements to start and then disclose themselves, ever more characteristically, ever more criminally, until the creation of the death camps, "the first crime in the long and sinful history of mankind that is a greater sin than murder itself?" (1951, p. 434). Or, to ask the question she was later to borrow from Daniel Ellsberg and ask in regard to American war makers in Vietnam, "How could they?" (1972, p. 33).

The Nazi leaders came for the most part from the mob, which she defined as the "refuse" of all classes and the "by-product of bourgeois society" ([1951] 1958, p. 155). In her description they were made up of a driven group of semi-intellectuals in passionate quest of some rectification of deep personal and spiritual disturbance, along with an anomic following eager for com-

plete and self-surrendering obedience. At the same time, the elite, the class of cultivated leaders of social and intellectual life, contained some who were fascinated by the mob because they were fascinated by the possibilities of destruction. Their aestheticism was nihilist. As Arendt's analysis unfolded, her attention focused ever more sharply on the totalitarian leadership in power, enabled at last to act out their nature without significant resistance. They did not rest until they made the world over to conform to their initial ideological "supersense" of the way it should be. Their maxim was "everything is possible," which meant both that nothing material, and that nothing moral, would impede their determination.

When Arendt said that totalitarianism was a novel form of government, she meant first that its mode of governance was novel and second that its aim—implicit in the mode and unthinkable without it—was novel. An understanding of the leaders' mentality was finally an understanding of the mode and the aim. The mode was terror; the aim was to compel the world to demonstrate the correctness of their ideology. Her main points were that the terror increased as the population grew more docile and that the ideology was not merely a cynical instrument of action but, essentially, an image of the only acceptable world. The only acceptable world was one in which helpless victims were transformed into noxious, subhuman elements by being treated as such. In the death camps the world became what it should be: "the supreme proof of his [the totalitarian leader's] omnipotence" (1951, p. 414). That the camps were useless from the point of view of the war effort, and indeed interfered with it, only showed how profoundly antiutilitarian the leadership was. In no conventional sense were the leaders impelled by the lust for power or expansion. It would seem that the motive that Arendt found at the heart of such crime was an infinite desire for revenge on life, revenge for feelings of smallness and impotence. Only omnipotence sufficed for an infinite desire of this sort. There are resemblances between Arendt's analysis and Nietzsche's thought on *ressentiment* and Heidegger's on revenge.

Arendt did distinguish various motivations in leaders. She maintained that Nazism before it had perished had not yet been taken over utterly by "the authentic mass man" acting with the "meticulous, calculated correctness" of a Heinrich Himmler ([1951] 1958, p. 327). She

also contrasted the rough animal brutality of the *Sturmabteilung* (SA) concentration camp guards—"men who really belonged in mental institutions and prisons"—with the methodical and passionless murderousness of the *Schutzstaffel* (SS)—"perfectly normal men" ([1951] 1958, p. 454). In her brief description of Himmler and the SS may be seen the incipient statement of the theme of "the banality of evil," which Arendt developed in her later, controversial book, *Eichmann in Jerusalem* (1963a). Eichmann, an important functionary though not in the inner circle, could have been, she suggested, perfectly harmless in other circumstances. But with power his deficiency became lethal: he was unable to think. He could not see the world as someone else might see it, nor could he imagine himself in the place of another. Without this capacity, a person interested simply in doing his job and in getting ahead could commit and abet crimes on an inconceivable and unforgivable scale.

There is great stimulus to reflection in Arendt's work on totalitarianism. One may reject her principal contentions or find that they need revision in the light of the conventional understanding that she strove to shock and overturn; but her writing on this subject has the amplitude of epic.

If Arendt explored the darkness of the century's worst experiences, she also tried to recapture the meaning of political greatness. The horror of absolute political evil did not diminish her eagerness to theorize about the peculiarly human excellence that she thought only political action could reach. At the same time, she did not claim that the absence of opportunity for political action produced the totalitarian pathology, or that involvement in political action would necessarily cure the psychological tendencies that were the root of totalitarianism. To be sure, totalitarian leaders and masses alike shared a sense of superfluosity—and therefore found it easier to project total loss of individuation onto their victims in death camps, while the greatest prize of political action was the enhanced individuation that actors came to have—the feeling of being irreplaceable. There was thus a strong conceptual link between the extremes, but no actual interdependence. In fact, each was, and had to be, historically rare. The burden of preventing totalitarianism rested on modern societies and their efforts to diminish the sense of superfluosity.

Arendt belonged to that small company of

thinkers ranging from classical to modern times for whom political action is intrinsically great—morally, aesthetically, or existentially—quite apart from any practical, especially economic, end it may accomplish. Varying with the philosopher, the form of involvement may be citizenship, governance, conquest, violent or nonviolent revolution. Each form has had theoretical vindication as an occasion for acquiring, perfecting, or exhibiting a humanly valuable trait or capacity. The emphasis may be on the enlistment of practical wisdom, the attainment of one's autonomy and the acknowledgment of that of others, the expression of virtue or *virtù*, the spontaneous creation of meaning or a memorably beautiful pattern of action, the growth of self-knowledge or worldly knowledge, the creation of new bonds between people, the satisfaction of leaving one's mark on the world, the exhilaration of overcoming resistance, the discovery of self-respect, or the enjoyment of a new kind of happiness that rivals private happiness or relieves private woe. Theoretical suggestions or elaborations can be found in Aristotle, Machiavelli, Rousseau, Hegel, and Nietzsche; and in such diverse twentieth-century figures as Georges Sorel, John Dewey, Mohandas K. Gandhi, André Malraux, and the leaders of the New Left in America and France. To this accumulation of thought on the intrinsic, non-instrumental value of political action, Arendt made a most complex and instructive contribution. She presented her theory in *The Human Condition* (1958), *Between Past and Future* (1961), *On Revolution* (1963b), and numerous essays.

If there is any substantial influence on Arendt's thought it comes from the Greek poets and historians Homer, Pindar, Herodotus, and Thucydides. Although the Aristotelian notion of *praxis* obviously provided some guidance, Arendt worked on the assumption that Greek philosophers, like most philosophers, were by nature hostile to the celebration of political action, or, when not hostile (as, say, Rousseau was not), praised action on unacceptable grounds. Arendt thus distanced herself from other theorists of action and claimed to have been either one of the first or one of the few to have seen what the early Greeks saw in action, and to be willing to render that vision philosophically.

Her discussion of political action is set against two other main kinds of human activity: the labor of the body to keep itself alive,

and the work of the fabricator to furnish the world with durable and sometimes beautiful objects. The greatness of political action is that through it, human beings achieve two things existentially. They do not necessarily intend either of them, but political action is the only way to achieve them. The first is the differentiation of humanity from nature, and the second is the differentiation of each human individual from every other. Arendt had a fundamental aversion to nature in its species characteristic, its samenesses and cycles, its domination by the care to survive. The shame lies in complete identification with, imitation of, or resemblance to, nature; honor lies in collective artifice and in individuation. A wholly private life does not sponsor individuation, which has nothing to do with individuality in John Stuart Mill's sense, an essentially private cultivation of private distinctiveness, a resistance to intellectual and behavioral conformity. Arendt saw indistinctness and self-delusion in liberal withdrawal from the public realm, and bondage to the perishable and biological in the apolitical consumerist society. Only in political action does the human individual acquire identity and a group of individuals their humanity. A person discloses who he is amidst the formalities and disciplines of appearing and speaking in the public realm; he can never know himself as others know him, but he can know others as they know him. At the same time, the common involvement of all citizens creates the world, the space, the nonnatural medium in which persons say great words and do great deeds that escape the futility of natural repetition by surviving in the memory of posterity.

Above all, political action is speech: "Without the accompaniment of speech . . . action would . . . lose its revelatory character. Speechless action would no longer be action because there would no longer be an actor, and the actor, the doer of deeds, is possible only if he is at the same time the speaker of words. The action . . . becomes relevant only through the spoken word in which he identifies himself as the actor, announcing what he does, has done, and intends to do" (1958, pp. 178-179). The content of speech is the public business, especially the decisions that must be taken to preserve the well-being and luster of the public realm itself or to launch great and heroic enterprises. Political action is not administration or governance. Arendt's model here is the assembly of the Athenian city.

In *On Revolution* she tried to show that there was a more recent model, that of the committees, councils, and communes spontaneously created by people from all classes during the revolutions of the last two centuries in America, France, Russia, Germany, and Hungary. These occurrences were not imitations of each other but rather the result of the sudden awareness in each case that some opportunity could be seized for involvement in the public life of decision making. Arendt acclaimed this public happiness, the splendid intoxication when previously private and silent individuals displayed capacities for concerted action that they had not known they possessed. By this display, they acquired a genuine identity. These occurrences were true illustrations of Arendt's dictum: "The *raison d'être* of politics is freedom, and its field of experience is action" ([1961] 1977, p. 146). The tragedy was that under the pressure of economic advantage (as in America) or of the attempt to abolish material misery (as in France) or of superior military strength (as in Russia and Hungary), the space of political action, the locus of participatory democracy, was destroyed. The supreme political achievement would be to devise and maintain a political system in which all who wished could have the daily experience of direct democracy. Representative democracy, though admirable for its liberties and securities, was a democracy only for the representatives. Arendt did not think that modern life, except in extraordinary circumstances (like revolution) or in episodes (like civil disobedience in the name of constitutional principles), could accommodate or could even understand freedom. Her main hope was to preserve the memory of freedom.

Arendt's writing was not confined to the extremes of totalitarianism and political freedom. She thought a great deal about modern culture, where she saw mostly darkness, though she looked for glimmers of light, finding them in exemplary modern lives, in the careers and fates of worldly writers and political actors. Her deepest philosophical concerns were expressed in her occasional pieces on actors and specific political events, but she could treat the particular on its own terms and not force it to serve her own larger theoretical purpose. *Men in Dark Times* (1968), with its essays on men and women whose work showed their love of freedom and the world, exhibits perfectly what she admired most.

In the last years of her life Arendt ventured

from "the relatively safe fields of political science and theory" (1978*b*, vol. 1, p. 3), turning to an examination of mental life. She tried to synthesize and expand the suggestions scattered throughout her earlier writings about the tensions and even the desirable connections between the life of action and the life of the mind. By the time of her death she had completed work on two mental phenomena, thinking and willing, but had not begun the third part, on judging. Although her discourse at times is unpolitical, her passion for the avoidance of political horror was the instigation of *Thinking*, as her equally intense passion for political freedom helps to unify *Willing*.

ARON, RAYMOND

Raymond Claude Ferdinand Aron was born in Paris on March 14, 1905. In 1928 he came out of the École Normale Supérieure at the top of his class, and in 1970 he was named a professor at the Collège de France. Aron's early inclination was toward metaphysical speculation but his principal teacher, the neo-Kantian and historian of mathematics and physics, Léon Brunschvicg, dampened such interests in the name of the triumph of science over philosophy, and encouraged him to think about the biological sciences. After a year of work in this field, Aron decided that it was impossible to theorize about biology without becoming a biologist. He concluded that a philosopher, on the other hand, could reflect upon either the natural or the moral and historical sciences. He chose the latter.

Aron then went to Germany, where as a young Jewish scholar of philosophy, he witnessed the relentless rise of National Socialism. The experience imbued him with a degree of pessimism about human affairs that he was never to lose. The ahistorical moralism of his French university training seemed irremediably bankrupt, as did his brief allegiance to the Socialist party. In 1931, he formulated his intellectual goal: to probe the relations between theory and action. It is out of this initial query that all of his books have emerged. In Max Weber he found inspiration and a kindred spirit. During these same years, he began his lifelong study of Karl Marx, which has affected all of his works.

Aron returned to Paris before the outbreak of World War II to complete his *Introduction to the Philosophy of History* (1938*a*). Exiled in London during the war, he edited the monthly *La France Libre*, and developed a taste for journalism that was in keeping with his desire to be both historian and participant in the events of his times. For decades he was a regular columnist for the conservative French paper *Le Figaro*, from which he resigned in June 1977. He subsequently joined the more progressive *Express*.

Aron's postwar works follow logically from his prewar concerns with epistemological and formal problems in the philosophy of history, which were influenced by, among others, Wilhelm Dilthey, Heinrich Rickert, Georg Simmel, and Max Weber. After the war, however, his work has a different orientation and addresses the immediate concrete political, economic, social, and international problems of life in the twentieth century. Because Aron's work is thoroughly

interdisciplinary, both in method and substance, and because his contributions to scholarship are prolific and dispersed, his books can be categorized in a variety of ways. A rough ordering would include: analysis of the industrial order; study of international relations involved in peace and war; ideological criticism; studies in French politics; and history and critique of sociological thought.

Aron's comparative sociological studies of the industrial order focus on liberal and communist régimes. While his analysis of class structures and bureaucratic imperatives has inspired "convergence theory" between "capitalist" and "communist" modes, Aron himself only partially subscribes to such an approach. In the age of industrial society, he believes that the political régime is the crucial factor that provides the specific difference between collectivities. In the tradition of Weber he sets up ideal types—the monopolistic and the constitutional pluralist—and argues that they provide social wholes with critical determinants that cannot be modified without affecting the entire order. The existence of a genuine opposition and the protection of individual rights are intrinsic to the constitutional pluralist mode. With this value of freedom comes the risk of corruption and conflict. Intrinsic to the monopolistic mode are bureaucratic solidarity and ideological conformity. The risk of servitude comes with this ability to centrally plan social and economic life. Social wholes are unities that can be reformed only if one understands the structural realities they imply. There is only a choice for change at the margin.

Although the nature of hierarchical structures of production and the impact of new technologies on all aspects of social life highlight the similarities of industrial societies whatever the régime, past values and formal political rules remain critical to understanding the fundamental differences between the two forms of industrial society that are well on their way to dividing the entire world. Both systems loudly proclaim an egalitarian ethic, but both have to face a nonegalitarian reality as the most cursory studies of income distribution, prestige differentiation, and power concentrations amply demonstrate. The dialectic between the ethic of equality and the reality of hierarchy forces some hard choices. Reconciling human dignity and the imperatives of modern industry is a problem for whoever owns the means of production—individuals, corporations, or state planning agencies. While industrial hierarchies are built on efficiency and

lack the stability of the traditional hierarchies of the past, Aron denies the possibility of their elimination through socialism; in fact he claims socialism leads to their proliferation. As the avowed heir of Montesquieu and Alexis de Tocqueville, he stresses historical and political forces and sees them, rather than underlying social and economic structures, as ultimately shaping the long-range destinies of collectivities. Indeed, Aron's distinction between the constitutional pluralist model and the monopolistic one is a continuation of Tocqueville's insight that the democratic age could lead to despotism as well as to régimes of freedom.

Aron's focus on history and politics also characterizes his monumental studies of peace and war in the twentieth century. He notes that for a century wracked by wars, war itself seems to play a singularly small part in scholarly interpretations. Aron approaches the study of war through theoretical, sociological, and historical categories. He analyzes the consequences of the shift from the balance-of-power to the balance-of-terror. By accumulating data on the space, resources, and political structures of competing sovereign states, he demonstrates how, for the first time in history, a global system of international politics is emerging, threatened and shaped by nuclear arrangements and rent apart by countless divisions, including the new nationalisms and political, economic, religious, and ideological deadlocks. He studies the evolution of the Western and communist blocs, the divisions between the rich and the poor, and between the atomic nations and those excluded from the atomic club. He analyzes three main diplomatic strategies in the twentieth century: dissuasion, subversion, and persuasion. War, to Aron, is central to understanding human history. Peace emerges as the effort to limit war—an effort that the nuclear threat may spur on to some form of transcendence—through a legal or imperial solution.

A traditionalist in international relations, Aron is skeptical about the explanatory value of games theory and abstract models. If even economic models have a dubious fit with social reality, how can models in international relations purport to reduce the cultural and historical complexities of collectivities competing through particular political leaders? He has serious doubts about computer-assisted simulations and about sophisticated scenarios of wars involving non-Western peoples, whose history and value systems become a dangerously ignored dimen-

sion in an attempt to predict the outcome of international political struggles. Although searching for general laws in international politics is probably futile, because the weight of the past and the clash of unique personalities in the present usher in an unpredictable future, Aron has established a wide-ranging framework for the study of international relations, and his pioneering scholarship has influenced the development of such fields as "polemology" and peace studies.

In tireless and ruthless attacks on the myths of the right and the left, his favorite targets are left wing French intellectuals, particularly Jean Paul Sartre and Maurice Merleau-Ponty. Aron's analysis of politically emotive words confronts ideology with reality. He accuses Parisian "left-bank Marxists" of confusing Marxist goals with Stalinist practice, deluding themselves on what the nature of French life would be under communism. In the late 1940s and early 1950s, he stood quite alone in this respect among the French intelligentsia. Then, in the late 1970s, the atmosphere changed abruptly as the "new philosophers" (particularly Bernard Henri Levy and André Glucksman) criticized the cynical and bloodthirsty applications of radical revolutionary ideology and utopian visions in the twentieth century. If Aron accuses the left of harboring terroristic methods in the name of illusory goals, he also sees terror behind the reactionary who turns radical in order to block change. He analyzes the ominous slide from conservative to fascist positions and tactics. The reactionary wishes to preserve or return to the past at all costs and denies change, while the revolutionary attempts to abolish the past and transcend it. Neither goal is possible, but supporters of both will go to inhuman extremes in the name of one or the other. Aron's complaint that French intellectuals play with words and do not understand the realities of communal existence has ties with Simone Weil's critique in the 1930s. It also has much in common with Albert Camus' onslaught against revolution and ideology. While Camus confronts the problem of human cruelty in the present in the name of the future from a moral point of view, Aron is repeatedly demonstrating this phenomenon from the perspective of history and the social sciences. The accumulated impact of Aron's work in this field influenced the "end of ideology" debate. He does not discount the impact of ideology on history so much as he wishes to show the excesses that are perpetuated in its name.

Aron's works on French politics are prompted by circumstances and the rush of events. He called for Algerian independence long before many of the thinkers on his left did. Despite his admiration for Charles de Gaulle, he openly attacked Gaullist policy toward Israel. In general he has traced and criticized the centralizing and statist tendency in French history and politics. He has not taken a conservative role in French politics as many have claimed; indeed, he has argued that both the right and the left reinforce state power in their plans and practices. Outspoken in his preference for economic liberalism as long as it strives for socially responsible policies, he has consistently argued for strong economic growth, and claims that the postwar period has been, in this respect, despite ups and downs, a real success in France.

Aron's intellectual portraits of Montesquieu, Comte, Marx, Tocqueville, Émile Durkheim, Vilfredo Pareto, and Weber are classics that provide a wealth of balanced analysis; they also place Aron in the sociological tradition and reveal his views on sociology itself. He is critical of the French sociological tradition of Saint-Simon, Comte, and Durkheim for relying too heavily on a deterministic theory of the evolution of industrial society, and for placing too much faith in science and in the economic and social benefits directly deriving from rationality. This optimistic sociology, and its normative twin, socialism, ignore the perennial reality of politics. So does Marxism with its view of economics as fate. Even if politics is but a subsystem of society, Aron reasons that it is a crucial one. From a different perspective he reaches the same position as did Giovanni Sartori on the primacy of the political. Aron, a classical realist, often seems closer to the great traditional political philosophers, Aristotle, Niccolò Machiavelli, and Thomas Hobbes, than to modern sociologists. Still, against the deterministic and optimistic conclusions of the latter, Aron sides with the liberal, realist, relativistic, and historically oriented views of Montesquieu and Tocqueville, and with the "value-free" approach of Weber. He cannot, however, accept Weber's radical distinction between moral choice and scientific demonstration. For Aron, commitment to specific values is an inescapable human necessity. Science can and does help make alternative value choices explicit even though it cannot decide the substance of the choice itself.

What unites all these areas of Aron's work is his search for the link between theory and ac-

tion, between the general tendencies of human collectivities and the unique, the contingent, and the accidental. Aron focuses on the interaction of historical experience and political will, and shies away from historical determinisms, believing that history is open ended. At the same time, he rejects extreme historical relativism and an anarchistic approach to values. Individuals and people need a perception of themselves, their past, and their future. Aron explores with insight and flexibility the many options of human consciousness expressed in history. He argues that a probabilistic theory of history is the best one, accounting for the contingent and the necessary, shedding light on what might have happened as well as what did, and revealing a past that helps determine a more open, progressive, and humane future. Aron's probabilistic theory of history is imbued with the same spirit as his margin of choice option in politics, that is the wedding of the ideal and the real, the working for progressive change without fanaticism or illusions.

Another theme that unites Aron's work is a concern for the epistemological and methodological limits of reason and knowledge. There is an irreducible subjectivity that no social science can conquer, particularly since its subjects are endowed with a self-consciousness that modifies all abstract models set up to understand them. All sociological theories remain marked by an ideology, charged with positive and negative values that cannot be eliminated scientifically. Sociological theory can only provide concepts, regularities, and patterns, not scientific laws. Aron believes this holds true for a Parsonian theory as well as for a Marxist one.

There are very few secondary sources on Aron's thought. Criticism focuses on his more polemic works and on the seemingly endless repetition of his major themes in lengthy and overlapping volumes. A more serious challenge, which Aron is very much aware of, involves consistency between his critical stance toward ideology and his own obvious and strongly stated preference for a liberal view. If the constitutional pluralist model alone permits freedom, how can one maintain a nonideological attitude toward it? If the freedom to criticize is a primary value, superior to the search for equality, how can differing systems be judged on their own terms as Aron insists they be, with an objective appraisal of the successes of each? Furthermore, in assessing structural realities, which are to be considered immutable and which transcendable? A Marxist would focus on economic, not political,

struggles as the key to historical development, the dignity of individuals, and collective liberation. On the other hand, proponents of a functional, statistically based social science would challenge the weight Aron gives to the past. Structural realities and personal values are viewed as a complex and integrated whole, interdependent and amenable to scientific methodology. Aron's work can be viewed as "old-fashioned."

For Aron there is no alternative to coming to terms with incompatible visions in politics or academic disciplines. One must take a stand through scientific study, and ultimately make a decision based on conscience. The scientific spirit can determine the outcome of some, but not all, debates. Commitments remain precarious because all régimes are imperfect and betray their ideals. Twentieth-century régimes, turned toward the future, offer the additional ambiguity of pleading their cause in the name of what they will become, not what they are. Perfection in human affairs can be stated formally only as a criterion and aspired to only as a goal. A degree of relativism is the authentic experience of politics because of the multiplicity of competing values and inescapable economic and social servitudes.

Aron's philosophy rests on a belief in the overwhelming value of freedom, and a perception of the impact of human reason, however limited, on history. It also rests on empirical and pragmatic assumptions and faith in industrial development. There are obviously tensions and difficulties in this constellation of human objectives. Aron's problem is the problem of liberalism itself, that eclectic and at times ambiguous commitment to both common-sense compromises and absolute principles. As an observer and scholar of his times he has done more than most to give heart to liberals and pause to its critics. In his work intellectual honesty has been a form of action, forcing a confrontation between theorizing and public policy. Aron's unique contribution to the social sciences lies in the lucidity and energy with which he has undertaken to understand the twentieth century as a whole, and with it the dawn of universal history.

ASCH, SOLOMON E.

Solomon E. Asch was born in Warsaw, Poland, in 1907. He came to the United States with his family at the age of 13 and settled in the lower east side of New York. Shortly after, he entered an elite high school, Townsend Harris, the preparatory school for the City College of New York, then did his undergraduate work at City College, obtaining a B.S. in 1928. His time at college was a period of search; his studies ranged from natural science to literature. During the next four years, he was a graduate student in the department of psychology at Columbia University; he received his Ph.D. in 1932.

Although Asch was attracted to psychology because he felt the need for a discipline that would solve human social problems, he thought of himself in his graduate school days as primarily a general experimental psychologist. He studied with Robert S. Woodworth, among others, and received friendly encouragement from the young social psychologists in the department, Gardner Murphy and Otto Klineberg, but did not work directly with them. His doctoral dissertation was an analysis of a problem in learning.

Asch began his academic career as an instructor at Brooklyn College, a newly established unit of the free system of higher education in

New York, later to become the City University of New York. During this early period two experiences turned him toward social psychology. One was a summer fellowship arranged by Gardner and Lois B. Murphy through Franz Boas and Ruth Benedict. It permitted Asch and his wife to spend the summer of 1936 in observations of child-rearing practices among the Hopi Indians, one of the Pueblo peoples of Arizona. The purpose of the study was to test hypotheses derived from Benedict's work among the Zuni, a related group. The summer did not lead to firm findings; the time was too short and the language barriers too high. But it did broaden Asch's perspectives. The second experience was a collaboration with two colleagues at Brooklyn College, Max Hertzman and Helen Block Lewis, on studies of stereotyping and halo effects in social judgments. At about the same time, Asch began a study of perceptual and space orientation based on Max Wertheimer's early observations of individual differences in *Phi* phenomenon. Later, these studies developed into the work on personality as related to field dependency, conducted with Herman Witkin.

Wertheimer's influence on Asch during his beginning years at Brooklyn College transformed his intellectual life. Fleeing the Nazis, Wertheimer had gone to New York to teach at the University in Exile, the New School for Social Research. In his ten-year association with Wertheimer, Asch was completely absorbed into the gestalt tradition, and in 1944, upon Wertheimer's death, Asch took over his position at the New School. Three years later he left for Swarthmore College, where he joined W. C. H. Prentice, Wolfgang Köhler, and others in a department with a marked gestalt orientation. He remained at Swarthmore for the next 19 years, a fruitful period that saw the publication of his widely read textbook, *Social Psychology* (1952), his studies on conformity (1951; 1955*b*; 1956), and, toward the end, the inception of his work on association (Asch & Prentice 1958).

In 1966 Asch left Swarthmore to become director of a new Institute for Cognitive Studies at the Newark campus of Rutgers University. There he joined a number of psychologists with whom he had previously worked on problems of memory, association, and cognition. They included Irwin Rock, John Ceraso, Dorothy Dinerstein, and Howard Gruber. In 1972 he moved to the University of Pennsylvania as a professor of psychology.

His many honors include two Guggenheim

fellowships, two residences at the Institute for Advanced Study in Princeton, a Nicholas Murray Butler award from Columbia University, membership in the American Academy of Arts and Sciences, and the distinguished scientific contribution award of the American Psychological Association.

Fundamental orientation. The basic theme of Asch's work, constant despite the shifting character of the particular problems, has been an examination and critique of widely accepted assumptions about the nature of man. The most important influence was Wertheimer, though Köhler's formulations of gestalt principles were also an important guide. Kurt Koffka's concept of memory traces and their evolution was a secondary influence. Unlike his mentors, however, who tended to use illustrative material whose "self-evident" character was evidence for the gestalt laws. Asch carried out a series of tight, well-designed experiments. In a way, he combined the habits of thought of the gestalt tradition with the experimental approach of American psychologists of his generation. He did not go past the techniques of the 1930s to the complex multivariate designs characteristic of the 1960s and 1970s in most areas of experimental study of personality and social psychology. His work consists of linked series of studies, each of which explores the influence of one independent variable on a clearly defined dependent variable. During his career he has made contributions to four areas: prestige suggestion, impression formation, "conformity," and association.

Prestige suggestion. A traditional view held that sources with high status would automatically affect attitudes and beliefs. Thus a statement praising revolution would be viewed positively by Americans if it were attributed to Thomas Jefferson, negatively if attributed to Lenin. Asch demonstrated that the response was not an irrational change in the value placed on the statement but a restructuring of its meaning. Incidentally, in a discussion of the positive results of an experiment by Muzafer Sherif on the prestige effects, Asch explained the findings in terms of the status of the investigator—a view based on "demand" characteristics not to become a common point of view for another two decades.

Impression formation. When two people meet, each forms an impression of the character and personality of the other. Traditional trait analyses required that these impressions be derived from the sum of perceived traits:

$P = a + b + c + d \dots n$, where a , b , c are specific traits. Asch rejected this notion, arguing that an impression is the product of a totality created by the *interaction* of perceptions of traits where each trait is affected by the context in which it is imbedded. He demonstrated this tenet with the well-known experiment in which subjects were given lists of traits and asked to describe the person. Identical lists differing only in the inclusion of "warm" or "cold" led to totally different impressions. Apparently the change from "warm" to "cold" was capable of altering an impression based on many components. However, "polite" and "blunt" had no such overriding effect. But when "warm" and "cold" were imbedded in inappropriate lists, the interpretation of those two terms was itself affected by the context. Most interestingly, subjects given triads of traits with one inconstant element (e.g., helpful, quick, skillful *vs.* helpful, quick, clumsy) were able to describe a change in the meaning of "quick" from one triad to the other.

Asch went on to demonstrate the occurrence of metaphoric uses of trait-defining adjectives, such as "sweet," in many languages from different language families and cultures, and to trace the development of such metaphoric usages in children from age three to adolescence. In the latter study, he demonstrated something like a Piagetian sequence. Children did use "sweet" or "warm" to define the personal characteristics of others at the ages of three to six, but it was not until the later years that they could verbalize the nature of the connection between the physical and psychological attributes denoted by the same word. This ability may coincide with the occurrence of formal operations, in Piaget's sense of the term. Later investigators have replicated Asch's "warm-cold" effect with judgments based on contact with real people rather than with lists of traits (Kelley 1950) and have studied some of the characteristics of potentially central traits (Hays 1958).

Conformity. It is ironic that Asch is probably best known as the inventor of the experiment in which a hapless subject is exposed to the non-veridical judgments of a group of supposed fellow judges. Asch developed the experiment because he believed that conformity is *not* an arbitrary, inevitable, mechanical reaction to social pressure. He was sure that even under extreme pressure some people would maintain independence; he was actually astonished at the extent to which many individuals yielded to group pressure. Nevertheless, he felt that even

those who "conformed" would be found to have redefined their ideas of the stimuli being judged or of the social situation.

In the best-known study, individual college students asked to judge lengths of lines were confronted with eight instructed fellow judges who made obviously incorrect judgments. Asch found that despite pressures to conform 68 per cent of the judgments were correct—that is, counter to those of the instructed majority. Subjects varied widely; about a quarter never yielded to the majority and a third always yielded. On postexperimental interviews some independent subjects were found to be confident, others were filled with doubt. Some yielders rationalized their behavior by postulating an illusion to which the majority were subject. Others went along because they feared the social consequences of nonconformity although they had no doubt of their own covert judgments. Through these reports of internal reactions Asch was able to describe the cognitive and emotional changes related to either conformity or independence. Neither the studies of conformity that preceded Asch's work nor the many parametric investigations based on his paradigm shared his concern for the subjects' perception of the situation. True, a decade later a number of social psychologists turned to such analyses, but the germs of the ideas found in the work of Herbert C. Kelman, Richard S. Crutchfield, or Morton Deutsch and Harold B. Gerard are either explicitly stated or implied in Asch's original discussions. The theoretical developments in social psychology of the 1960s and 1970s, in the work of Kelley and others (Kelley 1971) on attribution, or in Walster and her colleagues on equity (Berkowitz & Walster 1976), share with Asch's work an emphasis on cognitive processes, on the internal restructuring of ideas.

Association. The traditional view of association is the mechanical bonding of items presented contiguously. Students of verbal learning tend to regard these as stimulus and response units. During the 1950s this model was extended by the concept of mediating responses. These provide central and unobservable responses as part of the chain that links input to behavior.

Gestalt psychologists have always rejected this model. As formulated by Asch, gestalt theory approaches the problem of association as a part of the general issue of structure. An association is a central process in which units are

embedded in a structural whole; the association cannot be viewed as a simple additive consequence of the bonding of invariant individual units. Learning is restructuring, not the acquisition of responses. Asch spent a number of years conducting ingenious experiments to explore the implications of the gestalt approach. These include demonstrations of backward association as evidence that one does not learn responses to stimuli; of the changes in the character of errors as a function of the matrix of items; of the superior acquisition of association between related rather than unrelated items. This body of work was summarized in Asch's 1968 address to the American Psychological Association. One sentence from this address expresses his objective most succinctly: "To study the formation of associations is to study the coherence of experienced relations."

It is difficult for a nonspecialist to evaluate these contributions to the study of association. They address themselves to problems that were ignored or treated tangentially in the great explosion of experimentation in verbal learning and memory that occupied so many American psychologists from 1945 to 1970. In that body of work, for example, "meaningfulness" is linked not to the characteristics of items but to the number of associations they inspire in subjects (Underwood & Schultz 1960). The models derived from analogies to the computer require unchanged units that progress from box to box in metaphorically labelled storages. But they do not include the notion of a flexible restructuring of the "data" of experience or of the importance of their "intrinsic properties." It is hardly surprising that neither Endel Tulving and Stephen A. Madigan (1970) nor Leo Postman (1975) in their attempts at systematic reviews of research and theory in memory even mention the work of Asch and his colleagues. Whether their work will continue to be regarded as irrelevant, or whether psychologists will turn to the issues raised by Asch, remains to be seen.

Final comment. A final summary of Asch's work should stress its underlying unity. Each contribution strengthens his view of human beings, first fully presented in the *Social Psychology*, as rational, creative, structuring, and initiating organisms—in contrast to the tradition that views mankind as passive, responding only to environmental pressures or to variations in milieu. His search for sources of independence from social pressure was carried out, not coincidentally, during the height of the McCarthy

era. In fusing his social orientation with his psychological credo as a gestalt psychologist, he has provided a model for a generation of psychologists.

AYRES, CLARENCE E.

Clarence Edwin Ayres, American institutional economist and social philosopher, was born on May 6, 1891, in Lowell, Massachusetts, and died on July 25, 1972, in Alamogordo, New Mexico. After receiving his A.B. degree from Brown University in 1912, he spent one year at Harvard University, returning to Brown for his A.M. degree in 1914. From Brown he moved to the University of Chicago to continue graduate work in philosophy and economics, receiving his PH.D. degree in philosophy in 1917. He stayed at Chicago as instructor of philosophy until 1920, when he was appointed associate professor of philosophy at Amherst College. Resigning this position in 1923, Ayres was appointed professor of philosophy at Reed College. In 1924/1925 he was associate editor of the *New Republic*. In 1930 Ayres was appointed professor of economics at the University of Texas, a position he held until his retirement in 1968.

Ayres's intellectual development was affected powerfully by the stimulating, enriching environment of the University of Chicago. Although John Dewey had left Chicago a decade before Ayres arrived, his influence survived, and the young Ayres came under the spell of American pragmatism in its Deweyian variant. In particular, Dewey's *Studies in Logical Theory* (1903) made a deep impression. Moreover, Chicago's economics department had by this time given birth to that distinctly American school of economics, institutionalism. Thorstein Veblen, Wesley C. Mitchell, Walton H. Hamilton, John Maurice Clark, and Robert Hoxie had all taught there in their formative years. Only Clark and Hoxie were in residence during Ayres's student days, but the heterodox ideas of Veblen and his followers that were still in the Chicago air attracted him. This interest was decisively reinforced at Amherst by his colleague, Walton H. Hamilton, one of Veblen's most brilliant disciples. It was Hamilton who coined the term "in-

stitutionalism" to describe the way of thinking of which Ayres became the leading representative in the post-World War II era.

During Ayres's foray into journalism at the *New Republic* he read voraciously in numerous fields and wrote articles on a wide range of topics: theology, politics, sociology, education, music, philosophy, psychology, and belles-lettres. To an impressive degree he was able to integrate much of what he learned into his own teaching. Although he generously and correctly gave credit to Dewey and Veblen as his intellectual progenitors, the social philosophy that emerged from this mosaic of influences was highly original.

Ayres developed a theoretical system for institutionalism in an effort to do for economics what Dewey had attempted in philosophy: to bring about a genuine reconstruction. The building blocks were fashioned over many years, but the basic elements can be seen in his first two books, *Science: The False Messiah* (1927) and *Holier Than Thou: The Way of the Righteous* (1929). In the first book he described how the rapid growth of technology undermines traditional values and beliefs, placing emphasis upon the immense importance of industrial technology in transforming the values of civilization. The connection between science and values, between machines and morality, intrigued Ayres and remained the most important single conception that he held of change and progress throughout his career. In this volume he explicitly raised the issue of the moral requirements of social order by showing how the interaction of institutions and technology affects society's ethical and moral values. In *Holier Than Thou*, Ayres was concerned less with the growth of technology and its potentially devastating effects on social order than with the structure of the belief systems that were undergoing modification. The book's approach was strongly influenced by Veblen's dissection of the folkways and mores of a leisure-class society. However, it also contained a hint of the transcultural theory of value that Ayres was to develop in later years.

The publication of *The Theory of Economic Progress* (1944) established Ayres as the leading theoretician of institutional economics. The system he adumbrated in that work was refined and elaborated in *The Industrial Economy* (1952) and in his last book, *Toward a Reasonable Society* (1961). All these books exhibit a unity of method and intention. Ayres saw all

social behavior as capable of being dichotomized into technological and ceremonial components. He used the term "technological behavior" to refer to those activities in which mankind rationally applies hand and brain to solve problems and thereby contribute to the ongoing life process of the race. This process inevitably involves the use of tools. The tool-using function is broadly conceived to include all instruments by which human skills are organized, disparate artifacts that are related to each other by the same developmental forces. In Ayres's words: "The continuity of civilization is the continuity of tools. All the arts, all the sciences . . . together owe their existence and derive their substance from the continuity which links the surrealist's pigments to the clays in which the Aurignacian caves were daubed, and in terms of which the cyclotron is but a continuation of Neanderthal experiments in chipping flint" ([1944] 1962, p. 222). It is this process that was responsible for the enormous changes in the welfare of the human race over time. Ayres thus identified technological development as being a cultural process. The progression by which the arts and sciences develop results from the fact that accessible and objective instruments are capable of combination into new forms. Earlier tools (including ideas) always make the later ones possible. The retention and preservation of implements, a function of human memory power, are what make man a cultural animal and allow for progress over time in a way impossible for any other species.

By "ceremonial behavior" Ayres meant those activities in which emotion rather than reason holds sway. Accompanying the technological process are myths and ritualistic fantasies that define the status and caste system of a social order. Although the stock of tools, instruments, skill, and knowledge is constantly growing, a human element remains constant through the ages. In this, culture plays a decisive role. The human animal is given to fantasy making, obsessions, superstitions, and taboos that themselves are transmitted by community indoctrination through emotional conditioning. All tribal legends thus derive their sanction from the past. The past-bindingness of ceremonial behavior is completely contradictory to the ongoingness of technological behavior. Against the background of these opposing forces the drama of economic progress—or its failure—is played out.

The dichotomy of technological–ceremonial interaction enabled Ayres to make an important

contribution to the understanding of economic history. By identifying the dynamic and static elements inherent in the historical situation, he explained the timing and location of the industrial revolution. His stress on the rigidity of institutions as inhibitors of development was highly original and useful in demonstrating the importance of economic institutions for economic change.

One of the distinctive features of Ayres's work was his development of a theory of value which eschewed both moral relativism and supernatural authority. Ayres located the source of value on the technological side of his dichotomy, in the way of thinking and conduct that involves the use of tools. Human progress is made possible by the continuity of the technological process. The values derived from that process are transcultural, while the values deriving from superstition and ceremonial behavior are culture bound. Ayres argued that the values of freedom, equality, security, abundance, and excellence are technological values and stand in a symbiotic relationship to one another. This approach permitted a full-bodied defense of Western culture and the industrial way of life.

Although Thorstein Veblen, John R. Commons, and Wesley C. Mitchell laid the foundations for institutional economics, Clarence Ayres went beyond them in significant ways that advanced the cause of the movement. He was a creative social scientist of extraordinary ability, remarkable for his erudition and exuberance of style. More than any economist of his generation, he recognized the importance of philosophical issues and was competent to make contributions in that arena. He was also among the first economists to propose what has come to be called a negative income tax as a method of redistributing income to prevent the problem of inadequate demand. Since he rejected the orthodox theoretical framework of economics, Ayres's influence, not surprisingly, has been greater outside that science than within it. His students have included Talcott Parsons, C. Wright Mills, and Marion J. Levy, Jr. Among economists of distinction, John Kenneth Galbraith and Joseph Dorfman have acknowledged their intellectual debt to him. But outside of the southwestern and western United States, where

a regional school of institutional economists claims Ayres as its intellectual forebear, he has had few literal disciples.

B

BARON, SALO W.

Salo (Shalom) Wittmayer Baron was born on May 26, 1895, in Tarnow, Galicia, the southern region of Poland which then belonged to the Austro-Hungarian empire. His parents were Elias and Mina (*née* Wittmayer) Baron.

Baron was a middle child and an only son. His parents belonged, by the right of both ancestry and wealth, to the Jewish aristocracy of Galicia. The Wittmayers had been brokers in commodities. Elias Baron was a banker, whose interests included oil fields, lumber yards, mills, and real estate. The father, though somewhat "modern," was punctiliously Orthodox in religion. The mother was much more Western and stylish. Her manners were Frenchified, and she was fluent, in addition to Yiddish and Hebrew, in French, Polish, and German.

As a small child, Baron was entirely in the charge of a Polish nursemaid, and, thus, in the very midst of a religiously Orthodox household, his first language was not Yiddish but Polish. When he was four years old, his Hebrew studies began in earnest with a tutor, who started to teach him the Hebrew Bible translated into Yiddish. He was thus forced to learn both these languages at once. When Baron was ten, a new tutor, Aaron Wrubel (the father of the well-known Israeli medievalist Zvi Ankori) arrived and remained for the next eight years. During this period, Baron not only acquired a broad education in Jewish religious literature, especially in the Talmud, but also completed his work in the local Polish Gymnasium as an "external student" who was examined periodically by the faculty.

Thus, in these formative years, Baron lived in two cultures. He wrote Hebrew poetry as a 12-year-old, and was a passionately convinced Polish nationalist at the age of 15. Although he wore the traditional dress of Orthodox Jews into his teens, he changed into Western dress when the occasion required. All during these years, from the age of ten on, he was also trained for his father's business. By his 15th year, he was occasionally in charge of family enterprises during his father's absences.

At age 18, Baron decided against business and for scholarship. By 1917, he had received a doctorate in philosophy from the University of Vienna. To this degree he added rabbinic ordination in 1920 from the city's Jewish Theological Seminary, and two more doctorates from that university—in political science (1922) and law (1923).

After teaching history at the Jewish Teachers College (*Juedisches Paedagogium*) in Vienna from 1919 to 1926, he was invited by Stephen S. Wise to teach at the Jewish Institute of Religion in New York. He remained there from 1927 to 1930, when he was appointed to a newly-created chair at Columbia University, the Linda R. Miller professorship in Jewish literature and institutions. This was the first appointment in Jewish history to the history faculty of any American university. The many such chairs that have since been established owe much to his example, and nearly the majority of their present occupants are Baron's former students.

Baron retired from his Columbia professorship in 1963 but until 1968 remained the director of its Center for Israel and Jewish Studies,

which he had founded in 1950. Both before and after his retirement, he lectured and taught in many universities at home and in foreign countries, including Israel. Upon his retirement from Columbia, the university took the rare steps of conferring an honorary degree on a member of its own faculty and of creating a new chair in Jewish history, named in his honor.

Baron was never a scholarly hermit. He was the leading spirit of the American Academy for Jewish Research and its president three times (from 1940 to 1953; 1958 to 1966; 1968 to date); president of the American Jewish Historical Society from 1953 to 1955; cofounder in 1936 (with Morris Raphael Cohen) of the Conference of Jewish Social Studies, called in its early years the Conference on Jewish Relations; and president of that body from 1941 to 1954 and 1963 to 1967. Right after World War II, he was the founder and president of Jewish Cultural Reconstruction (the executive director whom he chose was Hannah Arendt), which worked in identifying and reclaiming libraries and other cultural treasures despoiled by the Nazis. In 1952, he became a corresponding member of the United Nations Educational, Scientific and Cultural Organization's International Commission for a Scientific and Cultural History of Mankind.

The Nazi assault on the Jews was a very personal matter, for his roots were in Poland. His parents were killed there by the Nazis in the spring of 1942. The climactic moment of Baron's public career came in a Jerusalem courtroom in 1961, when he was called by the prosecution in the Eichmann trial to deliver a historical account of anti-Semitism. He spoke for many hours, with a uniquely individual learning and passion.

Baron's scholarly productivity has been extraordinary, in a class by itself both in breadth of knowledge and sheer quantity. The most recent bibliography of his writings appeared in the first of a three-volume jubilee publication issued in 1974 to celebrate his eightieth birthday. It contains five hundred items; most are articles, but there are dozens of books. Baron has always regarded himself as primarily a historian of the modern era, but he undertook several works of synthesis that cover the range of Jewish history. The major ones are: *The Jewish Community* (1942); *A Social and Religious History of the Jews* (1937), which has been revised through the middle of the seventeenth century.

While engaged in these major tasks, Baron also wrote such books as *Modern Nationalism*

and *Religion* (1947); *Russian Jews under Tsars and Soviets* (1964); and edited, together with Joseph L. Blau, *Jews of the United States, 1790-1940: A Documentary History* (1963). His abiding concern in all his work has remained the problem that he defined for himself in his first monograph, *Die Judenfrage auf dem Wiener Kongress* (1920), in which he discussed the relationship of Jewish needs and rights to the Gentile society, as they had been considered on this scale, for the first time in Western history, at a meeting of Europe's major powers at the Congress of Vienna.

Central to Baron's vision of Jewish history is his view that Jewish experience through the ages has not occurred in isolation, but in a larger world within which the Jews have lived. In some versions of Jewish history this world was ignored or was perceived as the unchanging enemy. Jewish history thus became an account of the inner life of the Jews and of the ways they could find to resist hostility (*Leidens- und Gelehrten-geschichte*). Such an approach required of the Jewish historian no great insight into the history of the various Gentile worlds, for, by definition, such knowledge was of little importance to understanding Jewish history. Baron has insisted that at no point in the whole of their experience have the Jews failed to come into serious encounter with other cultures. The image of a sealed community does not hold for even the most closed of ghettos. In addition, those influences have not always been of one kind. The multinational Austro-Hungarian empire and the multicultural late Roman empire are contexts for Jewish history that differ vastly from the religious and cultural monism of the generation of Mohammed. In each of the changing ages and climes within which Jews have lived, their history can be understood only as part of human history.

This view has important consequences. As a theory it reflects an outlook that refuses to regard the Jews as pariahs, always in a position of "otherness" and "over-againstness." Baron is no Pollyanna; he is keenly aware of the tragic dimensions of Jewish history. But neither is he a Cassandra. He has been preeminent in calling attention to the times of peace and even cooperation between Jews and Gentiles. Rooted as he also is in classic Jewish thought and feeling, Baron continues to believe, even in the twentieth century, that man is not irretrievably evil and that the human past is not a tale of unrelieved wickedness.

This view also has important consequences for defining the field of Jewish historical research. It increases enormously the burden upon the Jewish historian. To work in the manner of Baron, one must be a first-class general historian, who can write with Baron's originality, on such subjects as Ferdinand Lassalle's political theory and on the interrelations between modern nationalism and religion. The task is all the more onerous if the field of a historian's research is not limited to one period but extends over the whole of Jewish history.

Having asserted that Jewish history is part of general history, Baron must inevitably confront the question: What is different about the Jews? His answer stands in a line of classic Jewish thought rooted in the Bible itself. In his view, the Jews are a peculiar people because they have been the bearers, from their beginnings, of a Messianic religion of universal import. The meaning of the career of Jewry in history is to live, in the dimension of time, as a people who through a particular way of life, exemplified universal moral ideas. Other peoples are created in space, on their lands. Their sense of community is rooted in geography, and it tends to die when such a people is exiled. The encounters of the Jews with Palestine are indeed the historical apexes of Jewish creativity. Still, Baron sees more to Jewish experience, even in those periods, than the simple fact of a people living on its land. Even during the First Commonwealth, and certainly during the Second, the Jews were characterized by the presence of an influential Diaspora. When the complete Exile began, they were prepared by prior experience to exist without a base on their own land. This people yearned always to be restored to Palestine, but it could cope with the fact of landlessness.

Baron thus affirms the importance for Jewish history both of Zion and of the Jewish communities outside the homeland, and he passes no judgment on the merit of one against the other. Indeed, this international people, retaining a spiritual and communal identity through changing ages and places, is the harbinger of the human future, when all identities will be historical rather than geographical. Nor are scholars and men of the spirit alone the major bearers of Judaism. Peddlers, economic innovators, and factions struggling for the control of Jewish communal organization—all the people who make up a society are of consequence in his depiction. If Israel, the people, is the bearer of its spirit,

Baron's vision is broad enough to recognize that the spirit has expressed itself in the most mundane social facts.

BASTIDE, ROGER

Roger Marius César Bastide (1898–1974) was a sociologist and anthropologist whose work reflected many personal and academic interests: mysticism, dreams, trances, madness, Afro-American cultures, and the comparative study of race relations. Between the years 1924 and 1938, Bastide taught at lycées in Cahors, Lorient, Valence, and Versailles. Between 1938 and 1951 he taught at the University of São Paulo in Brazil. On his return to France, Bastide served as a directeur d'études at the École Pratique des Hautes Études. In 1958 he became director of the Centre de Psychiatrie Sociale. Although Bastide retired from the Sorbonne in 1968, he remained an active scholar until his death.

Bastide and the Durkheimians. Bastide was not a Durkheimian in the strictest sense of the word, but his early academic work was conducted in a country in which the influence of Émile Durkheim and his nephew Marcel Mauss was still paramount. The Durkheimians regarded psychology and sociology as separate sciences, each occupying its own distinct territory. Any explanation of social phenomena in terms of individual psychology was regarded as suspect. Durkheim viewed religion as a product of social organization, and all attempts to explain it in terms of its emotional or intellectual value to its individual inventors were rejected by him as methodologically unsound. Attempts to relate variations in the suicide rate of different classes, as well as ethnic and religious groups to mental pathology and "race psychology" were rejected. One clear implication of the Durkheimian position was that certain phenomena—e.g., madness, dreams—were individual rather than social in nature and were therefore rightly excluded from the realm of sociology. Bastide's writings from 1930 until his death may be viewed as acts of loyal rebellion against some of these doctrinal positions.

In the first place Bastide, in some of his earliest writings on mysticism, was unwilling to accept the notion that religion is merely the product of other social phenomena. The mystic experience, the inexpressible and ineffable sentiment of union with the unknown, transcends

cultural boundaries and may even be attainable by the modern academic who knows no traditional faith and lives in a secular world (Bastide 1975). Second, Bastide was one of the first French sociologists seriously to consider the potential importance of Freudian theory. Although he condemned Freudian reductionism, he was not inclined to ignore Freudian and neo-Freudian contributions to the understanding of the growth of individual personality. Accordingly, he felt (1950) that the heirs of Freud and Durkheim had much to gain from a cautious interchange of ideas and perspectives. Third, a logical consequence of the latter position was Bastide's belief that sociology could successfully expand its territory and invade the psychologist's and psychoanalyst's realm. In an essay originally published in 1932 (reprinted in 1972*b*), "Materials for a Sociology of the Dream," Bastide claimed that dreams were, in a sense, social facts. Primitives used the dream experience as a guide to the cosmos and as a manual for social action. Furthermore, there was a relationship between the content of the dream and the social milieu of the dreamer. In his later work Bastide supported this argument with citations from the ethnographic writings of Peter Lawrence, Kenelm Burridge, and George Devereux, and with reports of his own interviews with subjects in São Paulo and Paris. In brief, Bastide applied Durkheimian notions to data that sociologists had excluded from the social realm. He believed that, insofar as social scientists excluded the "irrational"—e.g., dreams, trance, and madness—from their purview, they were the victims of the rationalist prejudices of contemporary Western man, who values only aspects of his culture that are of immediate technological and economic utility.

The extension of the Durkheimian program is clearly outlined in *The Sociology of Mental Disorder* (1965*b*). In this work Bastide, following Henri Ey and Michel Foucault, observes first that the definition of insanity varies geographically and historically; second, that the healing process, whether it involves shaman and sufferer or psychoanalyst and patient, reflects the expectations, beliefs, and desires of a third party—society; third, that each society has its own characteristic form of madness, insofar as the insane tend to act in the way society deems appropriate for them; and last, that much evidence has accumulated on the relationship between class, religion, ethnicity, and the incidence of mental disorder.

Brazil: The *candomblés*. Bastide's work in the sociology of religion, Afro-American studies, and race relations benefited greatly from his stay in Brazil. His earlier observations on religion in traditional and modernizing societies had been secondhand at best, and he had adopted the evolutionist view of religion that was still acceptable in some quarters. While in Brazil, Bastide conducted field research on the *candomblés* of Bahia (1958). The *candomblés* are cults in which African religious elements predominate. The gods of the Yoruba and Fon come down from Africa to take possession of their "horses" (cult initiates, who are usually female) in the course of elaborate, strictly regulated ceremonies that involve drumming, dancing, and trance states. Bastide's work on the *candomblés* reflected his growing interest in the question of African survivals in the New World. Melville Herkovits was, of course, the pioneer in this field, and Bastide was proud to follow in his footsteps. Bastide's scholarly thoroughness eventually led him to study Yoruba and Fon rituals on the other side of the Atlantic Ocean.

The most reported or misreported aspect of the *candomblés* was the trance state. Trances had traditionally been viewed as a phenomenon of psychopathology, and researchers had searched for evidence of insanity amongst members of *candomblés*. Bastide observed that, inasmuch as the guests at *candomblé* do not enter trance, and inasmuch as the possessed individual is expected to play the role of the deity who "rides" him while cult priests stand by to ensure that his actions become neither inappropriate nor overly frenetic, the trance is a social phenomenon, a rite that reenacts west African cosmogony in an alien environment. Furthermore, many of the cult initiates exhibit no sign of abnormality in their daily lives, which are conducted in an urban environment whose Luso-Hispanic culture and modern technology seem so remote from the "Africa" of the *candomblés*. Remarkably, participants in *candomblés* and other urban rituals of African origin seem able to dissociate these two aspects of their lives. Bastide elevated this behavior to the level of a scientific principle of social action, the *principe de coupure* or dissociation principle. Perhaps *candomblés* act as a compensation mechanism for the poor and oppressed. Bastide paid particular attention to the role of black women in *candomblés* and noted that this was a way in which they could still hold some power in a society that, the less African and more Brazilian

it became, increased rather than diminished the level of their subservience.

Bastide: Student of race relations. Bastide took part in two United Nations Educational, Scientific and Cultural Organization surveys in the field of race relations. The first began in 1950 in Brazil, as a result of a suggestion by L. A. da Costa Pinto, with a number of researchers working in different cities. Bastide and his student Florestan Fernandes undertook research in São Paulo. The second project was on African elites in French universities. The aim of the UNESCO project in Brazil was to attempt an explanation of the relative harmony of race relations in Catholic Brazil as compared with the Protestant United States. In his work on race relations, Bastide noted that miscegenation had been encouraged in Brazil and that a rich mulatto might well become an honorary white, whereas in the United States the slightest evidence of black ancestry relegated the individual to a low "caste" status, race in the United States being defined in social rather than biological terms. Bastide accepted Pierre L. van den Berghe's distinction between two ideal types of racially pluralistic societies, the paternalistic and the competitive. Brazilian society, being paternalistic and hierarchical, exhibited "color prejudice" rather than the virulent prejudice of "social race" that had been prevalent in the United States after the Civil War.

However, a more competitive pattern was emerging in São Paulo; as male blacks entered the proletariat, race prejudice was accordingly increasing. Noting that Calvinism and the early development of capitalism had been linked to the rise of racial separatism in the United States and elsewhere, Bastide endeavored to search for the reason why Protestant and Catholic countries had followed such distinct directions. He linked Protestant racism to the failure on the part of the Indians to live up to the unreal expectations of early settlers in North America that they should immediately pursue the work ethic and thereby demonstrate their worthiness to join the elect. The justification of racial separation by the Dutch Reformed Church in South Africa was perhaps a direct consequence of Calvin's denial of the doctrine of the mystic body of Christ and his support of the idea of a national church. There was, perhaps, much of value, but nothing that was particularly original in these assertions. Bastide's work on the role of sexual contact as well as sexual fantasies and dreams in racial conflict displays a striking origi-

nality. On the basis of interviews in São Paulo, Bastide observed that the mere fact of miscegenation was not necessarily the sign of good race relations. In fact, the reverse was more often true. In Brazil the young white exploited the black girl in order to gain his sexual initiation. Once he had slept with her, her social reputation in her own community declined. In France, many African students slept with white girls in order both to enhance their self-image by "climbing" the social ladder and to exact revenge for humiliation by whites, whereas white girls used black men as a symbol of their rebellion against their parents and conformist values. Once the African married the white girl, which he was often loathe to do, he could no longer return to the colonial environment and had to remain as a marginal individual in metropolitan France.

Bastide: Social visionary. Bastide's work, both in race relations and in the sociology of religion, reveals his staunch belief that sociology is and should be the reformer's science and should pursue the destiny that its creator Comte intended for it. He was a social democrat who believed in a socialism which would incorporate Christian ethical values. He was a defender of African traditions who proclaimed that the religions of west Africa were as beautiful as those of Greece and Rome. Last, but not least, he stated that his primary professional commitment was to engage in the most important battle of our times, the struggle against racism.

BATESON, GREGORY

Testing the fit and stretch of a new idea is not unlike trying on a garment. Ideas, however, unlike clothing, are best appreciated when we have been privy to their development—the cutting and stitching of the cloth, and all the painful trials in the testing of the fit. Regrettably, few among us have that degree of unself-conscious commitment to ideas that allows us to expose them (and ourselves) during their growth. Gregory Bateson is among those few. As a consequence he has achieved unusual influence

upon scholars of widely varying interests and ages.

Bateson was born May 9, 1904, son of William and Beatrice (Durham) Bateson. His father was a well-known geneticist and the Bateson clan generally has always been well represented in scholarly circles.

Bateson's earliest published work reflected anthropological interests, and though much of this work was of a seminal character, it was, at the time, largely outshone by the ebullience of the contributions of his first wife (and colleague), Margaret Mead. *Naven* appeared in 1936, and represented an original application of the comparative method of anatomists to anthropology. A joint photo study with Mead, *Balinese Character*, produced a few years later, was a blend of science and aesthetics that is rarely achieved. His next major series of scientific publications were in the field of psychiatry, followed by analyses of communication in a variety of animals. This brief list by no means encompasses all of Bateson's contributions, nor does it provide more than a suggestion of his Renaissance mind capable of dealing with a variety of subjects. Actually, Renaissance men were more often than not dabblers; although engrossing, entertaining savants, their contributions were fleeting and insubstantial. There is nothing of the dilettante in Bateson, nor does the range of his subjects reflect an absence of continuity in his attention.

The focus of Bateson's attentions have been questions and ideas: How do they interact? What sort of economic order limits their multiplicity and survival? He wrote: "In late 1969 I became fully conscious . . . that in my work with primitive peoples, schizophrenia, biological symmetry, and in my discontent with the conventional theories of evolution and learning, I had identified a widely scattered set of benchmark marks or points of reference from which a new scientific territory could be defined. These benchmark marks I have called 'steps' . . ." (1972, p. xvi). Thus does Bateson himself argue for the continuity underlying his various scholarly tasks. But it is not his contributions to the various disciplines, nor yet the large net into which he drew students from anthropology to zoology, that has earned him his influence. It is, rather, his emphasis on seeking to understand how we come to understand, and the role of consciousness reflection in adaptation. Or, in his words: "It is surely true that the content of consciousness is no random sample of reports on events

occurring in the remainder of mind. Rather, the content of the screen of consciousness systematically selected from the enormously great plethora of mental events. But of the rules and preferences of this selection, very little is known" (quoted in M. C. Bateson 1972, p. 16).

Bateson's major opus of the 1970s (although another major work is in preparation) was a collection of essays entitled *Steps to an Ecology of Mind* (1972). It is in this volume that he admitted the world to his dressing room to observe how he tries the fit of his new garments, a procedure in which hundreds of his students and fellow conferees were able to participate directly. He discussed the relation of principles to hypotheses, of hypotheses to facts, and the latter to our perceptions. Implicit throughout is the view that scientific research entails two disparate kinds of authority: observations cannot be denied and fundamental principles must be fitted (or replaced). He rejects a belief in induction from experience. Such a rejection would scarcely be novel for a modern philosopher of science, but is decidedly unusual among practitioners and teachers of sciences. How then to construct "a bridge between the facts of life and behavior and what we know today of the nature of pattern and order" (1972, p. xxvi)? Bateson has generated enthusiasm and commitment to the search by allowing witnesses to his struggles with that construction.

It is unlikely that Bateson's "double-bind" theory on the cause of schizophrenia will effect a revolution in the treatment of that disease. Nor will his analysis of the relation of analogy to homology in the study of morphology radically alter views on vertebrate evolution. However, what has revised the intellectual habits of his students is Bateson's belief that "such matters as the bilateral symmetry of an animal, the patterned arrangement of leaves in a plant, the escalation of an armaments race, the processes of courtship, the nature of play, the grammar of a sentence, the mystery of biological evolution, and the contemporary crises in man's relationship to his environment, can only be understood in terms of . . . an ecology of ideas . . ." (*ibid.*, p. xv).

Some intellectuals have argued that the complexity of our universe so far exceeds the complexity of our central nervous system as to preclude any but the crudest representation of the one by the other. This despairing counsel was an altogether expectable response to the ecological disasters that resulted from reduc-

tionist simplifications (as chronicled, for example, in Commoner 1971). Bateson's greatest contribution has been not merely to urge rejection of both extremes, reductionism and "standing in awe," but to pioneer in the development of more fruitful epistemologies (quoted from Bateson 1958, p. 54).

BECKER, ERNEST

Ernest Becker was a rare, panoramic intellectual who dreamed the Enlightenment dream of a unified, universally accepted science of man which could serve as the basis for the rational

formulation of human ideals and the means of achieving them. This intellectual quest gave him a personal sense of history, purpose, and meaning. At the same time, it caused him great disappointment.

Becker was born to Jewish immigrants in Springfield, Massachusetts, on September 27, 1924. He enlisted in the infantry during World War II and served with a second-line unit that won five campaign ribbons and helped liberate a Nazi concentration camp. After college at Syracuse University he served as an administrative officer and occasional intelligence liaison with the United States embassy in Paris. He loved France and learned French fluently, but became bored with his work. At the age of 32, he realized that he wanted to understand the meaning of his existence and so he decided to study anthropology because the term literally signified "the study of man."

In 1969 he wrote to the Reverend Harvey Bates: "I have arrived at a definition, finally, of the human personality that I think accurately reflects the basic truth: that what we call man's personality or his life style is really a series of techniques that he has developed, and that these techniques have one major end in view—the denial of the fact that he has no control over death or over the meaning of his life. If you expose this denial by undermining or exposing his techniques, you undermine his whole personality—which is the same thing" (Bates 1977). This central, fertile insight of his mature work was not the result of intellectual study alone; it was also a personal confession—the result of sober self-reflection on the meaning of his own life. Becker believed that thought must be understood in the context of its author's life and times, and his theory of human nature, designed as it was to guide our understanding of mankind, was also Becker's guide to understanding himself.

As a graduate student in anthropology at Syracuse University, Becker came under the formative influence of Douglas Haring, who was trained at Columbia under Franz Boas and Franklin H. Giddings. Becker's first book, *Zen: A Rational Critique* (1961), is an edited version of his doctoral dissertation, completed in 1960. It is dedicated to Haring with the motto: "the teacher imparts the spirit." By this Becker specifically meant the spirit of free reason as the guide of human progress. This was his basic faith and the ideal-critical basis of his science of man. This faith implies a battle with the anti-

rational forces of authority, tradition, superstition, and passion which constrict reason and freedom and foster instead uncritical obedience, compliance, and conformity. This antiauthoritarian rationalism is the underlying spirit of Becker's first book which was a critical comparison of Zen, psychotherapy, and thought reform. The mechanism by which the individual surrenders his autonomous reason to authority in each of these methods of personal transformation is the psychoanalytic concept of transference: the submission of the vulnerable individual to a powerful protective authority. Becker's first step toward an interdisciplinary theory of human nature was to claim the concept of transference from medical psychiatry for the science of man.

Haring was Becker's ideal social scientist: an interdisciplinary scholar who could construct a unified but critical perspective on particular human problems. Haring was a Japanese specialist and served as anthropological adviser to the Douglas MacArthur occupation in post-World War II Japan. This is the model that shaped Becker's personal ambition. He was never ambitious for wealth or power; he wanted the recognition and self-affirmation he believed would be rightfully his if he formulated a comprehensive and accurate account of the human condition which could contribute to human happiness. Becker hoped that if his work counted for something in human history, then he would count for something.

Becker was awarded his Ph.D. in June 1960, and then joined the department of psychiatry at the nearby Upstate Medical Center as instructor in anthropology—essentially the same position held by Haring. The next three years were idyllic. Becker developed a close relationship with Thomas Szasz, best known for his critique of psychiatric authoritarianism and its ideological correlate, the medical model of psychiatry. He saw in Szasz a broadly educated, incisively critical mind and an Enlightenment thinker, a Jeffersonian, who shared Becker's basic faith in individual liberty and the reign of free reason. Becker agreed with Szasz's critique of medical psychiatry but he was especially intrigued by his analysis of hysteria as a problem in communication, which suggested the possibility of "a re-assessment of all so called 'mental illness' as broadly cultural behavior rather than narrowly medical, phenomenon" (1964, p. 3). As a result of his association with Szasz at this historical moment in psychiatry, Becker was empowered

to translate and reinterpret the psychiatric syndromes from the language of medicine into the language of the combined science of man. Becker learned clinical psychiatry as an insider, in an open and invigorating intellectual climate. He attended clinical lectures and conferences and met frequently with Szasz and a small circle of intellectuals for informal, wide-ranging, and detailed discussions of human nature and mental illness in the context of the history of ideas. With Szasz's encouragement, Becker interviewed selected psychiatric patients and became a highly skilled clinical diagnostician.

In *The Birth and Death of Meaning* (1962b), an edited series of lectures to psychiatric residents, Becker drew from psychoanalysis and the social sciences to present his integrated theory of human behavior, which was the foundation of his work. The key idea is that self and society are derivatives of the human capacity for language. This means that the evolution of both the human species and the human individual are marked by the development of language. Becker reformulates the concept of the Oedipus complex from a theory of infantile sexual neurosis to a theory of the development of specifically human symbolic reactivity. The Oedipal transition, as Becker renamed it, is the period of socialization in which the individual learns techniques for mastering the anxieties of self-maintenance in the theater of social symbolisms. He conceived of personality formation as the narrowing (fetishization) of consciousness and performance to a range within which the individual masters anxiety. This mastery of anxiety through socially approved command of performance is self-esteem. Becker regarded self-esteem as the basic invariant motive of human action and the central integrative principle of his science of man. Broaden the theory of anxiety with the concept of the terror of death and one has the nucleus of Becker's mature work.

In his next major work *The Revolution in Psychiatry* (1964) Becker analyzed various psychiatric syndromes—schizophrenia, depression, psychopathy, anxiety, shame, guilt, sadism, and masochism—from the point of view of his unified theory of human nature. Heavily influenced by John Dewey and the American pragmatists and symbolic interactionists, yet drawing broadly from philosophy and the social sciences, Becker constructed a theory of mental illness based on the struggle of the linguistic self to maintain reflexive significance in the field of

social action. The basic problem for the human animal is anxiety because he is necessarily constricted by his transferences and fetishizations, but is constantly confronted by an incomplete sense of self and an uncertain future. Following Szasz, Becker viewed mental health and illness not as specialized medical problems, but as problems of living. The task of psychiatry therefore, as viewed by Szasz, Becker, and their circle, is the task of education and social reconstruction. Becker's revolution in psychiatry meant the absorption of psychiatry by the science of man.

Psychiatry was quick to react. In November 1962 Szasz received an order from the New York State Department of Mental Hygiene forbidding him to teach psychiatric interns and residents of the local state hospital, the main clinical teaching facility of the medical school's department of psychiatry. The reason given was that Szasz's concept of the myth of mental illness was dangerous to mental patients. Szasz, Becker, and others interpreted this as an infringement of academic freedom. They wanted the order rescinded or the department of psychiatry to sever its relationship with the state hospital. They decided as individuals to boycott the departmental meetings that were held at the hospital from which Szasz had been expelled. The members of this group were thus brought into direct conflict with the chairman of the department, who was also the director of the state hospital and was responsible to the commissioner of mental hygiene. He was supported by the ideological adversaries of Szasz and Becker. This produced an emotionally charged schism within the department that eventually engulfed the entire field of psychiatry as it came under criticism for the coercive tactic of involuntary hospitalization. At Syracuse, the result of this conflict was that Becker and several of his associates were dismissed and excluded from academic psychiatry. Becker's theories of mental illness have been ignored by medical psychiatry ever since.

Becker spent the following year in Rome reflecting on the historical origins and significance of his unified theory of human behavior. The result was *The Structure of Evil: An Essay on the Unification of the Science of Man* (1968). In this, he oriented his theory in the context of Western thought from the breakdown of the medieval world. The key period is the Enlightenment in which the problem of evil is transferred from the dominion of the medieval

church and feudal authority to the dominion of free reason. Becker believed that the proper function of the science of man is to replace traditional religious cosmology with an integrated, panoramic, and penetrating rational-empirical understanding of man and his place in the universe. This understanding could be used as a practical guide to the solution of life problems and the realization of human ideals. The urgency of contemporary human problems implied to Becker that social scientists must synthesize what is now known rather than to continually accumulate disjointed data in the hope of the future perfection of their science. This attitude, conveyed with messianic zeal, irritated and threatened many of his academic colleagues.

Becker firmly believed that he had realized both the Enlightenment and the Marxist vision of an ideal-typical science of man, which could be used as the basis of a critical analysis of both the individual and society. As Becker conceived it, mental health is a pseudomedical ideal individual type against which personal flaws (mental illness), or "failed heroics" as he called them, could be measured. Becker recognized that ideal-typical science was vulnerable to use as crypto-ideology; it could be used to promote authoritarian values, as in psychiatry in the Soviet Union, the United States, and elsewhere. But Becker was clear about his ideal-type individual: a free, self-reliant person with a flexible library of competent social performances who approaches life with an open, ideal-critical intelligence. This implies that in order to foster the free, creative energies of the individual, the ideal society must be an open democratic community, in the anthropological sense, which guides its destiny scientifically, by means of an integrated world view. Becker remained faithful to this ideal, but he struggled continuously with the obstacles to its achievement. In his early period, he adopted the Rousseauian position that man is basically good, or neutral, and becomes evil as the result of an authoritarian-repressive-alienated society. Later, he recognized that evil springs also from the breast of man—from the ego's restless striving to deny its own finitude by asserting its own perfection, power, and perpetuity regardless of the cost to humanity.

In the fall of 1964 Becker returned to Syracuse University, where some friends helped him to arrange a joint appointment for one year in sociology and education. Although he was ostracized from the medical school, he continued to refine his theory of mental illness, stimulated by

frequent, informal discussions with Szasz and his circle. He also became friendly with a small group of radical intellectuals at the university, including Stanley Diamond and Irving Louis Horowitz. The student rebellion against university paternalism was brewing, and the civil rights struggle was intensifying, led in Syracuse by George Wiley, Rudy Lombard, and Ron Corwin. Becker knew and admired these local leaders and shared their hope that these movements would catalyze a new era of reason and freedom in human affairs. In his lectures and public discussions, Becker presented his unified theory as the ideology for a radical critique of the issues raised by the student, civil rights, and antiwar movements. He focused particularly on the process of university education as a technique of socialization. In *Beyond Alienation: A Philosophy of Education for the Crisis in Democracy* (1967), Becker argued that the aim of education should be to develop the ideal type specified by his science of man: the competent, intelligent, self-reliant individual. He proposed as the ideal curriculum for achieving this ideal, the science of man: an integrated presentation of current knowledge about the human condition, the human ideal, and the method of progressing toward that ideal.

Becker was critical of the alliance of the university with patriotic and commercial interests. He believed this has the effect of constricting consciousness, fostering uncritical obedience to authority, and promoting fetishization of commodities. Becker was also outspokenly critical of empirical social science which, he believed, gave silent assent to evil by pursuing methodological purity for its own sake. Again, as a result of his views, Becker was not rehired.

In 1965, with some help from Erving Goffman, Becker was appointed visiting lecturer in sociology at the University of California at Berkeley for a one-year term. In 1966 he moved to anthropology on a similar contract. At Berkeley, during the period of student protest, Becker continued to speak boldly to the problems of the times. He became a favorite of the students who crowded his lectures. When his second appointment expired and it became apparent that the university would not rehire him, 2,000 students petitioned to retain him. In an unprecedented act, the student government voted to pay his salary of \$13,000 from their own treasury, but the administration forbade this. In the fall of 1967 he moved across the bay to San Francisco State University as professor of social psychology.

These were years of intense inner contradiction for Becker. On the one hand, he believed that the war in southeast Asia and the internal resistance to civil rights were of one piece and would lead to military-industrial totalitarianism. The martyred Protestant theologian Friedrich Bonhoefer was his model and he admired the heroics of Martin Luther King, Jr., David Miller, Daniel Berrigan, and others who took positive moral action. On the other hand, he was aware that his personal desire for self-affirmation was a basic flaw.

Becker was haunted by this contradiction and attempted to resolve it through the Christian existentialist attitude of positive action against evil combined with the acceptance of God's will. However, he discovered that the line between the heroic strivings of the ego and genuine Christian courage is ambiguous. Although he loved San Francisco and could have lived and worked there for many years, he resigned in January 1969 from San Francisco State University because he claimed that he could not teach freedom with the police on campus. This was a courageous act since he had no prospect of another job.

Becker wrote two books during his California period which reflect his inner struggle with the contradiction between piety and heroism. His spiritual task of renouncing heroic striving enabled him to accept as a social fact the failure in his time of a unified science of man. He wrote a historical account of this fact in *The Lost Science of Man* (1971). Yet, he retained his faith in an ideal-typical social science, not with the naive, utopian optimism of his youth, but with the sober hope that it could serve as a "holding action" against the forces of evil. In *Angel in Armor* (1969), a series of short essays, Becker drew from literature and film to illustrate the relevance of his science of man to universal human experiences.

In the fall of 1969, Becker moved to Simon Fraser University in Vancouver, Canada, as professor in the combined department of sociology, anthropology, and political science. Here, he completed his final trilogy. He rewrote *The Birth and Death of Meaning* ([1962b] 1971) for its second edition, integrating the theme of the denial of death into his basic theory of human nature. With the added richness of a decade of life and study, this book is the best introduction to his mature work. *The Denial of Death* (1973) is based on the concept of a basic paradox in human nature—self-body dualism—which is the

origin of human tragedy. Man is haunted by the inescapable contradiction that he knows his body is imperfect and doomed to death, yet can imagine and desire perfection and immortality. This contradiction generates anxiety. For man is plagued both by the desire to expand in the search for self-validation and by the desire to constrict in the search for safety from death and meaninglessness. The terror of death is mastered through denial, by means of the affirmation of its opposite: the "reality" of self and society. But death cannot be evaded. Hence, self and society are vital lies, or illusions. They are vital because meaningful social action depends upon them. But they are lies because they blind us to our basic creatureliness.

In his third work during these years, the posthumously published *Escape From Evil* (1975), Becker further developed the idea that everything man does is an ultimately futile attempt to transcend his creatureliness. Everything he does, therefore, is religious and heroic, but fictitious and fallible. The illusory ground of our immortality mechanisms creates in us a sense of guilt, which Becker defines as hesitation in fear that one has expanded too far to be sustained by one's limited powers. To overcome guilt, man, like other animals, must draw power from external sources. But for the symbolic animal, power is symbolic. One mechanism for drawing self-power from others is transference, which Becker believed no one could live without. Transferences are loci of safe operation. But when they are excessively narrow, as they tend to be under modern conditions of alienation, they become loci of repression and unfreedom in the web of other persons.

Another mechanism for symbolically increasing self-power is sacrifice, a primitive ritual for increasing the pool of life power in the group. This same mechanism is the basis for the ostensibly secular practices of the vendetta, the blood feud, scapegoating, and prejudice. It appears in interpersonal sexual form as sadism—the ritual increase in one life force at the expense of another. Money is also an immortality vehicle. Becker suggests that man's basic striving for immortality takes the form of a search for prosperity, the universal ambition of mankind. Money began as a fetish symbol for God—giver of prosperity. In modern secular society our gods and chiefs are still engraved on our money; and although we have forgotten its religious significance, money continues as a symbolic source of personal power which is psy-

chologically equivalent to the denial of creatureliness, the denial of death, and the illusion of immortality. Indeed, in Becker's view, patterned social behaviors are basically religious rituals in which individuals heroically play out their immortality schemes in everyday life.

With this view of the human condition, the pivotal question for Becker became: "On which level of illusion should man live?" His answer is that man should live at the grandest heights—the religious level. Not through unreflective compliance with rules and dogma, but in the primitive Christian sense, through humility—the acceptance of creatureliness; and through faith—the transference to the Ultimate Ground of Being. At this level the psychological ideal of mental health is merged with the religious ideal of enlightenment. The ideal—typical individual is the religious hero, on the model of Buddha, Moses, and Christ, men with a self-disciplined awareness of the transient, contradictory, and fictional qualities of self and society who are open to the mystery of the cosmic forces which shape ultimate human destiny.

Many of Becker's colleagues were threatened by his efforts to merge social science and religion. By rejecting Becker, they believed they were protecting the rational—empirical tradition from possible contamination by irrational and cultic influences. Ironically, Becker's merger of the scientific and religious perspectives was for him a logical imperative of his rational approach to human nature. Nevertheless, there seems little possibility of Becker's theories being integrated into the social sciences until these sciences are open to a merger with theology.

By the summer of 1972, Becker's major work was complete. In November, 1972 he developed an intestinal obstruction which, after emergency surgery, was diagnosed as cancer. He died on March 6, 1974, at the age of 49. On May 6, 1974, he was awarded the Pulitzer Prize in nonfiction for *The Denial of Death*.

BERNARD, JESSIE

Both Jessie Bernard's life history and her sociological contributions emanate reasonable, but unyielding, defiance—defiance of family tradition, life styles, occupational trajectories, sociological paradigms, and popular myths, as well as age-related patterns. In the 14 solo books, 7 coauthored or edited volumes, 25 chapters for other authors' or editors' books, and the 60-odd journal articles, her humane, but unflinching, examination of the "givens" of sociological, and often psychological, historical, and political, phenomena bespeak challenge and critical analysis of the status quo.

Bernard's unpretentious style, in her written work as well as in her personal and professional life, has created a medium in which her often defiant, even radical, message ultimately is attended without arousing resistance. Her private history may be read as a contrapuntal theme of amiable, but undaunted, rebellion against the expectations that family and society pressed upon a female born shortly after the turn of the century and living through two world wars and the subsequent societal upheavals that were to mark the second half of the twentieth century.

Early background. Born in Minneapolis, June 8, 1903, to parents of Romanian Jewish heritage, Jessie Bernard was the third of Bessie Kanter and David Solomon Ravitch's four children. Her maternal grandmother, Betsy Kanter,

set an early model of feminine pioneering (a topic which later was to concern Bernard in her own research on academic women, black women, and early American frontier women) by her emigration to the United States as a young widow in the late 1880s. Leaving her two grown sons behind in Romania, Bettsy Kanter traveled from Transylvania to New York, accompanied only by her preadolescent daughter, Bessie. Bessie Kanter, later the mother of Jessie Bernard, worked as a young girl in the New York garment district, demonstrating her own pioneering mettle by marching for women's suffrage and chafing against her mother's refusal to let her join the union.

Almost six years later, when the brothers in Romania had arranged a suitable marriage for their sister, both Bessie Kanter and her mother returned to their native country, where Bessie married David Solomon Ravitch, a local candlemaker. Shortly thereafter, the young couple and Bettsy Kanter returned to the United States, this time, as the 1900 census records, settling in Minneapolis, where the bridegroom's brother lived (a pattern of immigration Bernard describes in an anonymously authored article, "An Analysis of Jewish Culture" [1942*b*]). Even after Bessie and David Ravitch had their own family of four children, Bettsy Kanter reigned as the "cheerful, industrious, pious" matriarch of the family.

Bernard's Jewish cultural heritage, dispensed—in daily prayers and rituals—by her grandmother, was counterpointed by the "Americanization" practices which her older sister, Clara, another pioneering influence, brought home from public school. The acculturation Bernard experienced through her sister, whom she regarded as second generation (compared to her own second-and-a-half generation status) (1978, p. 327), served as a firsthand model for understanding and empathizing with the American acculturation experience of black generations in the postslavery years. It was Clara Ravitch who "pioneered the way" (1978, p. xix) for Bernard, not yet 17 years old, to enter the University of Minnesota, in January 1920, where she was a student of Pitirim Sorokin, Alvin Hanson, N. S. B. Gras, and Karl Lashley, all before they left for teaching posts at Harvard University.

Adulthood, marriage, and social positivism. In her freshman year, Jessie Bernard audited a sociology class of another prominent sociology professor, Luther Lee Bernard, 21 years her senior, whom she served as a research assistant

and, in 1925, married. The marriage occurred in defiance of her family's serious objections to age and religious differences. During the 21 years of their marriage, L. L. Bernard created a personal and intellectual milieu infused with social positivism within which Bernard grew to maturity, but then ineluctably renounced. L. L. Bernard, with whom Jessie Bernard, as a graduate student at Washington University, coauthored *Sociology and the Study of International Relations* (1934) and *Origins of American Sociology* (1943), was a sociological heir to Auguste Comte's nineteenth-century social positivism. She received her Ph.D. from Washington University in 1935.

It was on this intellectual foundation of social positivism that L. L. Bernard based his belief in social science's potential—through scientific, particularly mathematical, methods—for objectively determining "the best way to achieve desired societal ends" (1978, p. 130). Thus, social positivism was to transfuse Jessie Bernard's personal and sociological perspective for almost two decades, from her undergraduate days and early graduate work at Minnesota through her doctoral work at Washington University, where she was trained "strictly in the measurement tradition" (personal communication, 1979). Only the mid-1940s, the shock of the Nazi Holocaust ultimately evoked her disbelief, denial, and defection—intellectually, from the social positivist paradigm, and emotionally, from her mentor—husband, who personified that position.

The death of 69-year-old L. L. Bernard in 1951 left Bernard responsible for their three young children. Thus, she personally became a reluctant pioneer in new sociological territory—the female-headed family, which was to become a major family pattern of the future, as well as a focus of her own research. Again, Bernard's personal life as widow and female family head provided the experiential background for empathetic and insightful understanding of a major emerging sociological problem.

The beginnings of an independent career. Since her arrival with an aging scholar—husband at Pennsylvania State University in 1947, Jessie Bernard had been assisted in academia by another sociologist, Seth Russell, the chairman of the sociology department and later, associate dean. Under Russell's protective guidance, Bernard "shot . . . up the academic ladder to the top in record time" (1978, p. 5). During L. L. Bernard's declining days and last illness, Russell developed a close relationship with the family, becoming a father surrogate, particularly to the

youngest child. During the ensuing two-and-one-half years, Bernard relied on Russell for emotional and familial help; however, by the fall of 1953, with her youngest child in tow, Bernard had left for Europe to study postwar trends in sociological research and to mend her emotional wounds.

Before coming to Pennsylvania State, Bernard published her first solo book, *American Family Behavior* (1942a), and in the early years in College Park, Pennsylvania, she wrote *American Community Behavior* (1949a). In both volumes, there is a "preview of things to come," a foreshadowing of later work in the early efforts to measure how well the American family was performing its several functions, success in marriage, and the degree of "institutionalization" of marriage and family norms, topics in which Bernard would maintain a lifelong, but expanding, interest.

Renunciation of social positivism and academia. Bernard's first major intellectual defiance—against social positivism—had left a permanent residue of skepticism about social science's potential for changing the social order according to any rational plan. The trail of Bernard's disenchantment with the "social-salvation-through-science creed" is traced in a series of articles between 1947 and 1950 (1947; 1949b; 1949c; 1949d; 1949e; 1950a; 1950b). Later, in *Self-portrait of a Family* (1978), she recalled her disillusionment in a "faith" she had not questioned for more than 25 years: "It took a catastrophe as overwhelming as the Nazi Holocaust to shake that faith. A whole network of intellectual, emotional, and moral roots were dug up and exposed in the process. The faith on which I had built a life was shaken, the nineteenth-century faith in the benign nature of science, a belief that it was intrinsically good" (p. 131). Although her faith in social science's capacity to shape the social order was extinguished, Bernard's reliance on research findings as the best, or only available, evidence remained a hallmark of her scholarly treatises on dating, marriage, mating, motherhood, divorce, remarriage, and female culture.

After Bernard's year in Europe, she returned to Pennsylvania State, where she continued to work on two new volumes, the first study of *Remarriage: A Study of Marriage* (1957a) and *Social Problems at Midcentury: Role, Status, and Stress in a Context of Abundance* (1957b). A year as a visiting professor at Princeton University (1959/1960), the first year in which

women were allowed to enter the front door of the university library, proved to be a lonely and difficult experience. She later recalled smiling in the faculty club at faces that did not smile back. The next year, Bernard moved to Washington, D.C., where she spent her sabbatical year. From 1962 to 1964, she commuted from Washington to teach her classes at Pennsylvania State; however, by 1964, she had decided to abandon the constraints of academic life, where she sensed it was necessary to "censor [her] ideas to fit the pattern of ideas surrounding [her]" (personal communication, 1979).

Academic women and a new intellectual thrust. Bernard's break from academia came almost simultaneously with the publication of her most significant work to that time, *Academic Women* (1964). This study of women in academia, which received the Pennsylvania State University Bell award and later the Kappa Gamma honorary award, heralded a new thrust in intellectual energy and direction; however, as Bernard herself perceived, the academic Establishment responded initially with "a great big yawn" ([1964] 1974, p. xxvii).

Academic Women explored the condition of women who taught and conducted research in academe, dispassionately examining the evidence for and against discrimination. In addressing the question of discrimination ahead of the tide, it presaged Bernard's later attempts to identify and deal with significant social issues—abortion, battered women, child abuse, the culture of poverty, female-headed families, and sexism—before they had become the incendiary social questions of the day. Among her most influential works, both despite and because of the feminist criticism levelled against it, *Academic Women* scrutinized the factors—both formal and informal—that accounted for women's subordinate role in academia, before concluding that sex was more salient than role as a status determinant. Bernard accounts for women's unequal condition in terms of their propensity to teach in colleges rather than universities, to teach rather than undertake research, to act as bearers or transmitters of established knowledge rather than "men of knowledge," to follow patiently rather than innovate boldly—without tracing the discriminatory practices that force women into such "choices."

Bernard recognizes that scientific productivity is a function of a researcher's position in the communication system rather than of his or her sex. And she describes the "stag effect," a

subtle process excluding women from the informal communication system along which emerging scientific knowledge is disseminated. Although Bernard described the palpable procedures and processes of sexism (a term not yet coined), she fell just shy of recognizing them as the informal underpinnings of discrimination. Despite highlighting the informal mechanisms by which women in academia were prevented from developing their natural academic potential, she concluded that no formal or structural discrimination existed in the Halls of Ivy. Bernard's analysis of the "stag effect's" preclusion of women from the informal academic communication network and her awareness of the relationship between innovation and a public of peers did not yet include an unequivocal recognition of the underbelly of discrimination. In *Academic Women*, Bernard senses the presence, but does not yet perceive, as she will in her later works, the crippling relationship between the informal practices and attitudes of sexism and the formal structural manifestations of discrimination.

Academic Women touched the beachhead of concern about women's condition in society just ahead of the swelling wave of feminism. The radical feminists railed against Bernard's conclusion that no formal discrimination existed and identified the informal and subtle processes she had sensed and described—but not recognized—as "sexism." After her own conversion to a feminist perspective, Bernard would side with her critics and applaud their deserved critique. But *Academic Women* was the beginning of a new surge of intellectual strength, which even the male-dominated academic Establishment could no longer ignore.

Major themes and patterns. Over the next 14 years, Bernard's work gained a new momentum, eventually breaking through the functionalist (although not Parsonian) paradigm that had held mainstream sociology in its thrall and entering the new terrain of the feminist perspective. (Parenthetically, it is relevant to note Bernard's defiance of the mythology about age and creativity.) Beginning in her sixth decade, long after conventional wisdom would have us believe creativity is quelled, she began to mine a new, related, richer sociological vein that would prove to be her strongest and most prodigious intellectual contribution.

A chronological review of four decades of Bernard's work reveals complex recurrent patterns. Themes touched upon in her early work

reemerge later, each time with greater maturity and enlarged understanding. The seeds of later books can be seen as they are unconsciously planted, often three or four volumes earlier. Ideas and insights first appear, as grains of sand in an oyster, then begin to expand, creating an irritating, insistent presence, finally culminating in an independent entity—a new volume.

A case in point is Bernard's treatment of biculturalism, first discussed in terms of Jewish immigrants in America (1942c). She later expands this theme in *Marriage and Family Among Negroes* (1966) by developing the notion of two black cultures—the externally adapted and the acculturated—within the larger white context.

The Sex Game (1968b), an interactionist approach to communication between the sexes, returns to the bicultural motif. Here Bernard elaborates the concept to depict the sexes as two large, relatively unstructured collectivities living in sexual apartheid, beset by the difficulties common to discourse between inhabitants of different cultures. In *Women and the Public Interest: An Essay on Policy and Protest* (1971), a variation of the bicultural theme is introduced: women's sphere. This variation is further explored the following year in *The Future of Marriage* (1972), probably her most widely read published work. Here Bernard conceptualizes each marital union as composed of two different, noncoinciding marriages or worlds, in which the wife inhabits her own sphere, distinct and isolated from her husband's marriage. Later, in *The Female World* (forthcoming), the concept depicted in the title is elaborated to include a complex analysis of women's station, sphere, social class, and culture. Now not only do women live in different marriages than their husbands, but they live in different families, educational systems, social strata, occupational structures, political and cultural realms, as well. In short, from the time they enter their first "pink world," women live in the female world—a highly structured society.

Bernard does not deny that women also live in the world of men, simply that they are not "of" that male world, in much the same way that an American living in Paris is not a *bona fide* Frenchman. The anatomy of the female world's unique class structure is probed, and Bernard suggests that the very subconcepts underlying the notion of social class (long accepted in mainstream—read "male"—sociology

and applied to the male world) fail to reflect the class structure of the complex world within which women spend much of their lives.

Other major themes weave in and out the fabric of Bernard's work: formal *vs.* informal discrimination; power; women as a subordinate, dependent group; "stroking" as a fundamental unit of social action; the conflict between women's family and work roles; sexism as power relationships; the deteriorating effect of housework and total responsibility for child care on women's mental health; homosociality; sex differences, including typical *vs.* characteristic differences between males and females; biological sex roles *vs.* cultural gender roles; the function of stereotypes as mechanisms for papering over the lack of fit between gender roles and individual differences; tipping points and turning points; social policy as an instrument for alleviating the disadvantages women face; the historical youthfulness of the nuclear family; and the "cichlid effect."

This recurrent and intensified exploration of themes, particularly since the appearance of *Academic Women*, represents a relentless search for new understanding, even when that enhanced perception would require relinquishing comfortable metaphors and previous interpretations. Thus, in *Women and the Public Interest: An Essay on Policy and Protest*, Bernard discusses the pervasive influence of the "stroking" or supportive function performed by females.

Although Bernard marshalls evidence that both males and females are capable of stroking (or expressive) as well as instrumental behavior, she notes that women's specialization in stroking in most cultures throughout the world contributes to their subordinate position. Harking back to the Bales (1950) instrumental—expressive dichotomy, she describes stroking as expressive, supportive behavior in which the stroker "shows solidarity, raises the status of others, gives help, rewards, agrees, concurs, complies, understands, passively accepts" (1971, pp. 88–89). Such stroking behavior, Bernard argues, is incompatible with high level occupational roles, in which instrumental, aggressive, and often competitive behavior is required.

Bernard then introduces the "cichlid effect," stemming from Lorenz' description (1963) of cichlid fish, a species in which the male's sexual drive is extinguished by fear of his partner, and the female's sexuality is similarly affected by lack of awe for her male partner. Women, she argues, are denuded of their aggression, held in

awe of males by their assignment to the subordinate stroking or supportive role—all in the name of sexuality, male and female alike. Bernard traces the crippling that depriving women of aggression inflicts on their achievement and creative potential and suggests that very high achieving women are the primary victims. Why, she asks, do *all* women have to ransom sexuality by subordination and dependency? Why do women have to sacrifice achievement vis-à-vis men with whom they have no sexual relationships? Stroking, the behavior that addresses the cichlid effect, is not singlehandedly responsible for women's inequality, according to Bernard; however, "taken in conjunction with other aspects of the 'sphere of women' . . . [stroking] is a recipe for subservience" (1971, p. 94).

By the very next year, Bernard had moved beyond the cichlid effect in her explanation of women's subordination and its link to the stroking function. In *The Future of Marriage* (1972), she makes an important distinction between the

physical power of men and the male mystique which identifies it with sexuality . . . If power is measured as the ability to conquer a woman and if masculinity is defined as such power, the subjugation of women is demanded for potency. And, in fact, such a definition of masculinity has characterized the male mystique for centuries. From time immemorial, therefore, sex has meant power to men . . . The very term *impotence* betrays the power component in the male mystique. (pp. 168–69)

Feminist paradigm shift. Replacing the cichlid effect concept with the equation between masculine power and subjugation of women was an insight born of her breakthrough to a feminist paradigm. As she recounts in the autobiographical note in *The Future of Marriage* (1972, afterword, pp. 329–330), during the gestation of that work, she had her consciousness painfully and wrenchingly raised to the feminist perspective. In the late 1960s, a growing feminist consciousness had begun to infuse the scholarship of radical women, the same radical scholars and activists who had taken her to task for failing to take that important next step in *Academic Women*.

Just as Bernard had moved agonizingly, but irrevocably, from the social positivism of her first two decades of scholarship, now she was able to make an analogous quantum leap from a functionalist to a feminist perspective. After this new paradigmatic shift, she was able to look

back at *Academic Women*, describing it as a study "conceived, researched, and written in the old-fashioned scientific and scholarly tradition, quite well-mannered and subdued" ([1964] 1974, p. xxvii).

Surveying sociological phenomena through a feminist prism cast a different, more vivid spectrum of colors than Bernard had seen before. The cool "objectivity" of social science could now be perceived more objectively as a distortion, a rationalization for remaining emotionally uninvolved in the fundamental inequities and moral dilemmas of social life. Value judgments implicit in the selection of research topics suddenly became obvious, and social scientists' responsibility for helping to redress the gaping social disparities could no longer be denied—a new variation on an earlier social positivism, an integration of previous positions. Social science now could be diagnosed as part of the problem, the same social science that, in its scholarly cool, dispassionate stance simply studied social problems and implicitly accused, rather than helped, the victims.

Social science, long the bastion of Establishment male dominance, had possessed only the male lens through which to study society. Male and female researchers alike had to view society, record its ills, but remain aloof, through that single distorting lens. Missing, until the feminist perspective developed, was the female lens, the second lens essential to complete the social stereoscope through which the images of the two worlds could be combined to produce the realistic depth, compassion, and involvement of reality.

Since that important paradigmatic shift, Bernard has studied the female world through the feminist prism, insisting upon showing her audience, reasonably but firmly, previously unseen structures. Deliberately casting only occasional glances toward the male world, Bernard reports the new feminist historical discoveries, speaking boldly for the emerging options that will reduce the loss of women to meaningless relationships and empty, literally maddening lives. *The Female World* is an incisive examination of the worlds in which women have lived separated from men—their own world of family, friendships, education, occupations, childbirth and illness, politics, art, and death. Bernard concludes the ambience of the female world is sadness; however, she makes no apologia for women or for the sex differences whose irreduc-

bility she has insisted upon both before and after her feminist conversion.

The Female World is a serious, documentary celebration of women's unique strengths and differences, on which Bernard rests the chances for the future salvation of both men and women in a postindustrial society. Sex role transcendence and shared roles may be the wave of the future as Bernard predicted (1972; 1974; 1975; Lipman-Blumen & Bernard 1979), but now the entire panoply of the female world with its complicated structure and ethos, past and present, is dealt with in still well-mannered, but this time unsubdued, tones.

An eclectic perspective ahead of her time. Earlier in this essay, Bernard's propensity to move ahead of her time in addressing the key issues that were to concern scholars and policy makers was noted. Her research was groundbreaking, not simply in terms of issues per se, but also with respect to the strategies by which she attacked her subject. Here, again, we see her most salient intellectual characteristic—critical defiance of conventional beliefs and myths.

A case in point is *Marriage and Family Among Negroes* in which she laid bare the fallacies of the "black matriarchy" and debunked the notion that black family structure was typically "broken." By careful, scholarly use of census data, she demonstrated that the modal black family structure consisted of a marital union between original spouses living with and caring for their own offspring. She traces the profound influence of the history of slavery and racism on the relationship between black women and men. Although she perceives the black female as an unwitting participant in the travail of black men, she more properly attributes the condition confronting blacks to urbanization, with its crowding, mobility, and discontinuities, as well as to unemployment and poverty. Bernard's empathetic analysis of black society within a white environment (echoing her earlier writing about immigrant Jews)—albeit with some interpretations she would now reject—led a number of her black readers to conclude that Bernard, herself, was black. She hails the importance and predicts the rise of black racial pride and suggests that the self-emancipation of blacks is the critical treatment for the black male's wounds.

Another major myth that Bernard explodes is the fiction that marriage and motherhood are desirable for women. In *The Future of Marriage*

and *The Future of Motherhood* (1974), Bernard, with Durkheimian precision, carefully demonstrates that marriage benefits men more than women and that the Western, postindustrial structure of marriage, as well as motherhood, is deleterious to women's mental health.

Analogous to her foresight in identifying timely substantive issues is Bernard's anticipation of methodological strategies ahead of the trends. As early as 1966, she advocated investigations of the differential experiences of groups born or socialized at different points in history, a method to be raised to recent prominence under the label of "cohort analysis." Her early call for longitudinal studies to offset the distortions of cross-cultural research was ahead of the vogue. Earlier still, in 1964, Bernard was using cross-national data to make key comparisons among academic women in the Soviet Union, France, Italy, Britain, and the United States—again, a methodological approach which has since gained an impressive following.

Bernard's scholarship is eclectic, spreading over a wide range of substantive areas and using a complicated palette of methodologies. Stemming from her training in measurement, Bernard's earliest work, such as *American Family Behavior* (1942a), through *The Future of Marriage* utilizes macrodata, including macrostatistics from census and other government reports, to compare the patterns of various sociological groups and to gauge the strength and trends of sociological phenomena. Later, she turned to microdata in the form of personal documents, the letters she and her children exchanged over more than 25 years, in a courageously self-revealing effort to chronicle the intimate infrastructure of family life. In her work on black marriage and family structure, as well as her most recent research on the female world, Bernard focuses on blacks and women, respectively, deliberately giving scant attention to comparisons with whites and men. Thus, she intentionally eschews measurements of blacks compared to whites, women compared to men. In defiance of traditional social science canons, Bernard makes a conscious attempt to see blacks as blacks (not as deviants from white patterns) and women as women (not as would-be males). In *The Sex Game*, Bernard moves easily to an interactionist (although neither a Meadian nor a Goffman disciple) perspective. And her shift from social positivism to non-Parsonian functionalism to feminism ultimately seems a hu-

manistic integration of the strengths of each paradigm.

Awards and honors. Recognition of Jessie Bernard's work as a major contribution to the discipline, as well as to the education of a general audience, has come from every quarter. Ironically, her ability to speak lucidly and incisively to a larger public, as well as to her social science colleagues, probably delayed her inevitable professional recognition. (She once facetiously warned a colleague whose work had been cited in the popular press to "shield your co-workers from this; how good can a sociologist be if she is worth quoting in a popular magazine?" [personal communication, 1978]).

Amiably defying professional customs and mores, Bernard declined nomination to the presidency of the American Sociological Association, as well as to a host of other organizational positions. Nonetheless, in recent years, she has been the recipient of the Kurt Lewin award from the Society for the Psychological Study of Social Issues (1976); the first emeriti award presented by Pennsylvania State University (1976); the outstanding achievement award from the American Association of University Women (1976); honorary doctorates from Hood College, Northwestern University, Washington University, and Radcliffe College; the Stuart A. Rice merit award from the District of Columbia Sociological Association (1974), as well as the merit award of the Eastern Sociological Society and the Burgess award from the National Council of Family Relations (1973).

Several awards have been established in Bernard's name, awards designed to honor those, who, like Jessie Bernard herself, have contributed intellectually, professionally, and humanely to the world of scholarship and feminism. Thus, the Jessie Bernard awards, annual prizes established by the American Sociological Association in 1976 and the District of Columbia Sociologists for Women in Society in 1978, reflect the esteem in which her contributions—intellectual eclecticism, personal courage, reasonable defiance, unpretentious humanity, and feminist sisterhood—are held.

JEAN LIPMAN-BLUMEN

WORKS BY BERNARD

- 1934 BERNARD, L. L.; and BERNARD, JESSIE *Sociology and the Study of International Relations*. St. Louis, Mo.: Washington University Studies.
(1942a) 1973 *American Family Behavior*. New York: Russell. → Includes a new introduction.

- 1942b An Analysis of Jewish Culture. Pages 243–263 in Isacque Graeber and S. H. Britt (editors), *Jews in a Gentile World*. New York: Macmillan. → Published anonymously.
- 1942c Biculturalism: A Study in Social Schizophrenia. Pages 264–293 in Isacque Graeber and S. H. Britt (editors), *Jews in a Gentile World*. New York: Macmillan.
- 1943 BERNARD, L. L.; and BERNARD, JESSIE *Origins of American Sociology: The Social Science Movement in the United States*. New York: Crowell.
- 1947 Social Salvation Through Science. *South Atlantic Quarterly* 46:44–55.
- (1949a) 1962 *American Community Behavior: An Analysis of Problems Confronting American Communities Today*. Rev. ed. New York: Holt.
- 1949b The Art of Science: A Reply to Redfield. *American Journal of Sociology* 55:1–9.

BERTALANFFY, LUDWIG VON

Ludwig von Bertalanffy was born in 1901 in Atzgersdorf near Vienna, and died in 1972 in Buffalo, New York. His interests developed early and were always wide ranging. They encompassed experimental as well as theoretical biology, philosophy of science and of man, psychology and psychiatry, theory of symbolism, history, a broad variety of social problems, and even a topic as arcane as the origin of the postal service in the Middle Ages. In most of these fields he was a true pioneer, with ideas running ahead of the dominant views of his times. In many respects he suffered a fate not unusual for pioneers: the full recognition of the validity and significance of his theories late in life or posthumously, and the subsequent reemergence of his original notions in different fields and forms, sometimes without reference to his earlier statements.

Bertalanffy received his PH.D. at the University of Vienna in 1926, but his autodidactic studies ranged far beyond the formal curriculum. While still in his teens he studied Jean B. Lamarck, Charles Darwin, Ernst Haeckel, Karl Marx, and Henry T. Buckle; while in his twenties he also felt the influence of such early biological theorists as Wilhelm Roux, Hans Driesch, and Julius Schaxel. The “as if” philosophy of Hans Vaihinger, whom he knew as an elderly man, also influenced his intellectual development. Bertalanffy was named *Privatdozent* at the University of Vienna in 1934 under the aegis of philosophers Robert Reininger and Moritz Schlick. The latter was a founder of the famed Vienna Circle of positivism, a mode of thought that did not attract the young biologist, who despite his experimental work, believed in bold theorizing, had profound literary interests, and leaned toward mysticism. As professor at the University of Vienna, Bertalanffy belonged to the philosophical and medical faculties and lectured at the Zoological Institute. In 1937, he was awarded a Rockefeller Foundation fellowship to study United States developments in biology with regard to their applicability to Austrian universities. He traveled extensively in the United States and held appointments at the University of Chicago and the Marine Biological Laboratory at Woods Hole. In October 1938 he returned to Austria, where the outbreak of World War II the next year cut off further contact with America. His house, library, and laboratory were destroyed in 1945, during the siege

of Vienna, and a number of almost completed manuscripts were lost. He left Austria definitively in 1948 and, after travels in western Europe, assumed a position as professor and director of research at the newly founded medical faculty of the University of Ottawa. During the year 1954/1955 he was a fellow at the Stanford Center for Advanced Study in the Behavioral Sciences. While there, at a meeting of the American Association for the Advancement of Science in San Francisco in December 1954, he established the Society for the Advancement of General System Theory (now the Society for General Systems Research), together with Anatol Rapoport, Kenneth E. Boulding, and Ralph W. Gerard. From 1955 to 1958 Bertalanffy was director of biological research at Mount Sinai Hospital in Los Angeles and visiting professor at the University of Southern California. His subsequent appointments included a term as Sloan visiting professor and member of the research department at the Menninger Foundation in Topeka, Kansas, an eight-year tenure as professor of theoretical biology at the University of Alberta in Edmonton (1961–1969), and finally an appointment as faculty professor at the Center for Theoretical Biology of the State University of New York at Buffalo (1969 until his death in 1972).

Throughout an adventurous lifetime, Bertalanffy combined experimental work in biology with the broadest range of theoretical interests. His biological work centered initially on a quantitative determination of metabolism; the model derived from his laboratory experiments in Vienna and Ottawa provided the foundation for the widely used Bertalanffy growth equations. He later focused on cytochemistry, developing in this field the acridine-orange technique of determining DNA (deoxyribonucleic acid) and RNA (ribonucleic acid) by fluorescence microscopy, important in the early diagnosis of cancer.

Bertalanffy's enduring interests, however, were mainly theoretical. He pioneered the "organismic conception" of biology on the Continent, publishing papers on this topic as early as 1925–1926, and a major book, *Kritische Theorie der Formbildung* (1928a), summarized his ideas. This conception was to transcend the dichotomies of a mechanistic *vs.* a vitalistic explanation of life through consideration of the organism as an open system endowed with specific properties capable of scientific investigation. Together with the related concepts of levels

of organization and of the "active" as opposed to the "passive" (or reactive) organism, it constituted an early statement of a "holistic" theory of life and nature. Bertalanffy's organismic conception appeared a few years after Alfred North Whitehead published his first essays on the philosophy of organism (Whitehead 1920). However, Bertalanffy was not aware of Whitehead's writings, which then were little known on the Continent. Moreover, unlike Whitehead, he attempted to provide usable hypotheses for working scientists rather than a general philosophy. He elaborated the original organismic conception in *Theoretische Biologie* (1932–1942), *Das Gefüge des Lebens* (1937), and *Das biologische Weltbild* (1949a).

The organismic conception found a number of distinguished adherents, including Joseph H. Woodger, whose *Biological Principles* appeared in 1929, and Joseph Needham, whose conversion to the organismic concept is documented in *Chemical Embryology* (1931), *Order and Life* (1936), and *Integrative Levels* (1937). However, the conception encountered general resistance among experimental biologists, who sought to explain the processes of life by investigating physical and chemical laws on sub-cellular levels. (For example, the then authoritative textbook by Max Hartmann, *Allgemeine Biologie* [1927], contained hardly any reference to processes above the level of the cell.) The issue reemerged in the 1960s in the debates over whether life was ultimately explainable in terms of the properties of DNA and the laws of biophysics and biochemistry. Although Bertalanffy took an active part in these debates on "reductionism" (cf. Koestler and Smythies 1969), his original organismic conception was largely neglected in the literature.

The organismic conception of life, elaborated by Bertalanffy into a general theory of biology, later became the foundation for the general theory of systems. The development was logical. The organismic conception referred to the organism as an "organized system" and defined the fundamental task of biology as discovery of the laws of biological systems at all levels of organization. The task itself was taken up by Bertalanffy who, interested in the broadest implications of his conception, went beyond biology to consider psychological, social, and historical levels of organization. He conceived of a general theory capable of elaborating principles and models that were applicable to all systems, whatever the nature of their parts and the level

of their organization. He outlined the framework for such a theory in a seminar of Charles Morris at the University of Chicago in 1937 and later in lectures in Vienna. Unfortunately, the publication of the manuscript in which this "general system theory" was first described was prevented by the general upheaval at the end of World War II. Bertalanffy first published a paper on it, entitled "Zu einer allgemeinen Systemlehre," in 1949. It was followed in the next year by "The Theory of Open Systems in Physics and Biology" and "An Outline of General System Theory." The oft reprinted classical formulation of the principles, scope, and aims of the theory was given in 1955 in "General System Theory" and developed in greater detail in 1969 in the book with that title. Bertalanffy used these principles to explore a host of scientific and philosophical issues, including a humanistic conception of human nature that opposed the mechanistic "robot" conception of behaviorists and cyberneticists as failing to do justice to the spontaneous self-motivated activity of mind and body; a philosophy of mind and culture that distinguished human from animal nature in terms of the ability to use symbols; and the seeds of a new philosophy of history that revived valid components of Oswald Spengler's and Arnold J. Toynbee's theories in a perspective that saw civilizations themselves as systems.

The concept of system and the possibility of constructing system theories to explain human behavior and social progress became a major interest in the social and policy sciences almost four decades after Bertalanffy first outlined his organismic conception, and years after he began to explore the applicability of a general system theory to diverse psychological and social phenomena. Interest in systems theory was spurred by several factors, including recognition of the need for, and the legitimacy of, general theories in natural and social science, and the coming of age of modern automated technology with its concepts of cybernetic control and multichannel quasi-instantaneous communication. Norbert Wiener's classic work on cybernetics (1948), aptly subtitled *Control and Communication in the Animal and the Machine*, drew attention to the similarity between self-guided control processes in biology and technology and simultaneously encouraged expectation that through modern technology some living processes might be simulated and better understood. The study of systems became acceptable, even fashionable, among social and policy scientists. A crop of new

specialities emerged—systems analysis; cybernetics; information, decision, and game theory; communication and organization theory; functionalism; and "systems approaches" to a variety of problems ranging from urban planning, health delivery systems, and environmental pollution control, to international and world affairs. However, in the 1960s most systems theorizing drew its inspiration from relatively simple mechanistic cybernetic conceptions derived more from engineering than from biology (for a critique, see Hoos 1972). Only a handful of "general system theorists" rallied around the ideas originally proposed by Bertalanffy and elaborated and paralleled by Kenneth Boulding in economics, Paul Weiss and Ralph Gerald in biology, Anatol Rapoport in mathematics, and Karl Deutsch and David Easton in political science. These few adherents emphasized the basic concepts of irreducibility or "wholeness" of systems; their openness to energy, matter, and information; their "activeness" or spontaneity in coping with environmental changes and disturbances; and their evolutionary transformability and hierarchic organization.

In the 1970s several further developments lent support to the organismic conception of systems and credence to the eventual formulation of a fully worked out general theory. They included the Nobel prize-winning mathematical definition of Ilya Prigogine and his coworkers of nonequilibrium systems that offset their entropy production with entropy transport as they emerge through processes of alternating fluctuations and stability; the evolutionary perspective provided by Jacob Bronowski in describing the progressive buildup of complex systems (1970); Ervin Laszlo's attempts to provide a philosophical foundation for a general system theory of nature, man, and society (1972a); and a host of occasionally brilliant works in mathematics, humanistic psychology, psychiatry, management science, and policy and "futures" study.

Bertalanffy's original vision of an organismic conception in biological theory became a fountainhead for a nonreductionist and nonmechanistic systems approach, not only to phenomena of life but to problems of mind, evolution, society, and history. If general system theory is reproached for being vague and qualitative, and for failing to live up to expectations, it must be remembered that a fully quantified and experimentally confirmed general theory of systems would constitute nothing short of a master theory of evolution and of all that evolution pro-

duced in the way of life, mind, and society. The general system theory proposed by Bertalanffy is at present a "program" or "philosophy" (as emphasized by Rapoport, Boulding, and Laszlo, among others) of great vision and scope, with ample promise of bearing fruit in the biological as well as in the social sciences. This promise is demonstrated in the wide-ranging essays in *The Relevance of General Systems Theory*, papers presented to von Bertalanffy on his 70th birthday (Laszlo 1972b) and in *Unity Through Diversity* (Gray and Rizzo 1973), the two-volume *Festschrift* prepared in his honor by some 63 scholars and scientists from 12 countries.

BETTELHEIM, BRUNO

On the basis of a lifetime of clinical practice and academic research, Bruno Bettelheim emerged as one of the central figures in the reformulation and application of psychoanalytic thought both in the area of psychotherapy and in the analysis of mass society. The boldness of his formulations and the immense range of his interests make him an intellectual of immense influence. At times, he has been subject to intense debate, but with the passage of time his contributions have come to be accepted ingredients of clinical practice and of social science analysis. He was a university professor who believed in the unity of theory and practice, and who was deeply concerned with the impact of ideas on contemporary society and with the social responsibilities of the social scientist. One of his outstanding accomplishments was his

extraordinary ability to fuse together complex analytic discourse with clear and literate prose, which made his writings widely accessible.

Bruno Bettelheim in one lifetime followed three full careers, in each of which he achieved an international reputation of the first rank. As a psychoanalytic psychologist, he prepared a body of theoretical and empirical research literature which fundamentally fashioned group and milieu psychotherapy. As an educator-administrator, he was director of the famed Orthogenic School of the University of Chicago for emotionally disturbed children and teacher of generations of teachers and psychotherapists. In addition, he had widespread impact on lay audiences through his lectures and mass media appearances. As a social scientist and humanistic critic, he authored classic works on collective behavior in modern society, especially his analysis of the psychopathology of the Nazi concentration camp system. These were roles that he pursued concurrently through an extraordinarily active and productive career.

He was born in Vienna, Austria, on August 28, 1903. His parents were upper middle-class Jews who came from Eastern Europe and who were rapidly assimilated into the urban culture of Vienna. He was educated at the Reform Realgymnasium which was relatively "modern" in its curriculum and atmosphere, but which offered Bettelheim a classical continental education. After matriculating at the University of Vienna, he received his PH.D. in psychology and philosophy in 1938. In the course of his studies he spent considerable time in the humanities, especially in art history, but he became increasingly concerned with the study of psychoanalysis and the practice of psychotherapy. His work led him to an interest in emotionally disturbed youngsters, and foreshadowed his lifetime commitment to the development of residential treatment. He was influenced by the accomplishments and writings of Anna Freud, August Aichhorn, and others who were transforming the procedures of classical psychoanalysis.

Bettelheim's education included not only his formal academic training, but his exposure to the intellectual ferment of Vienna during the interwar years. Although there was a profound respect for the classics, a self-critical, inquiring, and innovative attitude was dominant. The remarkable intellectual figures who were present in Vienna during that era fashioned Bettelheim's interdisciplinary outlook and generated his con-

cern with linking dynamic psychology to social processes and social institutions.

For the time being, the increasing political tensions hardly demoralized the scholarly community. But the rise to power of the Nazis in Austria ended with one blow the Viennese scene, with deep trauma for all those involved. In 1938, after the Germans annexed Austria, Bettelheim was transported to Germany and spent one year in concentration camps—both in Dachau and Buchenwald. After his release in 1939, he was able to make his way to the United States and to start to rebuild a professional career. While the bulk of this wave of European intellectual refugees settled in New York and on the eastern seaboard, he found himself relocated in Chicago and the Midwest, a set of circumstances which deepened his integration into United States society and culture.

From 1940 to 1942 he was employed as a research associate at the University of Chicago on a project dealing with the psychology of art and with art education. He was an associate professor of psychology at Rockford College, Illinois from 1942 to 1944. During this period his health, which had deteriorated during his internment, gradually improved. In 1944, he was appointed to the faculty of the University of Chicago and soon became director of the Orthogenic School. He remained uninterruptedly at the University of Chicago throughout his academic career until he retired in 1973. Although he traveled widely throughout the United States and abroad, and lectured at numerous universities and therapeutic centers, the management of the Orthogenic School was a continuous and consuming task that dominated his work schedule. The diversity of his academic interests is indicated by the fact that he rose to the position of distinguished service professor of education, psychology, and psychiatry, in addition to his directorship of the Orthogenic School.

The core of his scholarly writings derived from his work with emotionally disturbed children and resulted in the publication of a massive series of theoretical and technical papers which were accompanied by a series of widely read books (1950; 1955; 1960; 1967). These books presented not only his general ideas and strategies, but also were rich in clinical detail. These studies were particularly noteworthy because they dealt not only with the young children and adolescents at the Orthogenic School, but encompassed the parents, staff, and social environ-

ment—that is the total lifespace of the school. Bettelheim opened his school to researchers who examined its institutional character in depth. This body of writing was an integral contribution to the shift in emphasis from classical two-person treatment systems to the development of supportive group and milieu therapy. This approach came to have a profound impact on the management of mental institutions and in turn on educational and social work practice.

Bettelheim sought to reach out and treat individuals who were deeply disturbed and who were excluded from conventional psychoanalytic treatment. He believed that such treatment was a worthy objective per se, and that it would also supply the basis for modifying family and educational practice for a free and democratic society. While he believed in the significance of psychoanalytic therapy, his long-term goal was to make dynamic psychology relevant for the educational process of modern mass society.

The focus of his therapeutic procedures centered on residential treatment. He believed that the class of patients with whom he and his staff were working came from such disorganized families and had suffered such traumas that they required a new lifespace if they were to be returned to society. In addition, he believed that treatment could not be limited to brief and periodic intervention. Instead he relied on ongoing contact between students and staff. His students had to be exposed to a staff that could engage extensively in therapeutic intervention as required by the human circumstance. In its outward manifestations, the Orthogenic School made use of a minimum amount of coercive restraint and a maximum reliance on interpersonal support. The logic of the treatment rested on the pervasive commitment of the staff to meeting the needs of the students as human beings, needs that were expressed in distorted form because of their previous traumas.

While many European refugees who specialized in psychoanalysis remained wedded to the analytical perspectives which they imported into the United States, Bettelheim was one of those few who displayed a strong sense of self-criticism and a desire to enrich their frame of reference. In the American scene, psychoanalysis was placing a greater importance on the centrality of ego functions and on ego psychology rather than continuing its traditional emphasis on the analysis and reconstruction of "instinctual" drives.

Bettelheim's theoretical writings and his strategy of residential treatment was an essential ingredient in this trend. In addition, Bettelheim himself acknowledged the importance of his exposure to American pragmatic philosophy and psychology for his work. Although pragmatism did not admit of the "unconscious," and thus of unconscious motivation, the parallel formulations of pragmatism and psychoanalysis were striking. The incorporation of pragmatic psychology into psychoanalysis by writers such as Bettelheim served to enrich and explicate dynamic theories of personality. Of critical importance was the formulation of human personality in interactional terms, rather than in conformity with stimulus response theory, and the emphasis placed on the continuity of the emotive and the rational.

The impact of the Nazi seizure of power, the events of World War II, and his enforced refugee status were traumatic events which penetrated his daily consciousness and existence. But Bettelheim responded to the opportunity for creative experimentation that the United States setting afforded his psychotherapeutic institution after 1945. Moreover, in his new found intellectual colleagues at the University of Chicago and throughout the United States, he also found powerful sources of intellectual stimulation and support for his core interests.

Bettelheim's application of psychoanalytical theory to the study of collective behavior was motivated by the same set of concerns that were at work in his approach to psychotherapy: namely, he was preoccupied with the defense of the individual against the destructive aspects of contemporary institutions; emotive energy and personal commitment were required.

After his arrival in the United States, he achieved widespread recognition with the publication of his famous paper, "Individual and Mass Behavior in Extreme Situations" (1943). The originality of his effort to examine the concentration camp in psychological and personality terms was accepted as a virtuoso performance. He traced the impact of the German concentration camp on personality and as a means for producing changes in prisoners which make them "more useful subjects" of the Nazi state. The ability of the Nazi officials to manage the internal administration of the concentration camp attracted his attention. The day-to-day administration of the concentration camp rested not merely on force and coercion. Bettelheim

focused on the process by which inmates under the brutal treatment of their captors came to identify with the camp authorities and to serve in time actively in support of their captors, the so-called identification with the aggressor syndrome. He underscored that realistic perception of the camp guards and camp officials assisted him to survive. As an inmate, his efforts to understand intellectually how the camp functioned as a social system contributed to his ability to endure its repressive impact. In his view, survival in the concentration camp, to the extent that it was possible, required the person to mobilize all of the skills and resources he had before entering the camp and to strain to approach the immediate reality in a realistic and unstereotyped fashion.

After this publication about the concentration camp, there ensued a series of major studies dealing with the relation between personality and social institutions in concrete settings. Bettelheim never presented his theories of human behavior without clinical and empirical illustration. In 1950, with Morris Janowitz, he published *Dynamics of Prejudice*, which dealt with the impact of World War II experiences on young veterans. In contradistinction to the then existing theories of authoritarian personality, the role of personal and social controls in containing hostility and prejudice was formulated. It was most difficult to identify a personality structure linked to prejudice; the ability of social scientists to describe personality structure on a group basis or in statistical terms was indeed limited. Instead the level of expressed prejudice was a function of both social and psychological factors; that is of a person's education, social position, and pattern of social mobility in interaction with his personal controls, in particular his ego strength. Out of these studies came a recognition of the markedly low level of anti-Semitism in the United States after 1945 and bold explanations of its decline.

Bettelheim was one of the earliest critics of the male orientation of psychological analysis as it was practiced during that period. Male viewpoints and the male outlook dominated psychological theory, including the central elements of psychoanalysis. Bettelheim's objective was not to develop a female psychology, but rather to make personality theories more accurate and more objective. In *Symbolic Wounds: Puberty Rites and the Envious Male* (1954), he used anthropological materials to reformulate the psychology of the "rite de passage" in order to pre-

sent a balanced analysis of male and female personality development.

The study of the concentration camp system supplied the basis for his subsequent book *The Informed Heart* (1960), in which he elaborated his argument about the limits of rationality in the defense of individuality. Bettelheim's philosophic position and his argument, based on empirical investigation, in no sense represents a rejection of rationality or rationalistic objectives. He fully avoided those intellectual trends which he thought were "scapegoating" science and the scientific method. Instead he was concerned with self-defeating limitations of a purely rationalistic psychology. He did not believe that the modern world suffered because it rejected and undermined the irrational and superstitious, but because the social institutions in mass society failed to take into account and satisfy unconscious motivation in a constructive fashion. The weakening of strong personal commitment, based on emotional energy, has had disruptive consequences. *The Informed Heart* continued the classic argument of Freud's "Civilization and Its Discontents" (1930). But because of his liberal social philosophy, Bettelheim left open the possibility of, and in fact argued for, a personal and individual solution or at least management of the dilemmas of mass society.

His continuing interest in the construction of new and alternative social institutions on behalf of the individual led him to study communal childrearing in Israeli kibbutzim, *Children of the Dream* (1969). He presented an interpretation that was highly controversial, because he sought to assess both the "costs" and "benefits"—the advantages and disadvantages—of collective child raising and personality development. He emphasized that the kibbutzim produced a new generation committed to group responsibility—values of high importance in a pioneer nation, especially in fulfilling the needs of military defense. But the result was to inhibit individuality, creativity, and individual adaptability to changing social circumstances.

His search for the psychologically significant led him to undertake an elaborate analysis of the changing character of fairy tales (1976). It represented the epitome of his elegant literary style, which in part accounted for its acclaim in humanistic circles. Bettelheim concluded that fairy tales and nursery stories had a positive function in assisting the child to master the realities of the outer world. The child was exposed to a threatening fantasy but the fact that

the parent or familiar household figure would read the story served to reassure the child. Moreover, the very fact that the fantasy was repeatedly read to the child also worked to communicate that the dangers of the external world could be mastered.

Throughout his university career he never abandoned his interest in making his theories and himself available to classroom teachers and to parents of normal children. He conducted extensive group discussions with mothers and parents which led to the publication of *Dialogues With Mothers* (1962). He wrote for and appeared in the mass media as part of his commitment to effective modern education. He was a popular teacher who had a reputation as one who made effective use of the Socratic method in order to stimulate independent thinking among his students.

He emphasized the fundamental debt to Freud's dynamic psychology to which he nevertheless had a critical stance. At the same time he acknowledged the impact on his work in the United States of the thinking of John Dewey, and remained proud that he was a member of the department of education that Dewey had helped to establish. Bettelheim's early youth gave him the opportunity to observe the ideological movements of the left in Vienna; he never accepted their political format, but thought of himself after his transplantation to the United States as committed to the liberal tradition. His reputation as a controversial figure rested not only on the boldness and originality of his writings and formulations, but on his personal opposition to totalitarianism—political and intellectual—of the left and of the right.

BICKEL, ALEXANDER M.

Alexander Mordecai Bickel (1924-1974), Sterling professor of law at Yale University, was at the time of his death one of the nation's leading constitutional authorities. In addition, he was active as a teacher, scholar, lawyer, journalist, and adviser to government officials. The range of his interests, as well as the penetration of his mind, prompted the columnist George F. Will to write of him posthumously as the "keenest public philosopher of our time."

Born in Bucharest, Romania, Bickel immigrated with his family at the age of 14 to the United States, where his father became a prominent Yiddish journalist in New York City. Bickel, though he spoke no English upon his arrival, rapidly acquired an ease and fluency in the language that distinguished his speaking and writing all of his life. He graduated from the City College of New York in 1947 and from Harvard Law School in 1949. He served as a clerk to Calvert Magruder, chief judge of the United States Court of Appeals for the First Circuit, was a law officer in the Office of the U.S. High Commissioner in Germany, and returned to serve as law clerk to Felix Frankfurter, then associate justice of the United States Supreme Court. Bickel's relationship with Frankfurter was particularly close, and the older man became a major intellectual influence upon him. In 1956 Bickel was appointed to the Yale law faculty, where he remained until his death 18 years later. During the brief span of his academic career, he published seven books, and two more appeared posthumously. Few academic lawyers publish as much in an entire career.

As a scholar, Bickel set for himself, as serious students of the American Constitution must, the central question of whether and how the

practice of judicial review—the power of the federal judiciary to set aside as incongruent with the Constitution the laws and actions of popularly elected officials—can be reconciled with the theory and practice of political democracy. An effort to summarize his intellectual legacy involves two kinds of distortion. In the first place, his thought was so rich, his insights in the course of argument so prolific and often profound, that a statement of the major features of his philosophy misses much of his genius. Secondly, his thought was in continual evolution so that positions stated, for example, in his first major work, *The Least Dangerous Branch: The Supreme Court at the Bar of Politics* (1962), were often expanded, modified, or qualified, explicitly or implicitly, in later works, including *The Supreme Court and the Idea of Progress* (1970) and *The Morality of Consent* (1975), as well as in his journalism, teaching, and conversation. These caveats, however, do not mean that his general approach was not consistent from first to last. Perhaps he became, over time, less hopeful of the capacity of judges to manage large political and social affairs, as well as more dubious of the legitimacy of their efforts to do so. He displayed at all times a complex understanding of the ways in which institutions of government and of the private order interact and limit each other's power. His thought owes much of its complexity to his Burkean insistence that most principles, in law as well as politics, be limited, nonabsolute, and depend heavily upon circumstance and context—that we be governed not by ultimates but by what he called “principles in the middle distance,” themselves subject to continual evolution.

Since the basic premise of American government is majoritarian, the power of the federal judiciary, and particularly of the Supreme Court, to thwart the expressed will of the peoples' representatives requires justification. Bickel located that justification in the Court's capacity to perform a function that the political branches of government could be expected to perform only inadequately: the explication of principle, as distinguished from expediency. “Judges have, or should have, the leisure, the training, and the insulation to follow the ways of the scholar in pursuing the ends of government. This is crucial in sorting out the enduring values of a society . . .” (1962, p. 25). Yet the Court was not to impose principle everywhere:

No society, certainly not a large and heterogeneous one, can fail in time to explode if it is deprived of

the arts of compromise, if it knows no ways of muddling through. No good society can be unprincipled; and no viable society can be principle-ridden. . . . The role of principle, when it cannot be the immutable governing rule, is to affect the tendency of the politics of expediency. And it is a potent role. (1962, p. 64)

It was in that continual tension between principle and expediency that he thought the Court and the function of judicial review must live, and the key to its ability to maintain itself was the Court's capacity, through a variety of technical legal doctrines, usually thought of as technicalities, to avoid decisions when the evolving principle had not yet matured sufficiently to be politically acceptable. The Court could, in a variety of ways, avoid legitimating what it thought would one day be unconstitutional, while at the same time avoid stating its immanent principle in such a way as to produce a head-on collision with the body politic. In this process the Court would certainly attempt to lead society and would create constitutional law that could not be discovered by traditional modes of interpretation. Judges were to extract “fundamental presuppositions” not from the document, and not from their own political sympathies, but “from the evolving morality of our tradition” (1962, p. 236). They could anticipate the evolution, and exert their moral support in one possible direction rather than another; but the Court could not go too far ahead of present law. According to Bickel, it “should declare as law only such principles as will—in time, but in the rather immediate foreseeable future—gain general assent” (1962, p. 239).

This role of anticipating future law can be reconciled to the theory of political democracy because the Court is not, in fact, final. As the subtitle to *The Least Dangerous Branch* puts it, *The Supreme Court [must stand] at the Bar of Politics*. Bickel wrote:

The Supreme Court's law could not in our system prevail—not merely in the very long run, but within the decade—if it ran counter to deeply felt popular needs or convictions, or even if it was opposed by a determined and substantial minority and received with indifference by the rest of the country. This, in the end, is how and why judicial review is consistent with the theory and practice of political democracy. This is why the Supreme Court is a court of last resort presumptively only. (1962, p. 258)

Bickel's justification for a Court that departs from the historic meaning of the Constitution

set the terms of a debate that has increased, rather than diminished, between those who defend an "activist" Court and those who would confine the Court to traditional modes of interpreting the document. That debate is still unresolved. Post-Bickelians have not yet established the legitimacy of the introduction of judicial "principle" as opposed to legislative "expediency" into our political processes; nor is it clear that the Court is not, in fact, final in more instances than Bickel thought it is or ought to be. Finally, there remains the problem whether the Court is or can be the philosophical and self-conscious institution that Bickel's theory requires.

Bickel himself was one of the activist Warren Court's severest critics. He found its opinions often intellectually incoherent, a failing that he thought inexcusable even on that Court's own premise that it sought to do social good, largely as perceived from an egalitarian viewpoint. In *The Supreme Court and the Idea of Progress*, he argued that the Court understood the public good very inadequately. Some of its most assured pronouncements seemed irrelevant to the ways in which the society seemed likely to develop. Moreover, though he thought a Court might, perhaps must, free itself to a large degree from the written and historical Constitution, it was properly limited to a slow, evolutionary pace in the modification of doctrine. Moreover, its choice of new values had to be explained and justified. This task the Court had shirked, perhaps because it had reached results that defied reasoned justification. Arguing that the Warren Court was one of the major examples of an attitude toward law and procedures that too closely resembled those that produced Watergate, Bickel wrote:

The assault upon the legal order by moral imperatives wasn't only or perhaps even the most effective assault from the outside. It came as well from within, in the Supreme Court headed for fifteen years by Earl Warren. . . . More than once, and in some of its most important actions, the Warren Court got over doctrinal difficulties or issues of the allocation of competences among various institutions by asking what it viewed as a decisive practical question: If the Court did not take a certain action which was *right* and *good*, would other institutions do so, given political realities? (1975, p. 120)

That, for Bickel, was deeply, profoundly wrong. "It is," he said, "the premise of our legal order that its own complicated arrangements, although subject to evolutionary change, are more im-

portant than any momentary objective" (*ibid.*). Perhaps in the long run Bickel's insistence upon the centrality of process, close reasoning, and intellectual coherence will come to seem more important than his justification of a Court that evolves new constitutional principles. Perhaps, indeed, those two major strands of his thought may come to seem in opposition to one another.

Outside of his central work on the theory and practice of judicial review, Alexander Bickel's interests and work ranged widely. He was given a joint appointment in Yale's history department. At the time of his death he had nearly completed a volume of the Holmes Devise History of the Supreme Court of the United States. For 18 years before his death he wrote continually for the *New Republic*, contributing articles, reviews, and unsigned notes. He wrote also for other magazines, some of his best work appearing in *Commentary*, and for scholarly journals. He testified frequently before congressional committees, drafted legislation, and advised politicians of both parties. He was lead counsel for the *New York Times* in the Pentagon papers case, a landmark first amendment controversy. At the time of his death, shortly before his fiftieth birthday, he had turned from concern with the Court and the Constitution to plan more wide-ranging work in political philosophy.

BOGARDUS, EMORY S.

Emory Stephen Bogardus (1882-1973) could have served as the prototype of the American

sociologist for his era. He was a scientist, a teacher, a philosopher, and an activist. He was committed to his profession, to his students, to his family, and to his university and world communities. Born in Belvedere, Illinois, descended from the earliest Dutch and English settlers in the New World, he completed his M.A. in philosophy and psychology at Northwestern University in 1909.

Bogardus received a Northwestern University Settlement fellowship in 1908, and during his year as director of Boys' Clubs at the settlement, he met Edward A. Ross of the University of Wisconsin, who, through his informal remarks at a dinner, introduced Bogardus to the science of sociology.

Ross had both direct and "sleeper" effects on Bogardus' career in sociology. Bogardus had, and continued to have, a person-centered theory of the causation of human social conditions. During his work at the settlement, he asked: "Can these tireless, restless denizens of the street become interested in practical and useful activities . . . ?" (quoted in 1962, p. 42).

When Ross came to visit the settlement, he explained to Bogardus "that sociology was engaged in studying the underlying causes of social problems, social inequalities, social conflicts, and how these situations were the result of social processes" (1970*b*, p. 120). Bogardus had found the bridge between his humanitarian philosophy and his intellectual quest for valid and reliable information about human behavior.

Inspired by his meeting with Ross and encouraged by him, Bogardus called on Albion W. Small, head of the department of sociology at the University of Chicago. He was offered and accepted a scholarship which, when renewed, provided funds for him to complete his doctorate at the University of Chicago in 1911.

Whether Bogardus foresaw the impact that the University of Chicago would have on him is perhaps irrelevant. The fact is that Small, James Rowland Angell, Robert E. Park, George Herbert Mead, Charles R. Henderson, and W. I. Thomas produced such ferment through their interactions as well as their individual achievements that he could hardly have avoided being tremendously influenced. From Small, he learned sociological theory; from Thomas, the technique and application of the method of gathering life histories by personal interview in order to learn more about the development of attitudes; and from Mead, the sociological aspects of role play-

ing (1962). Park, although never one of Bogardus' teachers, urged him to develop an objective instrument for measuring human reactions in the field of race relations, and this proved to be one of Bogardus' most important contributions to social science (1967, p. 1). Along with Bogardus, this powerful core of scholars at Chicago attracted such students and faculty as Ellsworth Faris, L. L. Bernard, William Fielding Ogburn, Harold D. Lasswell, Charles E. Merriam, Louis Wirth, Herbert Blumer, Samuel A. Stouffer, and Robert Redfield.

Bogardus continued his interest in psychology at Chicago, and his work under the direction of Harvey Carr resulted in the publication of "Experiments on Tactual Sensations of the White Rat" (Henke & Bogardus 1911). Angell and Henderson were members of his dissertation committee and his thesis, *The Relation of Fatigue to Industrial Accidents* (1912), could have been in psychology quite as logically as in sociology. Theory and method were as important in his studies as findings had been to most of his predecessors, and the label of the discipline in which he worked did not seem to present any kind of barrier to him, although after his Chicago days he consistently identified himself as a sociologist. Upon completing his dissertation, Bogardus accepted a position as assistant professor at the University of Southern California, where he remained until his death in 1973.

As a social scientist, Bogardus influenced both the discipline and the profession of sociology. His philosophy that all information is useful if it is placed in a meaningful context paralleled his philosophy that all persons can contribute to the common good in some way if leaders know how to elicit appropriate contributions from them.

In 1923, Bogardus began working on *The New Social Research* (1926*b*), in which he carefully organized a sociological methodology that would procure and process large quantities of personal data. This approach reflected a combination of the methods of Thomas and Carr, the motivations of Ross and Park, and the emphasis on meaning of Mead. In 1924, he began work on the operational definition of social and sociological concepts through the use of unidimensional scales.

In 1926 Bogardus administered a social distance scale to a nationwide sample of respondents. The original purpose of the scale was to

assign a value to the degree of sympathetic understanding between members of different races, but Bogardus and many other behavioral scientists quickly found it to be useful for measuring the social distance between persons and any stereotyped category of human beings—ethnic, religious, occupational, to name a few. The Social Distance Scale became so widely used and attracted so much interest that Bogardus repeated his surveys in 1946, 1956, and 1966. It then constituted one of the largest series of sociological studies ever made using the same operational definition of the phenomenon being observed. The same instrument has been used in virtually all quarters of the globe, so that comparisons can be made through both time and space.

Bogardus observed that the mean measured reaction to racial categories by United States respondents had changed slowly over the forty years of his study, and that the range of mean distance scores had decreased more remarkably. From these findings, he concluded that Americans in general had become measurably more accepting of persons of different races. He remarked, however, that his findings did not indicate that racial distances would disappear in the foreseeable future.

Bogardus was the first president of the American Sociological Society to be chosen from a school west of the Rocky Mountains. He founded one of the largest departments of sociology in the world at the time (it became the fifth most productive of doctorates under his leadership); he founded the sociological honor society, Alpha Kappa Delta, and the sociological journal, *Sociology and Social Research*; he was the first president of the Pacific Sociological Society; and he wrote more than three hundred books and articles during his career.

As president of the American Sociological Society, Bogardus actively encouraged liaisons with sociologists throughout the world, greatly increasing the amount of interchange with non-European sociologists in particular. Although he had visited personally many European scholars and was a close friend to several of them, including Leopold von Wiese, Henri Bergson, and Florian Znaniecki, he also visited sociologists in the rest of the world, and his students have taught in many countries in Asia, Africa, Oceania, and South America as well as in Europe and North America. He regularly published "Foreign Sociological Notes" in *Sociology*

and *Social Research*, which he had subtitled *An International Journal*, with the hope that it would encourage a world-wide exchange of sociological information.

Among Bogardus' students, who were greatly influenced by him, were G. Bromley Oxnam, Meyer F. Nimkoff, Pauline V. Young, J. Max Bond, and Edward C. McDonagh.

BOSE, N. K.

Nirmal Kumar Bose (1901–1972) belonged to a generation of Indian intellectuals who combined the pursuit of ideas with active involvement in the process of national transformation. Despite his wide-ranging intellectual interests, he was out of step with the professional social sciences developing in the metropolitan centers of Europe and America, and his published work was not generally written in that Western idiom.

Bose saw himself as a cultural anthropologist and presented his theoretical framework in his *Cultural Anthropology* (1929). He excavated paleolithic sites, studied the material culture of India's large tribal population, and undertook a survey of Calcutta, India's largest city. His writings covered other academic subjects, too, including temple architecture on which he completed a definitive work in 1932. For many years he edited almost singlehandedly India's oldest anthropological journal, *Man in India*, contributed papers to it regularly, and sometimes wrote half its book reviews.

Bose had a lifelong interest in the ideas of Mohandas K. Gandhi. He had already started to edit and interpret Gandhi's writings when he met him in 1934. Later he became more intimate with Gandhi and for a brief time (1946–1947), at a crucial point in Gandhi's life and the life of the nation, was his secretary. It is impossible to understand Bose's views on society and culture without a proper appreciation of Gandhi's influence. Although not a religious man, Bose admired Gandhi for his tolerance, freedom from dogma, and radically experimental attitude toward life.

Bose had a varied career. He studied geology (B.Sc., 1921), then anthropology (M.Sc., 1925), at the University of Calcutta, taught for some time in the department of anthropology, and until 1959, was reader in anthropogeography in the department of geography. He served as director of the anthropological survey of India from 1959 to 1964, and between 1967 and 1970, he held the office of Commissioner for Scheduled Castes and Scheduled Tribes. Concurrent with his academic and professional career was his involvement in the nationalist movement, which resulted in his imprisonment, and his association with the Gandhian movement before and after independence.

Bose saw anthropology as a field science and was himself an indefatigable field worker, partly because of his training, partly because of his long association with a department of geography, and partly because of the example of Gandhi, to whom ideas meant nothing if they were not tested through experience. However, Bose's field work did not follow the tradition of either Franz Boas or Bronislaw Malinowski. Adapted to the requirements of a man concerned with the study of his own society, it was extensive rather than intensive. Bose traveled widely and continually, visiting remote tribal settlements, multicasite villages, pilgrim centers, fairs, and India's many towns and cities. He had something of the restless spirit of the medieval wanderers whom he so greatly admired.

Bose wrote extensively in English and Bengali. His English prose lacked the finish of the professional social scientist, but his Bengali was always clear, direct, and vigorous. Although he recognized that the pursuit of science had its own logic, he believed that the fruits of science should be made widely available, not stored within narrow professional confines. In his youth it was a matter of honor to work to develop indigenous institutions; thus he hardly published

abroad, and his work received little attention in the international community of anthropologists. Even in India, he contributed not only to such professional journals as *Man in India*, *Geographical Review of India*, and *Science and Culture*, but to many popular and semipopular periodicals in English and Bengali.

Bose's views on Indian society and culture are best expressed in his Bengali book *The Structure of Hindu Society* (1949), first published in serial form in the literary magazine *Desh*. In it, he combined the perspectives and methodologies of field ethnography, classical indology, and social history. In the first part of the book, he described the tribal communities of India and their relationship to the wider civilization on the basis of his own field work and that of other ethnographers, notably S. C. Roy. In the second part, he gave an account of the theory and practice of Hindu social life as they were set forth in several major classical texts. The design of Indian civilization as reflected in the classical texts closely matched the one discovered through systematic field work.

According to Bose, the two distinctive features of Indian civilization were pluralism and hierarchy—the equal tolerance of diverse modes of life and their unequal ranking on a widely accepted scale. Bose noted the tension between hierarchy (as represented by the order of *varnas*) and equality (as represented in the succession of *bhakti* movements) in Hindu civilization, as well as the tension between the collectivity (as represented by the *sannyasi*). The last part of *The Structure of Hindu Society*, an exercise in social history, analyzed the way in which the structure of Hindu society, hardly altered by several centuries of Moslem rule, was toppled by the onslaught of British imperialism and capitalism.

Bose had a special interest in India's forty million tribal people, and he wrote extensively on their material culture, religious practices, and social organization. In a seminal paper titled "Hindu Method of Tribal Absorption" (1941), he argued that tribe and civilization had coexisted in India for several millennia, and he showed how tribal communities had transformed themselves into castes by carving out niches for themselves in the larger society. Hindu civilization recognized both *jati* (caste) and *jana* (tribe). The tribes lived in relatively isolated areas; their technology was simple and their division of labor rudimentary. Sometimes, due to pressure of population, they might aban-

don their isolation and establish regular economic relations, say as basketmakers, ropemakers, or agricultural laborers, with Hindus already organized on the basis of caste. They might then abandon their tribal dialect, adopt the language of the Hindus among whom they lived, and in due course emerge as a caste or subcaste of basketmakers, ropemakers, or agricultural laborers. He also published an important paper on Calcutta, showing it to be neither an "industrial" nor a "preindustrial" city, but the product of a unique historical process (1965).

Bose had planned an analytical study of the Gandhian technique of *satyagraha* (which may be very broadly described as "nonviolent persuasion through the force of truth") based on a detailed and systematic examination of a series of cases on which he had collected materials over the years. He died of cancer on October 15, 1972, before he could put this ambitious project into effect.

BRAUDEL, FERNAND

Fernand Braudel, born in 1902 in a small village of eastern France, wrote of himself in 1972: "I was in the beginning and I remain now a historian of peasant stock" (pp. 448-449). In the period following World War II he

came to incarnate, and represented the culmination of, the so-called *Annales* tradition of historical interpretation.

He did not found this tradition. The tradition is conventionally traced to Henri Berr, who launched the *Revue de synthèse historique* in 1900. Berr argued that it was not fruitful for history to be compartmentalized into a multiplicity of separate fields; rather, historical synthesis was the essential task of historians. This view of the unicity or totality of knowledge of the social world was the first pillar of the *Annales* viewpoint.

In 1903 the economist François Simiand published a celebrated article in Berr's journal in which he attacked the then leading figures in French historical writing for giving no place in their work to repeatable, quantifiable phenomena. He argued that history was about underlying "structures" and not ephemeral, inevitably unique, "events." This view was the second pillar of the *Annales* viewpoint.

When in 1929 Lucien Febvre and Marc Bloch, young professors at the University of Strasbourg, founded the *Annales d'histoire économique et sociale*, they proclaimed by its very title the third pillar of the *Annales* viewpoint, the centrality of economic and social history to the analysis of underlying structures. Politics was virtually to be relegated to the sphere of the event and hence to that which was "dust."

Braudel came to this viewpoint slowly in the interwar years as a history teacher in a lycée in Algiers. His decision to write on the Mediterranean "ripened of its own accord" between 1927 and 1933, and even then he still thought of his study primarily as a history of Philip II of Spain (1972, p. 452). It was Lucien Febvre who suggested to him that while Philip II and the Mediterranean was a fine subject, the Mediterranean and Philip II might be a greater one (Febvre 1950, p. 217). Happily, Braudel took what Febvre himself called this "imprudent advice."

After more than a decade in Algiers and several years in São Paulo, Braudel returned to Paris just before World War II. He spent most of the war as a prisoner in the confines of Lübeck prison, where he wrote, more or less from memory, his work on the Mediterranean, ferreting out chapter after chapter to Febvre. The locus of writing reinforced his attachment to the *Annales* viewpoint, as he explained: "All those occurrences which poured in upon us from the radio and the newspapers of our ene-

mies, or even the news from London which our clandestine receivers gave us—I had to outdistance, reject, deny them. Down with occurrences, especially vexing ones! I had to believe that history, destiny, was written at a much more profound level" (1972, p. 454).

The period following World War II was the moment of opportunity for the *Annales* viewpoint, and Braudel, more than anyone, was responsible for seizing fortuna. In 1945, as in 1929, as in 1900, the *Annales* viewpoint stood in opposition to, in "combat" with, "*l'histoire historicisante*," "*l'histoire événementielle*"—the viewpoint of the French university as expressed by the historians of the Sorbonne and their journal, the *Revue historique*. French Establishment history had emerged out of the assimilation after 1871 of the historical viewpoint of Leopold von Ranke, of the belief in the existence, primacy, and retrievability of the historical fact. Febvre called it "history as written by those defeated in 1870 . . ." ([1953] 1965, p. vii).

Against the narrative, ideographic history that was practiced by the vast majority of French (indeed of world) historians, *Annales* championed "structural" history, inspired by another German tradition, that derived from Gustav Schmoller and the *Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte*, a tradition "much admired" by Febvre and Bloch, and one that rejected the universalizing and segmentalizing premises of British empiricism (Braudel 1972, p. 463). Braudel would himself point out: "Is it by chance that Henri Berr, Lucien Febvre, Marc Bloch, and myself all four came from eastern France? That the *Annales* began at Strasbourg, next door to Germany and to German historical thought?" (*ibid.*, p. 467).

If in 1945 *Annales* still found the university "hostile" to it—Braudel like Febvre found the doors of the Sorbonne closed to him—*Annales* was suddenly taken up by the "youth of the university" (1972, p. 462). All it needed was an organizational channel. It found this channel in the construction, beginning in 1948, of the VI^e Section of the École Pratique des Hautes Études, presided over by Febvre until his death in 1956, but organized from the beginning by Braudel. The field of inquiry of the VI^e Section was defined as "social and economic sciences," but its presidents have always been historians. Though it was "outside" the university, it became, nonetheless, in the following two decades, the center of most of what was creative and innovative in French history and social sci-

ence. When Braudel disclaimed, overmodestly, that he had contributed any new idea to those of Febvre and Bloch, and said that what his generation had accomplished between 1945 and 1968 was simply that "the program became reality," it was to the VI^e Section—its hundreds of professors and visiting scholars, its multiplicity of published volumes, its international role—that he was referring (1976, p. 14). Yet, despite these achievements, "in those years, we remained, in effect, marginal men and heretics, still very far from the Establishment" (*ibid.*).

It is not true, however, that Braudel contributed no new ideas. In fact, he crystallized three underlying themes latent in the *Annales* viewpoint and hence introduced them as explicit guiding concerns of research: the concept of multiple temporalities, and most particularly of the *longue durée*; the view that early modern times (1450–1750) were intellectually a crucial nexus of analysis because they were the crucible of modern capitalism; the concern with the world-economy as a locus of social action and hence as a focus of research per se.

All three themes are exemplified in Braudel's great book *The Mediterranean and the Mediterranean World in the Age of Philip II* (1949). Braudel organized *The Mediterranean* by treating the subject thrice, according to each of three social times: structure (or *longue durée*), *conjuncture*, and event. In his essay "History and the Social Sciences" (1958)—the essential complement of *The Mediterranean*—Braudel spelled out the differences in these temporalities and in the importance, for the analyst, of the consciousness of *multiple* temporalities.

While defending the importance of the analysis of long time against short time, he simultaneously defended long time against very long (or universal) time. Braudel thus brought to the fore what had been implicit in the *Annales* viewpoint from the beginning. The *Annales* viewpoint was conducting a war on two fronts: against the "historicists," to be sure; but equally against the transhistorical generalizers (Braudel cited Claude Lévi-Strauss as an example). If the long organizational battle had meant that *Annales* supporters had emphasized the struggle against the French historical Establishment, and preached the necessity of history's learning from the social sciences, the *Annales* discovered in the years of its maturity under Braudel that, on its other flank, France (and the world) was witnessing a flourishing of an ahistorical variety of "structuralism," which had nothing to do, in-

deed was radically different from, the "structural" history practiced by Braudel.

The combination of the founding of the VI^e Section in 1948 and the publication of *The Mediterranean* in 1949 had a profound impact on both French and world scholarship. Within France, in the two decades thereafter, a large number of "regional" monographs were published, each emphasizing the total perspective, the rural majority, and the collection of serial data, over the *longue durée* of early modern times. Similar monographs were written under *Annales* influence about other countries, especially Spain and Italy. In addition, a second set of monographs and *opii magni* were written about trade, banking, and other manifestations of the operations of the world-economy, whose locus was sometimes the Mediterranean, sometimes the Atlantic, and even the Pacific. The ripples outward of this scholarship transformed in very basic ways the writing both on the Ottoman Empire and on Iberian America.

Annales had an international vocation from the outset, both in terms of its mode of analysis and of the two-way flow of influence. Braudel, however, institutionalized this vocation through the role of the VI^e Section and the Maison des Sciences de l'Homme, which he founded in 1963. The network of their impact spread along traditional lines of French cultural influence: to "Latin" Europe (Italy, Spain, Portugal), Turkey (because of *The Mediterranean*), eastern Europe (particularly Poland and Hungary), Quebec, and, with greater difficulty, Germany, England, and the Low Countries.

The effect was cumulative. In 1969 the creation of the annual *Settimana di Studi* in Prato, Italy, of whose scientific committee Braudel became the president, served as a pan-European intellectual event stamped by the *Annales* spirit. In 1972 and 1973, *The Mediterranean* was translated into English, and after years of neglect in the United States, Braudel began to have the same impact there on the "youth of the university" that the *Annales* had achieved in France in 1945.

Yet at the moment of its greatest success, the *Annales* viewpoint entered an intellectual and organizational crisis. The year 1968 was the turning point. Braudel, in his eulogy of Febvre, had written: "I do not believe in ivory towers, nor in intelligence without passion. Quite the contrary, I believe . . . in the intellectual value of passions" (1953, p. 16). Thus for Braudel it was, as he said, an "irony of fate" that in May

1968 he, the heretic, became the Establishment (1976, p. 16). Perhaps he had been that already, but it had not been official.

Soon thereafter, Braudel renounced the editorship of *Annales*. Within a few years, he stepped down as president of the VI^e Section, which would transform itself into a university, the *École des Hautes Études en Sciences Sociales*.

New winds affected the "new" *Annales*, and observers began to speak of *émiettement* (splintering), some as though it were a good thing, others to deplore it. Perhaps the correct way to appreciate it is to perceive that *Annales* had finally transcended its French national origins. It was no longer merely a French school with an international vocation, but rather a "paradigm" whose fate was being "played out not only in France but on a worldwide scale" (1976, p. 17). If so, this may be counted as the most significant accomplishment of the "historian of peasant stock" of eastern France, who "loved the Mediterranean with passion, no doubt because I am a northerner" (1949, p. 17).

BRINTON, C. CRANE

In a rare moment of self-revelation, Clarence Crane Brinton submitted a short sketch of himself for inclusion in the Twenty-fifth Class Report of his Harvard College class of 1919. Written in the slightly ironic style Brinton often found congenial to his temperament, he said:

. . . at present there are still a few ragged edges on my *Weltanschauung*. The more malicious among you will no doubt understand if I say that, whereas in 1919 I thought of myself as a liberal with at least an initial capital, I now think of myself as a liberal in inverted commas. As a Harvard freshman I was an innocent rationalist and Wilsonian democrat. Even while I was an undergraduate, and with the generous enthusiasm of my tutor, Harold Laski, to fortify me, the influence of the late Irving Babbitt began to undermine the foundations of that belief. In a sense, I have been ever since trying to reconcile the contrary influences of Laski and Babbitt. Towards that reconciliation—which would no doubt be unsatisfactory to both men—I have been greatly helped by my friendship with the late Lawrence Henderson. Briefly, my earlier rationalism has been tempered by an awareness of the

place of prejudices, sentiments, the unconscious and the subconscious, in human life. . . . You may write me down as born in the eighteenth century and yet not too uncomfortable—not at any rate schizophrenic—in the mid-twentieth.

Although this is a remarkably candid statement for Brinton to make, it raises as many questions as it answers. What was the young student and the lifelong teacher of history at Harvard like and what were his own special interests? What kind of influence did Laski, so different in his passionate concern with politics, have on the young Brinton who was only five years his junior? What was the fascination that Irving Babbitt, Harvard's maverick professor of French literature who was an intransigent conservative and rationalist and violently anti-Rousseauist, held for Brinton? What unlikely bridge did Lawrence J. Henderson, the biological chemist who studied industrial fatigue at the Harvard Business School, provide between two such disparate influences?

Clarence Crane Brinton was born in Winsted, Connecticut, on February 2, 1898, to Clarence H. and Eva Josephine Crane. He was soon called by his mother's maiden name, a choice that was not without significance, for she was a strong-willed woman who, after divorcing two husbands, concentrated her emotional attention on her only surviving son. His father was a department store manager. His ancestors on both sides were, however, New England farmers, and Brinton retained an attachment to the land and the temperament of an earthy, skeptical Yankee in spite of his urbane and scholarly life.

After receiving a classical high school education, Brinton entered Harvard. He received a scholarship each year, won the Bowdoin prize in his junior year for an essay on "Lord Acton's Philosophy of history" which he wrote for Irving Babbitt, and graduated magna cum laude in 1919. Fortified with a Shaw traveling fellowship, he then sailed for France to study art for a year before going to Oxford University to take up his Rhodes scholarship. At Oxford he wrote a dissertation on the "Political Ideas of the English Romanticists" and (as one of his students suggests) acquired the Oxonian style of nimbly and wittily avoiding serious subjects. It was a style which fitted Brinton, who has been described by colleagues, students, and friends as shy and exceptionally reticent, often appearing to be "detached, casual, even flippant, some-

times cryptic and baffling" (Ford et al. 1970). At Oxford, Brinton also acquired his interest in intellectual history, a new type of history that he interpreted as the study of the "relations between the ideas of the philosophers, the intellectuals, the thinkers, and the actual way of living of the millions who carry the tasks of civilization" (1950, p. 7).

Of the nature of the influence of Laski and Babbitt, Brinton has left tantalizingly little evidence. That he preferred the younger Laski, who was "rather under the influence of Maitland and Acton than Marx and Lenin," is suggested by Brinton's distrust of "unprincipled idealists" (a phrase he borrowed from A. Lawrence Lowell) and their abstractionist schemes and his referring to Laski as "a very bold spirit at least in his younger days" (Brinton to Carlton J. H. Hayes, March 13, 1936, Harvard University Archives). Brinton dedicated what he called his "brick to the temple of scholarship," *The Jacobins: An Essay in the New History* (1930) to Laski. Often considered his best scholarly writing, the book is a study of the membership records of the Jacobin clubs that uses statistical methods to achieve a dispassionate analysis of the motivations and actions of the Jacobins. The degree of Laski's influence on the book is not discernible, but it shows clear evidence of the impact of his exchanges with Henderson. In his introduction he compared the historian's aspiration to discover uniformities, or laws, of society to that of the biologist; in his conclusion he drew on Vilfredo Pareto (a favorite of Henderson) and his understanding of the influence of men's desires and passions on their ideas and actions.

Although Brinton did not often mention Babbitt in his writings, he shared Babbitt's belief in "New Humanism," an impassioned plea for moderation, balance, and rationalism and an attack on sentimentalism. This is most evident in Brinton's book *Nietzsche* (1941), which William Langer described as a book about Brinton rather than Nietzsche. Brinton himself later recognized its lack of objectivity and came to dislike it as much as he disliked the man. It was Nietzsche's contribution to the cult of irrationality (or "romanticism" as Brinton called it) that aroused his ire. In much the same way he must have disliked Babbitt's cult of rationality that attracted so many followers. Brinton was too much of a social scientist and historian simply to excoriate the passions. He wanted to study, as objectively as possible and without

doctrinal prejudice, the role they played in the lives of men and he wanted no blinders to obscure the rich "diversity of life, the nature of purposes and cross purposes," as he said in his Bowdoin prize essay.

Such were the interests he shared with Henderson, who was impressed by Brinton's Bowdoin prize essay. The older man first discovered Pareto in 1926 and then shared his enthusiasm with Brinton. Henderson also aroused Brinton's interest in Talleyrand and advised him on the details and the conclusion of his book, *The Lives of Talleyrand* (1936b). Brinton, with great wit and irony, portrayed this seemingly wily and opportunistic man as a diplomat who, like Machiavelli, saw the world as it really was and was thus able to achieve remarkable diplomatic successes. He contrasted Talleyrand's realism with Woodrow Wilson's idealistic and bungling diplomacy. Brinton wanted to deliver the much maligned Talleyrand from the distorting pens of those historians who announce "rather loudly that the historian is a scientist" while in fact they are making moral judgments and writing "violently partisan history" (1936b, pp. 15, 18). Brinton's pleasure in his subject and his zeal for the mission led him, as he admitted later, to overshoot his mark and be overly flippant.

Although *The Lives of Talleyrand* is Brinton's most Hendersonian book, the shadow of Henderson's influence is also evident in his two books on revolution, *A Decade of Revolution* (1934) and *The Anatomy of Revolution* (1938). The first is a study of the French Revolution which, lucidly and engagingly, attempts to portray the forces of change that made the revolution and the effects of that event on the lives of ordinary people. The second is an effort to delineate the stages through which every major revolution must move. It initiated a scholarly debate on theories of revolution. In both books he used an analogy drawn from pathology. He compares revolution to a fever. First, symptoms of the coming disturbance appear. Then the disease fully discloses itself, "and we can say the fever of revolution has begun." A crisis follows, often accompanied by delirium (the Reign of Terror), then convalescence and a return to equilibrium ([1934] 1963, p. 1; [1938] 1952, pp. 16-18). It is the kind of physiological metaphor that appealed to Henderson. Although the books use a conceptual framework drawn from the natural sciences, they are primarily historical and are an interchange with

such men as R. M. Johnston, with whom Brinton began his study of the French Revolution, Albert Mathiez, Georges Lefebvre, Brinton's lifelong friend Leo Gershoy, and other historians.

Having seen in the depression, the rise of fascism, World War II, and the postwar world a threat to the "good democratic" life that he held so dear, Brinton's postwar books carry a heightened sense of the need for understanding and knowledge. Many of them are surveys which draw on Brinton's great wealth of knowledge; others are addressed to specific political and cultural problems in the postwar world. Aimed at a larger public than his scholarly studies were, Brinton called them an attempt at "haute vulgarization." They indicate that Brinton always remained a "child of the Enlightenment," as he frequently called himself, in spite of his skepticism. The books were widely read in the United States and Europe.

Brinton shared his interests with a wide variety of scholars and students through his teaching, books, articles, reviews, his voluminous correspondence, speeches, and his membership in many clubs and societies with such engaging names as the Chance, Love, and Logic Society, the Star Chamber, and the venerable Saturday Club. The most important society for scholarly exchange of which he was a member was unquestionably the Society of Fellows at Harvard. Founded largely through the efforts of President A. Lawrence Lowell (who anonymously gave the necessary capital when the Harvard Corporation turned down his request for funds), Alfred North Whitehead, and Henderson, the society was designed to avoid what Lowell called the "mass production of mediocrity," that he felt was characteristic of existing PH.D. programs, by providing support and encouragement for the "rare and independent genius." Brinton, a senior fellow, was the society's chairman from 1942 to 1964. Its members often discussed problems of the methodology of the social sciences and revolutionary theory, and there was a remarkable interplay of ideas among men of very different backgrounds and disciplines (Brinton, disliking controversy, refused to raise the question of admitting women while he was chairman). Thomas Kuhn's *The Structure of Scientific Revolutions* (1962) was one of the many fruits of this intellectual exchange.

Brinton died in 1968 a few months after he retired as professor emeritus at Harvard. He was still planning to write the one book he had

never found time to write—a description of the little known roads and rambles of New England.

BROGAN, DENIS

Denis William Brogan (1900–1971) was born in Glasgow, Scotland. His father, who was born in Ireland, had emigrated briefly to the United States, but had returned to Britain to settle in Glasgow as a merchant tailor, and Brogan grew up in a home where interest in Ireland, America, and Liberal politics was strong.

After early education at a parochial Roman Catholic primary school, Brogan proceeded, via Rutherglen Academy, to Glasgow University, intending to study medicine, but soon switching to history when he found that he lacked the practical skills necessary for clinical work. After taking his M.A. in 1923 he proceeded for further historical study to Balliol College, Oxford. His principal tutor was Humphrey Sumner, the Russian historian, subsequently warden of All Souls College, but Brogan's American interests were also powerfully stimulated by contact with Samuel Eliot Morison, then in Oxford as the first holder of the Harmsworth chair of American history. At Balliol Brogan formed two lifelong and influential friendships, with Darsie Gillie, later the *Manchester Guardian's* Paris correspondent, and Norman Robertson, later Canadian high commissioner in London. In 1925 he went to Harvard University as a Laura Spelman Rockefeller fellow for two years of graduate study. But by now Brogan was essentially an autodidact, and although Harvard counted a good deal in his development, firsthand experience of America counted for more. For the rest of his life Brogan was a kind of intellectual oceanographer, indefatigably recording every shifting current of American life, public and private.

Returning to Britain in 1922, Brogan worked briefly on the *Times* (in him the gifts of the journalist were as innate as those of the scholar), before taking up successive appointments in history and politics at University College London, and at the London School of Economics. It was at the L.S.E. that in 1933 he wrote his first book, *The American Political System*. The book represented a total breakaway from the pre-

scriptive and theoretical approach to political science then dominant in Britain, reverting to the earlier tradition of firsthand observation and historical elucidation of James Bryce (also a Glasgow and Balliol man). Brogan's book, in its vividness, objectivity, and relish for the diversity of the American political experience, revealed a new America to British readers, academic and otherwise, who had been accustomed to view the country, when they were conscious of it at all, through the spectacles of the "hands across the seas" tradition or through the lenses of the sensational press. The book stressed the distinctiveness of American politics, its roots in the American past, and the social and economic environment that shaped it.

Hardly had *The American Political System* appeared than the coming of the New Deal transformed much of the political scene that it had described, and in 1954 Brogan revised his exposition in a work of comparable scale, *An Introduction to American Politics*. In one sense the *Introduction* was a reworking of the *System*; it utilized essentially the same categories of treatment, placed a comparable emphasis on the political process, reflected an equivalent belief in the dominance of historical forces and the same lack of interest in the administrative side of government. But in its range of material, its fecundity of illustration, its responsiveness to all the new factors shaping postwar America, the *Introduction* is a new book.

Alongside these major interpretations of American politics there flowed from Brogan's pen, during these years and after, a stream of occasional writing ranging from articles for the learned journals to what were virtually newspaper dispatches. To Brogan, the occasion, the auspices, and the audience made relatively little difference; neither by diminishing his notorious allusiveness nor by ballasting his sprightly prose with pompous periphrases did he seek to demarcate his scholarship from his journalism. It was a rare *pièce d'occasion* of his which did not contain some arresting idea or novel detail, an even rarer learned article which contained nothing to entertain or amuse. A selection of these appeared in *American Themes* (1947) and *American Aspects* (1964); the latter contains the justly celebrated essay, "The Illusion of American Omnipotence."

Brogan's devotion to American history is reflected in no major work. *The American Problem* (1944b) is a wide-ranging series of essays on the historical factors which have shaped

America's place and America's dilemmas in the postwar world. *The Era of Franklin D. Roosevelt* (1950) has the freshness that comes from the author's intimate acquaintance with the period and personalities described, but in scale and treatment it is a minor work. The accidents of Brogan's professional career may provide in part an explanation of this, in that he never held an academic appointment specifically in the American field (there were, in any case, very few such in the Britain of these years). From the L.S.E. he returned in 1934 to Oxford, as a fellow and tutor at Corpus Christi College. There the nature of his teaching duties invited him to venture into another area where, in any case, private circumstances, in the form of his wife's archeological activities, provided a supplementary stimulus. This was the history and politics of France. In fact, *The Development of Modern France, 1870-1939* (1940) is easily Brogan's longest work, more than twice the length of *The American Political System*. As a guide and stimulus to British understanding of her nearest neighbor, the book merits comparison with its American forerunner. For the first time the tangled and seemingly inconsequential events of the Third Republic were reduced to a narrative which, if sometimes too tightly packed, made sense of the story in terms, once again, of the legacy of the national past and the constraints, physical, social, and economic, of the present. The same qualities, on a smaller canvas, mark *The French Nation* (1957) and a volume of essays, *French Personalities and Problems* (1946a), which largely deals with the subsequent France of World War II.

In pre-World War II Britain there was a conspicuous lack of academic vacancies suitable for a man of Brogan's protean capabilities. Consequently, when the chair of political science at Cambridge fell vacant in 1939 on the retirement of Ernest Barker, Brogan accepted the offer of the post even though its subject matter lay at a tangent to his main interests. In fact, owing to the outbreak of war, Brogan did not move to Cambridge until he had completed a characteristically intensive bout of war service (he served in various capacities, but most notably as intelligence officer in the British Broadcasting Corporation's European Service and as adviser to its North American Service, providing each with a sustained and apposite flow of guidance and information derived from his encyclopedic knowledge of France and the United States).

Assuming his professorial duties at Cambridge after the war, Brogan was, for so notoriously allusive an author, unusually explicit and frank in his inaugural lecture: "The study of politics, as seen by me, is first of all and, perhaps, last of all, the study of the means whereby liberty and authority may be best combined" (1946*b*). He went on to express his skepticism about the possibility of a science of politics and to warn against imposing on the teaching of politics "a degree of abstractness or bogus neutrality which it cannot stand." Instead, he avowed his own conviction that the teacher could and should relate politics to history—"present politics is always at least half history"—and bring to bear on contemporary problems "the great minds of the past." He was frank about his own approach: "I am by equipment, by temperament and by limitations, a student of political institutions. I am incapable of changing, of becoming a political philosopher or a philosophical historian."

Indeed, in the conventional sense, Brogan was neither a system builder nor even primarily a political theorist. Yet his disclaimer went a little far. Not only were Brogan's lectures (regrettably unpublished) cogent and often bravura expositions of the history of political theory; he also had contributions to make of his own at the point where theory and institutions meet. *The Price of Revolution* (1951) is, at the very least, a searching examination of the applicability of political theory to political practice, an analysis of the effects on political and social life of the ideas of violent and revolutionary change. Moreover his *The American Problem* (1944*b*) is essentially a study of the formative roles in American history of tenaciously held American ideas and ideals and their implications for America's functioning in the postwar world. Both books are informed by Brogan's deep and intuitively liberal cast of thought. Though no doctrinaire laissez-faire-ist, he stood to one side of the fashionable socialism of postwar Britain and, although without bigotry, was more readily aware of the menace of a totalitarianism of the left than many of his scholarly contemporaries on either side of the Atlantic.

Despite the conscientious discharge of his professorial duties, it was the United States that continued to dominate Brogan's interests during his Cambridge years (a fact by no means to the university's disadvantage at a time when it lacked any denominated posts in American his-

tory or politics). The scholarly products of these years, mostly listed above, are marked by certain common characteristics. Brogan's interest in things American was rooted, in the first place, in a deep affection and intense relish for the variety and vitality of the United States. No one has better captured the sparkle and color of the American experience. Yet he never mistook surface appearances for underlying reality. He wrote as a pluralist and a pragmatist, devoted to the liberal, suspicious of the conservative, values of American society, and swift to pounce on the pompous, the pretentious, and the sham. Similarly, beneath the gaiety and vivacity of Brogan's almost uniquely wide-ranging depiction of America's past and present, there always lurks the stern moralist and the equally severe cultural mentor. To Brogan the observer, nothing is alien or insignificant; to Brogan the critic, values do not change when they cross the Atlantic or don modern dress. If his writings continue to have significance for the student of American history and politics, it lies in their distinctive combination of avidity for all the details of the American experience with an unsleeping awareness of the relativity of that experience. Not for nothing was Brogan a scholar of America *and* France. Though the points of intersection of the two cultures are limited and perhaps not crucially significant in themselves, they provide each other, perhaps for that very reason, with a set of contrasts and comparisons. Brogan had a remarkable gift for holding in his extraordinarily capacious memory something very like the total experience of these two societies and using their resemblances and differences to sharpen awareness of the distinctive character of each. As such, he is a constant prophylactic against parochial historiography, against illusions of American (or French) exceptionalism, against the latent menace of "un-American" as a value judgment. Other scholars may reasonably be judged to be greater authorities on the experience of either society; none has so effectively informed his understanding (and ours) of the one by his engagement with the other.

Brogan retired from his chair in 1968 but remained in Cambridge active as a writer and lecturer until his death in 1974.

BURKE, KENNETH

Kenneth Burke, born in 1897, has been influential in many fields: literary criticism, literary theory, semiotics, and rhetoric, as well as ap-

plied psychology, sociology, anthropology, philosophy, and religion. His wide influence has always been somewhat informal and indirect. Although he has taught and lectured in many colleges and universities in the United States, he has always remained somewhat on the margin of the academic world. He has not produced a "school" of explicit followers in any of the disciplines he has worked in, although he has been a decisive influence on many important writers and teachers. He has come to be recognized as one of America's most innovative twentieth-century literary and social theorists.

Although Burke's work may seem characteristically "American" in being homespun, eclectic, and miscellaneous, in the tradition of Emerson, Charles S. Peirce, or William James, it has in fact a constant focus, a consistent curve of development from the beginning on, and a constant set of decisive "sources." The sources include Aristotle, Coleridge, Bentham, Marx, and Freud; equally important, however, are the native American traditions of pragmatism and behaviorism. All of Burke's writing is characterized by a kind of pugnacious flexibility or playfulness, a desire to see things differently and upset the apperception of received opinion or institutionalized assumptions. His focus has always been on "man as the specifically symbol-using animal." This focus has meant a primary interest in language or signs generally, in relation to nonsymbolic bodily motion, in one direction, and to the realm of manifold social motivations, in the other. The center of Burke's investigations has always been language as a form of "symbolic action." Language for him is always designed to do something or to work as "a strategy for encompassing a situation." A text, he would say, whether it is a poem, a philosophical treatise, or a corporation executive's letter to stockholders, is the "dance of an attitude." The curve of Burke's development has remained within this single channel, moving back and forth between the analysis of a great variety of philosophical, social, and literary texts, on the one hand, and wide-ranging theoretical formulations, on the other.

Kenneth Burke was born in Pittsburgh. He spent his first years in a lower-class suburb there. The contrast in Pittsburgh between the vast smoky concentration of industrial power and the threatened remnants of an original natural beauty gave him an abiding (and prophetic) insight into the problems of "ecology." His early life also gave him a permanent sus-

picion of technology. He attended Ohio State University for a semester in 1916, then, after a brief time at Columbia University, abandoned a promising academic career to devote himself to writing. In 1918 he moved to Greenwich Village in New York, where he began a long-term association with such *avant-garde* writers as Malcolm Cowley, Matthew Josephson, Hart Crane, and William Carlos Williams. In 1922 he bought a farm near Andover, New Jersey, which he has made his permanent home. He worked as editor and writer for some of the important "little magazines" of the time: *The Dial*, *Secession*, and *Broom*. During this period he published much short fiction and a novel, as well as his earliest important criticism.

Burke's first collection of critical essays, *Counter-statement*, was published in 1931. He has worked out the implications of that first book in the multitude of books and essays that have followed. Service as a lecturer in criticism at the New School for Social Research in 1937 was the beginning of a career as university lecturer. From 1943 to 1961, with intermissions, he was professor of criticism at Bennington College in Vermont. He has taught or been appointed a research fellow at many universities and colleges, among them the universities of Chicago, Harvard, Wesleyan, Princeton, California (at Santa Barbara and at Irvine), and Pittsburgh, the Center for Advanced Study in the Behavioral Sciences, and the Princeton Institute for Advanced Study. He has received many grants, honors, and awards for eminence in humanistic and social studies.

A useful survey by Burke of his own development is the "Curriculum Criticum" he prepared for the 1953 reprinting of *Counter-statement*, and then extended further in a 1968 paperback edition.

Although *Counter-statement* may seem to differ from Burke's later books in its "aestheticism" and in its focus on such "art for art's sake" writers as Flaubert, Pater, Gide, and Remy de Gourmont, this first book is already characteristically Burkean in springing, as he says, out of the notion that dramatic or symbolic action forms the basis of all literature; in its concern with the revealing of motives that may be hidden under the aesthetic and representational surface of a work; and in its movement from the interpretation of particular works toward formal, rhetorical, or methodological generalizations. An example is the "Lexicon Rhetoricae" near the end of *Counter-statement*.

Burke's next book, *Permanence and Change: An Anatomy of Purpose* (1935), shifts from "the individualist emphasis of his earlier aestheticist period" to "interdependent, social, or collective aspects of meaning": "communication, interpretation, orientation, integration, cooperation, translation, simplification." Burke introduces in this book one of his most productive strategies, what he calls "perspective by incongruity." This is a Nietzschean technique of viewing a process or relationship through the lens of an unfamiliar terminology or metaphor. "Perspective by incongruity" is a codification of the linguistic nimbleness, the ability to shift from one code to another, and to translate vocabularies into one another, that has always characterized Burke's way with words. The emphasis in *Permanence and Change* is on the universals of social organization and communication in man the symbol-using animal, whereas the next book, *Attitudes Toward History* (1937), tries to "characterize tactics and patterns of conflict typical of actual human associations." This book analyzes the way even the most idealistic aims lead to less than ideal results when they are embodied in institutions or practical human activities. Burke calls this the "bureaucratization of the imaginative."

These two more or less sociological books were followed by one of Burke's most useful books for literary study: *Philosophy of Literary Form: Studies in Symbolic Action* (1941). This collection of essays and reviews exemplifies his notion that the surface patterns of a text will manifest, with proper translation of its terms, a cryptic symbolic action taking place behind the scenes. The theoretical groundwork behind such practical essays in interpretation was developed in the two books that followed: *A Grammar of Motives* (1945) and *A Rhetoric of Motives* (1950). They were to have been completed by "A Symbolic of Motives," which has never been published as such, though its outlines are clear enough from Burke's later books and essays, such as the large collection of periodical essays, *Language as Symbolic Action: Essays on Life, Literature, and Method* (1966). The *Grammar* works out the five key "dramatist" terms: act, scene, agent, agency, purpose. This pentad is based on the assumption that "any complete statement about motives will offer *some kind of* answers to these five questions: what was done (act), when or where was it done (scene), who did it (agent), how he did it (agency), and why (purpose)." *A Rhetoric of Motives* moves, with

many examples, back into the social realm of persuasion, but now with a special concern for pyramidal or hierarchical relations of higher and lower, up and down, in any bureaucracy, social order, or institution.

One of Burke's basic insights has always been into the way any system of language or other signs, even the most secular, takes on a structure like that of a metaphysical or religious system of terms and has its own "god terms," its own equivalents of heaven and hell, and the like. *The Rhetoric of Religion: Studies in Logology* (1961) reverses this perspective. It attempts to show, by way of interpretations of "Verbal Action in St. Augustine's *Confessions*" and of the first three chapters of Genesis, that "words about God" (theology) can be applied to a wholly empirical end, for the light they throw upon 'words about words' (logology)."

Burke's work will remain seminal for the wide range of disciplines he has influenced. He is a powerful model as much for the examples he provides of how to do things with texts, for his wonderfully exuberant, daring, and challenging interpretations, as for the bold but always somewhat incomplete system-building. In this he is true to his own principles, which are based on a sense of the constant mobility in any symbol system and on the notion that any piece of language—for example an essay on a particular poem or philosophical essay—must have a local purpose. Burke's own work has always itself been a strategy for encompassing a situation. His work of the 1930s was surprisingly prophetic of developments in the 1960s and 1970s in the humanities and social sciences, Parisian "structuralism," for example, or the "paradigm shift" initiated by linguistics, psychology, and Wittgensteinian trends in philosophy. This shift is from a constative or descriptive to a "performative" view of language. Burke's view of language has always been "performative." Nevertheless, he remains true to his behavioristic bent, to his sense that nonsymbolic bodily motion underlies even the most elaborate symbolic system and can never be happily coordinated with it. This means the belief that there is always a trustworthy referential dimension to words, along with their participation in elaborate processes of symbolic action that transcend the body and can never be reconciled with its sheer motion. As Burke puts this in an essay exemplifying the development of his thought in the 1970s: "In every tribal idiom, however rudimentary, there is a wholly reliable basic correspondence be-

tween a thing and its name; never the twain shall meet" (1978). In that "never the twain shall meet," in Burke's sense of "the unresolvable polar relationship between symbolicity and the nonsymbolic realm of motion" (*ibid.*), Burke's thought has remained from the beginning; but the ever-dissatisfied movement from one pole to the other has generated his remarkably fecund series of books and essays. In spite of his exuberance, Burke's sense of the incompatibility of these two poles has made his work to some degree somber, even "tragic," appropriately enough for someone whose orientation has always been "dramatistic."

BURNS, ARTHUR F.

Many of America's great economists have come to the United States from other lands. Arthur F. Burns, born in Austria in 1904, emigrated to the United States with his parents in 1914, and became one of America's most prominent economists. He found many opportunities in his chosen profession: a university professor for many years; an economic researcher; director of research and later president of a famous economic research institution; president of the American Economic Association; adviser to several presidents of the United States; and chairman of the Board of Governors of the Federal Reserve System. At the same time, through his teaching, guidance of the economic investigations of others, thoughtful and expert advice on economic policy, and role in managing a vital segment of that policy, he has enhanced the capacity of others to find their own opportunities.

Burns's professional career has been devoted largely to the study, and in recent years to the amelioration, of economic fluctuations. Secular trends, seasonal variations, cyclical movements—all have occupied his scholarly attention at one time or another. During his eight years as chairman of the Board of Governors of the Federal Reserve System, he became best known as America's inflation fighter. He was concerned about this problem because of the hardship he saw it create for so many people who were not in a position to adjust to a general, rapid, and sustained rise in prices. He was concerned also because inflation jeopardized economic growth, produced uncertainty about the health of financial institutions, encouraged speculation, and rendered ineffective many of the instruments of economic policy that had been developed to deal with recession and unemployment. He was in a position to see at firsthand how the various types of economic fluctuation interact with one another and how they affect and are affected by international trade and financial transactions. He brought to the current problems that he had to face a broad knowledge: of economic his-

tory; of economic growth and the factors that have hastened or retarded it; of construction activity and other forms of capital investment and the processes that create it; of the causes and consequences of financial crises and economic depressions as well as the milder recessions; of the role of government, its intervention in economic life, and the practical political process; of statistical data and methods of analysis and their value and limitations. His scientific books and papers, his testimony before Congress, his addresses to public audiences and his interviews with the press all reflect this store of knowledge and its relevance to matters of present-day concern.

Burns is meticulous about words and can convey complex ideas in simple language. He rarely resorts to mathematical symbols, though his work shows a capacity to use them—in footnotes or appendixes. Part of his early training in effective writing was developed when he wrote for the financial pages of the *New York Herald Tribune* in the early 1930s. He benefited also from the literary skill of his mentor and collaborator, Wesley Mitchell. In his work at the National Bureau of Economic Research, his professional home for more than thirty years, he often evaluated manuscripts produced by the staff and would invariably make editorial as well as substantive suggestions for their improvement. He likes to write, and even during his busy life as administrator of the Federal Reserve System he composed more than a hundred essays in the form of addresses before university, banking, business, and congressional audiences that are marked by his style of expression and knowledge of the subject matter.

Burns's first major research project was his doctoral dissertation at Columbia University, *Production Trends in the United States Since 1870* (1934). The book displays many of the qualities of his later work: careful attention to the factors affecting economic decisions by business enterprises; a blend of theoretical reasoning and empirical investigation; thorough acquaintance with the statistics being analyzed and their relationship to the phenomena they are taken to represent; and a sophisticated statistical treatment of the problem of measuring the growth and decline of industries. He found retardation of growth—that is, slower growth as an industry matures—to be nearly universal, and he attributed it largely to the rapid growth of newer industries that displaced the products of the older industries. Thus, the phenomenon of retar-

dation in growth was an inherent consequence of the competitive process, broadly defined, and of economic progress. The more vigorous the competition of new industries, the more evidence of retardation there would be.

Nevertheless, Burns observed, the retardation of growth in individual industries did not imply a slowdown in the growth of the total output of the nation. On the contrary, the rapid development of new industries, which produced the retardation, was essential to the continued rapid growth of total output. Retardation might, therefore, be found everywhere, but not in the aggregate output of the economy as a whole. What was characteristic of the parts was not characteristic of, or even visible in, the whole. This, too, was a finding that affected Burns's later thinking about the conduct of economic research and of economic policy. It was essential to look beneath the surface of the aggregates, such as gross national product, total employment, the general price level, in order to discover how the economy really worked. His continued distrust of models constructed largely from such aggregates stems in part from his view that the aggregates do not adequately reflect what goes on in the economy. His later work on business cycles stressed the "unseen cycle" in the components of aggregates, the fact that "corporations do not have a common pocketbook," and the "cross-currents" that develop as a turning point in the cycle approaches. Hence, the factors that are crucial to growth are often not apparent in such aggregates as the gross national product (GNP). Burns's first report as chairman of the Council of Economic Advisers under President Dwight D. Eisenhower started with the proposition that one of the powerful forces for economic growth was the development of mass markets for new consumer goods, and the first table in the report was devoted to figures on the output of new products such as television sets, frozen foods, and room air conditioners.

Burns's early work on production trends led Frank W. Taussig, then the editor of the *Quarterly Journal of Economics*, to ask him for a review article on the Brookings Institution's four-volume study of America's capacity to produce and consume. The review was published in May 1936 and faulted the work on both conceptual and empirical grounds. The study's estimates of productive capacity were not developed with sufficient attention to the economic, as opposed to the technological, possibilities of increasing production, which led Burns to note

that "an estimate of potential increase in output, whether high or low, has little meaning unless it is accompanied by a theoretical analysis which indicates how the increase may be realized." He did not attach much significance, therefore, to the Brookings Institution estimate that in the boom year 1929 the potential national output exceeded the actual output by 19 per cent. His skepticism regarding such estimates came to the fore again many years later, when estimates of the GNP gap became an extremely important guide to economic policy. In 1967, in diagnosing the failure of economic policy makers in 1964–1965 to recognize the signs of inflation that had begun to appear and to shift to measures of restraint rather than continued stimulation, he pointed to the estimates of the gap and the theoretical apparatus behind them, which attributed the gap entirely to a shortage of aggregate demand rather than to obstacles on the side of supply or to an incomplete adjustment of demand and supply to one another.

Burns's association with the National Bureau of Economic Research began in 1930, when he was appointed a research associate. In the same year he married Helen Bernstein. The bureau, then only ten years old, was directed by Wesley C. Mitchell, one of Burns's professors at Columbia. They became the best of friends and collaborators. Following the publication of *Production Trends* in 1934, Burns turned his full attention to business cycles and to the method of business cycle analysis that Mitchell, Simon Kuznets, and others had been developing. Together with Mitchell, he set about preparing a comprehensive description of the method and an exhaustive test of its properties. A short paper on the subject, the first of several authored jointly by Mitchell and Burns, appeared in 1935. Publication of the full report was delayed during World War II, but the massive book, entitled *Measuring Business Cycles*, finally appeared in 1946. It became the "bible" of the many researchers who have participated in the bureau's business cycle studies over the years.

In 1937 Mitchell and Burns collaborated in a study, requested by Secretary of the Treasury Henry Morgenthau, that utilized the measures of cyclical behavior as a guide to the selection of the most useful indicators of cyclical revivals. They laid down certain principles that should guide the choice and applied them to the 487 American monthly or quarterly series that had been analyzed in the research program, selecting 71 that had been "tolerably consistent in

their timing in relation to business cycle revivals and that at the same time are of sufficiently general interest to warrant some attention by students of current economic conditions" (Mitchell & Burns 1938, p. 4). They further refined this list to obtain 21 series that seemed to be the most trustworthy indicators of revivals. Although this report was considered by the authors to be a "minor by-product" of the bureau's studies of business cycles, it has had a lasting impact. The sets of "leading, roughly coincident, and lagging indicators" that are in wide use in the United States, Japan, the United Kingdom, Canada, and several other countries are the direct descendants of this work, and many of the indicators originally selected by Mitchell and Burns have continued to display the same cyclical properties that they discerned in them.

Measuring Business Cycles provoked a professional controversy. Its critics claimed it was "measurement without theory," the title of a review by Tjalling Koopmans. Burns and Mitchell had devised a system of measurement without first setting forth the theory of business cycles that they expected the measurements to test—an ineffective and inefficient way to proceed, according to the critics. The more promising approach was to adopt a provisional theory (and the one favored by most of the critics was the one set forth by John Maynard Keynes some ten years before), create a mathematical model that expressed the theory, obtain the data on the variables called for by the model, and see how well the model fit these facts. During the next thirty years this became the more popular approach in academic circles, but the controversy remained alive, partly because no single theory or model took the field.

This indeed was the condition that led Burns and Mitchell to adopt a comprehensive plan of measurement based upon a descriptive definition rather than a causal theory of business cycles. Their plan was to establish what was typical about these phenomena in terms relevant to the large number of theories that had already been excogitated. Knowledge of what was or was not typical would show what a general theory had to account for. Too many theories, they believed, had been based upon an incomplete knowledge of the facts, and hence either "explained" phenomena that were not typical or failed to explain phenomena that were typical. In the event, certain parts of this measurement system came to be widely used and kept up to date, notably the chronology of business cycle

peaks and troughs, patterns of expansion and contraction based upon these dates, and characteristic lead-lag sequences. In establishing a comprehensive measurement system with a minimal theoretical structure, capable of investigating the current and past behavior of virtually any economic variable, avoiding arbitrary and therefore controversial decisions about "causes" and "consequences," and emphasizing easily comprehended results, the research strategy that Burns and Mitchell advocated bore fruit in a wider public awareness of many of the facts about business cycles that they thought should be better known "before making a fresh attempt to explain them" (Burns & Mitchell 1946, p. 4).

Burns continued to hold the view that theorizing on the basis of an incomplete set of facts posed a serious danger to the development of economic science and to its role in policymaking. Between 1946 and 1952 he wrote a series of works on this theme: *Economic Research and the Keynesian Thinking of Our Times* (1946), "Keynesian Economics Once Again" (1947), *Current Research in Business Cycles* (1949), *The Instability of Consumer Spending* (1952*b*), and "Hicks and the Real Cycle" (1952*a*). He characterized the kind of economic analysis stimulated by Keynes as "bold and vigorous theoretical speculation" that especially needed to be checked against the facts because the results of such speculation were being used to guide economic policy. "Keynesian Economics Once Again" contains a strong statement on the responsibility of an economic adviser:

An economic theorist is justified on many occasions in oversimplifying facts to clarify in his own mind what he believes to be significant relationships. He is likewise justified in bringing the results of his speculative inquiries before his colleagues, whether to seek their critical appraisal before going further or to stimulate them by his work. As long as the economist moves within these boundaries he may be excused even for not making a strenuous effort to discover how seriously he has distorted the facts by his simplifying assumptions. But when he attempts to give practical advice, he loses his license to suppose anything he likes and to consider merely the logical implications of untested assumptions. It then becomes his duty to examine with scrupulous care the degree to which his assumptions are factually valid. If he finds reason to question the close correspondence between the assumptions and actual conditions, he should either not undertake to give any practical advice, or should frankly and fully disclose the penumbra that surrounds his analysis

and the conclusions drawn from it. Better still, he should rework his assumptions in the light of the facts and see whether he is justified on this new basis in telling men in positions of power how they should act. Economics is a very serious subject when the economist assumes the role of counselor to nations. (1947, pp. 264–265)

Some five years after enunciating these principles Burns had the opportunity to put them into practice, when he became chairman of President Dwight D. Eisenhower's Council of Economic Advisers. His path to this position was, however, not a smooth one, because Congress had become disaffected with the functioning of the previous council and was not eager to appropriate funds for this purpose under the newly elected president. After several months of uncertainty early in 1953 about the status of the council, a reorganization plan devised by Burns was adopted, the main feature of which was to concentrate authority in the hands of the chairman and make him directly responsible to the president. Burns was appointed to the post. He was immediately faced with the prospect of a business cycle recession. Indeed, his nomination and confirmation as chairman of the reconstituted council came in July 1953, a date he has reason to remember because that month was later designated a peak in the National Bureau's business cycle chronology, the same chronology that Burns had done so much to establish.

Undaunted by the challenge, he stepped into the task with authority and boldness. His account of the years 1953–1954, which is contained in the January 1954 and January 1955 *Economic Report of the President*, reveals a wide range of actions taken to offset recession, encourage growth, and prevent inflation. It also reveals much of what Burns had learned in his studies of business cycles, as well as his scholarly interest in stepping back and setting forth the principles governing policy actions as well as the lessons to be learned from the experience.

The January 1954 *Report*, which expressed the view—happily correct—that the relatively “minor readjustment underway since mid-1953 is likely soon to come to a close,” states the principles that would guide the administration in dealing with the possible threat of a depression:

The first and foremost principle is to take preventive action. . . . The second principle is to avoid a doctrinaire position, work simultaneously on several fronts, and make sure that the actions being taken harmonize and reinforce one another. The

third basic principle is to pursue measures that will foster the expansion of private activity, by stimulating consumers to spend more money and businessmen to create more jobs. . . . The fourth principle is to act promptly and vigorously if economic conditions require it. The government will not hesitate to make greater use of monetary, debt management, and credit policy, including liberalized use of federal insurance of private obligations, or to modify the tax structure, or to reduce taxes, or to expand on a large scale the construction of useful public works, or to take any other steps that may be necessary. . . .

The need for constant vigilance and preparedness by Government [the *Report* went on to say] does not, however, justify constant stirring or meddling. Minor variations in activity are bound to occur in a free economy, or for that matter in any type of economy. The arsenal of stabilizing weapons will be drawn upon by the government boldly, but not more frequently than is required to help maintain reasonable stability. Nor will flexible policies aiming to minimize economic fluctuations be permitted to interfere any more than is necessary with the fiscal objective of bringing down the scale of Federal expenditures, reducing taxes, and arriving at a budgetary balance. (*Report*, January 1954, pp. 113–114)

The January 1955 *Report*, which could point to clear evidence that economic recovery was under way, undertook to draw some lessons from “this latest encounter with the business cycle”:

First, that wise and early action by government can stave off serious difficulties later. Second, that contraction may be stopped in its tracks even when governmental expenditures and budget deficits are declining, provided effective means are taken for building confidence. Third, that monetary policy can be a powerful instrument of economic recovery, so long as the confidence of consumers and businessmen in the future remains high. Fourth, that automatic stabilizers, such as unemployment insurance and a tax system that is elastic with respect to the national income, can be of material aid in moderating cyclical fluctuations. Fifth, that a minor contraction in this country need not produce a severe depression abroad. Sixth, that an expanding world economy can facilitate our own readjustments. (*Report*, January 1955, p. 22)

Although Burns could take some pride in the essential validity of his diagnosis and prognosis in 1953–1954, and President Eisenhower could take pride in his lieutenant's crisp command of the situation, Burns was ever mindful of the limitations on economic foresight. The analyses in the *Reports* for which he was responsible frequently referred to the types of economic

indicators that his earlier studies had found useful. They are also filled with warnings like "it is well to keep in mind the sobering fact that there is no way of lifting more than a corner of the veil that separates the present from the future. . . . The uncertainty of economic predictions requires that the federal government be prepared to adjust its policies promptly if economic events should not bear out current expectations" (*Report*, January 1955, pp. 24–25). This caution led him to refuse to incorporate an explicit forecast of GNP in the *Report*, despite considerable pressure from Congress to do so.

In 1957 Burns returned to his professorship at Columbia University and became president of the National Bureau of Economic Research, where he remained until called to Washington by President Richard M. Nixon in 1969. One of the first essays he wrote during these years was "Progress Towards Economic Stability," his presidential address before the American Economic Association in December 1959. Here he traced some of the changes that had occurred in the severity and other features of business cycles over the years. He noted that the cyclical swings in production had become smaller, and that the linkages between production, employment, personal income, and consumption had become looser. "One of the triumphs of this generation," he concluded, "is the progress our nation has made in reducing economic instability."

Although the progress that had been made was clear, with the reasons for it lying partly with changes in the structure of the economy and partly with defenses erected deliberately to deal with recession, Burns did not believe the business cycle had been conquered. Many economists disagreed, especially during the long upswing of the 1960s, which was interrupted only by a mild recession in 1960–1961 and by slowdowns in 1962–1964 and 1966–1967. In Burns's view, however, the business cycle was not dead, and in 1968 he wrote a notable article to explain its self-generating features and what had been learned about them. The structure of his analysis is revealed in the headings of four sections of the essay: "The Cumulative Process of Expansion," "Gathering Forces of Recession," "The Process of Contraction," and "Forces of Progress and Recovery." To a historian, what is perhaps most striking about this explanation of the business cycle is its similarity, in main outline, with the account set forth by Mitchell in 1913. Burns's familiarity with the theoretical and empirical researches since then, with the significant

changes in economic institutions, and with the practical problems of policymaking at the highest level of government had simply reinforced his view that the Mitchellian approach to diagnosis of the swings from prosperity to recession was essentially valid and eminently useful. His chief amendment to this approach was to stress the role of factors making for long-term economic growth in the very process of a cyclical revival.

One of the reasons why, despite the progress that had been made in countering recession, Burns believed that business cycles were still to be reckoned with, was that he did not think similar progress had been made in dealing with inflation. Increasingly during the 1950s and 1960s he devoted attention to this problem. In 1957, in an illuminating essay on "The New Environment of Monetary Policy"—illuminating especially because of Burns's later role as head of the Federal Reserve—he noted that the great expansion of government expenditures since the 1920s had "reduced the area over which a restrictive credit policy can nowadays be effective," because governments are not likely to allow such policies to thwart their other objectives. He noted, too, that the Employment Act of 1946 pledges the government to "utilize all its plans, functions and resources" to foster economic expansion and to help prevent depressions, that this embraced the Federal Reserve authorities, and that they are therefore "fairly bound to pursue a policy of credit restraint with considerable caution, lest the application of restraints bring on the very decline of aggregate economic activity which it is the responsibility of the government to try to prevent" (1969, p. 164). In view of these and other limitations that attached to restrictive Federal Reserve policies, he concluded that "it would be unwise to depend on the Federal Reserve System as our sole or principal guardian of the stability of the dollar" (p. 174). It was an apt forecast of the situation he would face later.

Burns's term as chairman of the Federal Reserve Board, from 1970 to 1978, began in the midst of a mild recession and ended in a period of vigorous expansion. It encompassed the severe recession of 1973–1975, and it also encompassed a period of sharp inflation. He held office for 98 months, of which 26 were months of recession, 72 were months of economic expansion. The general level of prices and wages rose throughout the period, but the rate of inflation in both was not very different when he left office from

when he entered it. He presided during a turbulent period, the history of which is still to be written. Burns himself will surely participate in writing this history, and he has already provided some of the documentation in the form of a 475-page volume, *Reflections of an Economic Policy Maker* (1978), containing a selection of his speeches and testimony during his eight-year tenure as Federal Reserve chief. But historians' future appraisal of his role is unlikely to diminish his reputation as a wise counselor, skillful administrator, thorough scholar, responsible official, and patriotic citizen, a reputation that was enhanced by his chairmanship, both in his own country and around the world.

Despite his professional responsibilities and penchant for hard work, Burns has had a rewarding family life. One son, David, is a lawyer; the other, Joseph, is an economist. For many years the family spent their summers on a farm in Ely, Vermont, where Burns built a separate cabin to use as a study. Each summer he takes some time to paint abstract oils, always in vivid colors. Occasionally he takes a turn at house painting, one of the jobs he worked at as a youth under the guidance of his father.

A few weeks before he left the Federal Reserve, Burns recalled that he began his life in America as a Jewish immigrant. He summed up his feelings in the following words:

It is clear to me, therefore, as I reflect on my own life, that whatever success I have been able to achieve is due fundamentally to the fact that it has been my good fortune to be a citizen of a country whose people have had the opportunity to acquire a decent education, whose people have had the freedom to seek truth and to express it as they see fit, whose people have had the opportunity to put to work such special talents as they may have and to utilize those talents for themselves, their families, and their country.

In short, it has been my great privilege to be an American. (1978, p. 68)

BURT, CYRIL

Cyril Burt (1883-1971) was one of the leading pioneers in the development of psychology as an applied scientific discipline. While still a schoolboy he came into contact with, and under the influence of, Francis Galton, and his work can be regarded as essentially an attempt to uphold the Galtonian tradition of individual psychology. This tradition stressed the importance of individual differences in ability and character, the role of heredity in determining these differences, and the need to develop quantitative methods in order to study them scientifically. From the publication of his first article on intelligence in 1909 to his death in 1971 Burt worked assiduously and single-mindedly within this Galtonian framework.

Burt's early boyhood was spent in humble circumstances in London, where his father was a struggling medical practitioner. Nine years after his son's birth, Dr. Burt left the capital, and moved to a rural practice near Stratford-on-Avon,

and it was here that his contacts with Galton were first established. The Galton family resided in a nearby village, and Burt senior became their family physician. Young Cyril would accompany his father on his rounds during school holidays, and in this way first met the great Francis Galton. The meeting was to have a permanent and decisive influence on his development.

Burt's induction into psychology, however, was slow and uphill. At the beginning of the century it had hardly become a recognized subject of instruction, or a recognized career, in Great Britain. Since his father was never financially prosperous Burt's education depended almost entirely on his own efforts, and his success in winning scholarships. He was academically gifted, intellectually curious, hardworking, and quick on the uptake. So he made his way first to the ancient school of Christ's Hospital in London, and then to Oxford University. His education at school and university was primarily in the ancient classical languages, and in the literature of Greece and Rome. His mathematical and scientific education was acquired almost wholly by his own efforts after he had left school. At Oxford, however, the classical curriculum was a broad one, and included a training in ancient philosophy, logic, and, as an optional extra, psychology. Fortunately for Burt, William McDougall had just been appointed to take charge of psychology at Oxford, and Burt became his first student. McDougall, after Galton, was the other major influence shaping Burt's psychological development. McDougall confirmed him in his determination to take up psychology as a career, and provided him with his first opportunity. In 1902 the British Association for the Advancement of Science, largely as a result of Galton's advocacy, had decided to initiate an anthropometric survey of the British people, involving the measurement of both physical and psychological characteristics. In 1907 a psychological subcommittee was set up under McDougall's direction to plan the psychological side of the survey. In connection with this project, McDougall enlisted Burt to carry out an investigation into intelligence with the idea of checking some of the ideas on the existence and nature of general intelligence propounded a few years previously by C. E. Spearman. Burt carried out the practical work for this investigation during the 1907/1908 session immediately after graduating, and published the results in 1909. It was to set the pattern for the whole of his subsequent life's work. Meanwhile he had advanced his psychological

education by spending the summer of 1908 in Oswald Külpe's laboratory at the University of Würzburg, and had secured his first post as a lecturer in psychology attached to C. S. Sherrington's department of physiology at the University of Liverpool. He spent five years (1908-1913) with Sherrington, and although he had not had the training to take up physiological research as such, he was undoubtedly much influenced by Sherrington's general viewpoint on the integrative function of the nervous system and on mind-brain relations.

In 1913 Burt returned to his birthplace, London, on his appointment as psychologist to the London County Council. This was a new appointment, and the first of its kind in Great Britain. Burt's job was to assist the Council's education committee, which was responsible for London's schools, in two main tasks: to identify and assess pupils who required special treatment, either by reason of mental subnormality or of behavioral maladjustment, and to assist in the selection of gifted pupils for entry to secondary education, which was then, for those who could not afford to pay for it, highly competitive. In furtherance of these aims Burt conducted a systematic survey of the distribution of educational abilities among London school children, and compiled and standardized a set of mental and scholastic tests that remained in use for more than forty years. Among his tests were one of the first British versions of the Binet scale, and a verbal reasoning test, which was important in providing the stimulus for Jean Piaget's early studies on the development of intelligence. In addition to his psychometric work, Burt ran what was in effect the first child guidance clinic in Great Britain. The material he collected in this clinical work formed the core of his classical treatises, *The Young Delinquent* (1925) and *The Backward Child* (1937).

Burt's routine duties with the London County Council occupied only part of his time. The remainder he spent in various ways. During World War I he was engaged for some time at the Ministry of Munitions in statistical work. After the war he assisted the National Institute of Industrial Psychology, which had been founded in 1921, to establish a vocational guidance service, and directed a research project into vocational guidance. In 1924 he became part-time professor of educational psychology at the London Day Training College, a teachers' training establishment affiliated with the University of London. In addition he was encouraged by the London

County Council to undertake his own research, and it was in this connection that he began to collect the material on twins, which was published many years later, and which became a major focus of controversy.

Burt held the post of psychologist to the London County Council from 1913 to 1932. During this period he not only carried out his routine duties with great energy and competence, but he collected, with the aid of teachers, social workers, and research assistants, a large body of data, both clinical and psychometric—in fact most of the data he was to make use of in his subsequent publications. In quantity Burt's data were impressive; qualitatively, however, much of it lacked the rigor and precision required of research material. It was for the most part collected incidentally to Burt's practical duties as an educational psychologist; it was collected for a variety of different purposes; and much of it was gathered by assistants lacking in adequate psychological training. Accordingly Burt felt entitled to "adjust" test scores in the light of other evidence, often of a subjective kind. He possessed considerable skill in deriving conclusions by statistical reasoning from imperfect data, but it is questionable whether the elaborate treatment he later accorded it was ever really justifiable.

Burt's work for the London County Council soon brought him into public prominence, and his advice was increasingly in demand. He was called on to assist the Board of Education in its plans for the reconstruction of the English education system, and his evidence played a considerable part in shaping the scheme of selective secondary schooling that was incorporated in the Education Act of 1944. He was, too, largely instrumental in the setting up of a Child Guidance Council in 1926, which, with the help of the Commonwealth Fund of America, led to the establishment of the first fully staffed child guidance clinics in Great Britain.

In 1932 Burt's attachment to the London County Council terminated with his appointment to the chair of psychology at University College London, in succession to Spearman. This appointment marked the climax of, and at the same time a turning point in, his career. Until 1932, Burt's energies had been directed primarily towards applied problems; after 1932, he turned mainly to theoretical and methodological questions, chief among which was factor analysis. Burt's first acquaintance with factorial techniques arose through his contacts with Spearman

while still at Oxford. He employed factor analysis on a small scale in his early investigation into intelligence, and a few years later undertook a factorial study of emotional traits, one of the first excursions into the statistical analysis of personality. In London he applied factorial techniques to the analysis of educational abilities, and developed a method of analysis which anticipated L. L. Thurstone's centroid method. On his appointment to University College he began to concentrate on factorial studies. He acquired a mastery of the mathematics and methodology of factor analysis, and his conclusions began to diverge from those of Spearman, though he still publicly acknowledged Spearman's priority and preeminence in the field. His views were set out definitively in *The Factors of the Mind* (1940), and developed from 1947 onwards in the pages of *The British Journal of Statistical Psychology*, which he founded with Godfrey H. Thomson, and edited until 1963. In the statistical journal and elsewhere, Burt elaborated and amplified his factorial techniques, and summarized the conclusions of his factorial investigations, presenting arguments in favor of a hierarchical scheme of general, group, and specific factors, both of ability and personality. The most important factor was the factor at the head of the ability hierarchy, which, following Spearman, Burt designated "g" and defined as "innate, general, cognitive ability." This supreme ability he believed could be accurately assessed by means of intelligence tests. Burt was also much concerned, in the final phases of his factorial work subsequent to Spearman's death in 1945, in dethroning Spearman as the founder of factor analysis, and asserting his own claims to priority as the first user of factorial method in psychology. These claims were wholly unfounded, and led Burt to falsify the historical record in a way that suggests a morbidly egotistical streak in his personality.

Burt retired from his chair at University College in September 1950, and lived quietly at his flat near Primrose Hill for the remaining 21 years of his life. He kept extremely busy, writing articles, reviewing books and manuscripts, examining, editing his journal, and, until 1960, lecturing. Apart from an experimental study of typography, based on work carried out before his retirement, most of his publications during this period were of a theoretical nature—on consciousness, values, psychical research, factor analysis, and, in particular, the multifactorial theory of inheritance. After 1940 Burt did not

produce any major, large-scale work. The articles which flowed unceasingly from his pen were in the main either restatements of his earlier views, or rejoinders to attacks, to which he was increasingly subjected from the early 1950s onwards. After his retirement he carried out no research either in the laboratory or in the field. He became more and more a lonely and isolated figure, who, though convinced of his own rightness, felt the tides of opinion turning against him.

Things had, in fact, begun to go wrong for Burt in the early 1940s. At the outbreak of war, parts of University College, including the psychology department, were evacuated to Aberystwyth in Wales. Burt spent five years (1939–1944) in this remote spot on the Welsh coast, largely isolated from the center of affairs. This period of isolation affected him profoundly in several ways. It precipitated the breakdown of an unwise marriage he had contracted in 1932 with a student 26 years younger than himself, while the worries of the war situation led to a breakdown in his health. In particular, University College suffered serious bomb damage, and a great many of Burt's papers (his collection of children's drawings, case reports, and research data) were destroyed. In 1941, a few months after this devastating loss, he developed his first bout of Ménière's disease, a disorder which is now widely regarded as being precipitated by stress (Stephens 1975). He was to be handicapped by Ménière symptoms for the rest of his life, suffering severe attacks again in 1966. Though Burt preserved an outward equanimity he became more sensitive to criticism and more on the defensive. Particularly when under attack he began to display mildly paranoid traits, suspicious, devious, and self-aggrandizing. He fell out with many of his old students and former colleagues. After his retirement he was ordered, by the college authorities, to keep out of his old department, following his attempts to interfere with its running. In 1963, after long and bitter arguments with the British Psychological Society, he was deprived of the editorship of the statistical journal he had helped to found. These rebuffs aggravated his psychological condition. Beneath an apparently unruffled exterior Burt suffered from a whole range of psychosomatic symptoms, which he described fully in letters to his sister. His paranoid tendency became more marked. He was constantly engaged in controversy, going out of his way to pounce on those who disputed his views, and he became more

devious in his counterattacks. It is against this background that some of his later work must be judged.

Burt was 88 years old when he died on October 10, 1971, from carcinoma of the liver. He remained active till a few weeks before his death, and although his powers of concentration had begun to fall off and he was apt to make careless mistakes, his mind remained lucid and powerful up to the end. He was a person of remarkable erudition, with an extensive knowledge of psychology and its history, philosophy, theology, the physical and biological sciences, literature, and the arts. He acquired great technical skill in statistics and related branches of mathematics. He could expound his views with dazzling displays of scholarship and expertise, and as a critic and controversialist he could be devastating. Though distrusted by many, he managed, during his lifetime, to hold the fort against his attackers, and his reputation was not openly questioned. He remained until his death an eminent and still widely admired public figure. He had been knighted in 1946 for his services to education, and he acquired many honors both in Great Britain and abroad during the last 25 years of his life.

His downfall occurred not long after his decease. In May 1973, Leon J. Kamin of Princeton University, who had during the previous year spoken at various colloquia, delivered a paper in Washington on heredity and intelligence, which exposed numerous inconsistencies and contradictions in Burt's twin studies (Kamin 1973; 1974). Then, a year later, Arthur R. Jensen, a devoted admirer of Burt, examined Burt's kinship correlations in detail and was forced to admit that in spite of his theoretical mastery, there were serious shortcomings in his reported results (Jensen 1974). Two years later the medical correspondent of the British newspaper *The Sunday Times* maintained that in fact Burt "published false data and invented crucial facts to support his controversial theory that intelligence is largely inherited" (Gillie 1976). The matter rapidly became a *cause célèbre* and a center of controversy; one party upholding the fraud charge and maintaining that it seriously undermined the whole hereditarian position; others admitting that Burt may have been careless, but certainly not fraudulent, and arguing that in any case the hereditarian position was firmly founded on a mass of other evidence.

The twin studies, around which the contro-

versy centered, were commenced by Burt soon after he took up his post as London County Council psychologist. In particular, he was interested in collecting data on monozygotic (MZ) twins reared apart, as such twins provide highly important evidence for assessing the influence of the genetic component in intelligence. In his 1955 and 1956 articles (Burt 1955; Burt & Howard 1956) Burt claimed to have found 21 pairs of separated MZ twins. By 1966 (Burt 1966) the number had increased to 53 such pairs. Burt subjected this data, together with other kinship correlations, to an elaborate statistical analysis, using the methods of quantitative genetics developed originally by R. A. Fisher, and concluded that genetic factors contributed, in the case of intelligence, about eighty per cent of the variance, compared with only twenty per cent for environmental influences.

It was Kamin, who after a minute analysis of Burt's figures, revealed in them many strange anomalies. For example, the group intelligence test correlation of 0.771 for the separated twins was identical for the smaller population of 21 and the larger one of 53. And this was only one of a good many identical correlations with changed sample sizes. Kamin concluded that the absence of procedural description in Burt's reports, the frequent arithmetical inconsistencies and mutually contradictory statements, together with the improbable consistency of some of his results, rendered his work scientifically worthless. On the other hand, according to Jensen (1974) Burt had simply been careless in not reporting his findings more fully and accurately, but his conclusions were still valid. Even after the fraud charge had been leveled Jensen (1978) held that the peculiarities of Burt's kinship correlations were most reasonably attributable to carelessness rather than to deception.

An examination of Burt's diaries and correspondence, in the archives of the University of Liverpool, shows conclusively that Jensen's interpretation is untenable. Burt collected no twin data between 1955 and 1966; he was not in touch personally or by correspondence with the assistants, Miss Howard and Miss Conway, who were supposed to have helped him during these years; and he was incapable of collecting any data himself by reason of deafness and other infirmities. There was no ongoing research. Such data as Burt possessed were collected prior to 1950, and most of the original test sheets were lost during the war. The 1955 report was based on results abstracted into notebooks together

with a few cases recruited postwar; the 1966 report on data reconstituted from fragmentary remains, probably supplemented from memory and guesswork. From a scientific point of view the 1966 figures were a fabrication, since Burt no longer had the raw data. Indeed it is not certain that he had ever collected as many as 53 pairs of separated MZ twins. It was not until 1969 that in response to several requests Burt produced the table of intelligence quotient scores and social class ratings for his 53 MZ pairs reared apart. His diary suggests that he spent a whole week in concocting these figures, and he never was able to produce figures for the larger groups of MZ twins reared together, dizygotic (DZ) twins, and ordinary siblings. He put off inquirers by falsely alleging that the data were kept at college, and he could not provide them immediately.

Burt's motivation for this deception must be diagnosed in relation to the pressures to which he was subjected at the time. His work during the period of his retirement was mainly of a defensive kind, designed to uphold the Galtonian standpoint against mounting environmentalist and other attacks. These attacks came in two main waves, in the years 1953 to 1956, and again in 1963 to 1965. His two principal twin articles in 1955 and 1966, respectively, were his rejoinders. He wrote them in haste and anger, and with a determination to get the better of his adversaries by fair means or foul. There was a paranoid weakness in his personality which led him into these subterfuges.

These posthumous exposures, though they do not *ipso facto* undermine the whole hereditarian case, do largely destroy Burt's own scientific credibility. Burt, in fact, was never at heart a scientist. He was an able and ambitious man, who early came to regard the Galtonian tradition almost as gospel truth and himself as Galton's heir apparent. He was immensely erudite, industrious, and accomplished; he was, to those who were prepared to look up to him, kind and generous; and in his early years, up to the 1940s, he did valuable pioneering work in the field of applied psychology. But he could not take criticism or rebuffs; he could not brook opposition; and in the last resort he chose to cheat rather than see his opponents triumph.

BUTTERFIELD, HERBERT

Herbert Butterfield was born into a devout Methodist family on October 7, 1900, in Oxenhope, an industrial revolution village with two thousand inhabitants at the edge of the moors and a few miles from the Lancashire–Yorkshire border. His father left school at ten to work as a wool sorter in the mill, but through self-education trained himself to become a bookkeeper.

He carried with him through life his frustrated ambition to have been a Methodist minister, and without pressing his son unduly, made it clear that he would like him to move in the same direction. It was partly in the knowledge of the pleasure it would give his father that Butterfield, from the age of 16, became a lay preacher, a step that provoked the impatience of the man who was his most stimulating teacher at the local grammar school, a man very outspoken in his hostility to Christianity. Later, when Butterfield was at Cambridge University working under the famous historian, Harold Temperley, his growing interest in history, and his consciousness of being too shy to succeed in pastoral work, helped to draw him away from the idea of going into the ministry. But whereas religious and political thinkers have characteristically rebelled against the tenets of their childhood, Butterfield has never wavered from a fundamental Augustinian theology that included belief in the infinite worth of human personality, the reality of sin, the sovereignty of God, the limitations of human nature, and the fragmentary character of human existence. He never espoused Marxism, as did Reinhold Niebuhr and Paul Tillich, two philosophers and theologians with whom he had some affinity. He studied Marxist thought, however, and extracted from it certain insights on conflict in history and the importance of economic and social factors in history. A threefold interest in European and British history, in the relations of Christianity to history, and in the theory of international relations determined the focus of his thought.

But for the formative influence of his childhood and family life, Butterfield might have remained content with the traditional historical scholarship expected from a professor of modern history at Cambridge and the editor of the *Cambridge Historical Journal*. He was educated at Cambridge where he earned the degrees of master of arts and doctor of literature. In 1923, he became a fellow of Peterhouse at that university, and then, in 1955, its master. He served as president of the Historical Association of England in the late 1960s and, as a historian, was invited to take up residence at the Institute for Advanced Study at Princeton, New Jersey. His first publication, *The Historical Novel* (1924), reflected his early concern with the relation between literature and history. He demonstrated the role of literary imagination in furthering the actual rediscovery of the past. It was an anach-

ronism, he believed, to assume that the events from another era could be understood in the context of the present or recent past. Shorter and more concentrated books in which the historian drew on literary if not poetical skills might help recreate the past, and this became the standard for almost all Butterfield's writing. He followed his first book with a detailed study, *The Peace Tactics of Napoleon, 1806–1808* (1929), an analysis of the relation between military and diplomatic tactics of the period, including the Treaty of Tilsit in 1807. Reviewers praised his historical portraiture and observed that he had disproved the claims of German historians that Czar Alexander of Russia had conspired to desert Britain; it was the Prussians who persuaded the Czar to meet with Napoleon on a raft in the River Nieman. He edited *Select Documents of European History, 1715–1920* (1931a), and began research on what was to be a lifelong interest in George III, eventuating in his *George III, Lord North, and the People, 1779–1780* (1949b) and *George III and the Historians* (1957). His intention to write the definitive work on Charles James Fox and George III was sacrificed to a new set of interests in analytical historical studies, which dominated his research for the next four decades.

The first clear evidence that Butterfield was to go beyond traditional historical research came in 1931 with the publication of *The Whig Interpretation of History*, a critical analysis of the Whig and liberal view of inevitable progress in history. His concern for historiography was clearly demonstrated in this study, which earned for him a reputation as an authentic historical genius. Although the book criticized liberal politics and historical Protestantism, Butterfield questioned in a more fundamental way the failure of historians to do justice to the unique conditions and mentality of bygone ages. It was evident in this work that Butterfield was to follow in the steps of J. E. E. D. Acton (even though he was a chief object of Butterfield's criticism) and Leopold von Ranke, and not that of traditional British historians who concentrated on what was primarily descriptive history. His subsequent works, *Napoleon* (1939), *The Englishman and His History* (1944), and *The Statecraft of Machiavelli* (1940), carried him even further along the path of the philosopher of history and the political theorist.

In the late 1930s and 1940s, Butterfield, whose eminence as a leading British historian was by then unquestioned, entered a second

phase of historical writing that was inspired by the world crisis. In 1939 he lectured at four German universities on the "History of Historiography," emphasizing the developments in the sixteenth and seventeenth centuries. He argued that it was the Whig historians whom he criticized and not the Whig politicians who had fostered freedom and moderation from the later years of Charles II. The lectures enabled him to say that although he still regarded the Whig interpretation as fallacious, he believed it had helped in the development of liberty in England. It was the Whig historians who had perverted the story and not the politicians who used political compromise and political persuasion rather than coercion and force.

In 1948 he turned to religion and history and delivered a series of seven lectures at the request of the Divinity Faculty of Cambridge University. He expanded these lectures into six broadcasts presented in April and May 1949 by the British Broadcasting Corporation. He amplified the major themes of these lectures into a book entitled *Christianity and History* (1949a). Butterfield had hesitated to undertake these lectures because he doubted that a layman was qualified to prepare them, and he knew the suspicion that such an enterprise could generate among his fellow historians. But it became difficult for him to avoid the invitation when the representatives of the Divinity Faculty made it clear that they did not feel that it would be most useful to have a clergyman—the undergraduates might be more ready to listen to a man who had made his name as a historian. His turn to philosophical questions was doubtless inspired by the dual crisis confronting the West: the formidable challenge of the Soviet Union with its Marxist creed and the position of the Western countries as "frightened defenders of the status quo, upholding the values of an ancient civilisation against the encroachments of something new . . ." (1949a, p. 5). Butterfield warned that the idolatrous worship of some superperson, "society," "state," or other large-scale organization could so transform man's perspective that he would see the world as comparable to the world of the ants. It was dangerous to bypass history or to imagine that the natural sciences could safely be left to shape human destiny. It was not enough to look for God or man in nature or to conclude with Hitler in *Mein Kampf* that since nature is concerned not with individual human lives but with the development of the species, history in-

evitably imposes its cruelties, idolatries, and human sacrifices. This attitude Butterfield described as "the facile heresy of the self-educated in a scientific age" and counseled: "Too easily we may think of man as merely the last of the animals and in this way arrive at verdicts which we are tempted to transpose into the world of human relations" (1949a, p. 6). *Christianity and History* reasserted the author's profound belief in the central place of human personality in the historical process. He protested against the opposing view of certain behavioral social scientists and naturalists that history is the story of great collectivities to be studied through science and mathematics as no more than another chapter in "the great book of biology."

Butterfield elaborated and extended this criticism and restated the Christian perspective in a succession of writings in which he claimed to speak not as a theologian but, as had Arnold J. Toynbee, as a historian. He wrote as an individual scholar, not interacting, as had Arnold J. Toynbee, with other historians and theologians who propounded an elaborate historical scheme. His aim, as he conceived it, was to challenge Christians and non-Christians alike to renew awareness of the place in history of the Christian view. He added books on *Christianity in European History* (1951a); *History and Human Relations* (1951b); and *Christianity, Diplomacy, and War* (1953). Whatever questions critics raised about his Christian perspective, Butterfield resolutely maintained that history seen in its broadest dimensions is consonant with a Christian view of history. He has inveighed against mere "technical history" which falls short of a subtle comprehension of the past. For him history at its core is a drama, oftentimes tragic in dimension, of human personalities. The tenets of historical scholarship require the historian to practice intellectual humility and flexibility of mind. He must walk alongside the actors in history, placing himself in their position, seeking to recapture their perceptions of events and to understand the problems with which they had to cope.

Another facet of Butterfield's contribution stems from his study of science. Beginning in 1931, he had lectured to Cambridge undergraduates on modern history from 1492, with attention to such larger developments and long-term movements as the Renaissance, the Reformation, the French Revolution, and their interconnections. His approach, which followed the example of Acton, was intended as a reac-

tion against the overspecialization that had come to dominate the university study of modern history with its use of "outlines" and dry textbook accounts of the external relations of states. Instead, he focused on the emergence and major developments of the modern world and modern thought, devoting, for example, approximately six lectures to the rise of modern science. These lectures brought him into contact with prominent Cambridge scientists such as Joseph Needham and the group at the Cavendish Laboratory, which was in search of an ally among historians. Under the influence of these people, Cambridge appointed a history of science committee in 1947, and it was this body which, after a considerable conflict, induced Butterfield to deliver in the Michaelmas term 1948 a course of lectures on the subject. The lectures led to the publication of his most successful book, *The Origins of Modern Science* (1949c), and to a reawakening of interest in the subject in England and America. It brought trained scientists into touch with serious historical study and helped produce a new generation of historians of science.

In 1953, Butterfield was asked to deliver the Wiles Trust lectures at Queens University, Belfast, and he chose to return to the topic of "History of Historiography" in the eighteenth and nineteenth centuries. The subject had been a preoccupation of German historians and a few American historians, but despite the efforts of Acton and his disciple, G. P. Gooch, who wrote *History and Historians in the Nineteenth Century* (1913), it had not taken root in England. The Wiles lectureship brought together Butterfield, who lectured on *Man on His Past* (1955), and ten European and British historians who, as authorities on different aspects of his subject, criticized and commented on his presentation. When published in 1955, these lectures led to a considerable reawakening of interest in historiography among university undergraduates, research students, and professors. Subsequently, he wondered if enthusiasm for historiography had gone too far and urged that universities limit its study to historians who were equipped by temperament and experience for the task. Although he was pleased he had been able to advance the work of Acton and Gooch, he believed that for the ordinary research student, training in the processing of evidence and the main techniques of research must come first.

Ten years later in 1965 and 1966, he was called on to deliver the famed Gifford lectures

at the University of Glasgow, a series in which Americans such as William James, John Dewey, and Reinhold Niebuhr had participated. Butterfield chose to address the broad question of how the human race had come to possess a concept of "the Past," and how and why mankind had been interested in its past before historical writing had begun. He speculated that early religion might have had some influence, but wondered if it might also have been the enemy of genuine history. The historical mentality, he concluded, had emerged gradually from the conflicting desire to reconcile both religious and secular history. He believed that conclusions based on recent research in Egyptian, Mesopotamian, and Jewish languages were adaptable to the kind of questions that Western historians characteristically studied. The lectures constituted his boldest historical adventure, for he undertook to survey the entire "History of Historiography." His effort inspired interest, particularly in the United States, but left him uncertain as to whether he had or could ever acquire the universal knowledge on which a published treatise on the subject should be based. Then in the mid-1960s the focus of Butterfield's interest shifted and he never returned in a systematic way to the theme of his Gifford lectures.

In all his historical writings, he has argued that at one level, historical interpretation calls for painstaking research and the ability to relive "the lost life of yesterday" using the accumulated traces of history "to recapture a bygone age and turn it into something that is at once a picture and a story" (1924, p. 8). In the pursuit of this goal, Butterfield was following the tradition he had absorbed from his teacher, the master historian of diplomacy, Harold Temperley, seeking always to write history of a high and complicated texture. At another level, the historian has the obligation to identify with his subject in order neither to praise nor blame him but, rather, to understand the circumstances confronting him. In studying the diplomatic interchanges that accompanied Napoleon's campaigns against the Fourth Coalition, Butterfield felt compelled to consult major archives in London, Paris, and Vienna, the correspondence drawn from the Prussian and Russian archives, and the reports of ambassadors, ministers, and spies to the leading statesmen of that day. His purpose was to mirror the thoughts of the major personages of the time and to uncover "the strange tangle, the hidden undercurrents and the clash of personalities that lay behind a Na-

poleonic war" (1929, p. vii). Even in the two studies of Napoleon written early in his career, the structure of Butterfield's maturing view of history was discernible. The unfolding story was for him unpredictable and wayward, based on the interaction of diverse personalities proceeding, not in accordance with predetermined doctrines of a superior people or of inevitable progress, or with consequences clearly linked to their intentions, but with goals and actions whose efforts are deflected by the mysterious workings of Providence.

Butterfield's essential ideas about historical studies matured and were well-defined before he was 31 years old. He had won the LeBas prize at Cambridge for his first book, *The Historical Novel*, but his third, *The Whig Interpretation of History* (1931*b*), established the foundations of his later works, with their underlying theme of "the complexity of human change and the unpredictable character of the ultimate consequences of any given act or decision of men" (1931*b*, p. 21). Historical writing must communicate the texture of such complexity. Historical change for Butterfield necessitated reform more than revolution, which inevitably left a legacy of hatred, human suffering, and destruction. In his early thirties, Butterfield was persuaded that the Christian interpreter, more than other political historians, was safeguarded against the worst illusions and idolatries, being prepared by his faith for accidents and surprises in history. By his worship of God, he was rescued from such distorting influences as a fanatical worship of the state, the idea of progress, or an abstract political ideology. By devotion to the ultimate ends of religion, the historian was enabled to understand "the web spun out of the play of time and circumstances . . ." (1931*b*, pp. 65-66). Providence held mankind under the judgment of God; yet God was not a tyrannical ruler but the source of grace in history. Even the clash of human wills reflecting man's pride and indestructible egotism could serve to further God's will and bring good out of evil. For example, the American Revolution had led the British to invent a new and more civilized concept of empire. Man's most creative achievements were usually born out of human distress, and inner pressures and political systems founded on brigandage, such as those of ancient Rome and the British Empire, might evolve in time in the direction of some tolerable measure of justice and order.

For Butterfield, therefore, historical studies

and theology cohere and reinforce one another, for both have their center in a concern for human personalities. His dual emphasis on history and religion, however, has opened him to criticism from which he might have been spared had he followed the course of traditional history. Some critics see in his religious writings a diversion from the historian's primary task of producing a large corpus of solid historical writing, such as might have resulted had he continued his research on Charles James Fox and George III. His position as scholar-statesman in the Cambridge University community, in which he lived and worked for more than a half-century, culminating in his appointment as vice chancellor from 1959 to 1961, was certainly dependent to some degree upon his recognized preoccupation with moral values. His positions at Cambridge and his leadership roles in national and international educational bodies drew him away from full-time scholarship, as did the series of endowed lectures, characteristically on religious themes, in Germany, the United States, and the United Kingdom. Peter Geyl and other historians have questioned his emphasis on the persistence of evil in man's behavior and of human cupidity in society and his low estimate of the capacity of honorable men to effect social change through actions with certain and predictable consequences. This criticism of his questioning of the consequences of the moral and rational intentions of statesmen overlooks his debate with such twentieth-century British historians as Lewis Namier and his disciples, who portrayed politics largely as a struggle for gain and selfish interests. For Butterfield, ideas, attitudes, and rational intentions interact with self-interest in politics, and historians err when they reduce politics for all individuals and every century to the same dull level. The Namier school, in so often assuming that politicians are no more than the repository of self-interest, misinterprets political movements and political parties, which do not merely advance group interests but also articulate values and ideals.

A more serious and partly legitimate criticism of Butterfield's use of the Christian perspective has been leveled at some of his historical judgments. In *Christianity and History*, written after World War II, he appeared to explain the defeat and destruction of Germany as divine punishment for the sins of the German people. Yet critics ask: What of the many Germans who at grave personal risk opposed Hitler's régime? And what of the Baltic peoples who did not com-

mit the brutalities of the Nazis, yet suffered as grievously as the Germans? Butterfield has written of the need for thinking historically at two different levels, the level of technical history, which deals with the limited and the mundane and takes into account hard and tangible historical evidence, and the level of Providence, which is beyond the reach of the technical historian. Critics have maintained that Butterfield, especially when he enters the realm of general history, smuggles into his interpretations the Christian points of emphasis and doctrine that he excludes from his more technical writings in narrative history, where he is more cautious in his assessments of individual leaders. Worst of all, he sometimes appears to speak for the Providence whose divine words he merely notes and records. In fairness, those critics who extract from his writings moral valuations such as his indictment of the entire German people contained in a wider discussion of militarism will find him going on to say that "if Germany is under judgment so are all of us—the whole of our existing order and the very fabric of our civilisation" (1949a, p. 52).

Finally, Butterfield's influence on Western thought is not exhausted in his two major contributions to traditional and Christian history. In 1958 he founded the British Committee on the Theory of International Politics and has served for approximately two decades as its chairman and honorary chairman. This group took as its mandate the making of an inquiry "into the nature of the international states system, the assumptions and ideas of diplomacy, the principles of foreign policy, the ethics of international relations and war" (Butterfield & Wight 1966, p. 11). From the start the committee's approach reflected Butterfield's historical and religious orientation. The interests of this group of British thinkers contrasted with those of American colleagues who formed a similar committee, and its work expressed greater concern "with the historical than the contemporary, with the normative than the scientific, with the philosophical than the methodological, with principles than with policy" (*ibid.*, p. 12). The themes of the group's first major publication mirrored Butterfield's own writings and included "Natural Law," "The New Diplomacy and Historical Diplomacy," "Society and Anarchy in International Relations," "Western Values in International Relations," and "The Balance of Power." Butterfield's closest associate in the venture, Martin Wight, introduced the

volume with a paper entitled: "Why Is There No International Theory?"

The British approach was the antithesis of that of flourishing schools in America and Australia that dealt with international relations theory and systems analysis. Its frame of reference was the conduct of diplomacy, international society, and the nation-state system. Its point of view was historical, empirical, and deductive. Its underlying presuppositions assumed that historical continuities were more important than innovations in the international system; that statecraft provided a historical deposit of accumulated practical wisdom; that the classical writers in politics, diplomacy, and law had not been superseded by recent findings in such disciplines as psychology and sociology, and that the corpus of earlier diplomatic and military experience was worthy of study and reformulation to meet contemporary needs. Undergirding the committee's work was a pervasive moral concern about which Butterfield wrote: "The underlying aim . . . is to clarify the principles of prudence and moral obligation which have held together the international society of states throughout its history, and still hold it together" (*ibid.*, p. 13).

The influence of Butterfield and the British Committee has been greater in the United States than in Britain. American interest in the group's approach coincided with a mounting awareness in the 1950s and 1960s, first by a handful of political realists and later by decision makers and journalists, that the struggle between the Soviet Union and the United States was too complex to define as a clash between absolute right and wrong. The conflict involved a profound moral predicament, for even if the two powers were approximately equal in strength and virtue, each could justifiably fear the other. Each could be sure of its own good intentions without being able to trust the other. Each could feel that its rival was withholding the one thing that could make it feel secure. Each side in a conflict could pursue its own security through displays and threats of power, yet overlook the fact that it could ensure its own security only by destroying the security of the other. For Butterfield the security-power dilemma was the most urgent problem of war and peace, and for him the only solution was for one or the other great power to risk something in the name of peace. The way out of the worst of deadlocks, he prophesied, was through some kind of marginal experiment; but for such an experiment, Amer-

ica would need the hard-level judgment of a hard-boiled Bismarck, not sentimentalists for whom giving way was always too easy. Butterfield made his proposal more than a decade before the Nixon-Kissinger policy of détente was proclaimed. Butterfield approved of this détente and added that what was needed for accommodation was a leader experienced in power politics and capable of bold and subtle, yet hard-headed, acts of political and military judgment. He doubted that either a conventional moralist or an ordinary intellectual or idealist in the White House or in Whitehall could succeed in formulating and defending a policy of coexistence.

In the United States, the response to Butterfield's ideas came from political realists. Although he can be viewed as a spokesman for realism and practical morality, Butterfield's realism has been tempered by his profession as a historian and by Britain's ancient tradition in foreign policy. Like Reinhold Niebuhr, he has had considerable influence on more thoughtful leaders in the religious community, and has quoted the Bible as often as he has historical texts, applying its wisdom to the realm of foreign policy. For Butterfield, the enduring contribution of Christianity to the requirements of international relations lies not so much in the choosing of actual policies but in providing a background of ideas or a more civilized spirit with which men can work. Christianity can help the citizen to formulate his ideas on human sin, to recognize that although extraordinarily evil men do exist, the most difficult problem in international politics is the moderate cupidity of large numbers of men who hope to realize through their nations what society denies them as individuals. Such men exercise vast pressures on governments and make normalized relations among states more difficult. It is the main responsibility of religion to check the sovereign will of the people who want to achieve their objectives by too great an exercise of power, instead of by consciously cooperating with Providence.

In his appeal to American leaders in statecraft and religion to recognize their limits and to exercise prudence, Butterfield, writing at the height of the cold war to a citizenry overanxious about the Soviet threat and imperiled by the risk of a thermonuclear holocaust, may have made his most lasting and valuable contribution.

WORKS BY BUTTERFIELD

- 1924 *The Historical Novel*. Cambridge Univ. Press.
→ A Folcroft Library edition was published in 1971.
- (1929) 1972 *The Peace Tactics of Napoleon, 1806–1808*. New York: Octagon.

C

CANTRIL, HADLEY

Hadley Cantril (1906–1969), American social psychologist, received his B.S. in 1928 from Dartmouth College. After two years of study at universities in Munich and Berlin (1929/1930), he received his PH.D. from Harvard in 1931 and his LL.D. from Washington and Lee University in 1949. At the time of his death, Cantril was devoting his full energies to the application of the social sciences to the highest levels of government policy making. However, his personal commitment to the betterment of society, his belief in the social role of science, and his faith in the democratic process made that effort the culmination of a lifelong commitment. Of his 19 published books, 10, written during a span of 25 years, directly addressed this issue. His earlier work was restricted to the use of public opinion polling data, but his later books, remaining grounded in empirical research, drew on psychological concepts as a result of his development of the transactional approach to human behavior. The latter endeavor accounts for the remaining half of his scientific output.

Cantril's place in psychology and the social sciences grew out of the interplay of these two related themes. His belief that social science had value only if it could lead to the betterment of people's lives was linked to the proposition that this end could be achieved only by a social science that was theoretically and empirically sound.

Cantril held it "much more important to analyze crucial questions with whatever methods are available . . . than . . . to study trivial prob-

lems with precise methods" (1967*b*, p. 93). Throughout his career, he moved continually between applied and theoretical social science. He saw these not as two separate arenas but as aspects of a unitary process, and argued against the conventional separation of basic from applied research, of theory from practice, or of method from content.

At no point did Cantril even briefly abandon one interest for the other, although periods of different emphases divide his career into well-defined phases. From 1932 to 1946, his major efforts, including his dissertation (1932), concerned the development of the potential of polling techniques, with particular reference to public policy. In the years 1946 to 1955, he focused on the development of the transactional perspective in psychology, and the remaining 14 years of his life were devoted to synthesizing polling practice and transactional thinking into a comprehensive approach to global social and political realities.

In 1935, Cantril was invited to Princeton University, where he was to spend the next 34 years. He soon became a leading figure in the emergence of public opinion polling as a scientific endeavor of tremendous power. He pioneered in teaching opinion research as an academic discipline, participating in the establishment of the Office of Public Opinion Research in 1940, and four years later published *Gauging Public Opinion* (1944). In the prewar and war years, he advised the government on propaganda and policy matters through the interpretation of polling data. "Throughout all my Washington activities, I tried to avoid any publicity" (1967*a*,

p. vii), and most of his direct involvement at the government policy level at this time and later remained virtually unknown until the publication of the semiautobiographical *The Human Dimension* (1967a).

During this period Cantril also published a number of social psychological studies, most notably *The Invasion From Mars* (1940), *The Psychology of Social Movements* (1941), and *The Psychology of Ego-involvements* (Sherif & Cantril 1947). Although his interest in psychological theory is evident throughout these books, it was not until he coupled his long interest in the work of George Herbert Mead with the work of Adelbert Ames, Jr., whom he met in 1946, that he found the key to a way of thinking about psychological processes—the transactional point of view, which Ames had developed by combining his research in perception with the theories of John Dewey. Cantril adapted this perspective to meet the needs of social science, maintaining that “we do not ‘react to’ our environment . . . but ‘transact with’ an environment in which we ourselves play the role of active agent” (1967a, p. 17). Over the years he painstakingly elaborated this position into a comprehensive approach to psychology that received its initial expression in *The “Why” of Man’s Experience* (1950b) and was still being elaborated in terms of neurology and physiology at the time of his death.

Cantril’s interest in international social psychology remained active during this period, and was expressed in *Tensions That Cause Wars* (1950a) and *How Nations See Each Other* (Cantril & Buchanan 1953). In 1955 he established the Institute for International Social Research, to which he devoted his full energies thereafter. By then he believed he had both the methodological tools and the theoretical framework to permit a significant contribution to international understanding, a venture he advanced in a series of published and unpublished reports. Although always optimistic, he was toward the end dismayed at the slow acceptance of social science in government and politics.

Cantril’s lifelong interest in large-scale psychological theory and in global social relations was rooted in his concern for individual well-being and his belief in the unique potential of each human being. For him the human condition was expressed ultimately at the level of individual human feeling. His first published paper was a study of emotion (Cantril & Hunt 1932), and his last major paper, entitled “Sentio, Ergo

Sum,” asserted his conviction that “being is more reliably indicated by an awareness of feeling than by any rational thought” (1967b, p. 94). The 35 years that elapsed between these works can be seen as an attempt to systematize that position and apply it for man’s benefit.

It may be too soon to evaluate the success of that effort. During his life Cantril was occasionally attacked and often ignored by much of established social science. His appeal and ultimate influence were primarily with students and younger professionals who characteristically sought new ways of thinking, and for whom Cantril always had time and words of encouragement. He was fond of quoting Einstein to the effect that it is futile to try to convince one’s colleagues, and, true to that belief, he functioned largely outside the mainstream of American psychology. Yet psychology increasingly bears closer resemblance to Cantril’s thinking than to that of his critics. The concept of transaction has become commonplace in social science writing, although few think to acknowledge its originators or Cantril’s anticipation—prior to 1950—of the intellectual currents of the late twentieth century.

CARMICHAEL, LEONARD

Leonard Carmichael was born November 9, 1898, in the Germantown section of Philadelphia, Pennsylvania, and died September 16, 1973, in Washington, at the age of 74. At the time of his death, he was vice president for research and exploration of the National Geographic Society. Elected to the National Academy of Sciences in 1943, he served as chairman of its section of psychology from 1950 to 1953. Earlier honors included election to the American Academy of Arts and Sciences in 1932, and to the American Philosophical Society in 1942.

A physiological psychologist, Carmichael also had a flair for administration, serving as chairman of the Brown University psychology department from 1927 to 1936; as chairman of psychology and dean of faculty at the University of Rochester, 1936-1938; as president of Tufts University, 1938-1952; as secretary of the Smithsonian Institution, 1953-1964; and as vice president of the National Geographic Society, 1964-1973.

Carmichael was the only child of Thomas Harrison Carmichael, a successful physician, and Emily Henrietta Leonard Carmichael, who was active on many volunteer charitable boards. At the time of her death, she was chief of the Philadelphia Bureau of Recreation. His maternal grandfather, Charles Hall Leonard, D.D., LL.D., was for many years dean of the Crane Theological School of Tufts University.

Although his parents were not Quakers, Carmichael attended the Germantown Friends School. He entered Tufts University in 1917, and graduated in 1921 with a B.S. As a senior

he carried out a small research problem on the embryology of the eye muscles of the shark; it aroused his interest in the significance and evolutionary history of sense organs. His interest in sensory psychology and physiology as determinants of an organism's behavior was to become the dominant scientific theme of his career. At Brown, Rochester, and Tufts, he was director of the laboratory of psychology and sensory physiology. At Rochester, as professor and chairman of the department of psychology and dean of the Faculty of Arts and Sciences, and at Tufts, as president, he maintained an active and direct involvement in the research of these laboratories.

The books that influenced him most as an undergraduate were those of Jacques Loeb, the biological ultramechanist, and C. Lloyd Morgan, the proponent of emergent evolution. After reading Howard C. Warren's *Human Psychology* (1919), however, he decided that psychology, rather than anatomy or physiology, was the discipline in which he could best study the senses with a view to their functional role in behavior as well as in the biological setting.

He entered Harvard University as a graduate student on a fellowship provided by the educational psychologist Walter F. Dearborn, with whom he had an especially close association. Early in his graduate work, he participated in rebuilding an improved model of the famous Dodge-Deardorn eye movement recording camera. Carmichael was encouraged to satisfy his interest in biology as well as psychology. He took a number of courses in zoology, and his first piece of graduate laboratory research was a quantitative study of the reaction of the meal worm (*Tenebrio molitor*) to light. G. H. Parker, a professor of zoology, guided this work. Carmichael regarded Parker's lectures on the nervous system and the sense organs as models of clarity and scholarship. In psychology his teachers included E. G. Boring, L. T. Troland, and William McDougall.

Carmichael's PH.D. thesis, a theoretical and historical dissertation on the psychology and biology of human and animal instincts, was published under the title "Heredity and Environment: Are They Antithetical?" (1925a). In reviewing the literature on this subject, he reported accidentally discovering Wilhelm T. Preyer's work on signs of life in the fetus. He saw this approach as the way to study the morphological growth of receptors and the nervous system in relation to behavior at various stages

of early ontogenetic development in mammals before learning begins or is important.

In 1924, after receiving his PH.D. and completing a Sheldon Traveling fellowship, he joined the faculty of Princeton University to teach physiological psychology and history and systems of psychology. At Princeton he began his research on behavior development with larval amblystoma and frog tadpoles. He found that their physical development proceeded normally even after they had been immobilized with a mild concentration of the anesthetic chloretone. Here was an ideal situation, in which, presumably, all sensory input was reduced and all motor movement, clearly, inhibited, so that no practice (i.e., learning) was possible. He observed that when the anesthetic was removed, the experimentally treated organisms swam vigorously in as coordinated a manner as did the undrugged controls, who had been allowed to move throughout development. As he states in his autobiography: "These studies supported a hereditary rather than an environmentalistic theory of the determination of the growth of organized behavior. At the time, the results of these experiments surprised and almost shocked me. They did not support my then strongly held belief in the determining influence of the environment at every stage in the growth of behavior" (1967, p. 37). As a consequence, his reports of these experiments in *Psychological Review* (1926; 1927; 1928) seemed to dodge the obvious conclusion with his reiteration of the intimate interrelation of heredity and environment and the difficulties of disentangling their interaction.

In 1927 Carmichael moved to Brown University. Still in his twenties at the time of his appointment, he was one of the youngest full professors on the Brown faculty. Although he became busily involved in organizing the new laboratory and department, equipping it for graduate training and research in experimental and physiological psychology, at the same time that he continued his own research, he personally taught undergraduate and graduate courses and guided the research of undergraduate and graduate students. Carmichael was a clear and dynamic lecturer; his elementary course was extremely popular and students voted him the most popular teacher a number of times.

At Brown University, Carmichael achieved his long-cherished goal of studying the development of behavior in fetal mammals. His own preparatory work and that of others had shown

that fetal neural function rapidly deteriorated if circulation was occluded. He began with the study of the fetal cat and developed an especially designed cradle in which the pregnant mother cat could be supported while a heated trough filled with saline solution received the fetus, its fetal circulation intact, after a Caesarean section. In order to prevent the complicating effects of the anesthesia under which the preliminary surgery was performed, he devised a way of sectioning the mother's spinal cord in the cervical region. A kind of spinal anesthesia without drugs, it rendered her motionless and kept pain and other sensory input from reaching her brain. The fetus could then be studied in a nearly normal physiological state. James Coronius and Harold Schlosberg participated with Carmichael in the first study of the fetal cat. Motion pictures were taken and verbal records of behavior descriptions were dictated. After Carmichael's marriage to Pearl L. Kidston in 1932, she assisted in many early experiments, especially in transcribing and keeping records.

Carmichael's most extensive studies of development were performed on fetal guinea pigs, focusing on responses in more than 100 cutaneous pressure reflexogenous zones throughout the entire active prenatal period of 68 days. Carmichael remarked that it was not the nature of the physical stimulus so much as the fact that it was above the threshold of some skin receptors in a specific locus that determined the response. Many typical patterns of behavior remained amazingly constant in the rapidly growing organism. Yet growth could suddenly alter responses in such a way that they could easily be confused with learned responses, especially if such changes had been seen in postnatal life. He noted in "The Experimental Embryology of Mind" (1941):

I have never seen any responses in the late fetus which, in their elements, have not appeared as a typical patterned reaction to isolated stimuli many times before. In the late guinea pig fetus the hair coat is well grown, the teeth are erupted, eyes and ears are functional, and adaptive integrated behavior is well established. At this time such an animal will, to use the language of teleology, attempt in a most effective and even ingenious way to deal with a tactual stimulus applied to its lip. First, it may be, it will attempt to remove the stimulus by curling the lip; then, if the stimulus remains, it is brushed by the forepaw on the stimulated side. If the stimulus still persists, the head is turned sharply. Finally, a general struggle is

resorted to which involved movements of all four limbs and all trunk muscles. In a late fetus this final maneuver is sometimes so quick and effective that the experimenter is often thwarted and the offending stimulus is removed—by a guinea pig fetus that is having its own willful and annoying way in spite of anything the experimenter can do. . . .

Complex patterns of behavior emerge as a result of maturation. Such behavior is possibly as truly end-seeking and purposeful as is any behavior in the world which does not involve the use of language. I see no reason to believe that this emergent purposeful behavior is not as natural a result of the processes of growth as is the length of the fetal whiskers, and quite as independent of learning. (pp. 16, 17)

His findings on the development of sensorimotor responses in mammalian fetuses brought home dramatically the natural sequence of maturation and the role of genetic factors in behavioral development. But he was careful to avoid the broad generalizations about the course and nature of developmental sequences to which some workers were prone. The classic work of W. T. Preyer and G. E. Coghill on the sequence of motility in the developing amphibian larvae had shown the first movement to be a C-shaped or reversed C curvature, followed by an S or sigmoid form of reaction. Coghill (1929) had characterized the S reaction as a reversal of flexure before the earlier C flexure was completed, thus producing the sinuous behavior of the total organism. The entire sequence, when speeded up, was in fact the larval swimming movement. These movements appeared before the limbs developed. Although in this organism the forelimbs developed before the hindlimbs, both sets of limbs moved only as part of the larger trunk movement. Gradually, however, independent limb action began to individuate out of the dominant trunk movements. First the forelimbs, then the hindlimbs, showed a certain autonomy. Trunk movement in walking was regarded as nothing more or less than swimming movement at a reduced speed. Development was a progressive expansion of a perfectly integrated total pattern from which the parts—i.e., partial patterns—individuated with various degrees of discreteness.

Carmichael saw something different in fetal mammals. He gave more importance to the early individuation of certain quite specific responses that later became parts of integrated behaviors. Rather than debate the issue of holistic *vs.* particulate development, Carmichael cautioned that

the researcher would do better to record as unambiguously as possible the responses made by a fetus at any stage, rather than fit all developmental changes into one formula.

Carmichael began his experimental studies at a time when the American biological and psychological community was not familiar with the advances in ethology that documented the releaser function of patterned stimuli in eliciting species-specific responses. The regularity of these species-specific behaviors, and their occurrence in animals reared in environmental isolation with restricted postnatal experience, had led Konrad Lorenz and Nikolaas Tinbergen to argue for their instinctual basis. In much animal behavior occurring under natural circumstances, such “releaser stimuli” were often perceptually complex, a characteristic coloring and size of an egg, particular location and size of a red bill spot, even a sequence of movements by another animal.

Psychologists as a group are cautious in attributing behavior patterns to genetically determined processes or propensities. In the past, however, some have used this facile explanation to account for behavior whose full ontogenetic history and experience had not been adequately documented. With time, increasing interaction between students of animal behavior and psychologists has produced a sounder appreciation of the role of genetic determinants in behavior, both in their own right and as setting the stage upon which experience and learning can interact. Carmichael's work on the development of behavior and its sensory control was in a sense premonitory of changing views on the heredity–environment issue. His first two editions of the *Manual of Child Psychology* ([1946] 1954), and a third edition (1970) under Paul H. Mussen's editorship, are witness to Carmichael's unflagging interest in this subject. He was less able to devote his energies to such research during the Tufts years, which overlapped with the World War II effort. The Laboratory of Sensory Physiology and Psychology at Tufts turned to war-related projects that included the improvement and application of new techniques to the study of eye movements and visual fatigue. Electronic recording, rather than ocular photography, proved more suitable for long-time studies of reading fatigue, an old interest from his days with Dearborn. To this method of registration could be added the simultaneous registration of brain waves, the electrical signs of oscillatory neural activity in different brain

regions throughout the reading, and other visual tasks. Earlier, at Brown University and the Bradley House, he had pioneered with H. H. Jasper some of the first electroencephalographic (EEG) registrations of brain waves in humans and animals in the United States (Carmichael & Jasper 1935).

With his call to the Smithsonian secretaryship, Carmichael not only turned his administrative talents to modernizing that institution, which included the new Museum of Sciences and Technology, but found some opportunity to pursue his interest in behavioral development. He informed the superintendent of the Washington Zoological Park that he wished to be present whenever a birth was imminent among any of its exotic animal species. He reveled in observing the new-born yak or giraffe struggle to its feet and in relatively short order display coordinated, though awkward, motor patterns. He had become extremely interested in developmental studies of primates, and indeed served as first president of the Primatological Society. Later, at National Geographic, he was proud of its support of Jane Goodall's original and pathbreaking field studies of chimpanzees in their natural habitat.

Although Leonard Carmichael was active also in national affairs and in scientific and educational domains, this memoir has focused on his contributions in the study of behavioral development. His memberships, officerships, awards, and distinctions, too numerous to recount, include 23 honorary degrees, the presidential citation of merit, the public service medal of the National Academy of Sciences, orders of merit from four foreign countries, fellowships, trusteeships, and a legion of responsibilities and duties of distinction. His honorary degree citation from Harvard called him "a psychologist who combines distinction in his science and success in administration."

CARNAP, RUDOLF

Rudolf Carnap, the noted philosopher of science, logic, and language, was born in 1891 at Ronsdorf, near Barmen, Germany. He studied mathematics, physics, and philosophy at the universities of Jena and Freiburg-im-Breisgau before and after service in World War I, and received his doctorate in philosophy at Jena in 1921. Appointed a lecturer at the University of Vienna, he soon became, after Moritz Schlick, the leading exponent of logical positivism (later, logical empiricism)—the philosophy of the Vienna Circle. With Hitlerism threatening to overwhelm all Europe, Carnap, a humanist socialist in his sympathies, emigrated to the United States in 1936. There he taught philosophy for many years, first at the University of Chicago

and then at the University of California at Los Angeles. He died in California on September 14, 1970, at the age of 79.

Education. After having been taught at home for several years by his mother, a former teacher, Carnap entered the Gymnasium at Barmen. Here he was early drawn to mathematics because of its precise concepts and rigorous proofs. This concern for concept and proof continued throughout his life. His university studies at Jena and Freiburg-im-Breisgau centered first on mathematics and philosophy, shifting later to philosophy and physics.

At Jena, Carnap read Kant with Bruno Bauch and some Hegel with Hermann Nohl. But the event that most shaped his future career was his chance enrollment in the fall of 1910 in a seminar conducted by Gottlob Frege. In 1879, Frege had published a little book, *Begriffsschrift*, which founded the modern science of symbolic or mathematical logic. Now, a generation later, his great work still virtually unknown, he remained an obscure associate professor of mathematics at Jena, lecturing to a handful of students. The 1910 seminar, on the *Begriffsschrift*, gave Carnap his first view of "real logic"; he returned for another course with Frege in the spring of 1913, and again in the spring of 1914.

Meanwhile, in 1913, Carnap had begun doctoral work in experimental physics, but progress was slow ("I was certainly not a good experimenter"). When World War I broke out ("for me an incomprehensible catastrophe"), Carnap, nonpolitical but vaguely antimilitarist like most of his associates, nonetheless felt it his duty to go to the front. He served there until transferred to Berlin in the summer of 1917 for military research in physics. At this time, Carnap began to study the ideas and theory of the socialist workers' movement. Thus he, with his friends, was able to welcome the German revolution, and the Russian revolution before it, as a "liberation from the old powers." (But "in both cases, after a few years, we saw that the promised high ideals were not realized.")

In 1919, Carnap resumed his studies at Jena and Freiburg, this time in the philosophy of physics. His doctoral dissertation was a highly technical essay in conceptual analysis in which he sought to show that major controversies about the nature of "space" arise from a failure to distinguish among three meanings of the term: the formal or logicomathematical, the intuitive (here described in semi-Kantian terms),

and the physical. The dissertation was approved by Bruno Bauch in 1921 and was published a year later as a supplement to the influential journal *Kantstudien*, under the title *Der Raum: Ein Beitrag zur Wissenschaftslehre*.

During this period, Carnap continued to work in logic. He made a thorough study both of the massive *Principia Mathematica* (1910–1913) of Alfred North Whitehead and Bertrand Russell, to which Frege had referred in his lectures, and of Frege's own writings. Late in 1921, he turned to Russell's *Our Knowledge of the External World as a Field for Scientific Method in Philosophy* (1914), in which Russell had urged philosophers to follow Frege's example and use the "logico-mathematical method of philosophy." Carnap later wrote: "I felt as if this appeal had been directed to me personally." He at once set about an intensive study of all of Russell's writings on epistemology and scientific methodology. Soon thereafter he began a major work on the logical analysis of empirical concepts in the spirit of Russell's program.

In the early 1920s Carnap, who had been working in comparative isolation, started to develop relations with other scholars in his field. Among them was another young physicist turned philosopher, Hans Reichenbach, with whom Carnap remained in very close touch until Reichenbach's death in 1953.

The Vienna Circle years. In 1922, Moritz Schlick, a widely respected German epistemologist and philosopher of science, had accepted the prestigious chair in the philosophy of the inductive sciences at the University of Vienna. He quickly gathered around himself a group of scientists and philosophers, including Hans Hahn, the mathematician, and Otto Neurath, the sociologist-economist. In 1924, two of his students, Herbert Feigl and Friedrich Waismann, suggested that he form a regular discussion group in the philosophy of science. From these Thursday evenings was born the famed Vienna Circle.

Carnap had met Schlick through Reichenbach in 1924 and a year later was asked to lecture to the Vienna Circle. In 1926, he and Reichenbach became the leading candidates for appointment as instructor in philosophy at the University of Vienna. Schlick and Hahn, facing a difficult choice, finally recommended Carnap.

Life in the Vienna Circle was ideal for Carnap. Here was a spirit of free and undogmatic inquiry; here philosophy was practiced not in

the traditional mode of speculative metaphysics but as the painstaking, informed logical analysis of the concepts of the sciences; here too was an atmosphere of cultural and political enlightenment. Years later he recalled the five year instructorship as "one of the most stimulating, enjoyable, and fruitful periods of my life."

And fruitful it was. The manuscript of his Russell-inspired work, which he brought with him to Vienna, was discussed avidly and in detail in the circle. In revised form, it appeared in 1928 as *Der logische Aufbau der Welt*. Exploiting the logical apparatus forged by Frege and Russell, Carnap offered in the *Aufbau* a logical reconstruction of the concepts used in empirical science in terms of one or two concepts drawn from immediate experience. But he warned against construing this as a solipsistic "ontological" reduction of all "reality" to immediate personal experience. Here, and in a small monograph published the same year, and indeed throughout his career, he insisted that science is metaphysically neutral—and philosophy should be. Moreover, the only genuine issue that lurks behind such metaphysical pseudoissues as, say, realism versus idealism, is the problem of choosing a suitable language or conceptual framework for science. And this is a matter to be decided on practical grounds, not theoretical ones.

By 1929, Carnap had become a leader in the circle second only to Schlick. That year he published a text on symbolic logic; coauthored with Hahn and Neurath the circle's programmatic declaration *Wissenschaftliche Weltauffassung: Der Wiener Kreis*; joined Reichenbach in founding the new journal *Erkenntnis*; and helped organize the Prague Conference on the Epistemology of the Exact Sciences.

Two years later, Carnap accepted a chair in natural philosophy at the German University in Prague. Keeping in touch with the circle through frequent visits, he now focused his own research on language. His initial motivation is reflected in the title of a 1932 paper, "The Elimination of Metaphysics Through the Logical Analysis of Language." This research led to his second major work, *Die logische Syntax der Sprache* (1934), which laid the foundations for a new discipline, the study of the logical syntax of formal or constructed languages. Stimulated by the ideas of Alfred Tarski, the Polish mathematician, Carnap then extended his studies from the logical syntax to the semantics of formal languages.

Meanwhile, the Vienna Circle had begun to take on the aspect of a movement, "a new movement in European philosophy." Visitors had come to Vienna from Germany, Poland, Finland, the United States, and England. In Prague, Carnap was sought out by such younger American philosophers as W. V. Quine of Harvard University and Charles Morris of the University of Chicago. In 1934, he gave a series of lectures at London University, which became his first book published in English, *Philosophy and Logical Syntax* (1935). It was on this trip too that he first met his mentor, Bertrand Russell.

But another movement was also spreading. Nazism, having come to power in Germany, was preparing to absorb Austria and Czechoslovakia. The German University at Prague had become a center of Nazi agitation. There was no place on the continent for a German of Carnap's outlook to live and work. Thus he, like most of his fellow members of the Vienna Circle, found it necessary to emigrate. With his wife Ina, he left Prague at the end of 1935. In September 1936, through Quine, he was invited to the Harvard Tercentenary Celebration as a participating scholar, and was awarded an honorary sc.d. degree. With the help of Morris, he obtained a teaching post that fall at the University of Chicago.

Teaching in the United States. Carnap taught at Chicago from 1936 to 1952, with several leaves for visiting professorships and for research. He soon had many colleagues, old and new, with whom to discuss logical and philosophical problems. Feigl had come to the United States in 1930 and was teaching at Iowa State University. Reichenbach, after a stay in Turkey, was appointed to a professorship in 1938 at the University of California at Los Angeles. Carnap himself arranged in 1938/1939 for Carl G. Hempel and Olaf Helmer to join him as assistants.

There were many memorable experiences. Russell came to Chicago in the fall of 1939 as a visiting professor. During Carnap's own visiting professorship at Harvard in 1940/1941, Russell delivered the William James lectures the first semester and Tarski spent the full year there. Soon a regular discussion group was formed, with Russell, Tarski, Quine, and Carnap as the most active participants.

Carnap's books, monographs, papers, and reviews were now appearing in rapid sequence, especially from 1942 on. That year he published

his *Introduction to Semantics*, and a year later his *Formalization of Logic*. In 1947, he published *Meaning and Necessity: A Study in Semantics and Modal Logic*.

In the early 1940s, Carnap, prompted by Feigl, had begun to shift his attention from deductive logic and semantics to the problems of probability theory and inductive logic. The year 1950 saw the publication of his treatise *Logical Foundations of Probability* (as well as his influential paper, "Empiricism, Semantics, and Ontology," in which he developed and refined his 1928 thesis of metaphysical neutrality). From 1952 to 1954, he continued his researches on probability at the Institute for Advanced Study in Princeton, New Jersey. There he had a number of lively, enjoyable discussions with Albert Einstein.

In 1954, Carnap accepted an appointment at the University of California at Los Angeles, succeeding his friend Reichenbach. Carnap taught at the university until 1962, when he retired, as he wrote Russell, "to devote myself to the further development of my theory of inductive probability."

Originally, Carnap had intended his 1950 treatise on probability to be the first of a two-volume work. But his ideas on the subject had changed materially during the decade that followed. Instead of a second volume, he finally worked out a plan for a large group of papers to be written by himself and such colleagues and former students as John Kemeny, Richard C. Jeffrey, and Chaim Gaifman, and to be published from time to time as *Studies in Inductive Logic and Probability*. Delays set in, and volume 1 of *Studies*, edited by Carnap and Jeffrey, did not appear until 1971, some months after Carnap's death. It contained, among other contributions, his 130-page monograph, *A Basic System of Inductive Logic: Part I*. He was working on the final revisions for *Basic System: Part II* and had almost completed them, when, following a short illness, he died in September 1970.

"A towering figure." Carnap was a brilliant, dedicated scholar, who wrote—and spoke—with extraordinary lucidity and rigor. So much so, indeed, that, as Hempel put it:

To observers who did not know him closely, Carnap may well have appeared as intellect and rationality incarnate, as a powerful thinker moving in a theoretical realm far distant from the domain of human passions and hopes and fears; but this picture does not do him justice. Carnap formed very strong human

bonds; he was a warm-hearted and loyal friend, a most interested and sympathetic listener, and a broad-minded observer of the human scene. . . . (1971, p. xviii)

Although not a political activist in the usual sense of the term, Carnap took a keen, informed interest in the great issues of the day. In a letter (1962) congratulating Russell on his ninetieth birthday and signed "with deep affection and gratitude," Carnap wrote: "I am in complete agreement with the aims for which you are fighting: serious negotiations instead of the cold war, no bomb-testing, no fallout shelters. But, not having your wonderful power of words, I limit myself to participation in public appeals and petitions initiated by others and to some private letters to President Kennedy" (Russell 1969, p. 133).

Characteristically, he closed his "Intellectual Autobiography" (1963) with these lines:

Thus one of the main problems, perhaps the most important and most difficult one, after the terribly urgent problem of the avoidance of atomic war, is the task of finding ways of organizing society which will reconcile the personal and cultural freedom of the individual with the development of an efficient organization of state and economy.

It was also in keeping with his character that in January 1970, just a few months before his death, he made it a point to visit two Mexican philosophers, De Gortari and Molina, held as political prisoners in Mexico City. On his return, he sent a report to friends and colleagues, describing his visit and urging support for the release of the two men—one more expression of his profound commitment to justice and freedom. As W. V. Quine wrote: "Carnap is a towering figure. I see him as the dominant figure in philosophy from the 1930s onward, as Russell had been in the decades before" (1971, p. xxii).

CARR, E. H.

Edward Hallett Carr was born June 28, 1892, in north London, the son of a small manufacturer whom he has described as belonging to “the middle middle class.” He was educated at the Merchants Taylors’ School and in 1911 went on scholarship to Trinity College, Cambridge. His

contacts with Trinity’s most celebrated dons, such as Alfred North Whitehead, A. E. Housman, James G. Frazer, and Bertrand Russell were limited, but he earned a first in the Classics Tripos and university prizes in Latin epigrams, Latin poems, and Greek translation.

Had World War I not intervened, Carr might have become a classics don at Cambridge; instead he spent twenty years as a diplomat. Such accidents were to shape his intellectual journey for more than sixty years. One year after joining the Foreign Office, he was, in his words, “shifted onto the Russian Revolution.” By accident he was present at the Paris Peace Conference and later served as assistant adviser on League of Nations affairs in the Foreign Office. These experiences led him to try, in *The Twenty Years’ Crisis* (1939), to unravel the tangled web of international politics. During World War II he was assistant editor of *The (London) Times* and its chief leader writer; he exercised quiet influence in preparing the way for a Labour government in 1945. *The Times* in this period was referred to as the “Thrupenny” *Daily Worker*, and conservative critics identified Carr as a member of a band of *étatist* radicals. The two world wars, perhaps World War I especially, led to the erosion of his faith in the established values of liberal England and to his search for a world different from the conventional one in which he had been raised. He followed, not the route common to intellectuals in the 1930s—of flirtation with Leninism—but one that led to a discovery of the intellectual world of nineteenth-century Russia and the writings of F. M. Dostoevsky and M. A. Bakunin. Twice he returned to university life: in 1936 when he became Wilson professor of international politics at the University College of Wales at Aberystwyth, leaving the Foreign Office (acknowledging that he had stayed too long) to have greater freedom to write about the Russian revolution; and again in 1953 when he returned to Cambridge to take up what would be a quarter century of research on the history of Soviet Russia, an effort culminating in fourteen books arranged in ten volumes (1950–1977). His return to Cambridge came not because he was asked to leave *The Times*, but because, at age 52, he was determined to return to writing his history of Soviet Russia and its dual fascination with “otherworldliness” and the capacity for planned social change. As a journalist, he had been denounced in the House of Lords as “an active danger,” and Randolph Churchill in 1946 had charged that

Carr "had been mainly responsible for *The Times* becoming, apart from the Communist *Daily Worker*, the main British apologist for policies of the Kremlin." Carr had influenced *The Times* to support the Beveridge Report and postwar planning efforts that bore a resemblance to experiments in Soviet Russia. Having been identified in the United States with "hard line" policies toward the Soviet Union, he was second secretary from 1925 to 1929. His critics charged that he led *The Times* to "soft line" policies, although Carr has said that this criticism became significant only in his last year with *The Times* as the cold war set in.

Carr's intellectual contribution will ultimately be judged less by his journalism or his diplomacy than by his theoretical writings on international relations and by his *History* (1950-1977). The latter, though representing prodigious scholarship, is the more difficult to assess. As a historian of Russia, Carr represents no clearly identifiable school of thought. He has written contemporary history on a highly volatile subject not yet sufficiently removed in time to permit dispassionate scholarship. He has emphasized the broad economic, social, and political aspects of the Russian revolution without attempting much historical judgment of its more brutal and controversial aspects, which recede into his broader perspective. His volumes, whose publication spread over 28 years, reflect the shifts of British attitudes toward the Soviet Union. (Carr acknowledged that he would approach the first volume differently if he were writing in the late 1970s, stressing constitutional arrangements less and emphasizing the social and economic environment in which the new Soviet state operated.) Thus his *History*, written from three to six decades after the revolution, stands as an ambiguous historical classic, marred by its lack of passion and historical imagination, too cautious in its moral judgments for some critics and too defensive of collectivist social change for others, but accepted by all for its persistent scholarship on the first ten years of Soviet rule. The genius of the work is Carr's success in placing himself in the roles of leading Soviet statesmen, confronting the reader with the choices these men faced and enabling future generations thereby to walk alongside Russian policy makers despite the wide gulf of ideology and culture separating them. No other historian of the Soviet Union has achieved quite the same empathy with Soviet leaders and their tasks. None has made Carr's physical and intellectual investment in a painstaking

survey of a broad sweep of history utterly critical for understanding the contemporary Soviet Union.

In his career Carr combined the professions of political scientist and historian with those of journalist and man of action. He joined the Foreign Office as temporary clerk in 1916 and more than two decades later, while serving as assistant editor of *The Times*, wrote anonymous editorials on the need for a better understanding of Russia and its role in the postwar world. Although frequently at odds with the prevailing approach of the British foreign policy establishment, he served on various study commissions. He held diplomatic posts in Paris and in Riga, Latvia, was assistant adviser on League of Nations affairs, and first secretary to the Foreign Office. He also served as director of foreign publicity in the British Ministry of Information. He wrote extensively on intellectual and diplomatic history of the nineteenth and twentieth centuries and on the philosophy of history. He contributed biographical studies of Bakunin, Dostoevsky, A. I. Herzen and Albert Sorel, and theoretical works on international politics, as well as the monumental ten-volume history of Soviet Russia, which is comparable to Theodor Mommsen's history of Rome.

Carr's major theoretical contribution to international studies has been to lay the foundations for what is called "political realism." *The Twenty Years' Crisis, 1919-1939* was published in 1939, as the rise of Hitler and the outbreak of World War II shattered the illusions of the interwar period. Expressing the euphoria of their era, statesmen like Woodrow Wilson and William Howard Taft in the United States and David Cecil in Great Britain had heralded the rise of new forms of international relationships that were modifying the ancient and destructive patterns of national rivalries and power politics. Intellectuals and scholars within and outside leading universities had dedicated themselves as much to the reform as to the study of the existing international system, a trend prompting Carr to assert that international studies were becoming encumbered by utopianism, half truth, and ignorance. Foreign policies were judged in terms of categories of good and evil—good nations and bad nations, good internationalism and bad nationalism. "Heretic and renegade" to the prevailing establishment view, Carr as the editor of an *Ambassadors at Large* series wrote in an introduction to the volume on France: "In international politics, few of us have got be-

yond the stage of the small child who says, 'You *are* naughty' to anyone who does something it doesn't like; for the temptation to impute moral turpitude to policies which do not suit our interests is almost irresistible" (Ormesson 1939, p. iv).

Carr explained that *Crisis* was written "with the deliberate aim of counteracting the glaring and dangerous defect of nearly all thinking, both academic and popular, about international politics in English-speaking countries from 1919 to 1939—the almost total neglect of the factor of power" ([1939] 1946, p. vii). In explaining this neglect he concluded that the science of international politics was still in its infancy. Every science, Carr said, passes first through a utopian phase in which purpose gives to analysis its initial impulse and direction. In the biological sciences, the desire for improved health led to the emergence of medical science, while the necessity of roads and bridges ushered in the science of engineering. In this first phase, the element of wish or purpose is overwhelmingly strong and that of analysis of facts weak or even nonexistent. For political science, the impulse in studying war comes from a desire to cure a profound illness of the body politic, and whereas the basic scientist in his laboratory is also often several, or many, steps removed from the aim of eradicating a disease—e.g., cancer—and his emotions are irrelevant to his research, the political scientist in his research is never far from the urgent social need his inquiry is intended to serve. Indeed the ends of social research themselves become determining factors: the student orders and rearranges the data on which his conclusions are based—as do economists who seek to preserve or defend capitalism, or Marxists, however "scientific," whose analysis of capitalism becomes inseparably joined with the goal of supplanting or overthrowing that system. The social position and moral and political purpose of the observer inevitably shape and affect his research and give both meaning and direction to analysis and interpretation.

In the second phase, realism in the social and political sciences succeeds utopianism, and what is distinguished from what should be. Realism demands both the acceptance of facts and a search for their causes and consequences. By 1932 Winston S. Churchill had observed that never had "the gap between the kind of words which statesmen used and what was actually happening" been so great. Carr undertook to

diagnose and criticize utopianism and found that its weakness lay in its proponents' attempts to carry over the principles of nineteenth-century liberal rationalist thought from homogeneous national societies to the currently existing heterogeneous and half-anarchic international order. The League of Nations and other experiments in collective security were efforts to translate principles and institutions that had achieved relative success within particular nation-states into universal principles for the world of international affairs. Underlying these enterprises was the belief in a natural harmony of interest among nations, derived from the doctrines of laissez-faire economics in the nineteenth century. The passionate desire to eliminate war determined the first phase of international studies, and criticism of the means proposed to achieve it was branded mischievous or destructive. "The advocate of 'collective security,'" wrote Carr, "replied to the critic . . . by a statement that it must be made to work . . . or by a demand for some alternative nostrum" ([1939] 1946, p. 8). The concept of a natural harmony of interests, fundamental to the idea of a community among nations, conflicted with the division of the world into satisfied and unsatisfied, or have and have not, nations and the need for hard bargaining on conflicting interests. Both power and interest remained centered in independent sovereign nation-states, and conflicts resulted not only from a failure of understanding of national leaders but from the clash of incompatible goals and aspirations that could be accommodated, not by a priori rational principles, but only through compromise and diplomacy. International politics lacked objective and disinterested moral or legal standards for resolving conflicts.

Thoroughgoing realist that he seemed to be, Carr nevertheless recognized that realism was not enough. He observed: "Consistent realism excludes four things which appear to be essential ingredients of all effective political thinking: a finite goal, an emotional appeal, a right of moral judgment, and a ground for action" ([1939] 1946, p. 89). Utopian and realist thinking were both needed throughout history, and they existed in dialectical relationship with one another, the need for one or the other being greater in a particular era. Having demolished the cornerstone of the utopianism of the interwar period, Carr acknowledged the necessity of a new international vision for the future. Such a vision had to be free of illusions, and he warned a young

assistant lecturer: "I hope you will . . . steer clear of SUNFED [Special United Nations Fund for Economic Development], ECOSOC [Economic and Social Council] and all those other horrors which have no substance in them" (Abramsky 1974, p. 179). Carr saw the period between the wars as having called for greater emphasis, among defenders and foes of the status quo, on the need for peaceful change, based on what was just and reasonable, and reflecting shifts in international power relationships. Carr felt that those who were the major beneficiaries of a particular status quo (France and England between the wars) had to prepare themselves for sacrifice to the less satisfied powers. A successful foreign policy, therefore, had to oscillate between the poles of force and appeasement. The Munich settlement of 1938 had represented changes in both the distribution of power within the European balance of power and in the view of justice expressed in the principle of national self-determination. Critics noted that Carr's general principle calling for relating power and morality was unexceptionable, but that its application to the Munich settlement showed him surrendering to "the immanence power." He had himself fallen victim to a relativistic conception of morality to which he had been led by his concept of values being conditioned by the power and status of the nations espousing them.

Carr followed his major theoretical work, *The Twenty Years' Crisis*, with a more topical analysis of the international crisis, *Conditions of Peace* (1942). In it he repeated the warning that the democracies were trying to meet the world crisis with ideas and institutions carried over from the nineteenth century. The book was already in press when the attack on Pearl Harbor brought the United States into World War II. Germany and Japan were at the height of their power as Carr prepared the manuscript; thus he added an explanatory note upon its publication, apologizing for the tentative nature of his policy conclusions. He had argued that Soviet Russia and Nazi Germany held the key to the future because they had virtually eliminated unemployment by instituting planned economies. The privileged status quo powers, with the possible exception of the United States, idealized the past while minimizing the advantages of a collectivist approach to economic problems. They suffered from a preoccupation with security and privilege and clung to laissez-faire capitalism and national self-determination while the Germans and the Russians tried to build a world of

larger units under centralized planning and control. Hitler, whom Carr depicted as a twentieth-century Napoleon, "consummated the work, which Marx and Lenin had begun, of overthrowing the nineteenth-century capitalist system" (1942, p. 9). Carr prophesied that even if Hitler were overthrown, nineteenth-century German capitalism could not be restored any more than the downfall of Napoleon had restored feudalism. The idealists of the English-speaking world courted disaster by placing themselves "in opposition to the new world revolution which first broke through the crust of the existing order in the Bolshevik Revolution of 1917" (1942, p. 7).

When the peace settlement of 1919 had increased the number of weak and struggling states in the name of national self-determination and left the economic order of central and eastern Europe in an enfeebled state, the victorious Allies by this action had in effect lost the peace. It was beside the point to argue that the Versailles treaty had been too vindictive or not vindictive enough. Soviet Russia and Nazi Germany had won the peace because their leaders had understood the contemporary revolution and made giant strides toward recovery through economic planning, while the victors had remained helpless spectators and prisoners to nineteenth-century thinking. Political parties in the democratic countries represented powerful established interests, and the will of the unorganized majority remained impotent against the might of organized economic power. Democracy's survival depended on the redefinition and reinterpretation of the majority's rights and the discovery of a common moral purpose powerful enough to generate self-sacrifice by the strong in the interests of the weak. Communism, much like Christianity, had discovered its ground for action and its finite goal in a higher purpose. Carr prophesied: "The cooperation between the Western peoples and Soviet Russia in the war should help to resolve the antithesis, incidental rather than fundamental, between the secular ideals of Christianity and those of communism" (1942, p. 121). He hoped that the democracies might profit from the lessons of communism's moral and economic successes.

In *Nationalism and After* (1945), which appeared at the end of World War II, Carr examined the far-reaching changes between nineteenth- and twentieth-century nationalism, principally the extension of political participation within nations to include new social groups, the visible reunion of economic and political

power, and the beginnings of a vast proliferation ultimately quadrupling the number of nation-states following the war. He warned of the bankruptcy of nationalism resulting from the carnage of two world wars and the coming obsolescence of the nation-state, which could no longer provide military security or economic well-being to its citizens on an autonomous basis. A new international order was necessary to transcend the destructive consequences of rampant national self-determination, but it could not be established by constitutional design. It must rest rather on some new enterprise or common effort, such as the world-wide quest for social justice, which comprised for Carr equality of opportunity, freedom from want, and full employment. While acknowledging the unlikelihood of world-wide cooperation, he found that the best means of achieving these goals lay in large multinational and regional groupings and joint planning on programs of full employment or assistance to backward areas. In the aftermath of the age of nationalism, Carr suggested, European cooperation for social justice, with Britain participating, might offer an alternative to the Soviet ideology of state monopoly and the American ideology of unrestricted cooperation.

In *The Soviet Impact on the Western World* (1946), and in his monumental *The Bolshevik Revolution* (1950–1977, vols. 1–3) Carr turned explicitly to a study of the Soviet challenge to the West. In his biography of Marx he had described his subject as “the protagonist and the forerunner of the whole twentieth-century revolution of thought” (1934, p. 302). Reflecting certain continuing Marxist presuppositions, he declared in *The Soviet Impact*: “The missionary role which had been filled in the first world war by American democracy and Woodrow Wilson had passed in the second world war to Soviet democracy and Marshal Stalin” ([1946] 1947, p. 3). Soviet democracy was an outgrowth of Western democracy; just as the Cromwellian and Jacobin dictatorships had given birth to political democracy, the Soviet dictatorship of Lenin and Stalin and the Russian proletariat had created social democracy. The first impact of Soviet democracy on the West was to stimulate concern for “the common man”—a challenge “western democrats will be well advised to ponder” ([1946] 1947, p. 19). The achievements of the Soviet planned economy helped prepare the ground for Keynesian economics in the West. In foreign policy, the Soviets openly acknowledged the power factor as the determinant of policy freed of the ideo-

logical disguises of League of Nations statesmen. They also perfected the use of propaganda as a normal instrument of foreign policy, but Carr looked elsewhere in explaining the impact of the Soviet challenge. He observed, “the gravamen of the Marxist revolution is . . . that it has called in question the moral authority of the ideals and principles of western democracy by declaring them to be a reflexion of the interests of a privileged class” ([1946] 1947, p. 94). The age of individualism that had prevailed from 1500 to 1900 was drawing to a close and represented little more than an oasis between the totalitarianism of the medieval church and empire and modern collectivist societies. Two world wars, revolutions around the globe, and far-reaching social and economic upheavals had altered the moral climate and convinced “all but the blind and the incurable that the forces of individualism have somehow lost their potency and their relevance in the contemporary world” ([1946] 1947, p. 111). The nature of the Soviet threat, therefore, was predominantly moral, not military, and “security is and will remain” the primary factor in the Soviet policy toward Europe. “Nothing in the Russian tradition supports a policy of military action in Europe beyond the eastern zone, . . . [which is] . . . for the Soviet Union today what the Monroe Doctrine is for the United States, the Low Countries for Great Britain, or the Rhine frontier for France” ([1946] 1947, pp. 107, 108). A far more important and likely threat is the penetration of the West by ideas from the East, and he warned that “the danger for the English-speaking world lies . . . in its relative lack of flexibility and in its tendency to rest on the laurels of past achievements,” rather than in its searching “for new forms of social and economic action in which what is valid in individualist and democratic tradition can be applied to the problems of mass civilization” ([1946] 1947, p. 113).

Any assessment of the enduring value of Carr’s contribution to international political theory must be qualified and tentative at this stage. By demolishing utopian beliefs in the natural harmony of interests of states, Carr was among the first to restructure the study of international politics in the name of political realism. Making use of the intellectual tools of the sociology of knowledge, he demonstrated the relationship between national values and ideals and the interests and power of states. His claim that international disputes were more likely to be resolved through hard bargaining that recognized con-

flicting national interests than through international processes analogous to national judicial or legislative actions has survived the test of time. (Carr's analogy between great power negotiations and collective bargaining in industry is more debatable, given the lack of moral consensus in international relations.) The defects of his contribution to these issues stem more from polemical overstatement than from untruth. His critical analysis of the limitations of Western political thought continues to have value. The legacy of his history of the Bolshevik revolution helps explain the actions and motives of Soviet leaders and the wellsprings of Soviet policy.

The question remains, however, how so major a thinker could have gone astray so grievously in his practical judgments in the interwar and postwar period. He found in Neville Chamberlain the exemplar of the moral realist and in the Munich settlement the paradigm of a political settlement based on principle and power. He linked Hitler and Mussolini uncritically with Mustapha Kemal, Józef Pilsudski, and Antonio de Oliveira Salazar as leaders in the revolt against liberal democracy. He felt no need to make moral distinctions between Wilson and Stalin or between the crusade for American and what he called "Soviet democracy." He could write: "There is . . . no essential incompatibility between democracy and dictatorship" ([1946] 1947, p. 11). These errors in judgment appear not accidental but rooted in a more fundamental weakness in his political philosophy.

Four explanations are possible for the shortcomings of Carr's philosophy, and all four have roots in the apparent philosophical weakness of his approach. First, his Marxist orientation (he once remarked that he was more truly Marxian than uncritical and dogmatic Marxists who asked no questions of their ideology) drove him, in the spirit of Hegel and Marx, to search for values within and not outside the historical process. As a result, he lacks an objective basis for practical moral judgments. Second, and related to the first explanation, he appears repeatedly to have equated superior morality with superior power. Moral reasoning is for him not a weighing of good and evil or of competing *goods*, but exclusively the means for "an escape from the logical consequences of realism" (1939, p. 118). Critics, with this weakness in mind, have asked whether he lacks an understanding of the essential nature of morality. Third, Carr, who has relied on the inspiration of Reinhold

Niebuhr in other respects, says little about proximate morality and provides few examples of prudential judgments of contending political movements. (Niebuhr, by contrast, wrote in the early 1940s that if men could not make moral distinctions between democracy and Nazism, then moral evaluation of any type was in practice impossible.) Fourth, Carr, having affirmed the need for a standard of judgment of politics, has had no transcendent point of view from which to appraise the phenomenon of power. In *What Is History?* (1961) he seeks a philosophy of history to supply such a viewpoint but concludes there is no possibility of discovering an objective standard outside history. The closest approximation for him is to state:

The absolute in history is not something in the past from which we start; it is not something in the present, since all present thinking is necessarily relative. It is something still incomplete and in process of becoming—something in the future toward which we move, which begins to take shape only as we move towards it, and in the light of which, as we move forward, we gradually shape our interpretation of the past. (1961, pp. 160–161)

If this definition is Carr's clearest formulation of an objective standard, he must clarify whether he means that the only basis for judging history is history itself or that what survives in history is *ipso facto* good. It is a question by which earlier historians have been judged and found wanting. One critic of Carr concludes: "It is a dangerous thing to be a Machiavelli. It is a disastrous thing to be a Machiavelli without *virtù*" (Morgenthau 1962, p. 43).

To this criticism Carr has responded that certain moral absolutes do exist: liberty and equality, justice and democracy, but as broad categories of thought almost devoid of meaning or application unless given specific content. They are blank checks that are valueless unless and until they specify how much liberty is to be allocated to whom, and whom we recognize as equals. How a given people fills in such checks is a matter of history. The content given these values in the nineteenth century was undermined in World War I. After that war, which revealed the bankruptcy of liberalism, Carr has argued, only one of two responses was possible: the establishment of socialism or the establishment of conservatism. He has opted for socialism in part because he is a man of the left and in part because socialism represented the optimism of change; and he has staunchly arrayed him-

self against those who find change menacing and the source of doubt, gloom, and fear. At the age of 86 he declared:

When Sir Lewis Namier warns me to eschew programs and ideals, and Professor [Michael] Oakeshott tells me that we are going nowhere in particular, and Professor [Karl] Popper wants to keep the dear old Model T on the road by dint of a little piecemeal engineering, and Professor [H. R.] Trevor-Roper knocks screaming radicals on the nose, I shall look out on a world in tumult and a world in travail, and shall answer in the well-worn words of a great scientist: "And yet—it moves." (Scott 1978, p. 8)

CATTELL, RAYMOND B.

Under Sail Through Red Devon (1937b) may seem a curious title for a book by a young psychologist dedicated to the multivariate study of human personality. Yet it reflects the depth of the roots of Raymond B. Cattell, born in 1905, in his British homeland and the Devonshire countryside. The relative social and economic homogeneity that he knew as a child was to stand in marked contrast to the broad range of conditions that he later found when he entered the University of London at age 16. The city's extremes of wealth and poverty reawakened a social concern that had been incubating since his days as a young hospital helper during World War I.

Shortly before receiving his degree in physics and chemistry three years later, Cattell decided that psychology would be his life's work. Although he was still registered at King's College, Cambridge, it was C. E. Spearman, in whose laboratory at University College Cattell spent most of the next five years, who had the most profound influence on his professional development. He saw in Spearman's factor analysis a tool that could be applied to the study of behavior and that might yield results with an objectivity and replicability rivaling those of the physical sciences.

Cattell received his doctorate in 1929 from King's College, but the economic climate of Great Britain offered bleak prospects for a research career in the emerging science of psychology. To support himself, Cattell accepted a teaching position at Exeter University and there began formulating his research program. With Spearman's retirement and emigration to the United States, he turned to Cyril Burt for critical discussion of his substantive and methodological ideas. It was at this time that Cattell decided to leave academic life in order to gain clinical experience as the director of school psychological services for the city of Leicester. This experience helped to crystallize his views on issues of personality, and the population of Leicester was the subject of his first major research effort. Noting a tendency for children of lower

intelligence quotients (IQ's) to come from larger families, Cattell researched and published *The Fight for Our National Intelligence* (1937a). Although his prediction of a slow decline in the average intelligence of the population was not realized in a subsequent investigation, Cattell's concern with possible dysgenic effects on complex behavioral traits was to remain a primary social concern reflected in his later work.

Despite his prolific writing, the early years in England were frustrating because support for basic research in the behavioral sciences was practically nonexistent. Thus, he accepted Edward L. Thorndike's invitation to be a research associate in his laboratory at Columbia University for a year, although it meant uprooting himself from his beloved England. At Columbia, Cattell found an innovative and pioneering style of attack that he incorporated into his own research strategy. He remained in the United States, first as G. Stanley Hall professor at Clark University, later moving to a lectureship at Harvard University. With the advent of World War II, he joined the U.S. Adjutant General's Office, where he was offered the opportunity to continue his development of "objective" measures of personality that might prove useful in officer selection. Through these experiences Cattell recognized the efficiency to be gained when a small group of researchers gathered to attack a problem of common interest from a variety of perspectives. This he envisioned as the optimal research setting.

With the war's end, Cattell accepted a research professorship at the University of Illinois, soon to become preeminent in the area of multivariate analysis under the leadership of Herbert Woodrow. There he established his Laboratory of Personality and Group Analysis, which was to attract 77 research associates and numerous other social and behavioral scientists in its 37-year history.

Cattell considered Spearman's *The Abilities of Man* (1927) a definitive work in that area and had set as his own goal and that of his laboratory the systematic study of the realm of human personality. Two considerations defined the general framework within which the work of the laboratory would proceed. From his background in the British school of psychology, with its greater emphasis on biological influences on behavior, Cattell viewed behavior as essentially organic in nature, with an as yet undefined structure. Further, the complexity of human behavior required that the methodology employed

allow for the investigation of multiple causation. Spearman's factor analysis, with its further development by Godfrey H. Thomson, Cyril Burt, and L. L. Thurstone, appeared to offer the only reasonable approach to elucidating this structure. Thus, first priority was given to the specification of the relevant underlying dimensions of personality. The development of specific measures and the establishment of their reliability and validity, of necessity, assumed a secondary position.

A limited number of principles, derived from Cattell's philosophy of the manner in which the objective investigation of personality should proceed, may be identified. Each has had a major influence on the substantive productivity of the scientist.

One of Cattell's major contentions was that theory should derive from research, which in turn would suggest the appropriate direction for further empirical investigations. The search for structure and a theoretical model that would accommodate the data thus became an iterative procedure. He recognized that factor analysis did not lead to a unique solution except under the most simplistic of conditions, and he saw the pitfalls of overemphasizing the results obtained from a single sample. Thus, his empirical efforts required careful cross validation as both instruments and theories were refined. Researches in personality, motivation, social psychology, and abilities each became programmatic, with later work building on and extending what had gone before. As a result, his more complete and refined statements of theory do not appear in the literature until the mid-1950s.

A second major principle guiding Cattell's research was that of catholicity. This requirement expressed itself in two ways. First, if the dimensions that were identified as the primary source traits of personality were indeed the salient variables, then it should be possible to demonstrate parallel structure across measuring instruments. These included peer ratings, already in wide usage, personality questionnaires, which were undergoing rapid development, and objective tests or miniature behavior samples. Cattell pioneered the development of this latter approach, with work beginning in England and culminating in the publication of descriptions of some four hundred measures (Cattell & Warburton 1967). The second dimension on which he expected to be able to demonstrate the universality of the source traits was across cultures. His organic conception of personality specified these

traits as ingrained characteristics of mankind. Thus, local populations might differ with regard to mean values on the dimensions, but the interrelationship of the elements defining the traits should remain unchanged. Cross-cultural studies of the structure of personality and of abilities became an essential feature of Cattell's work and were undertaken as opportunities arose.

Cattell's commitment to factor analysis grew from both his desire to identify multiple causation and the necessity to remove the subjective element from the determination of structure as much as possible. This commitment was further stimulated and enhanced by his association with Thurstone whose *Multiple-factor Analysis* (1947) laid out the principles and procedures with which Cattell had become so familiar. As with any research program, theoretical development or empirical verification often reached an impasse because appropriate statistical methods to answer the most pressing questions were lacking. At these junctures, Cattell would turn his attention to the further development of the factor analytic model or the innovative application of existing procedures. These efforts led to numerous developments, including his "scree" test for number of factors; the development of a similarity coefficient for comparing factor analytic solutions; with his wife, Karen Cattell, a method for the unique rotation of two-factor analytic solutions derived from proportional correlation matrices; the factoring of repeated measures on single individuals to study fluctuating personality states; and others. His efforts in the development of a theory of personality fathered many methodological innovations and could not have proceeded without them.

Finally, Cattell's interest in ultimate causation led him into occasional forays into human behavioral genetics. The result was his development of the method of multiple abstract variance analysis for genetic analysis of sib data, obtained from all combinations of identical and fraternal twins and full and half sibs, raised together and apart.

Cattell's pursuit of a comprehensive theory of behavior through factor analytic methods has produced a variety of theoretical models and psychometric instruments. His theoretical developments in the measurement of personality by questionnaire are embodied in the 16 PF (personality factor) (Cattell, Eber, & Tatsuoka 1970), the High School Personality Questionnaire (Cattell & Cattell 1975), and other tests

for different age ranges. The study of personality structure in objective test devices has produced the Objective-Analytic (O-A) Battery (Cattell, Hundleby, & Pawlik 1965) and the High School O-A (Cattell & Schuerger 1978). Closely related has been the study of state patterns with the subsequent development of modulation theory to account for short term perturbations in measured traits, reflected in his work with Scheier, Curran, and Nesselrode. Excursions into the study of motivation led to the dynamic calculus, developed with Child, the Motivation Analysis Test (Cattell, Horn, Sweney, & Radcliffe 1964) and a school version of the same. Cattell's Culture Fair Intelligence Test (Cattell 1950a) is a direct descendent of his theory of fluid and crystallized intelligence, designed to measure the former. His work on the dimensions of cultures has been picked up and pursued further by political scientists and most notably by Rudolf J. Rummell. Finally, his efforts to integrate these areas of behavior into a comprehensive framework has produced *Comprehensive Personality and Learning Theory* (1978a).

It is not surprising that such dedication to a methodological approach, coupled to the development of theory, should have generated some criticism from behavioral and social scientists. The most persistent have dealt with the psychometric properties of the measuring instruments and the incomplete mathematical development of Cattell's methodological innovations. Both might be more understandable in the context of the disparate aims of the theoretician and the psychometrician. For the former, cross validation through the repeated demonstration of similar structural patterns in the developing instruments is the *sine qua non* of his endeavor. Although some satisfactory level of reliability and validity must be present for replicable patterns to be demonstrated, these levels need not necessarily be those most desired by the applied behavioral scientist. Given limitations on time and energy, some degree of compromise is inevitable. Whether the course that has been chosen will affect the utility of the measures produced remains an empirical question.

It may be decades before Cattell's impact on the social and behavioral sciences can be adequately determined. Certainly the methods and directions that he pioneered will continue to be explored by his colleagues and students, and by the members of the Society for Multivariate Experimental Psychology, which he founded. In

the meanwhile, with the increasing methodological sophistication of social and behavioral scientists, the familiar refrain of many introductory texts in personality, that "Cattell's methods are too complex for presentation here," may no longer be necessary.

CHAMBERLIN, EDWARD H.

Edward Hastings Chamberlin (1899-1967) was born in La Conner, Washington, May 18, 1899, the second son of Fred Hastings and Irene (Dagan) Chamberlin. His father, a minister of the Methodist Episcopal Church, died while he

was still in grammar school. Soon afterwards his mother moved to Iowa City, Iowa, where she worked to put the two Chamberlin boys through high school and the University of Iowa. While at the university, young Chamberlin contributed to his and his family's support by writing for the *Iowa City Citizen* as well as for the university's student newspaper.

On graduating from the University of Iowa, Chamberlin began graduate study in economics at the University of Michigan. His interest in economics had no doubt been sparked at the University of Iowa by the distinguished American economist Frank H. Knight, who was later to move to the University of Chicago and become recognized as the precursor of what is popularly identified as the "Chicago School" of economic thought, known for its contributions to the theory of the firm and the operative mechanics of market economies. It is likely that Knight's forceful writings and teachings, to which members of the school are said to owe their parentage, also shaped Chamberlin's interests. At Michigan, Chamberlin also studied under Leo Sharfman and Fred Taylor. Sharfman was an authority on railroad rate structures and Taylor a distinguished analytical economist concerned with the functioning of firms in a socialistic economy. After taking his M.A. degree at Michigan in 1922, Chamberlin moved on to Harvard University, where he completed his doctoral thesis in 1927. Except for a year as distinguished visiting professor at the University of Paris (1950/1951) and wartime service with the Office of Strategic Services (1943-1945), he was to spend the rest of his life at Harvard. In 1924 he married Lucienne Foubert; they had one daughter.

While at Harvard he wrote his thesis under the well-known economist Allyn Young, who at Cornell University had had Frank Knight among his students. Both Young and Knight had written and lectured widely on the theory of the firm and the relationship among rival firms in the market place. Chamberlin's intimate colleagues have observed: "It is now possible with hindsight to see that Chamberlin's thought may have emerged from reflections on these ideas and problems—but only if hindsight is very acute" (*Harvard University Gazette*, March 23, 1968).

Chamberlin wrote many articles and several books in the broad area of inquiry known as microeconomics, but the single work that clearly defines his distinction among the economists of

the world is his seminal *The Theory of Monopolistic Competition* (1933), an outgrowth of his doctoral thesis. Although the writings of a few economists published shortly before the publication of *Monopolistic Competition* had, at least in some sense, anticipated fragments of Chamberlin's essential theory, the work clearly represented an innovation of impressive magnitude. Classical and neoclassical microeconomic theories had been erected on the proposition that markets were *either* monopolistic *or* competitive. Accordingly, the received economic wisdom consisted of a theory of perfect monopoly and a theory of perfect competition. The essential thrust of Chamberlin's work was that since neither of these theoretical conditions was often found in the real world, prevailing theories of the firm and markets were largely irrelevant. The mission of the theory of monopolistic competition was to bring microeconomic theory into conformity with the conditions of the business world to which it pertained.

As a general proposition, Chamberlin contended, each individual business firm had some control over its price. In fact, the attainment of this control was the obvious objective of such familiar firm activities as advertising, product differentiation, the search for superior business locations, and so on. In most cases, however, these business strategies fell far short of establishing the degree of control over price that conventional microeconomic theory ascribed to monopoly. Rival firms, it must be borne in mind, were engaging in similar strategies. Hence, while each firm's *limited* control over its market bestowed on it some finite element of monopoly, the strategies of its many rivals limiting this control bore a strong resemblance to the normative models of competition. The resulting Chamberlinian model of *monopolistic competition*, though built upon elements of the existing models of monopoly and competition, emerged as a new explanatory hypothesis of the firm that was more in keeping with the observable conditions of the real business world.

In his systematic and meticulous analysis of the shortcomings of existing models of the firm leading up to the full-blown development of his own model (chapters 1-3), Chamberlin presented a searching review of the theories of markets in which firms were few in number and found them equally wanting. Antoine Augustin Cournot, the early nineteenth-century French economist and mathematician, had developed a model of a two-firm industry (duopoly)

in which a determinate equilibrium solution rested on the condition that each firm assumed its rival's output to be fixed (1838). The model was readily adaptable to the few-firm case (oligopoly). While other scholars, notably Bertrand (1883) and Edgeworth (1881), had pointed out the lack of realism in the Cournot model, only Chamberlin sought to develop a new model overcoming its logical flaws.

The essence of Chamberlin's oligopoly model (chapter 3) springs from his observation that, when a firm makes a move that affects the fortunes of its rivals, that firm is obviously refusing to look beyond its nose if it assumes its rivals will not react. For example, if firm A reduces its price to obtain larger sales, and the market consists of only a small number of firms, this move will obviously reduce the sales of its rival B, forcing it to react—to take the countermeasure of reducing its price. Since A should reason beforehand that B will retaliate, it will make the initial move *only* if both A and B would be better off after B reacted. In time, a determinate equilibrium solution to oligopoly must postulate that all firms will take into account the *indirect* as well as the *direct* effect of their actions. In the special case where the number of firms is quite small, the final equilibrium solution would be very close to that of monopoly.

Chamberlin's new theories had immediate impact on both the formal structure of microeconomic science and its implications for public policy. College textbooks, at least those of the more discerning authors, were quickly enlarged to accommodate chapters on monopolistic competition. This impact would have been explicitly attributed exclusively to Chamberlin had it not been for the appearance of Joan Robinson's *The Economics of Imperfect Competition* (1933) shortly after the publication of *Monopolistic Competition*. For some years, in spite of the vast differences in substantive content of the two volumes, members of the economics profession tended to lump them together as the joint foundations of the new microeconomics. Although their substantive difference came gradually to be recognized, the profession's tendency at first to treat them as quite similar theories was an obvious source of injury to Chamberlin's professional pride, and prompted him to devote much scholarly energy to distinguishing between them. In the preface to the fifth edition he lamented that "it has been unfortunate that two theories as divergent in their interpretation

of economic phenomena as Mrs. Robinson's and my own should have been identified in the minds of so many." To clarify the differences he added a new chapter in that edition, "The Difference Between Monopolistic and 'Imperfect' Competition." In all, the book went through eight editions, each of which improved the orderliness of the presentation and refined the theoretical construction.

There are eminent scholars whose fame rests on a major contribution and whose professional lives are devoted to elaborating and perfecting it. There are also those who explore most salient aspects of their discipline. Chamberlin belongs in the first group (see *Harvard University Gazette*, March 23, 1968). The eminence of his contribution is attested to by the many empirical studies of firm behavior and markets that it inspired, most designed in one way or another to test some tenet of Chamberlin's theory, and by the honors bestowed upon him. He received honorary degrees from the Università Cattolica del Sacro Cuore in Milan (1949), from the Sorbonne, University of Paris (1951), and from Boston College (1954). He was vice president of the American Economic Association and a member of the American Academy of Arts and Sciences and the Real Academia de Ciencias Economicas y Financieras of Barcelona. When the International Economic Association devoted a conference to monopoly and competition in 1952, it called upon Chamberlin to give one of the principal papers and to edit the resulting volume, *Monopoly and Competition and Their Regulation* (1954). At Harvard he occupied the prestigious David A. Wells chair in political economy, was chairman of the department of economics from 1939 to 1943, and was editor of the *Quarterly Journal of Economics* from 1948 to 1958. The capstone to this stream of honors came with his election in 1965 as distinguished fellow of the American Economic Association and the publication in 1967 of *Monopolistic Competition Theory: Studies in Impact; Essays in Honor of Edward H. Chamberlin*, under the editorship of Robert E. Kuenne. The central theme of that volume of essays was anticipated in the citation that accompanied his election as AEA fellow—which singled out the immense impact that *Monopolistic Competition* had on economic thought in the author's lifetime: "It is not given to many scientists to reach into the minds of all their fellows and to influence the work of a whole generation, but the author of *The Theory of Monopolistic Com-*

petition did so. The nature of products, the character of interproduct competition, the accommodation of selling costs in price theory, and the theory of oligopoly have all undergone major change because of Chamberlin's great work."

The volume of essays appeared, unfortunately, almost exactly at the time of Chamberlin's death, and the manuscripts made available to him reached him while he was in the final stages of a complete paralysis that had gradually set in after a cruel stroke in 1961. The authors, perhaps as distinguished a group of economists as were ever represented in a single volume, weighed Chamberlin's impact on microeconomic theory in the United States and abroad. Kuenne summarized the results of their assessments as follows: "[The book] bears witness to the revolutionary impact of the complex of concepts and analytical frameworks introduced by Edward H. Chamberlin thirty-three years ago, and to the correctness of his decision to devote his career to the perfection and development of that theory."

Although Chamberlin was preoccupied almost exclusively with the elegance of his theory and paid scant attention to its public policy implications, its relevance to the practical issues of policy soon became evident. National anti-monopoly policies, especially those expressed in the antitrust laws of the United States, are based on assumptions about the interrelationship between market structure, business behavior, and business performance. The more ardent proponents of an aggressive antitrust policy found in Chamberlin's determinate oligopoly model a highly respectable *raison d'être* for breaking up large corporations with substantial shares of relevant markets and for the prevention of mergers that substantially increased firms' market shares. Since in markets where a few firms controlled the entire output each firm would, by taking into account the indirect as well as the direct effect of a price move, eventually charge the monopoly price, the obvious antitrust remedy was to make all firms so small in relation to the market that they would ignore the indirect effect, thereby bringing about the structural conditions conducive to competitive pricing. In this sense it can be said that Chamberlin is a silent expert witness in virtually every important monopoly case prosecuted under various nations' antitrust and cartel policies. Beyond this, those who propose that these policies be strengthened by new legislation often

appeal to the Chamberlinian solution as their authority.

Chamberlin's great impact on economic thought during his lifetime, an impact that obviously endures, is all the more impressive when assessed in the light of the time frame in which *Monopolistic Competition* was born and matured. The great depression of 1929–1933 had diverted the attention of economists from the market allocative problem with which Chamberlin was concerned and toward the macroeconomic problems of unemployment, general price levels, and economic growth. The appearance in 1936 of John Maynard Keynes's *General Theory of Employment, Interest and Money* provided a theoretical framework for analyzing and prescribing remedies for these new and pressing problems. The Keynesian model quickly became the "new" economics, absorbing the intellectual energies of the vast majority of the economics profession. It is a signal tribute to Chamberlin's dedication to refining his own theories that he did not succumb to the immensely popular trend. It is an equally high tribute to the results of his tenacity that *Monopolistic Competition* and the *General Theory* are often identified as the two most influential economic treatises of the twentieth century.

In contrast with his professional concerns, Chamberlin's personal life was enriched by a variety of interests, including music, painting, the theater, and literature. He spoke French with the fluency of a Parisian and lectured widely in French when visiting universities in France, a country he came to love dearly as the birthplace of his wife, Lucienne. Throughout his uninterrupted career at Harvard, often characterized as the "Golden Age" of Harvard's economics department, consisting as it did of such internationally known economists as Frank W. Taussig, Joseph A. Schumpeter, Sumner H. Schlichter, Edward S. Mason, Alvin Hansen, Wassily Leontief, and, of course, Chamberlin himself, his reputation was of a cultivated man with a circle of friends drawn from all parts of the university. He was in every sense a cultured gentleman and a courageous and tenacious scholar.

CLARK, COLIN

Colin Clark, one of the most fertile minds in twentieth-century applied economics, was born in London in 1905. After graduating in chemistry at Oxford University in 1924, he worked as assistant to William H. Beveridge, Allyn Young, and A. M. Carr-Saunders, stood unsuccessfully as a Labour candidate in the May 1929

general elections, then joined the staff of the Economic Advisory Council which had recently been formed by the Ramsay MacDonald government and which included among its members John Maynard Keynes, G. D. H. Cole, Josiah C. Stamp, and R. H. Tawney. Having declined an invitation by MacDonald to help him prepare a protectionist manifesto, he was glad to receive an appointment in 1931 as lecturer in statistics at Cambridge University (Clark 1977). In 1937, he accepted an invitation to spend two terms as visiting lecturer at the universities of Melbourne and Sydney, but remained in Australia for fourteen years, from 1938 as director of the Bureau of Industry and economic adviser to the government of Queensland. When, in 1952, after increasing divergence of opinion, there remained no policies of the government with which he could agree, he resigned and spent a year, first as a freelance writer and business consultant, then as visiting professor at the University of Chicago. From 1953 until 1968 he was director of the Institute of Agricultural Economics at Oxford University, then he returned to Australia, as research fellow at Monash University (1969–1977) and since 1977 as research consultant in economics at the University of Queensland.

In the first decade of an astonishingly prolific half century of research and writing, Colin Clark established himself as one of the pioneers of national income estimates. His first two books (1932; 1937) greatly improved on existing estimates for the United Kingdom and extended them for additional years; the next two (Clark & Crawford 1938; Clark 1939) did the same for Australia and the Soviet Union. In these books and several major papers he made methodological contributions so fundamental that he has justly been described as coauthor, with Simon Kuznets, of the “statistical revolution” that accompanied the revolution in macroeconomic theory of the 1930s (Patinkin 1976). He was the first to use the gross national product (GNP) rather than national income—he may reasonably be regarded as the inventor of GNP—and among other innovations made the first quarterly estimates of national product and devised time series of labor productivity and fixed capital formation. An early Keynesian, he made some of the earliest attempts to estimate the size of the multiplier from national income data (Clark & Crawford 1938; Patinkin 1976, pp. 1100–1104) and was among the first to present estimates in the framework of the main compo-

nents of aggregate demand, $C + I + G$ (Patinkin 1976), and to develop a multisector multiplier analysis (Samuelson 1966). By 1940, he had gone a long way towards justifying in his published work Keynes’s discovery in 1931: “Indeed, Clark is, I think, a bit of a genius: almost the only economic statistician I have ever met who seems to me quite first-class” (letter to Daniel Macmillan, December 1931, quoted in Patinkin 1976). He had an international reputation for posing important questions and answering them by ingenious use of inadequate statistics. In the words of another fellow of King’s College: “Mr. Clark is a famous maker of bricks without straw” (Giblin 1941).

In 1940 appeared Clark’s most important work, *The Conditions of Economic Progress*. The idea of drawing on all available national income and other data for an international comparative study of the problem which Adam Smith had called that of the origin of the wealth of nations came to Clark in 1935 and he worked on it intermittently and single-handedly but with incomparable energy, verve, and imagination for four years. The book is a seminal work in at least three respects. First, it was one of the first systematic attempts to use national accounts data for a wide range of countries to test macroeconomic hypotheses and in this sense a pioneering contribution to modern macroeconomic econometrics. Second, it was the first major work, after decades of almost exclusive preoccupation of the Western economic profession with static problems of resource allocation and latterly with economic fluctuations, that turned attention back to the classical problem of economic growth and was thus a starting point of modern development economics. Third, by supplying the first substantial statistical evidence of the gulf in living standards between rich and poor countries, it helped awaken Western opinion to the problems of underdevelopment. Clark may be regarded as the discoverer of the “Gap.” Well into the post-war years, until United Nations data became available, almost every writer on development economics quoted his estimates.

Among many specific novel ideas in the book, three deserve special mention because each gave rise to a later literature of its own. One was the technique he devised for international comparisons of the purchasing power of national currencies, and thus of real national product, his so-called IU (international unit) (Stu-

denski 1958). The second was his thesis that, in the course of economic growth, a country's occupational structure shifts, in the terminology he took over from A. G. B. Fisher, from primary to secondary and tertiary industries (Hoselitz 1960). The third was the use of a Cobb–Douglas production function for macroeconomic estimates of the marginal productivity of capital.

In the following years, Clark revised and developed all parts of the book; indeed for some years he published a monthly journal, *Review of Economic Progress* (1949–1952), which consisted entirely of revisions and new studies subsequently incorporated in the third edition of the book. But the most notable development was the publication of *The Economics of 1960* (1942), a daring (to use no stronger word) attempt at an econometric forecasting model for the world economy. The most surprising forecast was that the terms of trade would move by ninety per cent in favor of primary products, mainly because of massive industrialization of China and India. "The prediction was not fulfilled," as he has since conceded in a personal communication, "but, as [Bertrand] de Jouvenel pointed out, the book performed a service, in showing on how many points the estimates can go wrong" (1978). It was useful also as a counterweight to arguments soon to become fashionable that the terms of trade must inevitably move against primary products (Higgins 1959).

So important and original was Clark's work of the 1930s that one wonders why his name is not universally recognized as among the half dozen great economists of the twentieth century. Part of the answer is suggested in two brilliant reviews of *The Conditions of Economic Progress* (Rothbarth 1941; Giblin 1941). One reads in part:

It is difficult to know what to admire most in this book: the boldness of the underlying scheme or the energy and labour that went into its execution, the avoidance of unnecessary subtleties or the width of observation and experience that made this avoidance easy. And yet it is in many ways a very annoying book. . . . Mr. Clark has such a wealth of material to work on that it seems to matter very little what he does with it; he does not grade it sufficiently according to quality; he frequently throws it before the reader in the raw state and equally frequently he works on it with primitive and inappropriate tools. . . . He never reaches that highest level of achievement—the product of close theoretical penetration of complex facts—where one perceives

suddenly with a feeling of its inevitability a new unity and a new simplicity amongst the mass of accidental material. (Rothbarth 1941)

Since the end of World War II, while continuing to make contributions to applied economics on all manner of subjects—from the declining importance of capital (compared with knowledge) as a determinant of economic growth, trade cycles in the United States, the causes of inflation, the economics of beef cattle, irrigation, and housework, to estimation of net capital stock and the marginal utility of income—Clark's work has been dominated by an event that preceded the war, his conversion to Roman Catholicism. Whether, as his critics claim, he has subordinated his own thinking to the tenets of the Church or whether, as he would probably see it, he has been attracted to Catholic social thought because it has corresponded most closely to his own values, most of his writings in the last thirty years explicitly or implicitly support the social teachings of the Catholic Church, and he has been one of its most effective lay protagonists. Two themes stand out.

One is opposition to neo-Malthusianism. As the most influential lay member of the Pope's Commission on Population (1964–1966), Clark is believed to have provided much of the economic rationale for the hard line against birth control by contraceptive devices of the papal encyclical *Humanae Vitae*. In essence, his case, expounded in numerous books, pamphlets, and articles, has been that the world's resources, rationally used, are sufficient to provide adequate food for any foreseeable population growth and that, generally speaking, growth of population and per capita real income are positively, not negatively, correlated (1951; 1967; 1970). The former part of the case stimulated nearly two decades of specialization on agricultural economics and drew on the empirical evidence yielded by this work; the latter part, with its belief in increasing returns, went back for its inspiration in part to his earliest professional work as assistant to Allyn Young and editor of G. T. Jones's study (1933).

The second theme has been opposition to totalitarianism and increasingly to big government of any kind. In 1945, Colin Clark amazed the economic profession by arguing in an article in the *Economic Journal* the thesis (for which he gave credit to a "brilliant insight" by Keynes 20 years earlier) that there is a

limit of about 25 per cent to the ratio of taxation to national income, the limit being set by resistances to higher taxation which cause inflation and thus bring the ratio back to about 25 per cent. In 1954, he created an even greater stir by arguing, in a pamphlet on *Welfare and Taxation* that, if the welfare state were dismantled, so that people had to obtain their social welfare requirements through voluntary organizations, but having at the same time the major part of what they now pay in taxation refunded, they might in the end be better off. Both theses were distinctly unfashionable when they were first expounded, and the coat-trailing assertiveness with which they were put forward did not help win them adherents. Now, almost a generation later, they may be recognized as anticipating the reaction to welfare statism associated especially with the University of Chicago, Virginia Polytechnic, and proposition 13, but by no means confined to the United States.

Clark has always relished being provokingly unfashionable:

He supported Keynes long before he became fashionable, and questioned Keynes when he was fashionable. He opposed the protection of agriculture in Britain and of manufactures in Australia. Long before others he questioned the high rate of economic growth in Soviet Russia. In *Growthmanship* . . . he argued, against the fashion, that economic growth could not be accelerated artificially by capital investment . . . and now [he argues] that the way to reduce [taxation] from 40 to 25 per cent is to dismantle many state welfare services and return to the average family a large part of the income taken from it so that it can make better provision for itself. (Editor's preface 1964)

This, too, may be a view less unfashionable in the 1980s than it was in the 1950s.

Like George Bernard Shaw and Bertrand Russell, Colin Clark has often written and spoken *pour épater le bourgeois*, not just for the fun of it but to startle his audience out of the errors of its ways. Even more than a first-rate quantitative economist, he has been a prophet. How far his has been a voice crying in the wilderness is for a later generation to judge.

COASE, R. H.

Ronald Harry Coase was born in Willesden, England, on December 29, 1910, and was educated at the London School of Economics (B.COM., 1932; D.SC., 1951). There he enrolled in the industry and trade curriculum, which exposed him to both economic theory and the detailed study of business and legal institutions. Apart from wartime service with the British government, Coase has spent his career in the world of books and ideas. In Britain he served on the faculties of the Dundee School of Economics and Commerce, the University of Liverpool, and his alma mater. In 1951 he moved to the United States, where he has held appointments at the University of Buffalo, the University of Virginia, and the University of Chicago. In 1964 Coase assumed the editorship of the *Journal of Law and Economics*, the outlet for some of his most important contributions.

The theory of the firm. In Coase's first major work, "The Nature of the Firm" (1937a), he resolved several difficulties in the economic theory of the firm. Coase began by contrasting economic activity between firms, where resources are allocated in response to market-determined relative prices and economic activity within firms, where inputs are assigned to various jobs according to managerial directives. He sought to explain why production was sometimes coordinated centrally within firms, but determined at other times by decentralized market forces. In short, why did firms exist?

The answer pivoted on Coase's recognition of the costs of making market transactions. Real resources are required to learn prices and make contracts governing every productive activity of each input. Whenever the coordination of resources can be accomplished more economically by central organization, firms will be established. But the costliness of coordinating many inputs limits the firm's size. Beyond that size, resources will be allocated more economically by market forces.

Coase's theory of the firm is an important breakthrough. It eliminates relying upon legal requirements, residual income claimants, or the division of labor as reasons for the existence of firms. The theory explains a firm's size: If the cost of organizing an additional transaction is less within a firm than accomplishing the same activity through market exchange, a firm will expand (an explanation that neatly fits the Marshallian framework of substitution at the

margin). Coase's focus on the cost of using the market became an integral component of the economic theory of property rights.

Cost and pricing behavior. In economic analysis, the cost of something is the highest valued alternative given up in order to get it. Early in his career Coase clarified the kind of cost figures businessmen would need to operate economically. He demonstrated the logic and relevance of data based on opportunity costs, contrasting these with the statistics traditionally gathered by accountants. By this time Coase was intimately acquainted with the decision-making methods of the business world; yet he defended the adequacy of the marginal analysis of firm behavior used by economists. When managers purported to use a nonmarginal rule in decision-making, such as full cost pricing, he viewed this as reconcilable with orthodox economic theory because the implementation of such rules implicitly takes some account of demand forces or incremental costs of output variations.

Since the 1930s, many economists have advocated that public utilities price their output at marginal cost. Coase has been a critic of this proposal, ascribing its appeal to "blackboard economics"—analysis with diagrammatic allure that nevertheless overlooks a policy's operational requirements. While not denying the significance of marginal cost, Coase argued that the total economic effect of a policy must be assessed, including the behavior of the social institutions that will implement it. He proposed a multipart pricing structure, giving appropriate weight to marginal cost while avoiding difficulties perceived in proposals based strictly on marginal cost pricing.

The economics of communication. Coase's interest in public utilities focused primarily on institutions of communication, notably radio, television, and the post office. On one level his work was historical. The account of the monopoly origins of radio and television in Great Britain, the operation of the Federal Communications Commission in the United States, and the response of the British post office to rival enterprise required exhaustive examination of newspaper clippings, corporate archives, and government documents. Yet Coase viewed this material through economist's spectacles, and from it also came important analytical contributions.

Coase explained how radio broadcasting could be organized by the market system, meet-

ing head-on the conventional argument that without government control or monopoly there would be interference as stations transmitted simultaneously on the same frequency. He demonstrated that such congestion was not an example of market failure, but rather of a situation where one of the preconditions for the proper functioning of a market had not been met: the existence of private property in the electromagnetic spectrum. If individuals could, by virtue of ownership rights, exclude others from particular frequencies, there was nothing to prevent a free market in broadcast frequencies; and in testimony before the Federal Communications Commission in 1959, Coase recommended that the agency auction broadcast frequencies to the highest bidder, the proceeds going to the Treasury, and the media then being subject to the discipline of competition. Coase's scholarly interest in broadcasting led to his seminal article, "The Problem of Social Cost" (1960), the rudiments of which appear in his article on the Federal Communications Commission (1959).

In addition, Coase took the arguments in support of freedom of speech, religion, and the press and showed how, conceptually, these arguments favored a free market in radio and television as well. Expanding upon the work of Aaron Director, he later advanced the broader proposition that, from both an economic and a libertarian perspective, there is no distinction between the market for ideas and the market for goods; economic freedom serves the same ends in each sphere.

The concept of social cost. Before Coase's social cost paper was published in 1960, external economies and diseconomies were catalogued by economists as market failure. For example, it was argued that polluting firms would choose outputs based on private costs of operation, ignoring spillover costs imposed upon others; inefficiency in resource allocation would be the result; a tax on the pollutor was usually recommended to remedy the market's defect. Coase challenged this view in tripartite fashion.

First, he showed that if property rights are established for all inputs, and transaction costs are negligible, external effects will be mitigated efficiently through voluntary agreement, *sans* government action. Then he proved that under these conditions, the locus of liability (or fault) for any external diseconomy does not alter the composition or value of total output. In the case

of a polluting firm, resources will be allocated efficiently by private negotiation, no matter who is technically liable for the pollution. This proposition is now called the Coase theorem. Coase then focused on a world of nonnegligible transaction costs, demonstrating that here rules of liability did affect resource allocation but that no a priori assignment was efficient; instead, the total costs and benefits of alternative rules had to be estimated.

The article has proved rich in theoretical implication and institutional detail, receiving great attention and generating a literature all its own. It has provided a framework for the discussion of externality policy, such as pollution and accident control. So germinative has Coase's analysis proved that it has served for the tackling of such diverse topics as antitrust, share tenancy, blood delivery systems, and the baseball reserve clause as well.

Other work. Coase's scholarly interests have been diversified. In addition to the contributions reviewed, Coase has authored papers on duopoly and monopoly pricing, the pig-cycle, consumer's surplus, the pricing of North Sea gas, advertising, the financing of public goods, antitrust enforcement, and the proper scope of economic inquiry. His paragons are Adam Smith and Alfred Marshall, about whom he has astonishing knowledge, and he also has written about the lives and work of these economists.

Assessment. It is no easy task to trace out the direct influence of other scholars upon Coase. A case could be made for his teacher, Arnold Plant, and for Edwin Cannan (Plant's mentor). Frank H. Knight, Philip Henry Wicksteed, Friedrich A. von Hayek, Aaron Director, and Leo Herzel made contributions from which Coase has drawn. But basically he must be seen as his own man, an archetype of the self-contained scholar. Not unlike Adam Smith, Coase has worked productively alone, drawing ideas from his reading and reflection, classifying facts through his grasp of economic theory. Indeed, his work is a testimony to the power of inductive reasoning, since Coase uses his extraordinary interest in the commonplace facts of economic behavior to generate ideas with far-flung consequences.

Coase's scholarly influence has been selective, for the methodology and interests of his research have commonly run against the grain. His enthusiasm for abstract theory without practical application has always been restrained;

he eschews advanced mathematical and statistical techniques; and he considers the history of ideas to be consequential. The theme of his work has been to preserve and expand the scope of market processes. His influence, accordingly, has been most notable in the United States where there is greater interest in the market system than elsewhere.

It is too early for an unqualified evaluation of Coase's work, in part because he continues to produce. But to rank him as one of the principal founders of the modern discipline of law and economics is not premature. He has altered fundamentally the way many legal scholars view torts, contracts, and property law. His editorship of the *Journal of Law and Economics* has contributed significantly to the intellectual growth of this area of study. In economics Coase's work has greatly advanced the property rights paradigm and appreciably altered the way economists view business firms, externalities, public goods, and the case for an economy organized by market exchange.

COCHRAN, THOMAS C.

Thomas Childs Cochran, born in 1902, was a pioneer in the introduction of the behavioral sciences into history and the concomitant effort to shift scholarly focus away from the study of national political and military events toward social history. Believing that business and economic changes were the most distinctive and dynamic elements in the American past, he concentrated his research and publications on business history. He was the best-known and most widely respected analyst of our "business civilization" in the middle decades of the twentieth century.

Educated at Adelphi Academy, New York University (B.S., 1923; M.A., 1925), and the University of Pennsylvania (PH.D., 1930), Cochran was a "late bloomer" as a scholar. He began his undergraduate studies at N.Y.U. with the intention of becoming a chemical engineer, but decided late in his junior year that his real interests lay in history. Through his mid-thirties, relative financial security and a wide range of interests made his academic job at N.Y.U. and his scholarship virtually avocations. As he later wrote in a typescript autobiography, he initially pursued these avocations "chiefly because I had a Calvinistic urge to be purposefully occupied" (1977a). His doctoral dissertation, written under the direction of St. George L. Sioussat, was published in 1932 as *New York in the Confederation*. Cochran later worked sporadically on a set of ideas concerning what he saw as the central role of business in the American past. In 1938

he married his third wife, Rosamond Beebe Cochran, and, he wrote many years after, "became, for the first time, a real scholar." By the close of the depression decade, both his personal and professional lives had become more settled and purposive; his marriage to his helpmate and his intellectual interest in the role of business in shaping culture would occupy his attention and energies for the following four decades.

In his developing career Cochran sought to disseminate some of his emerging ideas about the need for a "cultural approach" to history, employing concepts from such disciplines as anthropology, sociology, and psychology. Many of these notions were apparent in the book he published in 1942 with William Miller, *The Age of Enterprise: A Social History of Industrial America*. That study sought to reinterpret the broad contours of nineteenth- and twentieth-century America in terms of the impact of business enterprise; the quest for "economic opportunities and economic freedom," they asserted, "has been most powerful in determining the nature of our culture." Cochran expanded and drove home these arguments in a highly influential essay entitled "The 'Presidential Synthesis' in American History" (1948*b*). There he denounced as a failure "the old skeleton of wars, presidential administrations, and the westward movement" which still held the edifice of American history together despite "fifty years of rapid growth in the social sciences." History as practiced in academe was virtually irrelevant; it lacked "social realism." Cochran called for a new "social science synthesis" explicating the "material or psychological" changes that most affected "such human conditioning factors as family life, physical living conditions, choice of occupations, sources of prestige, and social beliefs." In the next three decades, many historians in the United States came to accept this emphasis on underlying social structures and processes rather than on superficial political history. Relatively few, however, would follow Cochran in stressing business as the central element influencing the evolution of our society.

Cochran raised the analysis of American business history far above the dominant categories of case studies of individuals or firms and the shallow, moralistic interpretations of business leaders, whether as "robber barons" or as "industrial statesmen." In *Railroad Leaders, 1845-1890* (1953), written during his stay at Arthur H. Cole's Research Center in Entrepreneurial History at Harvard University, he sought

to explicate the "business mind." Influenced by historian-sociologist Leland Jenks, he employed hypotheses from sociology and social psychology in that study. Throughout his work, and especially in *Business in American Life* (1972*a*), he explored the interrelationships between business and other social institutions such as the family, religion, education, the law, and politics. More than any other historian, he succeeded in analyzing business in its wider social context.

From the late 1940s on, Cochran enjoyed a varied and highly successful professional career, teaching and writing at N.Y.U. and then at the University of Pennsylvania, sitting on influential committees of historical associations, serving briefly as a director of the National Bureau of Economic Research (1950-1952) and later of the Social Science Research Council (1960-1964), editing professional journals, and receiving many honors, including the presidency of both the Organization of American Historians and the American Historical Association, as well as honorary degrees and prestigious lectureships. He wrote prodigiously, primarily but not exclusively, on the history of business in the United States.

Ironically, although Cochran was widely identified with the use of social science in history, he always remained the inductive historian, refusing to allow any body of theory to determine his view of the past. And, despite his emphasis on business and economic history, he made little use of perhaps the most powerful of social science theories, economics. He preferred the "softer" behavioral sciences, and he took no part in the move toward highly mathematical and theoretical "cliometrics" that became so popular in economic history in the 1960s. Moreover, he persisted in defining himself as a business and social historian, not an economic historian. In his 1977 memoir he declared, "I have always held abstract ideas tentatively, trying to weigh them against evidence, and ready to discard generalizations that seemed no longer tenable." His role was to broaden historians' acquaintance with other disciplines, to encourage the use of other methodologies when they seemed helpful, and to push historians toward a focus on new topics. The social sciences were for Cochran never more than another assortment of tools for the eclectic historian's toolbox. Hugh Aitken in *Explorations in Enterprise* (1965) offered a wise assessment of Cochran's use of sociological and psychosocial notions in his days at Cole's center: "Cochran

. . . took much of the heat out of the controversies and misunderstandings that were . . . developing, demonstrating by his work—the only way that could carry conviction—that there was nothing in the new concepts and hypotheses that need divert an honest craftsman from doing an honest job” (p. 13). That assessment could well have been written of his work as a whole.

CORWIN, EDWARD S.

Edward Samuel Corwin was born, as he used to emphasize, “of Old English stock” on a farm near Plymouth, Michigan, in 1878. As an undergraduate at the University of Michigan (B.A., 1900), he concentrated on the study of American history under the tutelage of Andrew C. McLaughlin. He went on for graduate work to the University of Pennsylvania (Ph.D., 1905) where, under John Bach Masters, he specialized in the history of the American colonial and revolutionary periods. In 1905 Woodrow Wilson, then president of Princeton University, appointed him one of the original fifty-five “preceptors” at the university with which Corwin’s name would be associated throughout his scholarly career.

Princeton’s new preceptorial system, regarded at the time as a radical innovation in undergraduate teaching methods, combined lectures with intensive small group discussion of assigned readings. The faculty preceptor in each such group, which typically covered several hundreds of pages each week from “standard” works (e.g., Holland’s *Jurisprudence*, Maine’s *Ancient Law*), was expected to work closely and on a personal, even a social, basis with his students. Hence, Wilson required that preceptors be “clubbable,” a term referring to the personality traits especially valued by the members of Princeton’s somewhat snobbish eating clubs. In an instructional system that put heavy demands on the faculty member, Corwin rapidly established a reputation as a tough teacher. A bit of a martinet in the classroom, he retained among students and colleagues alike the nickname “the General” throughout his career at Princeton.

Corwin’s vocation as a commentator on American public law spanned an eventful half century that saw the U.S. Supreme Court reach the apogee of “constitutionalized laissez-faire,” then retreat to a position of relative neutrality on economic issues during the “constitutional revolution” of the New Deal years. Throughout the first three decades of the twentieth century, Corwin was widely considered to be one of the two or three most influential students and critics of the Court. He served as president of the American Political Science Association in 1931. In the 1940s Corwin shifted his interest somewhat, from the Supreme Court to a focus on the office and powers of the American presidency (1940b). During the 1950s Corwin authored, coauthored, or edited five books, one of them

the magisterial *Constitution of the United States of America: Analysis and Interpretation* (1953), the result of a major research effort sponsored by the Library of Congress. He continued to publish major articles, reviews, and letters to the editor, many of them severely critical of the post-1940s trend of constitutional decision (1947; 1949). Active almost to the end, Corwin died in Princeton in 1963.

Corwin began to specialize in constitutional history and interpretation soon after he assumed his preceptorial duties at Princeton, in what was then the department of history (which in 1937 would see the "secession," under Corwin's leadership, of a new department of politics). Corwin once told a student that the mentor of his undergraduate days, "Andy Mac" McLaughlin, had been the leading influence on his scholarly and pedagogical approach. McLaughlin, however, had kept his courses in American constitutional history and constitutional law in more or less separate compartments—a not unusual approach in those days. On the one hand, McLaughlin dealt in his lectures and books with personal, political, and social forces that had influenced the authors of the constitutional document. But he treated the interpretation of this document as the product of pure judicial reasoning from agreed premises that were largely beyond the give and take of politics.

Along with Charles A. Beard of Columbia University and Thomas Reed Powell of Harvard University, Corwin attained leadership in the development of a broader conception of public law. Rejecting McLaughlin's dualistic approach, Corwin in his classes and his scholarship stressed the connection between legal doctrines and larger philosophical, political, and socio-economic issues. Corwin's emphasis on the historical context of constitutional development, rather than merely the internal logic of exfoliating legal doctrines and rules, probably represents his most significant contribution to scholarship.

The fruits of the first phase of Corwin's scholarship were probably the most important and enduring of his career. This phase stretched from the earliest years of his preceptorship through the late 1920s. During this period, Corwin produced what he himself regarded as his most creative work: his studies of such foundational doctrines as "due process of law," "vested rights," and "higher law" (see, for example, 1909; 1911; 1914*a*; 1914*b*; 1914*c*; 1925*b*; 1928–1929). Most particularly, Corwin directed his attention to the doctrinal underpinnings of

the keystone institution of the American constitutional system, judicial review itself.

Corwin's concern with the philosophical basis of judicial review was altogether natural, in view of the fact that the first two decades of the twentieth century saw the reopening—and eventually, the settling—of a great debate over the role of the federal appellate courts in American politics. Some progressive politicians (such as Wisconsin Senator Robert M. LaFollette), some labor leaders (such as Eugene V. Debs), and some scholars, who objected to the probusiness orientation of an increasingly active federal judiciary, either denied the validity of judicial review or proposed its repudiation by constitutional amendment. Other observers of the American political scene (such as Beard, whose *The Supreme Court and the Constitution* [1912] and *An Economic Interpretation of the Constitution* [1913] touched off a flood of controversy) conceded the legitimacy of judicial review. But the supporters of the institution offered a variety of theories on which to base the distinctive judicial authority. All contributors to the debate had to contend with the framers' failure explicitly to provide for any power of review.

In contrast to Beard (whose most famous book, the *Economic Interpretation*, Corwin seems not to have particularly admired; see 1914*c*), Corwin regarded judicial review not as a device to secure certain economic privileges for the propertied class, but as a product of prevailing political–legal philosophy at the time of the framing. A proper understanding of the basis for judicial review, Corwin argued, must begin with an appreciation of the framers' assumptions. The founding fathers, most of them lawyers, were heirs to the British tradition of a fundamental law. Since the time of Edward Coke, this tradition had implied the existence of a vaguely defined "higher law" capable of controlling acts of the legislature. From this seventeenth-century conception, it was but a short step to the concept of higher law in the sense of a body of principles that possess intrinsic validity. In relation to such principles, positive enactments of legislatures are not exertions of human will, but rather acts of discovery or declaration (1928–1929). The framers, Corwin argued, regarded the written Constitution as the embodiment of such higher law principles. This view would automatically have yielded a justification of some power, somewhere in government, to review positive legislation.

But how did this power become the peculiar

province of the courts? In the higher law tradition, judges, who were the defenders of rule of law against royal prerogative, had occasionally been willing to invoke natural law—always defined in light of common law precedents (1914*a*, p. 255). The common law tradition carried the further implication that judges possessed a special competence. As the adepts in what Coke had called the “artificial reason of the law,” judges were the only persons competent to discharge the task of comparing legislative enactments with superior law. In this way, Corwin argued, “law had become a *professional*, nay an *official mystery*” (1934, p. 109) rather than man’s universal inheritance, attesting his participation in the reason and order of the universe and, indeed, in the Godhead itself. According to Corwin, then, judicial review rested on general principles implicit in the jurisprudential assumptions of an age, and hence needed no express indication of the intent of the framers, registered in a written line of the Constitution.

But Corwin also argued that judicial review must keep pace with change over time if it were to survive as an institution in a democracy. Just as its initial validity (in the sense of the historicity of the framers’ intent) depended on the “public opinion” of the earlier generation, the continuing vitality of judicial review (in the sense of widespread popular acceptance and hence legitimacy) required decisions capable of eliciting broad public support. Laissez-faire decisions by the Supreme Court had begun to erode public confidence in the judiciary. Beginning in the late 1920s and running to the eve of World War II, Corwin turned his attention from historical and jurisprudential questions to the economic and political issues of the times (1925*a*; 1932; 1934).

Underpinning the attacks that Corwin directed with increasing frequency (and vehemence) against the Supreme Court under Chief Justice William Howard Taft and later, under Charles Evans Hughes, was a distinctive conception of the judicial process. In a paper for the *American Political Science Review* (1925*a*), Corwin asserted that constitutional interpretation depends not only on “constitutional law” in the strict sense of a set of rules whose logical application to the facts of a case will yield a decision. Interpenetrating constitutional law as thus defined is “constitutional theory,” a less coherent corpus of doctrine rooted in contending ideas of some historical standing about the meaning of the

Constitution. Constitutional theory inevitably presented itself in the form of mutually contradictory ideas: strict *vs.* loose construction; dual federalism *vs.* national supremacy; Chief Justice John Marshall’s conception of an adaptive, expansible constitution *vs.* Roger B. Taney’s (professed) strictness of adherence to the views of the framers.

Because constitutional law consists of a set of rules for decision, it should logically compel a judge to reach a unique decision in any given case at the bar. The hallmark of law, in other words, must be mutual consistency of each decision with decisions on the same point that went before it.

Corwin’s argument against judicial supremacy turned on his charge that the Supreme Court had gradually ceased to function as a court in the strict sense of a panel applying “law.” The justices had acquired freedom to choose from competing lines of precedents so as to endow themselves with the liberty to reach politically predetermined results under the guise of drawing conclusions compelled by law. In short, they had substituted their own preferred version of constitutional theory for constitutional law. For example, as against state laws regulating wages and hours or the quality of merchandise, the Court could apply the due process clause of the fourteenth amendment on the ground that such laws interfered with employees’ “liberty” or with the entrepreneurs’ “property.” Or again, the Court could strike down such laws—provided that the enterprise involved was not strictly local—on the ground that states lacked constitutional authority to regulate interstate commerce. On the other hand, the Court could overturn congressional laws regulating industry, citing the “reserved powers” clause of the tenth amendment as a restriction on national power. “And the total result of this kind of reasoning,” Corwin wrote at the height of the New Deal court battle, “was the appearance of a no-man’s land in which interests organized on a national scale at all times escape all regulation” (1936, p. 153).

The Supreme Court retreat during the years 1937–1941 to positions consistent with the needs of a unitary national economy subject to active legislative regulation (and, when Congress deemed it desirable, active stimulation too) represented a victory for those identified with Franklin D. Roosevelt (1941). Corwin, in the forefront of scholars who championed the New Deal, had been selected by Roosevelt’s

attorney general, Homer S. Cummings, as the first academic figure—indeed, as the first witness who was not a member of the administration—to testify before the Senate on behalf of the eventually unsuccessful “court-packing bill” (1937). There is evidence that Corwin had been led to expect a reward of some sort—perhaps even a seat on the high bench itself (Garvey 1969)—if the “court-packing bill” passed. However, the judicial “switch in time that saved nine” helped to defeat Roosevelt’s disingenuous plan for judicial reorganization. Corwin, his reputation for independence now damaged by the example of his serviceability to political figures, never heard the call that might have taken him from Princeton to power and place in Washington. For whatever reason, following the “constitutional revolution,” Corwin’s enthusiasm for Roosevelt’s expansive view of executive power waned, and several important titles during the years of World War II challenged the basis of broad powers being exercised by the president (1940a; 1940b; 1947).

CURTI, MERLE

Merle Eugene Curti, dean of American intellectual historians working in the Progressive tradition, has himself summed up the major theme and approach of a lifetime of scholarship and service: he “emphasized the functional role of democratic ideas and forces in the history of American thought and put that history in a social setting which includes tussles between com-

peting interests and values" (1952, quoted in 1955, p. 23).

For well over two decades, Curti played a special and even unparalleled role. From at least 1935 to 1955 he was not only a major contributor to the literature of historical scholarship, but he was moreover a recognized and honored leader of his profession in its educational and organizational work. In 1952 a survey of more than one hundred American historians revealed that his Pulitzer Prize winning book, *The Growth of American Thought* (1943), was, judged on the basis of accuracy and contributions to knowledge, the "most preferred" of all works in American history or biography published between 1936 and 1950, "best for reference or for reading or for both purposes" (Caughey 1952, pp. 289-302). He had served as president of both the Mississippi Valley Historical Association (1951/1952) and the American Historical Association (1953/1954). In 1955 he published a collection of his essays that originally appeared between 1926 and 1953, demonstrating not only the wide range of his interests, the depth of his research, and the breadth of source materials with which he worked, but also a rich interpretive ability sufficient to produce significant synthesis as well. By the close of that period he had already trained a remarkable number of graduate students now teaching in leading departments of history in every section of the country. While he never became especially well known to a wider public or a figure of general political importance as other historians have, few in the history of American history have had such a career of professional and scholarly achievement.

Born in Nebraska in 1897, he remained proud of his Swiss heritage that he always associated with the love of liberty. He received his undergraduate and graduate training at Harvard University where he found himself especially drawn to the teaching of another middle-westerer, Frederick Jackson Turner. In Turner's seminar he developed a series of essays that were to be among his first publications. Often studies of the role of ideals in history in mid-nineteenth-century America, these early works show a particular fascination with the role of reformers and reform movements, idealists and social critics in the optimistic America of that era. They also indicate an interest in the question of national self-consciousness and patriotism. Perhaps the best known of these pieces is the study of the "Young America" movement, his first

publication in the *American Historical Review* in 1926. When Turner retired from Harvard in 1924 he was replaced by another middle-westerer, Arthur M. Schlesinger, under whom Curti completed his PH.D. work in 1927. For his dissertation he elected to expand one of his earlier essays on the American peace movement into a full-length and more definitive study. This work was published in 1929.

Curti had taught at several smaller colleges before moving in 1925 to Smith College, where he remained until 1937, advancing rapidly in rank. The same year he came to Smith he married Margaret Wooster, an active child psychologist with a publishing career of her own. About this same time, Curti accepted a commission to prepare a paper that reflected his own developing interests. From the start of his career he showed a special concern for the social sciences in general, and more specifically, an interest in the relationship between these areas of inquiry and historical study. When the Committee on Scientific Method in the Social Sciences of the Social Science Research Council asked Curti to contribute to a large and important project, he accepted. It began for him a lifelong association with the SSRC. The committee was organizing a major collection of interpretations of scientific methods employed by authors of significant contributions to social science. Curti provided an analysis of the methodological concepts of Frederick Jackson Turner (1928, in 1931*b*, pp. 353-367). He showed that Turner, far from being simply a historian of the American frontier, also made important contributions to social, intellectual, and diplomatic history—indeed to all aspects of American development—as well as to explaining the importance of the role of economic group conflicts in United States history. The essay clearly demonstrated Curti's deep commitment to applying research from all of the social sciences to history, and the volume itself is a landmark effort to deal with the methods and nature of the social sciences.

Before he left Smith, Curti accepted another assignment of importance, this time for the Commission on the Social Studies of the American Historical Association. Established to recommend improvements in the teaching of history and the social sciences, it commissioned a series of studies on which its proposals might be more solidly based. Curti prepared part ten of that report, *The Social Ideas of American Educators* (1935). The result was a book of major impact in the history of education and in the

history of American social thought as well. Arguing that ideas about education always reflected more fundamental social ideas and attitudes, existing social problems and conflicts, Curti produced a work of historical scholarship based on careful and detailed research. It was sound but not disinterested. As Curti made clear in his preface, he believed that his historical analysis might prove "useful in the work of clarifying the purposes of social studies in this time of rapid social change."

Thus, by the time Curti accepted a post at Columbia's Teachers College, in 1937, he was not only a scholar with several major publications on his record, but also a professional, seriously involved with the work of national professional associations in history and the social sciences, and most especially concerned with the quality of teaching in these fields. He had already committed himself to the Progressive vision of the New History that had officially announced itself in 1912 (he insisted correctly that Turner was a charter member of the new history group that included James Harvey Robinson, Charles A. Beard, and Carl Becker). He might well have associated Columbia University with this school of historians as well as with one of the philosophers who helped inspire it. For John Dewey, a hero of his book on American educators, was perhaps the living philosopher with whom Curti felt most comfortable. He had come to accept as his own Dewey's belief that "ideas are plans for action," and had in his own work increasingly stressed not only the functional nature of ideas in history but also the view that historical understanding was itself the function of time and place, of social forces and social needs.

Curti soon had occasion to develop further his own strong interest in the interrelationship between history and the other social sciences. He served on the program committee planning the American Historical Association national convention for 1939. That committee decided to focus on three areas: techniques of cultural analysis and synthesis; the cultural role of ideas; and cultural conflict and nationality groups. These are precisely the areas to which Curti had devoted himself from the start of his career. As a member of the committee, he was responsible for sessions on psychology and history. He also presented a paper at a session discussing the so-called "flowering of New England" in the middle of the nineteenth century. Curti's comments, in the form of a statistical analysis of the background of the participants in the "flower-

ing," suggested that the roots of the movement might be found in the intellectualistic tradition of Puritanism and in the nature of the middle class.

The 1939 program was an event of importance professionally; for Curti it was a prologue to his greatest work, already in progress. In 1942 he accepted a position at Turner's old school, the University of Wisconsin, where he remained until his retirement in 1968. (In 1947 he was fittingly given a chair bearing the name of his own great teacher, Frederick Jackson Turner.) But before this event, Curti published a work of such remarkable scholarship, organization, and synthesis that he was awarded the Pulitzer Prize in 1943. It is a difficult work to discuss. An enormous contribution to knowledge just in terms of its research base and the new data unearthed, it is often so thorough that some readers are overwhelmed by its encyclopedic nature and by Curti's persistence in grounding the entire discussion in some meaningful social or socioeconomic context. Curti sought such contexts to prove the broader significance of the thoughts he presented, but the book offers no general theory or interpretation, no particular view of social change. In this sense, its viewpoint is eclectic. "Social" and even "socioeconomic" are terms Curti used, but refused to define with precision.

Yet this is a work of greatness. Curti insisted on the widest possible definition of "thought." Thus the work deals with formal ideas and systematic philosophical positions: ideas about politics, the state, society, human nature. But Curti also considered attitudes and beliefs important aspects of thought; thus he dealt with attitudes toward children and child rearing, the family, women, Indians, blacks, workers, the poor, classes, patriotism, and national self-consciousness—revealed not only by philosophers or self-conscious thinkers, but rather in ordinary social behavior and action, in the popular culture and literature, in the songs and folklore. There is still another kind of thought important in the work: knowledge. For *The Growth of American Thought* is also in many ways a historical sociology of knowledge, dealing with how knowledge is developed and used; how knowledge is diffused more widely and democratically over time; how it is organized and institutionalized. Thus, he devoted considerable attention to a wide range of educational and intellectual institutions and to the social role of scholars, scientists, and intellectuals.

The importance of this book is not in its

general view of social relations or the functional nature of ideas. It is rather the total vision of the nature of thought in America—its broad definition—and the remarkable revelation of the availability of sources previously largely untapped. The book was thus a basic document of, and a significant influence in the shaping of, the rapidly growing American Studies movement of the period. (Curti was, with others, a founder of the most important journal of that movement, the *American Quarterly*, which began publication in 1949. He served as the historian on a board of editors that included distinguished scholars in American art, literature, philosophy, economics, and sociology.)

During the 1940s, Curti undertook one more major professional responsibility with which he will always be associated. He assumed the chairmanship of another important SSRC committee—the Committee on Historiography. Its final report, *Theory and Practice in Historical Study*, the famous Bulletin No. 54 (1946b), was a series of essays and bibliographies for the clarification of key historiographic issues. Especially addressed to graduate students, it was one of the finest statements in defense of historical relativism, and often a brilliant extension of the vision of Beard, who as a member of the committee wrote parts of the report.

The 1940s was a fruitful decade for Curti. In addition to his professional work, he further developed his earlier interests. His *Roots of American Loyalty* (1946a) probed some of the ideas that had fascinated him from the time of his early essays. In this slim but impressive work Curti perhaps pushed closer to the kind of internal analysis of ideas his critics generally faulted him for failing to do. This charge was never quite just—Curti had to understand ideas before he could relate them to the social world in which he was especially interested—but there are passages in this work that show how effectively Curti can present such analysis. The second work was the huge history of the University of Wisconsin that he coauthored with his colleague and friend, Vernon Carstensen (1949). Curti was always interested in education, particularly in the sociology, organization, and diffusion of knowledge. Thus, the university was a fitting subject and the work itself one of a handful of good university or college histories.

While the 1950s represented a period of personal triumph, it also marked a time of significant rebuff to many ideas that Curti valued. In the historical profession itself, there was a major

assault on the bastions of historical relativism and the theories of Dewey, Beard, Becker, Turner, and therefore Curti. He found himself increasingly on the defensive in these debates in historical journals and at professional meetings. He spoke out vigorously against what he regarded as the voices of unreason that denied the possibility of rational action and planning. The newer vision of irrational and existential man troubled his old Progressive orientation, and it was during this period that he began his detailed study of various ideas of human nature in American thought, a study completed in the late 1970s. It was difficult to be a Progressive in the face of the challenge of a new pessimism. As early as the concluding words of his Pulitzer Prize volume, Curti could announce, in the midst of war and totalitarian challenge, that “hope, if not optimism, still lived.” Yet in later revisions in 1951 and 1964, Curti’s tone seemed increasingly uncertain about the future. During the remainder of his teaching career at Wisconsin in the 1950s and 1960s, he devoted more of his own efforts to the study of American influence abroad (again a subject that had interested him since his first essays) and the history of American philanthropy. Both of these efforts produced a series of creditable books and articles marking an honorable contribution to knowledge, but offering little in the way of new interpretation of our national past that could capture the professional interest accorded his previous writings.

There was, however, one exception. In 1959 Curti, with the aid of several of his graduate students, published a work of singular importance—a book, in a sense that Curti had spent a lifetime preparing to write. *The Making of an American Community* is a landmark volume. In it, Curti brought to bear all his knowledge and interest in social science. Using all available data—quantifiable data as well as the more traditional sources—he projected a two-fold strategy. In the wake of the historiographic debates of three decades could there really be an objective or more objective history? Was quantification a way out of total relativism? And, second, could Curti’s own interpretation of Turner’s frontier thesis actually be tested scientifically with the data from one frontier county in Wisconsin? The aims are within the tradition Curti had established for himself from the start of his career and were a fulfillment of Turner’s own dreams. The results are fascinating and important. The full significance of this achievement in reconstructing the social structure and

operation of an American community has yet to be fully appreciated. Too many dismissed it in the recent impatience with the old debate about Turner and his frontier, missing its larger implications.

Merle Curti is no historian of the frontier but he is most profoundly one of Frederick Jackson Turner's major students. Like his own teacher, he has opened many new directions in historical study. Like Turner, he had encouraged his vast number of graduate students to undertake work developing their own interests. He urged no particular methodology but was rather open to all ways of understanding. He provided no singular interpretation of history, but instead proposed a theme and an approach most significant for his own times. He struggled to retain a Progressive vision in an era when precisely that vision was under assault. Always one to doubt the possibility of one truth or of an objective history, he nonetheless pressed the use of various social science approaches in an effort to move closer to the impossible goal. In all of this lies his strength, rather than his weakness, his greatness as a man, a teacher, and a historian.

D

DART, RAYMOND A.

Raymond Arthur Dart was born to Samuel Dart and Eliza Anne Brimblecombe in Brisbane, Australia, on February 4, 1893. He was educated at schools in Queensland and at the universities of Queensland and Sydney. After receiving a B.Sc. (Hons.) in 1913, he became a medical student at the University of Sydney. In 1915 he was awarded the M.Sc. and in 1917 the M.B., Ch.M. (Hons.) from the same university. The latter year saw him a demonstrator of anatomy under James T. Wilson, who was, as Dart himself would be, a "maker of men": he left a long record of distinguished protégés rather than an outstanding research record. Dart was to prove a "maker of men" as well as a brilliant, intuitive researcher. Enlisted in the Australian Army Medical Corps, he served in England and France (1918–1919). On demobilization he became senior demonstrator in anatomy under Grafton Elliot Smith at University College London. Elliot Smith, with his strong emphasis on the nervous system and its role in primate evolution, was another major influence in Dart's life. When the Rockefeller Foundation established its fellowships program, Dart and his fellow Australian anatomist, Joseph Shellshear, were the first two Rockefeller fellows (1920–1921). Dart spent most of his American visit under Robert J. Terry in the anatomy department of Washington University in St. Louis, Missouri. Within a year of returning to University College, he accepted the chair of anatomy at the University of the Witwatersrand, Johannesburg, succeeding the first incumbent, Edward P.

Stibbe. Dart held the chair from 1923 to 1958, a period of 36 years. He piloted the growth of the infant medical school (founded in 1919), serving as dean of the medical faculty for 18 years. During his stewardship, a dental school was established and courses in physiotherapy, occupational therapy, and nursing came into being. He gave much time to the needs of the school and to public service.

Some years after he retired from the chair, he was appointed a visiting professor in the Institutes for the Achievement of Human Potential at Philadelphia and spent 6 months a year there between the ages of 70 and 86.

Dart's initial research contributions were in comparative neuroanatomy and neuroembryology, and a generation of protégés followed his work. He was interested in the peoples of Africa and originated the concept that the Khoisan peoples of southern Africa were descended from an earlier population he called the "Boskop race" (after the fossil human cranium found at Boskop near Potchefstroom, Transvaal, in 1913). This concept was supplanted by newer, nontypological approaches focused on the history of southern African peoples.

Dart's name will always be associated with the discovery of the Taung skull and his prescient recognition of its significance. At a time when discoveries in Java and China had led to the view that Asia had cradled mankind, there fell into Dart's hands in November 1924 a cache of fossil bones encased in hard calcified breccia. They had been recovered from a dolomitic limestone cave between Kimberley and Mafeking, on the edge of the great Kalahari desert. At that

stage the only fossilized apes found in Africa had come from much further north. Dart spent six weeks working on one of the specimens, whose partly-exposed, natural endocranial cast had immediately struck him as being too large to be a baboon's (it was a fossilized baboon skull that had originally drawn Dart's attention to Taung). He laid bare the superbly preserved skull and "brain-cast" of a child of perhaps five years old. Although the endocranial cast was no bigger than that of an ape of comparable age, it showed a number of man-like features, as did the teeth, especially the small canines. Dart (1925a) published an account of the skull and proposed to make the creature the type-specimen of a new genus and species, *Australopithecus africanus* ("southern ape of Africa"). He recognized it as a higher primate that was not a pongid (or member of the zoological family of the apes): in its departures from the ape's structure, it had moved decidedly in a human direction, despite its ape-sized brain. He even demonstrated that the head must have been held on a virtually upright spine.

The 32-year-old Dart's claims met with almost universal hostility. Nor did it help for him to remind his colleagues that Charles Darwin in 1871 had predicted that such ancestral forms were more likely to be found in Africa than anywhere else. For a quarter of a century the place of *Australopithecus* was in dispute, but Dart maintained his position. Later adult specimens were found by Robert Broom at Sterkfontein and Wilfrid E. Le Gros Clark of Oxford University showed not merely that the South African higher primates were not apes, but that they were members of the hominids or family of men, a view later to become widely accepted.

Dart and his students and staff were responsible for finding another cave site containing australopithecine fossils—Makapansgat in the northern Transvaal. Long before such finds of very early hominids had started to emerge from east Africa, Dart had been responsible for a remarkable series of fresh advances:

(1) He had corroborated Darwin's old prediction that Africa would prove to have cradled mankind;

(2) He had forced upon a reluctant world the realization that a creature with a brain no larger than that of a modern ape (recent man's brain size is three times that of an ape) could nonetheless show signs of moving in the human direction;

(3) He had shown that the principle of *mo-*

saic evolution had applied to these early claimants to human ancestry—that is, that some parts of the body (e.g., the teeth and the postural mechanism) had hominized in advance of other parts;

(4) He had shown that the particular pattern of mosaicism evinced by *Australopithecus* was totally at variance with that prognosticated by his old mentor, Elliot Smith, who had held that brain enlargement must have been in the vanguard of hominization. Instead, brain enlargement was not evident in *Australopithecus*, whereas dental and postural hominization were!

Dart's appreciation and interpretation of the hominoid traits of *Australopithecus* were the most important breakthroughs in paleoanthropology of the twentieth century; next to it, all the other African discoveries represented a mere filling-in of details. Dart lived to see his early claims vindicated. His claim that the australopithecines had used as tools the bones, horns, and teeth of the animals they are presumed to have eaten was, however, strenuously resisted by most paleoanthropologists. Some believe that in this concept Dart made another seminal contribution to the understanding of early stages in the hominization process.

Considerable recognition was accorded Dart in many parts of the world; in his honor the Institute for the Study of Man in Africa was founded at the Witwatersrand University to foster the study of man in Africa, past and present, in health and disease. A Raymond Dart lectureship was also established by that institute.

DAVIS, KINGSLEY

Born in 1908, Kingsley Davis, demographer, sociologist, educator, analyst of urban phenomena, and Latin American specialist, can be best described as a social demographer. Once the relatively narrow field of formal demography was thoroughly explored, it was inevitable that its range would be expanded to include the causes and consequences of population phenomena in their full economic, social, and cultural contexts. The credit for setting this broader perspective cannot be assigned to any one person or nation, but in a list of pioneers Davis would be close to the top. *The Population of India and Pakistan* (1951b) contains all the analysis of fertility, mortality, and migration that its title would lead one to expect, but also well-rounded chapters on caste, religion, education and literacy, the characteristics of cities, and population policy. In his words, the book attempted an “analysis of social organization and social change . . . a contribution to the sociology and economics as well as to the demography” of the two countries. The nondemographic elements, far from being diversions from the main theme, are fully integrated parts of a book conceived in a spirit of what might be deemed a new discipline—social demography.

Others who have tried to combine social with demographic analysis typically started with population and found the murky field of sociology difficult to master. Davis moved in the opposite direction. His undergraduate major at the University of Texas was English; he took avidly to the study of literature, joined the Scribblers Club, and edited two of the campus literary magazines. He mastered a clear style uncluttered with jargon, the means of communication on a wide range of subjects to both professional peers and the general public. It was he who coined such terms as “the population explosion,” “the demographic transition,” and “zero population growth”—so graphic and felicitous that they have become commonplace in analyses at all levels.

After receiving an A.B. (1930), Davis continued graduate work at the University of Texas in philosophy, economics (under Everett Hale and Clarence E. Ayres), and sociology (under Carl Rosenquist and Warner Gettys). With a

master's degree in philosophy (1932), he entered Harvard University and initially concentrated on sociological theory under Talcott Parsons and the study of the family under W. Lloyd Warner. Both as a graduate student and subsequently as a junior member of the faculties at Smith College and Clark University, he participated in Talcott Parsons' famous discussion group, joining there such later prominent sociologists as Émile Benoit-Smullyan, Robert Bierstedt, Edward Devereaux, Robert K. Merton, and Logan Wilson. When Parsons' *The Structure of Social Action* appeared in 1937, Davis had already received his doctoral degree (1936), but he used the book in graduate seminars and thus improved his grasp of social theory. After joining, as chairman, the sociology department at Pennsylvania State University (1937–1944), Davis received a postdoctoral fellowship from the Social Science Research Council to study statistics, mathematics, and demography, partly under Samuel A. Stouffer at the University of Chicago, partly at the Bureau of the Census. He also did field work in the region surrounding the mountain town of Lares in Puerto Rico.

With this rich and diverse preparation, Davis went to Princeton University, first with the Office of Population Research, then half-time in the Wilson School of Public Affairs, ultimately in the economics department as associate professor of anthropology and sociology, charged with starting a program in those two fields. He brought to Princeton Wilbert E. Moore, Paul K. Hatt, Melvin Tumin, Edward Devereaux, Marion J. Levy, Jr., and Harry Bredemeier—men who soon made the department one of America's best. There, and subsequently at Columbia University (1948–1955) and the University of California at Berkeley (1955–1977), the wide perspective of social demography characterized his classroom teaching. For instance, nearly two decades before ecology became a fad, Davis was devoting a tenth of the assigned reading in his basic course to a highly sophisticated treatment of ecological relations as these affect the quality of life. In his teaching no less than in his writing, Davis' demographic inquiry was a means to a fuller understanding of human behavior and social structure, as well as a criterion with which to assess policies designed to improve human welfare.

The subjects of Davis' first published papers were sexual behavior, the family, parent-child relations, and thus (but almost incidentally) fertility—all analyzed in a neo-Parsonian manner.

That is, he took topics ordinarily discussed emotionally and moralistically and tried to show why certain all but universally condemned practices persist. One "function" of prostitutes, for example, is to provide a sexual outlet for men lacking a legitimate one. Illegitimacy, similarly, is not merely a "social problem" but the absence of legitimacy, the principle that (following Bronislaw Malinowski) he defined as the functionally necessary bond linking father and child into a socializing agency, the complete family. Colleagues found these pieces stimulating and often amusing, but some of them reacted differently to a piece that Davis and Wilbert Moore wrote on stratification, for in this case it was the conventional beliefs of academic liberals that were subjected to the same astringent analysis. In spite of repeated invocations over the centuries to social equality, why is it that a class structure persists? It survives all efforts to erase it, Davis and Moore wrote, because the persons carrying out tasks most important to "societal survival," especially if these tasks demand high intelligence and long training, must be rewarded with "great prestige, high salary, ample leisure, and the like" (Davis & Moore 1945). In the seemingly endless debate, opponents challenged whether in real societies values were in fact distributed according to this principle of justice, but the more acerbic reaction was to the authors' irreverent dismissal of the dogma of equality.

The high point of this early phase was a first-rate text, *Human Society* (1949), which drew heavily on ethnographic data to illustrate general principles of societal analysis. Davis' skill in exposition was—as it should be—almost invisible, and the functional theory that set the volume's content was also beneath the surface. As he developed skills in statistical and demographic analysis, Davis became less enamored of purely verbal theory, less confident that cultural patterns determine behavior, and more interested in social-economic and demographic theories that can be exemplified, documented, or tested with numerical data.

One of Davis' enduring interests was cities. In 1946, he wrote, with Ana Casis, "Urbanization in Latin America." At Berkeley he organized the International Population and Urban Research Unit, which sponsored international conferences—for example, the set of papers later published as *India's Urban Future* (Seminar . . . 1962)—and published a series of 17 monographs. Most importantly, Davis and his associates issued a remarkable set of statistics on the world's cities,

a considerable improvement over those published by the somewhat larger and wealthier United Nations, and in a second volume used the figures to analyze *World Urbanization, 1950-1970* (1969-1972). In 1971, he became Ford professor of sociology and comparative studies at the University of California at Berkeley, and in 1977, the distinguished professor of sociology at the University of Southern California.

While producing a long list of notable publications and teaching many students indebted to his meticulous pedagogy, Davis found time to advance his profession in time-consuming functions. He was a member and then chairman of the Division of Behavioral Sciences of the National Research Council when the NRC was beginning to extend its range from physical to social sciences. As the first sociologist elected to the National Academy of Sciences, he took pains to see that he was not the last. He was president of both the American Sociological Association and the Population Association of America, and he worked in comfortable tandem with anthropologists and economists. His frequent efforts to explain social trends to the lay public culminated in a very fruitful relation with the publishers of *Scientific American*.

Kingsley Davis has had several overlapping careers. His works on India, even years after their publication, are still cited in India as authoritative. From the first field work in Puerto Rico, he developed an increasing knowledge of Latin America. Several of his books and articles were translated into Spanish, and two of his better papers were in that language—"Apreciación crítica de Malthus" (1951a) and "Las causas y efectos del fenómeno de primacía urbana" (1962). He had competence in every social discipline except psychology. Yet his life's work was not dispersed; it shows a remarkable unity with a clear line of development, linked by persistent interests and a clear-sighted search for consistent excellence.

DOBB, MAURICE H.

Maurice Dobb, one of the foremost Marxist economists of the twentieth century, was born in 1900, at a time when the main flow of innovative Marxist thought was moving away from economic analysis toward cultural theory, philosophy, and aesthetics. At the time of his death in 1976 the tide had turned, and once again political economy was attracting widespread attention, not only in Marxian studies *per se*, but also in economics in general, where the obvious failure of neoclassical orthodoxy to explain major economic problems, and the exposure of logical fallacies in its analytical framework, led many to turn to classical and Marxian ideas. In this process Dobb had played a central role as both scholar and publicist. For many years he was, with Paul M. Sweezy, the only significant Marxist economist writing in the West. Their work in difficult periods, such as the late 1940s and the 1950s, was a guide and inspiration to later generations.

Dobb was attracted to the political left, to Marxism, and to the study of economics as a reaction against the mindless chauvinism of the World War I era, and by the contrast between Western economic failure in the aftermath of the war and the hopes inspired by the 1917 Soviet revolution. He studied economics at Cambridge University and at the London School of Economics, where he received a PH.D. in 1924 for a thesis on the history and theory of capitalist enterprise. He returned to Cambridge at the end of 1924 as a lecturer in the faculty of economics and politics, from which he retired, as a reader, in 1967. While in London Dobb had joined, in 1922, the recently formed Communist party of Great Britain. The dominant elements in his life's work were to be a profound intellectual grasp of orthodox economic theory, a commitment to the over-all development of Marxian thought in the social sciences in general and in economics in particular, and a belief in the necessity of social revolution in the interests of economic welfare and human dignity.

A major part of Dobb's work was devoted to the construction of a satisfactory theoretical framework, built on Marxian foundations, for the analysis of capitalism. Since a theory of value must stand at the core of any theory of capitalism, Dobb devoted much of his career to the study of contemporary theories and their historical development. The unusual combina-

tion of a deep understanding both of Marxian analysis and of orthodox ideas was to lead to a curious ambivalence in Dobb's early writings, for while he regarded Marxian theory as a superior system of social thought, he apparently still believed the neoclassical orthodoxy to be *logically* sound. Thus his rejection of the neoclassical theory of value was based on its failure to comprehend the anarchy of an individualistic system (1925), its inadequate representation of the institutional structure of capitalism (1928*b*), and the essentially vacuous character of a subjectivist theory of the sphere of circulation—in contrast to an objective theory grounded in the reality of the process of production (1937). Some uncertainty may also be found in his discussion of the logical foundations of Marxian analysis (see Bharadwaj 1978). However, following his collaboration with Piero Sraffa on the *Works and Correspondence of David Ricardo* (Sraffa 1951–1973), and the publication of Sraffa's *Production of Commodities by Means of Commodities* (1960), Dobb's position changed. For not only was the "Ricardo–Marx tradition in economics" rehabilitated on a sound logical footing; but also the neoclassical orthodoxy was shown to be incapable of providing a logically sound theory of the determination of the rate of profit, and hence incapable of analyzing capitalist markets. Although a methodological critique remains an important part of Dobb's *Theories of Value and Distribution* (1973), the emphasis is on the logical structure of the surplus approach to the theory of value and distribution, exemplified by the works of Ricardo, Marx, and Sraffa.

Dobb's attitude to the other major theoretical innovation in twentieth-century economics, John Maynard Keynes's theory of effective demand, was somewhat equivocal. Although not unaware of the significance of Keynes's ideas Dobb regarded them to be of fundamentally less importance than the rehabilitation of the Marxian approach; indeed, they were incomplete unless allied with a satisfactory theory of value (Garegnani 1978–1979). Dobb was not involved in the Cambridge debates that surrounded the construction of Keynes's *General Theory of Employment, Interest and Money* (1936) in the 1930s, being heavily committed to the antifascist movement and similar political work.

While the theory of value was a major theoretical concern, Dobb also developed other aspects of Marxian theory, notably the theory of

crises, and made important contributions to the history of economic thought in which he stressed the historically relativist character of economic thought, both in the choice of problems analyzed and in the social "vision" embodied in the formal framework of theory.

Early in his career, Dobb's political interest dictated an attempt to understand and interpret the new Soviet society. In 1927 he completed *Russian Economic Development Since the Revolution* (1928a), working with a translator, since he did not then read Russian. In this and successive revised editions, Dobb charted the path of Soviet development and analyzed the theoretical approach adopted by Soviet planners. The book has subsequently been criticized for ignoring the harsher realities of the Soviet experience, but at the time it was well received. Keynes wrote to Dobb in 1927 that it was "a most valuable and original work. . . . It gives a picture of what has really been happening in Russia such as has not been available before to English readers." Dobb emphasized the advantages of centralized planning over the anarchy of the market, a basic theoretical position he was to maintain against the seductive charms of so-called "market socialism." But he became increasingly aware of the institutional problems inherent in a centralized state: "The centralised system will itself have bred attitudes and habits of work of its own, together with a structure of relationships between administrative levels that may exercise a strongly conservative resistance to change and to the adoption and cultivation of new attitudes, relationships, and methods" (1970, p. 62). Nonetheless, he was confident that "even if there be signs of a freezing of bureaucratic structure . . . it is hardly likely that the new technological age and higher living standards can be contained within the old administrative mould inherited from Stalin's day" (*ibid.*, pp. 68-69).

Dobb's interpretation of the Soviet experience was to be of major importance in his analysis of development in the Third World. In his famous Delhi lectures (1951), in which he identified economic development with industrialization, he advanced the then novel propositions that in a surplus labor economy investment can be increased without depressing *average* consumption, and that decisions on investment must involve both the structure of investment as between sectors and the time pattern of production. In the more complete statement of his views (1960),

he concentrated on what he felt to be the central issue—the relationship between the generation of surplus, the structure of the labor force, and the choice of technique. The problem was analyzed in an essentially static framework, with a focus on the choice of the optimum capital-labor ratio in a model with a (paradoxically) neoclassical flavor. While today emphasis would be placed more on the dynamics of development and the relationship between technological and social change, Dobb's emphasis on industrialization points to the key to the attainment of economic independence in the Third World.

Dobb's interest in development was not confined to analysis of socialism and of the Third World. Perhaps his most innovative and influential application of Marxian analysis was in an area in which he was a self-confessed amateur. In his *Studies in the Development of Capitalism* (1946), he not only analyzed the history of capitalist development but also posed the vital question of the nature of the transition from feudalism to capitalism. He utilized Marx's notion of a mode of production as a combination of social relations (in particular property relations) and technical forces to provide an interpretation of the "organic" collapse of feudalism. The interaction between material and social forces in feudal society had led to crises in East and West, producing in the East, greater repression, and in the West, the irreversible development of capitalism. This analysis emphasized the role of class struggle in the development and overthrow of the feudal mode of production, in opposition to Marxist and other arguments dependent on technological determinism or the role of "external forces." Dobb's position has been the basis for a continuing debate (see Hilton 1976).

Dobb's career was devoted to the *development* of Marxian analysis as a political tool. A confirmed opponent of dogma in both intellectual and political affairs, he gained world-wide influence through his care and consideration as a teacher, the wide range of his writings, and his unique position as a Communist prominent in the Western economics profession. He was, however, a quiet and modest man. His intellectual commitment and personal modesty are illustrated by his work with Sraffa on Ricardo's *Works and Correspondence*. Given Sraffa's well-known reluctance to set pen to paper, the necessary editorial introduction was accommodated by a procedure in which Dobb and Sraffa discussed

each paragraph, Dobb wrote it up, Sraffa revised it, Dobb rewrote it, and so on. The editorial introduction to Ricardo's *Principles* proved a vital step in the development of understanding of the role of the labor theory of value in classical analysis, and in the provision of logically sound foundations for the Marxian theory of value and distribution.

The breadth and penetration of Dobb's contributions could, perhaps, have been made only by an innovative thinker using the Marxian tradition of social thought, a tradition of which Dobb's work now forms an important part.

DOBZHANSKY, THEODOSIUS

The modern understanding of the evolutionary significance of genetic variation within and between human groups rests almost entirely on the work of Theodosius Grigorievich Dobzhansky. Although his research was devoted chiefly to other species, particularly natural populations of *Drosophila*, the views he developed on genetic variability in natural populations, and on the evolution of geographical races, had a profound effect on physical anthropology.

Theodosius Dobzhansky was born in Nemirov, Russia, on January 25, 1900. He was the son of a high school teacher, the grandson of a Russian Orthodox priest. After his university training at Kiev (his only doctorates were honorary degrees), Dobzhansky began an extensive study of variation in natural populations of *Coccinellid* beetles distributed across Europe and Asia. His first contribution to the study of genetic variation, published in 1924, described the polymorphism of color patterns in these insects. This work was important for Dobzhansky's own development and generally for the modern view of genetic variation. In the study, some species showed the same frequencies of genetic variants over their entire range, while others showed marked geographical variation in frequencies of different phenotypes. Instead of taking the conventional view—naming morphological races and subspecies and describing the geographical range of each—Dobzhansky maintained that there was in each instance a single polymorphic species, and that the problem was to understand the pattern of geographic variation in terms of various evolution-

ary forces. The change from viewing each phenotype as a "race," to be named and mapped, to viewing the species as a genetically segregating population, or series of populations, with no single "wild-type," was fundamental. It led to Dobzhansky's concept of the Mendelian population, a geographically coherent group of individuals exchanging genes, which is now the fundamental concept of evolutionary genetics. This was a major departure from the typological view that a species could be broken into a few well-defined races on a purely phenotypic basis, with no reference to the breeding structure or genetics of the species.

Like most middle-class intellectuals of the time, Dobzhansky supported the February revolution but opposed the Bolsheviks, and in 1927 he left the Soviet Union never to return. He joined T. H. Morgan's group at Columbia University, which had for some years been the center of development of classical genetics, and began his studies of the cytogenetics of *Drosophila* and of the causes of sterility in species hybrids. When Dobzhansky began his work on the genetic differences between species, the species concept was primarily a typological and taxonomic one. Using chiefly morphological characters, taxonomists tried to define the stage of differentiation at which races should be regarded as species. At the same time it was understood that there were a variety of barriers to crossing between species. They included failure to mate; inviability of hybrid embryos if mating did occur; or sterility of hybrid adults if development of hybrids succeeded. Yet there was no understanding of the relationship between these observations and the problem of differentiation of races and species, because the problem of species definition was seen from a static, rather than a dynamic, viewpoint. It was Dobzhansky who saw, from the geneticist's standpoint, that the critical issue was the passage of genes from one population to another. In 1935 he provided the biological definition of species that remains the underlying concept of species formulation at present. Dobzhansky defined the species as "that stage of evolutionary divergence at which the once actually or potentially interbreeding array of forms becomes segregated into two or more separate arrays which are physiologically incapable of interbreeding" (1935, p. 354).

The essence of this concept is that a continuous process of genetic differentiation between geographically separated populations finally results in a stage of total genetic isolation. This

stage is a critical one, however, and is qualitatively different from mere race formation, because after the point of speciation the units are genetically and evolutionarily independent.

Dobzhansky's work on cytogenetics, species hybrid sterility, and his studies of genetic polymorphism in natural populations converged in the production of a synthetic theory of evolutionary genetics published in 1937 as *Genetics and the Origin of Species*. His most influential work, it is the point of departure for all subsequent synthetic treatments of the evolutionary process. *Genetics and the Origin of Species* begins with the observations of classical genetics: the production of genetic variation by mutation and chromosomal rearrangements. These types of variation are then related to the variation observed within and between natural populations. The dynamics of the variation is explained in terms of theoretical population genetics, especially the stochastic theory of Sewall Wright. For the first time evidence is brought together from a variety of sources that natural selection actually operates to mold the genetic composition of populations. Dobzhansky's successful melding of the stochastic theory of gene frequency change with the observed facts of genetic variation was the first real synthesis in biology of a complex theoretical structure with a large body of observation and experiment.

The second half of *Genetics and the Origin of Species* concerns the development of species differences by the acquisition of genetic barriers to gene exchange. As a basis for the speciation process, there is a large amount of genetic and cytological variation within populations. The variable populations then become spatially differentiated either through natural selection, which favors different genes in different environments, or through the interaction of selective forces with random processes of accidental differentiation. Genetic differentiation in space results in geographical races which are incipient species. Whether or not these geographical races continue to diverge to the stage of speciation when they can no longer exchange genes depends upon the balance between selection for divergence and the homogenizing effect on all populations of migration and of common selective pressures. Human populations, for example, have diverged from each other in the past to form a large number of genetically differentiated local populations which can, more or less arbitrarily, be grouped into major "races." But this differentiation has not and cannot lead

to speciation because of greatly increased migration, because selective forces have become increasingly homogenized spatially, and because populations have become so large that random differentiation is very weak.

Beginning in 1935, and until his death in 1975, Dobzhansky devoted his scientific work to the study of genetic variation within natural populations, chiefly of *Drosophila*, but also of humans. His studies of chromosomal polymorphism in *Drosophila* populations convinced him that sexually reproducing species were highly polymorphic genetically and that the typical individual in such a species was heterozygous for most of its genes. He regarded the main causes of this genetic variation to be the balancing forces of natural selection, in particular the superior fitness of heterozygous individuals. The central core of this theory was developed in a series of 43 papers on "The Genetics of Natural Populations," which attempted to document the genetic polymorphism of *Drosophila*, to measure the force of natural selection maintaining the polymorphism, and to apply the full apparatus of population genetic theory to the study of natural populations. Dobzhansky stood at the center of an international school of evolutionary geneticists devoted to his view of the genetic structure of species. This "balance school," as Dobzhansky called it, was opposed by the "classical school" of H. J. Muller who believed that species were chiefly monomorphic genetically, except for a "load of mutations" that were deleterious and that were constantly being swept out of the population by natural selection. Muller regarded the load of mutations as limiting the reproductive potential of a species; he feared, for example, that the human species might be extinguished if radiation-induced mutations increased the genetic load. Dobzhansky, to support his position, attempted to show metabolic polymorphism in humans by studying patterns of excretion of amino acids, but this technique proved too crude for the purpose. In fact, no technique available during most of Dobzhansky's lifetime was capable of deciding the issue, and an acrimonious debate on the meaning of a series of ambiguous experiments marked population genetics for many years. Recent work on the polymorphism of enzymes has shown that Dobzhansky was correct in his assertion that most organisms, including the human species, are highly polymorphic genetically. Whether or not this polymorphism is maintained by hetero-

sis and other forms of balancing selection is yet to be determined.

Dobzhansky and Muller both agreed that different human abilities were largely genetically determined. For Muller these abilities were on a graded scale from bad to good, and he promoted a program of selective breeding through artificial insemination that would eliminate the inferior genotypes and increase the superior ones. Dobzhansky's general view on polymorphism and heterosis led him to the conclusion that genetic variation in ability was advantageous to the species as a whole, that polymorphism was adaptive. Moreover, since he believed that heterozygotes were the superior genotypes, no program of eugenics could concentrate these types. These views, together with the argument that differences in ability should not be differentially rewarded, are summed up in Dobzhansky's major statement on human polymorphism, *Genetic Diversity and Human Equality* (1973). It is ironic that the struggle between Dobzhansky and Muller was based upon a common assumption for which neither had any evidence. It is still not known whether differences in human skills, abilities, and temperaments have any genetic basis at all, or whether they are the consequences of developmental accidents and cultural conditioning.

Dobzhansky's theory of race and species formation and his study of polymorphism led to a complete reorientation of physical anthropology. Like the rest of biology, physical anthropology had long been typological and taxonomic in its approach. Using morphology, anthropologists described and classified human racial types, the number of "races" varying from five to more than one hundred, depending upon the prejudices of the observer. Catalogs of photographs of racial types were produced, and even Dobzhansky, in *Mankind Evolving* (1962), gave serious consideration to these classifications. Although it was recognized that migration and interbreeding had produced mixed groups, even these hybrid entities were implicitly regarded as stable types to which typical descriptions could be applied. If any evolutionary dynamic was assumed, it was a branching process by which one racial type gave rise to another in a phylogenetic tree like the phylogenetic trees of species.

With the destruction of typological systematics in biology, a reorientation in anthropology began. Morphological traits were progressively deemphasized because their genetic basis was

complex and uncertain. Instead, anthropologists began to measure the frequencies of simple Mendelian genetic characters—e.g., blood groups and other biochemical traits. But the characterization of a local human population in terms of gene frequencies rather than morphological traits changes the entire emphasis of description. Frequency is a characteristic of an ensemble rather than an individual, so that it becomes impossible to pick a “typical” individual to represent the group. Local populations are observed to be mixtures of different genotypes, and what characterizes the differences between populations is differences in relative frequencies of the different genotypes. The concept of pure race also becomes untenable. Since, for any of the genes studied, two human populations do not differ absolutely, but only in relative frequency, no “pure” types exist. It also becomes impossible to delineate major races, since it is purely arbitrary which level of frequency difference is to be regarded as defining race. Indeed the concept of race has virtually disappeared from modern anthropology.

A second effect of Dobzhansky's view of the polymorphic species was a change in the problematic of anthropology. From a purely descriptive and taxonomic science, physical anthropology became a branch of population genetics. The problem of physical anthropology came to be an explanation of the causes of human polymorphism. The entire apparatus of theoretical population genetics has been brought to bear on the explanation of genetic differentiation between groups. It has become important to characterize the actual breeding structure of a village or tribe; thus, data from cultural anthropology on kinship systems and marriage patterns are now important to physical anthropology. The study of genetic differentiation at the level of neighboring villages, as for example among the Yanomamo and Makritare, is now the mode for anthropology. As a consequence, physical anthropology has passed from being a simple consumer of evolutionary genetic theory to a primary producer of it. A major justification of the study of primitive peoples and cultural isolates at the present time is that they are expected to provide tests of general evolutionary and population genetic theories.

What is so remarkable about the revolutionizing influence of Dobzhansky on the study of human variation is that it is based entirely upon the extension of ideas developed outside of an-

thropology. Except for the ill-fated attempt to study excretory patterns of amino acids in the early 1950s, Dobzhansky never made any attempt to study human genetic variation directly; and the Institute for the Study of Human Variation, which he founded together with L. C. Dunn in 1951, was short-lived and unproductive. Dobzhansky recognized, however, the significance of population genetics for the study of the human species and carried out an active campaign of propaganda among anthropologists and students. Anthropologists, in their turn, seized on population genetics as a way to break out of the sterile taxonomy of classical studies, and to regenerate the study of human evolution.

DODD, STUART C.

From the time Stuart Carter Dodd began collaborative efforts with George Lundberg until the time of Dodd's death at the end of 1975, he symbolized for many sociologists the pursuit of an elusive Holy Grail: social science modeled on physical science and approaching the latter's precision and predictive power.

The son of a medical missionary, Dodd was born in 1900 in Talas, Turkey. After serving as a psychologist at the State Home for Boys in Jamesburg, New Jersey, and earning a B.S. magna cum laude in 1922, an M.A. in 1924, and a Ph.D. in psychology in 1926, all at Princeton University, he received a postdoctoral fellowship from the National Research Council and studied in London. From 1927 to 1947 he was

affiliated as a sociologist with the American University of Beirut, where he developed and directed that university's Social Science Research Section. His teaching there was interrupted when he and his family were evacuated during World War II, and he served for a time as director of surveys with the U.S. Army in Sicily. He was decorated by the Republic of Lebanon "for Humanitarian Services," and his eldest son subsequently taught sociology at Beirut.

From 1947 on, as research professor of sociology at the University of Washington, Dodd directed the Washington Public Opinion Laboratory (1947–1961), and was a dedicated teacher of methodologically oriented seminars until he became professor emeritus in 1971. During his four years of retirement, he continued to express in writing his vision of science. Over his lifetime he published some 150 papers in a wide array of journals.

The major theme of Dodd's academic career was a lifelong effort to promote a system of symbols and to contribute to a pattern of language use that he believed would make the social sciences more scientific. In addition, he also pursued a range of other causes, all, in his view, related to his major objective. In the final year of World War II, he proposed the establishment of an international polling agency to provide a "barometer of international security" that could facilitate efforts by the United Nations to preserve peace and foster human progress. In pursuit of this goal he helped organize the World Association of Public Opinion Research. As president of the Pacific Sociological Association in 1953, he advocated applied social research in a presidential address entitled "Can the Social Scientist Serve Two Masters?" In 1960/1961 he served as vice president of the American Humanist Association, after proclaiming in a mimeographed circular to its membership the importance of an "emerging science of Axiology" and affirming his belief that "measuring man's pursuit of goals helps make evolution more purposive." In 1966 he took time to give enthusiastic assistance to a group of students who were devising measurement techniques for a campuswide course critique.

Dodd came to the attention of Lundberg through publication of *A Controlled Experiment on Rural Hygiene in Syria* (1934), which Lundberg cited in the second edition of his textbook on research methods ([1929] 1942), calling the

first 38 pages of Dodd's monograph a "model of clear orderly statement of the methods of a research project." The two men met when Lundberg visited the Middle East, and, as a result of their discussions, Lundberg's *Foundations of Sociology* (1939) and Dodd's *Dimensions of Society* (1942) were published as "companion volumes," although publication of the latter was delayed by the war.

Two papers by Dodd, effectively previewing *Dimensions of Society*, appeared in 1939. The first, "A Tension Theory of Societal Action," remains one of the best examples of Dodd's contribution to useful reconceptualization in sociology. It provided a unique clarification of the nature and interrelations of such processes as conflict, competition, and accommodation, an unusually lucid analysis of Malthusian theory, and a perceptive comparison of Nietzschean, Buddhist, and Western philosophies. Except for the use of presubscripts (in addition to the more conventional postsubscripts) in Dodd's equations, nothing in the first three-fifths of the article was particularly unconventional or difficult to follow, and even the more difficult section on "second order processes" was illuminating. The second paper, "A System of Operationally Defined Concepts for Sociology," moved farther from customary sociological thoughtways. It succinctly outlined the "S-theory" that he elaborated subsequently in *Dimensions*, and it remains the most palatable first-hand overview of Dodd's ambitious attempt to rebuild the sociologist's vocabulary.

Dodd sought to synthesize the description and analysis of all social situations by an equation, $S = T; L; P; I$, where S stood for situation, T for time, L for linear distance, P for population, and I for indicators of the innumerable characteristics of people and their environments. The semicolon could stand for any of the mathematical operators—addition, multiplication, and so on. Further, each "dimension" in the formula could be modified by an exponent. In the case of L , for example, if the exponent were 1, then the base letter designated a length; if the exponent were 2, it designated an area; if it were 3, a volume. Thus, a population density—a ratio of people per unit area—was P^1/L^2 , which could also be written P^1L^{-2} . Each base letter or dimension could also be modified by three other corner scripts, the postsubscript designating a class, the presubscript designating class intervals, and the presuperscript designating a case.

The exponents, however, were the most im-

portant of the corner scripts. A process—involving a characteristic changing in time—could be represented as P^1T^{-1} . Different processes would involve different amounts of different characteristics, but all would share the -1 exponent on T , showing they all were a kind of “velocity.” Similarly, a rate of natural increase in a population would be recognized as a velocity when written P^1T^{-1} . A *change* in a rate of natural increase would be P^1T^{-2} —the time period *increment in the rate* of population increase per time period. Thus, any formula containing T^{-2} represented an acceleration.

Dodd believed that sociologists would find their efforts to classify social phenomena became more scientific if they categorized situations according to whether or not the formulas for those situations shared the same sequence of exponents. He even took qualitative variables into account by assigning them a zero exponent (so that their quantity—taken as 1—did not modify any product in which they entered as a factor).

Reviews of Dodd's work were mixed but generally negative. Not all criticisms were cogent; of those that were, the one that most affected his subsequent writings was the charge that what matters most to sociologists was left to his residual category, *I*. Several reviewers warned that it would be inadvisable for sociologists generally to emulate Dodd or adopt his notation. One critic noted that Lundberg's valuable natural science approach for sociology might be neglected if it were identified with Dodd's S-theory (Calhoun 1942, p. 504). Others denied that the S-system accomplished what Dodd claimed for it (Parsons 1942; Shanas 1942). One reviewer, however, wrote that it was more likely than any alternative to make sociology scientific (Robinson 1942, p. 454), and another held that it would be profitable for any sociologist to read and evaluate *Dimensions* (Calhoun 1942, p. 504). A mathematician who reviewed the book called S-theory “a feeble mathematical pun” (Bell 1942, p. 709), and one author of a textbook on sociological theory later called Dodd's work “almost unreadable” but credited him with “a tour de force” in his use of the zero exponent (Timasheff 1955, pp. 308, 309). Another theory text cited *Dimensions* as “an example of the danger always facing pure positivism of degenerating into an empty formula” (Martindale 1960, p. 119). Howard B. Woolston, reviewing the book in the *Annals* of the American Academy, suggested that “perhaps a brief

handbook presenting typical problems and solutions might be more useful for students, and offer a definite basis for trial by investigators” (1942). Dodd's approximation to such a handbook was entitled *Systematic Social Science* (1947), a typescript volume reproduced by offset in a “temporary edition” as a publication of the Faculty of Arts and Science of the American University of Beirut.

Convinced that his scientific language would become more widely adopted if offered in more piecemeal form, Dodd intended, when he went to the University of Washington, to spend the next twenty years publishing segments of his system in journal articles. At the University of Washington, he also directed a series of team research projects, the largest and most notable being Project Revere, a three-year study for the U.S. Air Force during the Korean War that explored various aspects of communication through airborne leaflets. A number of able graduate students were trained under Dodd's direction, and many research papers by him and by them were published, but his hope that a multivolume “definitive treatise” would eventually be published setting forth sociologically fundamental findings from Project Revere (comparable in his mind to the World War II series by Samuel A. Stouffer and others on *The American Soldier* [1950]) remained unfulfilled.

In 1961 the Washington Public Opinion Laboratory became the Institute for Sociological Research, and Dodd relinquished the directorship. His efforts turned increasingly to the development of a set of ideas that had fascinated him earlier (1944; 1950*b*). By now he had broadened his interests beyond the boundaries of the behavioral sciences, and began to apply his symbolic analyses to cosmological questions in an endeavor he called “Project Epicosm.” In an unpublished memorandum written in 1967, Dodd spoke of all research as “the search for . . . optimal symbolizing,” and alluded to “formulas which so describe as to explain and predict” all parts of the cosmos.

Dodd's style of thought and his approach to science derived in part from his bilingual childhood in Turkey. A fascination with classification, with categorical distinctions, and especially with logical products, arose from his early acquaintance with contrasts between a highly agglutinative and a highly analytic language. This fascination was nurtured further by his pleasure in studying French and Latin in school, and by modest encounters with Greek,

German, Italian, Arabic, and Esperanto. Later, as a psychology student, he readily embraced Karl Pearson's conception of statistics as the "grammar of science" and easily viewed all of mathematics as a language.

His worldview emphasized sets of elements interacting in random combinations. It was doubtless influenced by his efforts as a young man to combine C. E. Spearman's and Godfrey H. Thomson's different approaches to the factor analysis of human intelligence. Dodd's essentially religious approach to science, rooted in his missionary heritage, drew also from the ideas of Henry Nelson Wieman and was reinforced by his exposure to the cosmological writing of Harlow Shapley. The work of Percy W. Bridgman provided a basis for Dodd's devotion to operational definitions. His conviction that physical science offered promising models for social science drew support from admired works by J. Q. Stewart and George K. Zipf. The writing and counsel of George Lundberg was the chief sociological influence upon Dodd's thought, and Lundberg remained until the end of his life Dodd's staunch defender, close friend, and sternly constructive critic.

DOLLARD, JOHN

John Dollard's training in sociology, anthropology, psychoanalysis, and behavior theory has enabled him to integrate psychoanalytic and learning principles with concepts relating to

society and its culture. Displaying an exceptional concern for the wholeness of knowledge, he has derided the "ologies" that describe man from many different and segmented perspectives, thus creating a "sociological" or an "economic" man. In Dollard's view, there is just one man and there should be one science that deals with all of him, flesh, blood, and culture. Thus he has been a pioneer in the interdisciplinary integration in behavioral science.

Born in Wisconsin in 1900, John Dollard was the eldest son of the seven children of James E. and Ellen Brady Dollard, of third generation Irish stock. After graduation from the University of Wisconsin in 1922, Dollard became a fund raiser for the Wisconsin Memorial Union. Work for the union brought Dollard into contact with Max Mason, the physicist and inventor, who became his model.

When Mason was appointed president of the University of Chicago, Dollard joined his staff as an assistant. The University of Chicago was an exciting place, and Dollard enjoyed the sense of being at the forefront of intellectual change. Mason introduced Dollard to William Fielding Ogburn, who gave him his first scientific training and became his thesis sponsor in sociology. The subject of Dollard's dissertation was "The Form and Functions of the Early American Family" (1931). Both at Wisconsin and Chicago, Dollard took mathematics courses that served him well in learning statistics and the use of experimental methods.

After receiving a PH.D from Chicago, Dollard was awarded a Social Science Research Council fellowship to study psychoanalysis in Germany. His analyst was Hans Sachs, one of the "seven rings" of Freud's circle.

When Dollard returned from Berlin, his friend Edward Sapir brought him to Yale University to assist in the direction of a one-year international seminar on the impact of culture on personality. After the seminar, Dollard was hired by Mark A. May, director of the Institute of Human Relations at Yale. This was a teaching as well as a research institution, and thus appropriate for a person with Dollard's broad training. Nevertheless, he paid a price for crossing traditional disciplinary boundaries, being a peripheral member of two other departments before he was belatedly accepted into full membership in the department of psychology.

At the institute, Dollard had a stimulating relationship with the psychoanalyst Earl F. Zinn, and with social scientists such as George

P. Murdock and Allen Gregg, who worked for the Rockefeller Foundation. He also met Neal E. Miller, a young psychologist who had studied psychoanalysis. Miller taught Dollard the principles of reinforcement learning theory based on Clark L. Hull's synthesis of the thinking of Edward L. Thorndike and Ivan P. Pavlov. Combining research and theory on learning with social science observation, Dollard and Miller developed the conditions-principles thesis—that human learning occurs according to certain biopsychological principles under conditions arranged by society. This theory disregards disciplines and centers on how man's habits are established and changed by social conditions.

Dollard's first book, *Criteria for the Life History* (1935), was a call for unity in the life history field. The goal was to show how the biological substratum of an individual, with all its innate urges and potentialities, was transformed into the observed social and cultural being. It established seven criteria for the effective life history and judged a number of documents according to them. None met the test of the seven criteria because they neglected either biological or cultural factors. Margaret Mead described this book as "a landmark in the study of personality and culture" (Mead 1936).

Of all of Dollard's books, *Caste and Class in a Southern Town* (1937) is the most widely read. It was a six-month study of the color-based caste system that barred children of a black-white union from legitimate descent and locked blacks into a lower social and economic class. In his research in "Southerntown," Dollard noted prejudice and hostility along caste lines, overt in whites and latent in blacks. He concluded that the system was designed for the benefit of the white population and that it conferred certain prestige, as well as economic and social gains, on the white caste. When it was first published, this book aroused considerable hostility among many whites, including scholars, and at one time it was banned in Georgia and in South Africa. The changes in the legal and social status of blacks are due in part to the long-term effects of the early insights provided by this courageous, pioneering study.

Dollard's second book relating to the problem of race relations, *Children of Bondage* (1940), was coauthored by the social anthropologist Allison Davis. This work analyzed seven life histories of black youths in New Orleans and Natchez in an effort to discern the psychological and social variables in the lives of black chil-

dren. Although the authors discovered internal class and color lines within the black caste, all types of personality variables seemed to be represented and no evidence appeared of genetic differences between the castes. The research for this book gave Dollard the opportunity to use social class analysis as developed by W. Lloyd Warner.

During the 1930s, Dollard and his colleagues at the Institute of Human Relations began interdisciplinary research into the problems of frustration and aggression (Dollard et al. 1939). Dollard had already formulated the hypothesis that "the usual human response to frustration is aggression against the frustrating object" (1937, p. 267). The institute encouraged further work on this theme because it helped to explain a wide range of psychological, sociological, and cultural observations.

Dollard's special interest, however, was in learning theory and analysis. He and Miller stressed the importance of the principles and social conditions of human learning and investigated the orderly way in which human culture is learned in the more than five thousand different cultures on record (Miller & Dollard 1941). To understand human behavior, one must know both the principles of learning (including the nature and demands of the organism) and the conditions of culture and society. This view is a point of departure for a unified social science. Miller and Dollard supported their thesis with experiments on children and animals, and they discussed the economy of imitation as a way of hitting on the "right response" in an early trial. This work has encouraged others to study social learning and to study aspects of imitation, such as the importance of the prestige of the model.

With the outbreak of World War II, Dollard pursued a project that he and Miller had developed for a book on fear in battle. Dollard conducted a questionnaire study of veterans of the Abraham Lincoln Brigade in the Spanish Civil War to gather information that might be of use in training servicemen in World War II. The salient point of the book (1943) was that everyone is afraid, and that differences in behavior result from more or less successful ways of learning to cope with fear in combat.

Dollard considers his best book to be *Personality and Psychotherapy* (Dollard & Miller 1950). It attempted to synthesize knowledge about the principles of learning derived from experiments in the laboratory with knowledge about the social conditions of learning derived from studies

of culture, and to use this knowledge to explain natural-history observations of human behavior in psychotherapy. The book also analyzed the ways in which different aspects of neuroses can be learned, repression can interfere with reasoning and thought, and psychotherapy can teach the patient to discriminate between real and imaginary dangers, recover the use of higher mental processes, and learn more adaptive social behavior. By demonstrating in concrete detail that psychotherapy is a process of social learning and emotional reeducation, this book helped to lay a scientific foundation for the participation of psychologists in psychotherapy. Although it did not establish any school of psychotherapy, it strongly influenced generations of psychotherapists.

In *Scoring Human Motives* (Dollard & Auld 1959), the authors constructed a system to correlate and code the content of psychotherapeutic interviews with a score for each sentence based on symbols for components in the patient's speech and the therapist's comments in transcripts of recorded interviews. Such emotions as anxiety, hostility, and resistance are scored, as are interpretations by the therapist. Conscious and unconscious events are identified separately; and reliability of scoring is reported. Dollard strongly believes that this type of study is the only way to bring recorded therapy interviews into the domain of science.

In the period from 1960 until his retirement in 1969, Dollard and his research associate, Alice M. White, waged a long and stubborn battle with the problem of coding psychotherapy content. They tested both the reliability and validity of their coding system and published a number of papers related to the measurement of psychotherapy content.

Throughout his career, Dollard's research has creatively integrated contributions from four separate disciplines. If this no longer seems to be a daring and novel enterprise, it is a measure of his long-term influence on the field of behavioral science.

DOUGLAS, PAUL H.

Paul H. Douglas (1892–1976) made lasting contributions to labor economics during his academic career, 1916–1948 and 1966–1969, and he achieved greater distinction in his political career, most notably as a United States Senator, 1948–1966, than any academic economist in American history. Douglas began his career as a labor economist at a time when economics was sharply divided between the deductive methods of neoclassical theory and the inductive methods of the historical and institutional schools. He became a leading figure in the transformation of economics into an empirical science based on econometric testing of micro- and macroeconomic theories.

The transformation of economics occurred between 1920 and 1950, and Douglas' contributions to measurement and econometric estimation in labor economics were unmatched. His research on the theory and measurement of income distribution, the labor demand function, the labor supply function, and on the measurement of wages and unemployment inspired several generations of labor economists and is still cited today.

In addition, Douglas contributed significantly to the scholarship on many institutional aspects of labor markets. This work was enriched by the

knowledge he gained from his activities in social reform causes, campaigns for economic and welfare legislation, and arbitration in collective bargaining.

The academic, public, and personal sides of Douglas were closely interwoven. He merged his economic research with his interests in public policies, and imbued both with his personal feelings. His life was remarkably diversified.

Biographical sketch

Douglas was born in Salem, Massachusetts, on March 26, 1892, but his childhood home was in Maine. He grew up in frontier conditions, and less than a year and a half of his elementary education was spent in a classroom.

In 1913 Douglas graduated from Bowdoin College with honors in economics. About his college studies he wrote: "John Stuart Mill became an inspiration, and has remained so throughout my life" (1972, p. 24). Indeed, their lives had interesting similarities. Both were famous economists who engaged in social reform movements and who, late in their careers, were elected to their nation's highest legislative office. Douglas, like Mill, attempted a difficult task for a superior neoclassical economist: namely, that of advocating and rationalizing a liberal and quasisocialistic role for governmental intervention in the economy.

Douglas took his graduate work at Columbia University. There, John Bates Clark, one of the founders of the marginal productivity theory, provided Douglas with the training in neoclassical economic theory that became the basis for Douglas' later work in production theory. Douglas was, however, repelled by the strain of social Darwinism that was then so much a part of neoclassical economics. He was sympathetic to trade unionism and protective labor legislation. His mentor at Columbia in these interests was Henry R. Seager, whose work in labor legislation in New York paralleled the work by John R. Commons and his followers in Wisconsin. In 1915/1916 Douglas spent a year in graduate studies at Harvard University, where Frank W. Taussig strengthened his training in neoclassical economics. Douglas received his doctorate in 1921. His dissertation was published with the title, *American Apprenticeship and Industrial Education* (1921).

Douglas was an instructor in economics at the University of Illinois, Reed College, and the University of Washington before joining the University of Chicago in 1920, where he re-

mained until 1948. During a three-year leave of absence at Amherst College, 1924–1927, he collaborated with a mathematician, Charles W. Cobb, on work on production functions. After his third term in the U.S. Senate ended in 1966, Douglas taught at the New School for Social Research in New York (1966–1969). He was 77 years old when poor health forced his retirement.

Douglas married Dorothy Wolff in 1915. She was the daughter of a prominent New York banker, and she became an academic sociologist and an activist in social reform movements. After their divorce in 1930, he married Emily Taft, the daughter of the famous sculptor, Lorado Taft. Her active life included careers as an actress, a social activist—particularly in civil rights causes, a congresswoman representing Chicago (1944–1946), and an author of several books on the feminist movement.

Douglas' life as a social reformer began in his student days. At Bowdoin he opposed the fraternity caste system, and while at Columbia he was arrested once for participating in a union organizing campaign among retail clerks. After his conversion to the Quaker religion and his move to Chicago in the 1920s, Douglas was so frequently and deeply involved in reform causes that his scholarly achievements during these same years became all the more impressive. He worked with Jane Addams, the American Friends Service Committee, and, in 1928, with a national citizens committee for the socialist candidate for president of the United States. From the late 1920s to 1940, Douglas participated in the advocacy, and often the subsequent drafting, of legislative proposals for social welfare: a family allowance plan (which he preferred as an antipoverty measure to minimum wage laws), the Illinois State Utilities Act of 1933 (following his work in exposing the corrupt practices of Samuel Insull), the Illinois Old Age Pension Act of 1935, and the Illinois Unemployment Insurance Act of 1937. At the federal level he served on commissions on consumer protection and the social security system.

Douglas won his first political election in 1939 when he became alderman from Chicago's famous maverick fifth ward. Although a Democrat, Douglas fought against the notorious corruption in the Democratic city administration as vigorously as he had opposed corruption in the Republican city administrations during the 1920s. However, on rare occasions, he could work with the Democratic political machine, and in a strategy that was prophetic of his

future political career, he was actually supported by the Democratic machine in his 1939 victory. In 1942, on the other hand, the machine candidate defeated him in the primary for the U.S. Senate.

Although he was fifty years old, Douglas joined the marines as a private and served in combat in the South Pacific in World War II. He received the Bronze Star for heroism and was twice wounded.

In 1946, he returned to the University of Chicago, where he remained until his election to the U.S. Senate in 1948. He was dissatisfied with the department of economics during his last two years, partly because the laissez-faire orientation of the department clashed with his political liberalism. Douglas was considered the underdog in the Senate general election in 1948, but that was the year of the political upset. He won second and third terms easily in 1954 and 1960, but in 1966 he was defeated in his last political campaign by Charles H. Percy.

As a senator, Douglas was often characterized as a champion of lost causes, who was frequently at odds with Senate leaders in his own party. In an article in *The New York Times*, Charles Kaiser referred to the paradox of his combination of the "moral rectitude of New England . . . with crusading liberalism," and the article quotes Newton Minnow, who said: "Douglas was a liberal who was also simultaneously concerned about what things cost—that was a rare combination" (Kaiser 1976). But it should not be rare for a first-rate economist, even a liberal, to apply the cost-benefit calculus to government policies. In fact, Douglas as a senator was an enemy of waste in government and of pork-barrel legislation generally (see Douglas 1952*a*; 1952*b*). His professional skills as an economist were also evident in his battles, mostly futile, for tax reform, but also when he was on the winning side of free trade, conservation, and truth-in-lending legislation. On the other hand, most economists would question his legislative efforts on behalf of two per cent interest rates for the Rural Electrification Agency, large federal subsidies to housing, restrictions on branch banking, and price regulation of natural gas.

Douglas as an economist

Two principal themes stand out in Douglas' economic research. One was his desire to use economics for understanding and dealing with social problems. The second was his goal of

bridging the large chasm between textbook theory and real world data. In his generation he ranks with Wesley C. Mitchell and Henry Schultz in this important accomplishment.

Production theory and the demand for labor. Douglas is most renowned in the literature of economics for his work on production theory. His outstanding contribution was not so much the "discovery" of the famous Cobb–Douglas production function, but his pioneering estimation and application of it to major issues. Douglas reconciled two important real world phenomena: the *estimated* shares of labor and capital in national *production* and the *observed* shares of labor and capital in national *income*. His methodological technique is still widely used, and even his numerical estimates of these shares, 30 to 35 per cent for capital and 65 to 70 per cent for labor, have held up over time in innumerable applications (see Douglas 1948; Tobin 1973, p. 439).

It is difficult to determine what standards are appropriate for examining the robustness (or stability) of Douglas' parameter estimates, however. The estimation consisted simply of a linear function (in logarithms) in which indexes of output were regressed on indexes of labor and capital inputs. The functions for separate industries within countries often had widely varying parameter estimates, and these did not always correspond closely to earnings shares. With national aggregates as the units of observation and with variables measured in physical quantities, the aggregation and measurement problems are overwhelming. Crude data are often fit as well by linear functions as by more complicated functions. When the variables are in monetary units, the variation in prices on both sides of the equation introduces simultaneity in the relation, and estimation by least squares is probably inappropriate. The regression function loses the simple interpretation of one-way causality it had when the variables were physical quantities.

Douglas' first paper on the Cobb–Douglas production function was presented at the American Economic Association meetings in 1927. In his presidential address to the AEA in 1947, he surveyed the work done in the field during the preceding twenty years (Douglas 1948). Approximately 25 years later, when Douglas was an emeritus professor at the New School, he returned to empirical research on production functions. His work on production functions therefore spanned 45 years.

The main body of Douglas' early work is in his classic book, *The Theory of Wages* (1934). James Tobin (1973) described it as a "major vindication of the marginal productivity theory," which carried the following ironical implication. The correspondence between the production and income shares of labor seemed to imply that not much could be done by minimum wage laws, unions, or other interventions in production to change the distribution of earnings. Yet, Douglas became an ardent champion of minimum wage laws, unions, and various governmental interventionist strategies. The tensions between a neoclassical analysis of the workings of the economy—Douglas the economist—and an advocacy of an interventionist strategy—Douglas the reformer and politician—were never thoroughly discussed or analyzed in Douglas' writings. Albert Rees (1979) suggests that Douglas saw business monopoly and monopsony, along with prevailing unemployment, as impediments to a reliance on laissez-faire policies.

Two additional ironies concerning Douglas and the Cobb–Douglas production function are worth noting. One stems from the development of the function in the hands of mathematical economists and econometricians, who discovered all sorts of convenient and illuminating mathematical properties in it and extended it to applications in utility theory. However, there is not the slightest indication that Douglas understood or even cared about the substance of any of this work. Until the late 1960s Douglas was unaware of the popularity of the Cobb–Douglas production function in economics literature, and then he expressed surprise and gratification, and remarked: "A seedling that I had planted long ago, but left untended, had been cared for by younger men and in the fullness of time became a sturdy tree" (Douglas 1972, pp. 614–615). The other irony is that although the function carries Douglas' name, it was probably discovered or invented much earlier by Knut Wicksell of Sweden and by Phillip H. Wicksteed of England.

Labor supply. Douglas' work on production functions was his contribution to the theory of the demand for labor. His work on the supply of labor was also influential and laid the foundation for the important modern work by Clarence D. Long, H. Gregg Lewis, and Jacob Mincer. Douglas' supply research first appeared in *The Theory of Wages*. In the best-known part of this research on labor supply, Douglas and his co-workers regressed labor force participation

rates for a large number of age-sex groups on real wages for a number of large cities, using data from the 1920 and 1930 censuses.

There are several notable points about this work: (1) Relatively stable negatively sloped supply curves of labor were estimated. The cross-section relationships were reconciled, therefore, with the observed time series negative relationship between the labor supply and real wages. (2) For men, the elasticities of labor supply with respect to real wages were low— -0.1 to -0.2 —numerical estimates that have held up for the last 40 years. (3) For women, two lasting insights that emerged were the importance of the industrial structure in the labor market and the effect that the dual role of women in both home and market production had in increasing the elasticity of the female labor supply function. However, the most serious flaw in Douglas' labor supply research concerned women. The primary fact about the female labor supply function emerging from modern research is its large positive wage elasticity, whereas Douglas found a large negative elasticity. Douglas' mistake was his failure to separate income effects (as measured by male earnings) from wage effects (as measured by female wage rates) in the function. The positive wage effect has been found to be dominant, and, in fact, this effect is a major explanation for the increase in market work by women over time (see Mincer 1962). Douglas' female labor supply function was both theoretically misspecified and inherently an unstable empirical relation. (4) Perhaps the most methodologically profound aspect of Douglas' work was his grasp of the distinction between the abstract labor supply model of price theory and the various labor supply models that apply to varying circumstances in the real world (Douglas & Schoenberg 1937, pp. 78–79).

The measurement of wages and unemployment. The empirical testing by Douglas of economic theories of the labor market had to await the construction of an appropriate data base, and the chief architect of this was Douglas himself. Wage series were not compiled by the Bureau of Labor Statistics in the first part of the century, and cost-of-living indexes were nearly nonexistent. Douglas examined real wage trends and real wage differentials from 1890 to 1926, a period of rapid economic growth, huge waves of immigration, and sporadic spurts of union growth. His book, *Real Wages in the United States: 1890–1926* (1930), was a major work

in its own right, and it established the foundation for *The Theory of Wages*, published four years later.

Douglas' contributions to the study of unemployment are several. In his scholarly works in support of unemployment insurance programs, the role of unemployment benefits as an automatic stabilizer over the business cycle is developed. While a senator and member of the Joint Economic Committee he developed an unemployment measure that was an alternative to the conventional unemployment rate; specifically, a measure that included part-time workers who want full-time jobs. The measure has appeared regularly in the "economic indicator" series of the Joint Economic Committee, and it is a forerunner of the current emphasis on multiple measures of unemployment (see Shiskin 1976). Douglas wrote several books on unemployment and depressions, but his macroeconomic theories are not well developed. Despite his interventionist position regarding the role of government and his advocacy of public employment programs to combat unemployment, Douglas was more a monetarist than a Keynesian. He was one of the first senators to invite testimony from Milton Friedman, and there is an ironical note to Douglas' indirect role in the resurgence of the monetarist position in the federal government.

Paul H. Douglas had many careers—economist, reformer, soldier, and politician. Each was marked by superlative achievements. Tobin's tribute (1973 p. 438) is fitting: "Any one [career] alone would fill with distinction the lifetime of a man of unusually prodigious talent and energy. Men of Paul Douglas' range, intensity, and dedication are not just unusual; they stride across the national scene only once or twice a generation."

DUBOS, RENÉ

René Dubos, biological scientist and social philosopher, was born in France in 1901. He emigrated to the United States in 1924 and became a citizen in 1938. He has been associated with the Rockefeller University for more than fifty years, and since 1971 has been emeritus professor of environmental biomedicine.

Raised in small farming villages of the Ile de France, Dubos moved with his family in 1913 to Paris. In 1919 he won a scholarship to the Collège Chaptal where he became interested in human geography and social history. Despite a professor's encouragement to pursue a career in social history, Dubos decided upon agronomy as a more secure livelihood. He received a degree in agronomical sciences at the Institut National Agronomique in 1921, and soon obtained a post as a research reviewer for the International Institute of Agriculture in Rome.

Two years later on board a ship bound for the United States, he chanced to meet for the second time Selman A. Waksman, an agricultural bacteriologist at Rutgers University. As a result of the re-encounter Dubos enrolled at Rutgers, and earned a doctorate in agricultural chemistry and bacteriology in 1927. Almost immediately thereafter he began his long affiliation with the Rockefeller Institute for Medical Research, later the Rockefeller University. For 14

years he worked in the laboratory of Oswald T. Avery, best known for his chemical identification of DNA (deoxyribonucleic acid). In *The Professor, the Institute, and DNA* (1976), Dubos writes not only of Avery but of the intellectual and scientific stimulation of the institute as environment—its genius loci. His own professional development was influenced by Avery, Alexis Carrel, Alfred E. Cohn, Thomas M. Rivers, and others through the ease of collaboration with a variety of biomedical disciplines. Early in his affiliation, Dubos won international acclaim for his discoveries related to the successful use of soil microbes in the treatment of disease.

After a two-year leave as George Fabyan professor of comparative pathology and professor of tropical medicine at the Harvard University School of Medicine, Dubos returned to the institute in 1944 to direct his own laboratory. He has written more than 200 scientific papers, numerous articles for specialists and lay persons, and 21 books. He holds 39 honorary degrees, including 3 honorary medical degrees. In addition to many scientific honors, Dubos won the Pulitzer Prize in 1969 for *So Human an Animal* (1968*b*). Since his retirement, Dubos has continued an active career as writer, lecturer, and educator. As author, he is best known for his books on the relations between the environment and health/disease, science in society, and an evolutionary, adaptive perspective on the social problems and opportunities of contemporary life. Dubos' contributions to social thought are characterized by three major intellectual themes: an interest in the relations between things rather than in things as independent entities, an emphasis on human choice and free will, and a concern for the humanizing of science.

Relations between human beings and environments. Dubos' earliest work in soil microbiology was already ecological. His doctoral work was shaped by his interest not in the microbe alone, but in the soil as milieu for the microbe and in how its nutriment and acidity affect the nature of its microbial population. Later, his medical research was rooted in the relations among microbe, individual host, and the population in which the host is embedded. A personal tragedy led to further development of Dubos' systemic ideas. After his first wife died of tuberculosis in 1942, Dubos' interests turned to studying the relations between social conditions and susceptibility to tuberculosis. His subsequent work

reflects Dubos' growing environmentalism as first he explored the relations between environment and infectious disease, then between environment and disease in general, and finally, the environmental influences at work in all aspects of human life.

For Dubos, the environment comprises the natural, the built, and the social worlds. It is anything that evokes an active response in the human being (passive reactions to environmental conditions occur, of course, at the physico-chemical level). People's active, and often creative, responses to the environment change it to conform to human needs and goals, sometimes enhancing and sometimes degrading the environment in the process. In either event, humans must then adapt to the very changes they have created, as well as to the constant changes occurring in the environment as the result of nonhuman forces. The extreme adaptability of humans poses a danger in that some environmental changes induced by human activity have negative consequences for the quality of human life and for human biological and psychological functioning, based as it is on a high degree of genetic stability since the Stone Age.

Because human beings have remarkable biological plasticity and a low degree of biological specialization, Dubos gives more weight to the role of the environment in the nature-nurture interplay. For him, it is not so much that environment determines behavior as it is that past responses condition subsequent responses to the environment. More importantly, the environment offers options to humankind: men and women are shaped by the selections they make among many possible physical and social environments. In general, Dubos' position is that over evolutionary time, certain features have been built into the human genome. These programs of potentialities, however, must be activated by appropriate environmental stimuli at the appropriate time if they are to become functional attributes. Hence, Dubos' major humanistic thesis calls for the creation and sustainment of environmental diversity so that the multiple potentialities in human children and adults may be released.

Free will. Dubos' convictions concerning human choice and purpose distinguishes his position from the environmental emphasis of B. F. Skinner and the genetic emphasis of the sociobiologist Edward O. Wilson. He abjures behaviorism on the basis that willful actions influence

environmental conditioning, and sociobiology on the grounds that social factors are more important than genetic factors in history and in individual lives. Human beings are not merely reactive to environmental conditions or merely impelled by genetically programmed behaviors. Human development and functioning is the outcome of the dynamic interplay between both, *plus* the exercise of free will and deliberate choice based on values, knowledge, and experience.

Dubos views the acceptance of two seemingly incompatible notions—determinism (genetic-environmental interplay) and free will—within Niels Bohr's conception of complementarity. Both determinism and free will are needed to understand the richness and complexity of human life. While obeying the laws of genetic-environmental determinism, humans at the same time transcend them. By virtue of the great complexity of the information programs in their DNA, humans are the most teleonomic of all organisms. Within the constraints of a given culture, they make choices and take action guided by awareness of past experience, aspirations for the future, and value judgments. Thus human beings have influenced the course of their evolution as well as their individual development. Human freedom arises in good measure from social evolution (culture) which, though different in kind, is itself the result of organic evolution. Like Paul Tillich, Dubos sees humans as most human at the moment of choice.

Although Dubos, like other biologists, does not address the traditional philosophical issues in free will, he does recognize the presence of the unconscious and irrationality in human affairs. And, more explicitly, he is deeply concerned about the constraints on human freedom imposed by the social forces of poverty, racism, malnutrition, poor housing, and all forms of social injustice that stifle the expression of individual potentiality. Yet, for Dubos, the very existence of free will "makes it possible to envisage a future world in which human society, despite the genetic stability of the species, can be improved by changing environmental forces and ways of life" (1974a, p. 32). Thus the Promethean capacity for deliberate choice carries responsibility for creative stewardship of the earth, including the design of social environments that will foster the realization of human and environmental potential. Admittedly, this is an anthropocentric position, but ecological

values are necessarily anthropocentric: what is "really" good for human beings is good for the rest of nature.

Science in society. Dubos' concerns about science arise inevitably from his holistic perspective on human-environment relations and his emphasis on free will. In his judgment, the biological sciences have continued for too long their analytic focus on elementary structures and processes, and have failed to study human life in its wholeness. Without discounting the remarkable achievements of biology, Dubos believes that to continue solely to study the human being as a fragmented and isolated object will limit science's contributions to human welfare. He advocates, instead, studies of the nonlinear, closed-loop feedback systems that maintain and those that undermine the goodness-of-fit between human beings and environments. Such studies are likely to uncover the multiple and so far unexpressed potentialities of both, and will therefore complement the more mechanistic studies that are limited to the predictive aspects of the human organism. They can lead toward the anticipation and then prevention of short- and long-term consequences of technological innovations and to an understanding of free will. Science will then have extended the rational basis for the exercise of human purpose, choice, and action.

The social philosophy of Dubos is best summed up in the title of his regular column in *The American Scholar*, "The Despairing Optimist." Once pessimistic about humanity's ability to stave off ecological disaster, Dubos has taken comfort from the growing public concern, a spreading commitment to social values among scientists, world-wide efforts to develop alternative sources of energy, new social designs and life styles, and plans to conserve the wilderness and improve rural and urban land use. His own manifold contributions to each of these developments have helped point to new directions in the life sciences and the social sciences, and have helped shape new objectives and methods in such diverse professions as architecture, engineering, medicine, social work, and urban planning.

DUMÉZIL, GEORGES

In the early decades of the present century, as a result of the eclipse of Max Müller's "solar mythology" (see Dorson 1955), the science of comparative mythology—especially comparative Indo-European mythology—reached a low ebb. Narrowly focused research into the specific Indo-European traditions—Greek, Italic, Celtic, Indic, and the like—became the order of the day. Yet the basic questions to which Müller and his adherents had addressed themselves remained unresolved, and in 1920 a young Indo-Europeanist, Georges Dumézil, set out to find a new and viable framework in terms of which these problems might once again be approached;

problems posed by the obvious thematic, if not etymological, parallels among a great many ancient Indo-European gods and heroes.

Born in Paris in 1898, Dumézil had attended the Lycée Louis-le-Grand and later the prestigious École Normale Supérieure. After serving as an artillery officer from 1917 to 1918, he returned to his studies at the University of Paris where, in 1924, under the direction of the eminent Indo-Europeanist Antoine Meillet, he completed his doctoral thesis. Entitled *Le festin d'immortalité: Étude de mythologie comparée indo-européenne* (1924), it marked the beginning of one of the most distinguished scholarly careers the twentieth century has yet witnessed.

Dumézil's initial attempts (e.g., 1924; 1929) to develop a "new comparative mythology," grounded as they were in James G. Frazer's (e.g., 1890) now largely discredited theory that religion everywhere reflects an attempt to renew the world by periodically killing and replacing kings and other persons symbolic of divine beings, ultimately proved unsuccessful (see Littleton [1966] 1973, p. 56). By 1938, however, he had made a major discovery and had begun to draw upon a wholly different theoretical base. The discovery was that several ancient Indo-European speaking communities were characterized, at least in their earliest periods, by a tripartite social class system that broadly resembled the three Aryan or "twice-born" castes of classical and later Indian society (Dumézil 1930). The new theoretical base was the sociology of Émile Durkheim and his followers, to which Dumézil was introduced by Marcel Granet. Although it is unfair to characterize Dumézil as a full-fledged Durkheimian (his fundamental training was in philology and the history of religions), he nevertheless came to adopt one of Durkheim's most important axioms: that important social and cultural realities are "collectively represented" by supernatural beings and concepts (see Durkheim 1912).

In a remarkable series of books and essays written during the course of the next decade (1938–1948), Dumézil successfully combined the newly discovered evidence for social tripartition, Durkheimian sociology, and the traditional techniques of comparative philology, and arrived at a comprehensive model of the common Indo-European ideology—that is, the cognitive structure in terms of which the ancient Indo-European speakers ordered their social and supernatural universes. As presently understood, the salient features of this ideology are

threefold: (1) the maintenance of juridical and sacerdotal sovereignty; (2) the exercise of physical prowess; and (3) the promotion of physical well-being, fertility, wealth, etc. Each of these three principles forms the basis of what Dumézil calls a *fonction*, or "function"—a complex whole that includes both the ideological principle itself and its numerous social and supernatural manifestations.

The clearest example, perhaps, can be seen in Vedic India, where the "first function" (sovereignty) was manifested in the Brahman caste and its two primary collective representations, Mitra (the juridical aspect) and Varuna (the sacerdotal aspect). The "second function" (physical prowess) was manifested in the Kshatriya caste (the military/ruling elite) and its primary representation, the great war god Indra. The "third function" was reflected at the social level by the Vaishyas (the herder-cultivator caste) and at the divine level by the twin Ashvins, or "Divine Horsemen," as well as by the goddess Sarasvatī, all of whom were principally concerned with physical well-being, fertility, etc.

At least some evidence for the presence of similar social and supernatural triads can be found in almost every other ancient Indo-European speaking tradition from Italy to Iceland. Moreover, it eventually became clear that the three functions are reflected in an extremely wide variety of cultural phenomena, including triads of epic heroes (see Wikander 1947; Littleton 1970), threefold categories of diseases (see Puhvel 1970), and even tripartite conceptions of physical space (see Molé 1952; Dumézil 1968–1973, vol. 1).

At first glance, Dumézil's approach might appear similar to that espoused by his fellow countryman Claude Lévi-Strauss (see, for example, Lévi-Strauss 1964). However, there are some important—indeed fundamental—differences between them. Unlike Lévi-Strauss, Dumézil does not suggest that the tripartite cognitive structure he has discovered is a universal feature of the human psyche. On the contrary, the ideology in question is, in the Old World at least, uniquely Indo-European, and is therefore necessarily bounded in time and space. Thus, the two French scholars are working at wholly different levels of abstraction (see Littleton 1974).

However, if the specific structural phenomena that Dumézil has brought to light are by definition limited to the Indo-European domain, the method he has developed does have some

general implications for social research. It may be that most if not all of the world's major language families, such as the Uto-Aztecan, the Malayo-Polynesian, the Bantu, the Hamito-Semitic, etc., are, or were at some point in their histories, characterized by analogous genetically related ideologies, each with its own unique set of "functions" (see Littleton [1966] 1973, pp. 232–233).

To be sure, Dumézil's theories and methods have not met with universal approval, and there are those who suggest that on occasion he has imposed the tripartite model on data that are perhaps amenable to other interpretations (see Littleton [1966] 1973, pp. 186–202). But despite these criticisms, Dumézil, who, until his retirement in 1968, was professeur de civilisation indo-européenne at the Collège de France (the position was created for him in 1948), has been eminently successful in his lifelong effort to develop a "new comparative mythology," and the implications of what he has achieved are profound indeed for the social sciences as a whole.

In November 1978, in the autumn of his eightieth year, Dumézil was elected to the Académie française.

E

EGGAN, FRED

Frederick Russell Eggan has been a centripetal force in mid-twentieth century anthropology. His scholarly work fuses the structural-functional approach developed in British social anthropology with the concern for cultural historical processes characteristic of mainstream American anthropology. His synthesis avoids both the narrowness and ahistoricity inherent in the British position and the fragmentary and diffuse problem focus of much American work. He has played a strategic role as a teacher, administrator, and spokesman, consistently advocating an integrated, holistic approach to anthropological understanding.

Born in Seattle in 1906, Eggan grew up in the Chicago area, attended public schools, where he displayed an aptitude for science and mathematics, and enrolled in the College of the University of Chicago. He majored in psychology, but exposure to courses in geography rekindled his childhood interests in distant places and peoples. He took his first anthropology course with Fay-Cooper Cole. Cole, a Boas-trained ethnologist who later devoted himself to Midwestern archeology, was in the process of building a major anthropology department at Chicago. As an undergraduate and beginning graduate student, Eggan also took courses with the brilliant Edward Sapir. Although his aptitude for linguistic transcription was limited, Eggan retained from Sapir's teachings certain conceptual models of long-range cultural process and an appreciation of the psychological dimensions of culture.

Eggan completed his undergraduate work in 1927 and continued as a graduate student in psychology but took many of his credits in anthropology. Under the supervision of L. L. Thurstone, the eminent psychometrician, he produced a master's thesis, "An Experimental Study of Attitudes Toward Race and Nationality" (1928), that combined his psychological and anthropological interests. However, survey data, numbers, and calculators proved less exciting than archeology and ethnology, so Eggan decided to pursue a career in anthropology. Lacking funds, he taught psychology, sociology, and history for two years at Wentworth Junior College and Military Academy in Missouri. During the summers he worked on Cole's archeological field projects.

Eggan returned to Chicago in 1930 as a full-time graduate student in anthropology. Courses with Leslie Spier aroused his interest in kinship studies and southwestern ethnology. He planned to write a dissertation on the relationships between ethnological and archeological cultures. The topic was premature, but Eggan later did produce a perceptive paper (1952) on this subject when more reliable archeological data became available. In 1931 Cole hired A. R. Radcliffe-Brown to replace Sapir, who had departed for Yale University. Eggan attended Radcliffe-Brown's course on family, kin, and clan, and was impressed by the Englishman's erudition and fresh theoretical orientation. Radcliffe-Brown was highly critical of most work done by American anthropologists and advocated the synchronic study of social structures as systems of action and meaning. Social structures, he

maintained, could be studied as functioning wholes, and nomothetic principles of organization could be deduced. Radcliffe-Brown came to America with a program for reanalyzing the social structures of North American Indians along the lines that he had recently developed in his Australian work (1931). Eggan became Radcliffe-Brown's research assistant and pored through the literature on North American kinship to produce extensive summaries of what was known and what remained to be done. In the summer of 1932 Eggan participated in a summer field school directed by Leslie A. White and began his lifelong association with the Hopi. Material from that field trip provided the basis of his 1933 doctoral dissertation, a structural-functional analysis of Pueblo social organization.

Eggan remained affiliated with the University of Chicago as a postdoctoral research associate. He returned to the southwest to collect additional material and also did brief field work with the Mississippi Choctaw and with the Cheyenne and Arapaho in Oklahoma. These latter experiences led to the publication of "Historical Changes in the Choctaw Kinship System" (1937*b*), which utilized ethnohistorical data to demonstrate the systematic influence of acculturation in modifying kinship behavior and terminology. Hypotheses about similar systematic changes among other southwestern tribes were substantially confirmed in later work by Eggan's student Alexander Spoehr (1947). Results of the Cheyenne and Arapaho research appeared in a sweeping essay prepared for the *Social Anthropology of North American Tribes* (1955), a *Festschrift* for Radcliffe-Brown that Eggan edited. Here the kinship systems were related to other features of social organization, and comparative analysis suggested broader interpretations about the development of the Plains' social systems. This essay clearly anticipated the relevance of what Eggan was later to label "the method of controlled comparison."

In 1934-1935 Eggan was sent by Cole and Robert Redfield to investigate problems of culture change in the northern Philippines. The Tinguian area was chosen, since Cole had done extensive ethnographic work there twenty years earlier; Redfield wanted to see if some of the general processes of change that he had recently discerned in Yucatan could be replicated in another area of Spanish contact. Aided by Cole's practical ethnographic knowledge of the area, Eggan made a rapid adjustment to field work

and collected voluminous material on social organization, ceremonialism, and dreams. However, he had difficulty applying Redfield's model of the folk-urban continuum to the northern Philippine situation. Although European contact had made significant inroads into the area, Eggan emphasized the effect of internal structural dynamics in prefiguring the degree and direction of social change (1941; 1963). He argued that only after the functional integration of the native cultures and social structures had been analyzed, compared, and placed in historical perspective could European influences be properly assessed. Eggan's rich Philippine data have only partially been published.

On his return from the Philippines, Eggan received an academic appointment at Chicago. Much of his energy during this period was devoted to teaching. Earlier interests in historical problems resurfaced, since, as he notes, "with both Radcliffe-Brown and W. Lloyd Warner [and one might add Redfield] on the departmental staff, most of my teaching in the 1930s centered on ethnology and culture history, and I gave ethnographic courses on all the major regions of the world, except for Europe" ([1934-1972] 1975, p. ix). When not in residence, he continued his southwestern field research.

Eggan held a variety of research and administrative posts during World War II. He was a consultant to the Board of Economic Warfare in 1942, after which he became chief of research for the Philippine government-in-exile. Next he was assigned to the School for Military Government. In 1943 he was sent back to Chicago to establish the Civil Affairs Training School for the Far East. Near the end of the war he served briefly as a cultural relations officer for the State Department. These wartime experiences broadened his administrative skills and his range of national and international contacts.

Eggan's academic career flourished in the postwar period. He was promoted to full professor in 1948 and served as departmental chairman from 1948 to 1952 and again from 1961 to 1963. He continued to publish the results of his southwestern and Philippine research. In 1950 a much-revised and expanded version of his doctoral dissertation appeared as *Social Organization of the Western Pueblos*. In this, his most important work, he elegantly summarized the social organization of the Hopi and compared it with four other western Pueblo groups. From this structural-functional analysis he showed a basic uniformity among the western

Pueblos in which matrilineal clans, matrilineal households, and Crow-type kinship systems predominated. This pattern contrasted with that of the eastern Pueblos, whose social organizations featured dual divisions, bilateral kinship systems, and an emphasis on relative age. Forming a bridge between these two types, both structurally and geographically, were the Keresan Pueblos. Thus Eggan demonstrated that underlying the apparent homogeneity of Pueblo culture were distinct types of social structure. He offered historical hypotheses about the way these variations could have evolved from a common type. His reconstruction has been challenged by Robin Fox (1967), who did field work with Keresan groups, but the issues remain unresolved. Eggan's description and analysis of western Pueblo social systems remain a landmark in Americanist studies. In his postretirement years Eggan has sought the ancestral forms of Hopi social organization among linguistically related groups in the Great Basin.

Eggan's 1953 presidential address to the American Anthropological Association, "Social Anthropology and the Method of Controlled Comparison" (1954), articulated the particular synthesis that he effected between British social anthropology and the American historical tradition. In it he called for comparative synchronic studies of geographically proximal, historically related, or typologically similar societies. Such focused comparisons could then be utilized for cultural reconstruction and the discovery of regularities in diachronic process. In the expanded edition of *Social Anthropology of North American Tribes* ([1937c] 1955), Eggan contributed a state-of-the-art essay in which the methods and results of controlled comparison of American Indian societies were masterfully demonstrated.

By the 1960s Eggan had become a senior statesman in anthropology. He continued to publish important articles on the southwest and Philippines, but he was increasingly called upon to write forewords to the work of others, to contribute articles to *Festschriften* of distinguished colleagues, and to serve as a convener, contributor, and commentator on important symposia. Eggan's interests also turned more toward the history of anthropology. He established intellectual kinship with that pioneering student of social organization and the American Indian, Lewis Henry Morgan. A series of articles culminated in his published University of Rochester lectures, *The American Indian: Perspectives for*

the Study of Social Change (1966). This book not only surveyed Morgan's contributions but evaluated his legacy through a selective review of subsequent work on North American social organization.

Eggan epitomized the excellence of anthropology at the University of Chicago during the middle decades of the twentieth century. High standards set by his teaching for two generations of graduate students; quiet diplomacy and administrative talents that help provide an environment for creative anthropological research; service on many scholarly committees; and active membership in honorary societies brought national and international distinction to himself and to Chicago.

Eggan's greatest impact, however, derives from his writings. His clarity of vision, ability to reduce complex phenomena to their essentials with minimal distortion, and capacity to demonstrate productive connections between hitherto disparate approaches and theories have earned him an enduring reputation in the social sciences.

ELIADE, MIRCEA

Mircea Eliade, historian of religions, orientalist, and man of letters, is noted for his interpretation of archaic and primitive modes of religious experience and expression. His scholarly work manifests an unusual combination of philological–historical research with an intuitive–imaginative approach, perhaps reflecting his double career as scholar and *littérateur*. In the post-World War II era, he attained a predominant position among historians of religion and won a wide audience for his works.

Life and works. Eliade was born in Bucharest, Romania, March 9, 1907. He began his literary career at 14 with a piece on the silkworm in a popular science review, and followed with articles on entomology, alchemy, history of religions, travel, and literature in various Romanian journals. During his student days at the University of Bucharest he founded a short-lived literary journal and regularly contributed profiles, book reviews, and travel pieces to a local newspaper. At the same time, he pursued his

academic career in philosophy and oriental studies, earning his licentiate in philosophy (1928) with a thesis on the Italian Renaissance thinkers, Marsilio Ficino and Giordano Bruno. Inspired by reading the first volume of Surendranath Dasgupta's *History of Indian Philosophy* (1922–1955), he journeyed to India to study under the eminent Indian scholar, aided by a scholarship from the Maharajah of Kassimbar. Arduous textual and linguistic studies at the University of Calcutta and the Asiatic Society of Bengal were interspersed with travels throughout India and a six-month period of intensive Yoga practice and meditation at a Himalayan *ashram* (retreat). Eliade had decided to devote his doctoral dissertation to a comparative history of Yoga, a decision that was to mark the beginning of his illustrious career as a historian of religions. The Indian experience was to have a lasting effect on his work and thought, but, as he noted later, for a complete view of man he would also require what he had learned from the Italian Renaissance, plus an understanding of “primitive” man and popular European folklore. Conversely, he found that what he had learned in India provided insight into peasant cultures generally and into Romanian folk culture in particular.

Back in Bucharest in late 1931, his double career as scholar and writer flourished. After translating his dissertation on Yoga from the original English into Romanian, he received his Ph.D. in 1933, and became an assistant to his master Naë Ionescu, the eminent Romanian philosopher, at the University of Bucharest, where he taught philosophy and history of religions until 1940. His novel *Maitreyi*, an intense erotic–spiritual tale, set in Calcutta and based on his own experience, won first prize in a contest for unpublished novels (1933) and gained him instant literary fame in Romania. He also published other novels, a book on his travels in India, and numerous scholarly articles and books on folklore, alchemy, and the history of religions. His work on Yoga was translated into French (1936) and many of his articles were written in French, English, and Italian, gaining him a wider, non-Romanian scholarly audience. He founded and edited (1938–1942) *Zalmoxis*, a distinguished international journal of religious studies. (Eliade was also later cofounder and coeditor of the journals *Antaios* [1960–1972], and *History of Religions* [1961–].) During World War II, he served as cultural attaché at the Romanian legations in London (1940–1941)

and Lisbon (1941–1945). After the war, when the new Communist régime was established in Romania, he emigrated to Paris rather than return to his own country.

The Paris years (1945–1956) were a period of both great difficulties and great triumphs for Eliade. His personal journal reveals the depression, frustration, and sometimes despair of the exile compelled to write and lecture in a foreign tongue, unable to fulfill his vocation as a Romanian writer, and seeking a place in a strange new environment. However, Eliade's work on Yoga and his scholarly articles were well known and respected by eminent French orientalist and historians of religions. Under the sponsorship of Georges Dumézil, he lectured at the prestigious *École des Hautes Études* on subjects that were the themes of two key works that would later establish his scholarly reputation: the *Traité d'histoire des religions* (1949b) and *Le mythe de l'éternel retour* (1949a). In the early 1950s, he published a series of works that further solidified his position as a leading historian of religions: *Le chamanisme* (1951), *Images et symboles* (1952), an improved, expanded version of *Yoga* (1954), and *Forgerons et alchimistes* (1956a). In a creative rebirth of his fictional powers he also brought forth *Forêt interdite* (1955), regarded as his literary masterpiece.

In 1956, Eliade came to the United States as visiting professor of the history of religions at the University of Chicago, where he delivered the Haskell lectures, later published as *Birth and Rebirth* (1958). In 1957, he became professor and chairman of the history of religions and professor of the committee on social thought at Chicago, where in 1964 he became the Sewell L. Avery distinguished service professor. During the late 1950s and subsequently, his scholarly work, most of which appeared in English translation, became the subject of intense interest in the United States, not only among university scholars, but among circles far removed from academic disciplines. The vigorous critiques of his approach that began to appear in the 1960s apparently did not diminish his self-confidence and certainly not his productivity. In 1976 he published the first volume of *Histoire des croyances et des idées religieuses*, a historical work covering all the major developments in man's religions from the Stone Age to modern times, purposely written after decades of work on the basic cross-cultural, transhistorical patterns of religious

experience and expression, thus perhaps refuting the accusation that he was "an anti-historian of religions" (Dudley 1976; 1977).

Basic concepts and approaches. Eliade saw the task of the historian of religions as the understanding of *homo religiosus*, man as a religious being, intended toward a transcendent, infinite, absolute realm. Although this intentionality is a universal human structure, it is most evident in archaic and primitive cultures and has tended to be repressed in modern, urbanized societies. Hence the attention devoted by the historian of religions to archaic and primitive phenomena is not aimed merely at providing interesting exotica, but rather at arriving at an understanding of how premodern man has seen his situation in the cosmos and the means of coping with it—at basic matters of being, meaning, and truth. In doing this the historian of religions accomplishes not only a cognitive mission, but also a transformative one: the recuperation of lost or forgotten areas of the essentially human for the modern inquirer and his audience. Thus at the end of his quest self-understanding, as well as other-understanding, and the makings of a complete philosophical anthropology are promised.

While not claiming that the mind and life of archaic and primitive man are confined to the spiritual aspect, Eliade concentrated on the latter as the one that most needed exploration and illumination, an aspect that had been relatively neglected, misunderstood, and traduced (there is also no doubt that he considered it the essentially human aspect). He insisted emphatically that it was not to be understood in sociological, psychological, economic, or any other nonreligious terms, but nonreductively, as something absolutely *sui generis*. Religion, or the religious man, was to be understood on its own terms—i.e., in terms of the sacred and its manifestations.

Here Eliade had recourse to a concept that had been highlighted by two generations of anthropologists and historians of religions: Robert R. Marett, Émile Durkheim, Arnold van Gennep, Nathan Söderblom, Rudolf Otto, Gerardus van der Leeuw, and Roger Caillois. Like the latter he simply defined the sacred as the opposite of the profane: The sacred is utterly other than the ordinary, the usual, the mundane. Archaic and primitive man has experienced the world in these two contrasting aspects in what Eliade called "the dialectic of the sacred and profane." Anything may be selected as bearer of the

sacred—a place, a man, a stone, a tree, nutrition, excretion, coition—and the bearer both remains itself, a “natural” object, person, or process, and at the same time becomes (is revealed as) something absolutely other, acquiring a transcendent character. The locus of the sacred may change, desacralization, as well as sacralization, occurring in this paradoxical dialectic. Eliade coined the term “hierophany” to indicate the character of the particular objects or actions as manifestations of the sacred. And it is to the systematic elucidation of the hierophanies that he devoted his work.

In this quest for the “morphology of the sacred,” Eliade sought the general structures, the typical patterns, underlying the specific phenomena. For instance, an examination of the multitudinous varieties of plant hierophanies among the ages and peoples of the world, from the archetypal symbol of the Cosmic Tree to the popular custom of “bringing home the May,” indicates a coherent system of meanings, centered on the recurrent rhythm of birth and rebirth, the eternal cycle of vegetative life, and, beyond that, the eternal renewal of the cosmos. The meaning of each particular plant hierophany, therefore, is fully understandable only in terms of the whole system, a “whole” that is constructed intuitively. Hence, when discussing such topics as sky gods, water symbolism, or moon mystique, Eliade brought together materials from widely separated places and ages, and sought their basic, underlying, common structure, apart from the specific, local contexts and meanings. His essential concern was for the typical, the general, the universal.

Although, in this view, the inquirer must begin with concrete historical data, acquired through his own research or that of others, philological, historical, or ethnological description and analysis are not enough. The historian of religions must also possess *understanding*. He must seek to attain the depth meanings underlying the data, through a discernment of the basic patterns in a much larger context and through an interpretation that deciphers their transhistorical intentionality. Thus in his noted work *Shamanism*, Eliade not only extended the term to a far wider geographical area than had been customary, but also saw it as a primitive mode of the ecstatic type of mysticism, usually regarded as a speciality of the “higher religions.” He placed shamanism solidly in the general history of religions. In his conception, the historian of religions is not primarily a historian or

philologist (e.g., a Sinologist or Indologist), but a comparativist, phenomenologist, and “hermeneut” (practitioner of the art of interpretation). He proceeds by an intuitive act resembling the eidetic vision of the philosophical phenomenologist, but exercises it on empirical historical phenomena.

For Eliade, all religious facts have a symbolic character, which must be deciphered by the historian of religions. The fullness of religious meanings (particularly the paradoxical coincidence of opposites) is not conveyable in rational concepts. Hence, the interpretation of myth and symbol plays a central role in his work. This involves not only sympathetic participation in the thought world of the (usually archaic or primitive) *homo religiosus*, but also a significant emphasis on the objectivity of the interpreter’s perception. Interpretation is not merely a matter of the replication of what the subjects may have in their consciousness. The historian of religions must go down beneath all the elaborations, accretions, distortions, and amnesias to the essential meaning of a particular religious phenomenon. He does this on the basis of his systematic construction of the general structures of hierophanies. For example, people who bring home tree branches at the beginning of spring may have no idea of the sacral significance of their act. Here the historian of religions resembles the literary critic who claims to understand the writer better than he understands himself or the psychoanalyst who claims to discern unconscious motivations in the patient’s mind.

Another important element in Eliade’s synoptic vision of man’s religiousness is the central role of *archetypes* and *repetition*. There are universal archetypes of human intentionality, which, when discerned by the inquirer, signal the meaning of all kinds of phenomena, a meaning which is not always or usually immediately apparent. Through the repetition of these archetypes in mythical narratives and ritual performances, premodern man finds the ground of value and meaning for his daily activities and the pathway to a transcendent realm. Thus rites of initiation are not fully understandable merely in biological or societal terms; essentially they involve a transformation to a higher mode of being in a repetition of the basic archetype of death and rebirth (conversely, death is an initiation into a higher realm). Archaic and primitive man finds the meaning and value of his existence in the archetypes that serve as models

and thus provide ontological rootage for his works and days. The central model, myth, and rite is that representing the Creation, the emergence of cosmos out of chaos, periodically repeated in a renewal of the world and time. Traditional man seeks to attain the original time of beginnings by reactualizing it in ritual repetition. This is the basic model for all actions, beginnings, productions, and constructions in everyday life. Its ultimate expression is "the myth of the eternal return," which is acted out in everything from New Year's festivals to housewarming celebrations. Man seeks release from the serial progression of historical time in the cyclical rhythms of the cosmos.

There are some obvious similarities between Eliade's approach and that of depth psychology, particularly Jungianism, with its notion of archetypes of the collective unconscious. Although Eliade saw a certain corroboration and encouragement in this pursuit, his concern and emphasis were rather to discern and decipher what is expressed in overt, concrete, historical phenomena—in the lore, ritual, and myths of peoples—not in the individual psyche and its processes. He stressed the transhistoric and "trans-conscious" orientation of man's religiousness, the *nisus* toward being, the avid aspiration for ontological reality, within a cosmic and meta-cosmic framework. He projected his *Myth of the Eternal Return* as a study of "archaic ontology" and once expressed the desire to construct a metaphysics and ethics based solely on archaic and primitive phenomena. Indeed, he claimed Plato as "the outstanding philosopher of 'primitive mentality,'" because Plato, like primitive man, views essence as preceding existence. For Eliade, myth, ritual, and symbol are concerned with being and its attainment by man, who has fallen into a profane condition and become prey to "the terror of history." It may be said, that paraphrasing Freud's dictum on the id and the ego, Eliade would have his *homo religiosus* proclaim, "Where there profane is, there shall sacred be." In a sense, Eliade was pursuing philosophy of the metaphysical (and salvific) variety, not through abstract speculation, but by considering in depth the concrete materials of the history of religions. In so doing, he may have made a noteworthy contribution to philosophical anthropology.

Critiques. As the main lines of Eliade's work and thought emerged, negative criticisms of his methods and conclusions increased. Historically minded historians of religions (e.g., Raffaele

Pettazoni and the European comparative-historical school generally) objected to what they considered sweeping generalizations and ingenious reconstructions based on fragmentary data, and the juxtaposition of instances widely separated in space and time under some general structural category arrived at in an a priori manner. They preferred more cautious conclusions derived methodically from documentary sources. American critics, such as Hans H. Penner and Robert D. Baird, complained that his was an intuitive method, never clearly explicated and not subject to ordinary, consensual verification or falsification; moreover, that definitely ontological assertions were being hidden under a phenomenological manner. They insisted that Eliade was not only describing archaic man's religious stance, but vigorously espousing it, and that he was asserting the supreme value and meaning of the sacred (never established in any logical or empirical way), not merely presenting it as a phenomenological referent. Although he signed the 1960 Marburg manifesto of the International Congress for the History of Religions, which proclaimed the field an empirical, nonnormative discipline, he was trenchantly criticized as having normative, *parti pris* stances: proreligious, proarchaic, and even pro-Christian (e.g., his position that the incarnation of God in Christ may be viewed as the supreme hierophany). His refusal to define religion beforehand, except to say that it has to do with man's experience of the sacred (also undefined), was assailed as irrational and unscientific; his antireductionist stance, his insistence that religion is something *sui generis*, was attacked as a theoretically inadmissible position that would make a "science of religions" impossible (Penner & Yonan 1972; Baird 1970; 1971). It was also charged that his approach to and appreciation of religious phenomena was skewed by his intimate study and experience of Indian Yoga. (Excellent presentations of historical critiques are in Dudley 1977; Bianchi 1975).

Anthropological critiques followed along much the same lines as those by historians of religions: inadequate or sloppily handled data, precariously supported grand generalizations, one-factor universals, glaring errors of fact, the ascription of a specific cast of mind to primitive-archaic man, proceeding deductively from a priori metaphysical postulates, providing no explicit method of verification and correction, abstracting religion from its sociocultural con-

text, deemphasizing actual primitive–archaic views to bring out the scholar's pet interpretations, and armchair scholarship with outdated sources and theories. Adverse judgments on Eliade's works from an anthropological viewpoint were expressed in reviews and books by Lord Raglan, Peter Lienhardt, William Lessa, Anthony F. C. Wallace, Annemaire de Waal Malefijt, Weston La Barre, Edmund Leach, John A. Saliba, and many others. Dudley (1977) and Mac Linscott Ricketts (1973) summarize the significant negative views. A few approving views were expressed (e.g., Hudson 1968).

Despite his alleged pro-Christian bias, Eliade was also forcefully criticized by some Christian scholars as depreciative of Christianity and the biblical tradition (Hamilton 1965), or at least as illegitimately trying to subsume them under his archaic, cosmocentric, ahistoric paradigm (Altizer 1962; 1963). Where Eliade saw modernity as a Fall into meaningless, historical time, these critics saw it rather as an ascent to a new and fuller mode of existence. Altizer, a devoted but critical disciple of Eliade, viewed him as untrue to his dialectic in not heralding the emptying out of the sacred into the profane, signaled by the Death of God in Christ; in not welcoming, instead of rejecting, the godless, profane, modern age.

Whatever the cogency of some of these criticisms—historical, anthropological, or theological—Eliade's work as a whole was not necessarily vitiated by them. A closer consideration of the careful qualifications expressed in his works—sometimes obscured by Eliade's sonorous, poetic style—may have modified some of the critiques. Besides, many of the latter came from theoretical and methodological positions that were themselves being vigorously questioned as naive or historically false—e.g., the empirical data-hypothesis–verification (or falsification) pattern, both in the natural and human sciences (see, for example, the attacks by Thomas Kuhn and Paul Feyerabend on the conventional views of scientific method). Meanwhile, the creative role of intuition and a priori elements in human knowledge was being more positively evaluated, and scholars like Ian C. Jarvie (1964) were calling for broad generalizations and syntheses to rejuvenate the social sciences. The safer, more obvious, more manageable methods advocated by some of his critics contrasted with Eliade's grand vision and adventurous risks, but perhaps promised to provide more security than insight. To see Eliade as a shaman in scholar's garb, whether disapprovingly (Leach 1966) or

approvingly (Altizer 1963), is, of course, flagrant hyperbole, but still may indicate a special kind of scholarship and science, more in the spirit of Vico than of Comte.

ERIKSON, ERIK H.

Erik H. Erikson was born on June 15, 1902, in Frankfort am Main, Germany. Winner of both the Pulitzer Prize and the National Book Award, Erikson is one of the most eminent and influential psychoanalysts of the twentieth century. His theories concerning the biologically-determined stages of human development as shaped by environment have been widely accepted by, and have profoundly changed, such seemingly diverse theoretical and practical fields as clinical psychoanalysis, ethics, history, literature, politics, the social sciences, child care, and family relations. The multifaceted application of Eriksonian theory has made his contributions difficult to define and categorize. The difficulty in evaluating Erikson's work is a consequence of its scope as an all-embracing and rational explanation of the psychosocial development of humans in any given environment. Erikson views every person as a biological entity produced, and ineluctably guided by, both genetic and environmental factors, who also changes his own culture and, therefore, history as a whole. Thus, everyone becomes a strand in the tapestry of humanity, acted upon while acting, observing and altering his environment and himself, motivated and motivating. Erikson's son Kai, a sociologist, has observed of his father: "He's got his own discipline. Like most original people

he places greater faith in the furniture in his own head than in any particular discipline."

Erikson's contributions to an understanding of mankind in society began introspectively, with the insight provided by his analysis with Anna Freud. Erik Erikson is, in a sense, the son of two fathers. His natural father, a Dane, abandoned his mother, an artist, before their child was born. For some time, in keeping with the practices of his day, the child, Erik, was kept unaware of the existence of his natural father. The father he knew, in whose house he grew up, was a German-Jewish pediatrician, Theodor Homburger, whom Erikson's mother married. Homburger not only fully accepted the stepson but expected him to follow his own profession. After some occupational detours, Erikson did so, in a sense, becoming a healer of children's emotional and mental disturbances and not infrequently, thereby, also of their physical malfunctions.

Erikson has acknowledged both his fathers, first publishing under the name of Homburger and later under the name of Erik H. (Homburger) Erikson. His ambiguous personal background was formed in the also ambiguous historical and geographical setting in which he lived. As a young man Erikson lived in Schleswig-Holstein, an area claimed by both Germany and Denmark. This territorial dispute was very much in focus while Erikson attended the Gymnasium in Karlsruhe, and Erikson, a partisan for the German claim, soon found himself rebuffed by his classmates. The implication was that, as a Jew, he was unsuited to embrace a German cause. Yet he found himself equally a stranger in his father's synagogue, where he was dubbed "the goy" because of his fair Scandinavian appearance and perhaps, as well, because of his mixed parentage. Erikson's exploration of the effects on the individual of ambiguous background and the resulting uncertainty about one's identity, which originated in his personal conflict—and which is an acute problem in contemporary Western civilization—is one of his main contributions to the understanding of individual psychology. Among his many other theoretical and clinical contributions to an understanding of humans in society are his complete "scaffolding" for human development in the eight stages of the human life cycle, and the coalescence or clash of individual history and the historical setting (the time and place in which a person happens to live).

On finishing high school, Erikson, following

his mother's profession, sketched his way as a budding artist through Europe, thus experiencing (according to his later postulations about the stages of the life cycle) a kind of "moratorium" between childhood and adulthood. This interim period gives a young person an opportunity to explore his potentials and limits, to shed, in however a painful way, that part of his childhood which seems useless or obsolete, to shape his conscience and, if not his destiny, at least his destination.

In 1927, on the suggestion of his friend Peter Blos, Erikson went to Vienna, where both men taught in the Burlingham School, a small private school with a psychoanalytic orientation. The logical sequel of this affiliation was Erikson's contact with the Vienna Psychoanalytic Institute, where, lacking medical training, he found himself a kind of odd man. Erikson, himself, describes his role there and elsewhere as having a "favored stepson identity, that made me take for granted that I should be accepted where I didn't belong." This identity of favored stepson has been Erikson's fate. An eminent scholar without academic credentials; a psychoanalyst who pioneered in exploring the ego rather than, as has usually been the case, the drives or the id; a wide-ranging theorist who explored the lifelong interplay and influence of a person's genetic endowment and biological ancestry, his environment, his chance fate, Erikson reaches across borders into other experts' territories.

In keeping with his role as favored stepson, Erikson first found far greater response and appreciation among such outstanding anthropologists as Margaret Mead, Ruth Benedict, A. L. Kroeber, and S. Mekeel than among his colleagues at Harvard Medical School. He, in turn, benefited from anthropological methods and arenas of exploration, drawing on the experiences of other cultures (Sioux, Yurok) in addition to his own, in order to test his life-cycle theory. The study of other "simple" cultures also helped him to gain understanding of the ever present organic system, culture-family-child.

According to Erikson's life-cycle theory, the sequence of developmental stages has always been the same for the entire human race. In brief, the life cycle comprises an inescapable succession of eight developmental stages. Each stage has its specific conflict, the resolution of which, with a positive feeling dominating, leads to the next stage. The developmental conflicts characteristic of each stage are: trust versus

mistrust in the first stage of infancy; as trust is reinforced and becomes dominant, the second stage, autonomy versus shame and doubt, is attained during the toddler years; with the dominance of autonomy over shame and doubt, the next, third stage, initiative versus guilt, occurs during the preschool years; this leads to the fourth stage, industriousness versus inferiority during the school years, which, in turn, leads to the fifth stage, identity versus role confusion during adolescence, to be followed by intimacy versus isolation, the sixth stage, during young adulthood, then the seventh stage, generativity versus stagnation during mature adulthood, and finally, in the eighth stage, ego integrity versus despair during old age. The life style of, say, the Sioux, the French Canadian, the Zulu, or any definable subgroup depends on "what a culture makes" of a given developmental phase.

Thus, for instance, the second stage, which roughly coincides with the so-called toddler years, is characterized by the conflict between wanting to be autonomous and the doubt that one will ever be able to. This conflict is accompanied by shame whenever the child feels that he is not succeeding in mastering such bodily functions as urination, defecation, walking at will. He is equally perturbed about having the adult's standards forcefully imposed upon him. The battle between the parent who must put limits on the child's behavior, and the youngster's determination to have his own way, leads to any number of possible conflict resolutions, or compromises. For further healthy development it is necessary that the sense of autonomy prevail over the shame and doubt which, though mastered, is nonetheless potentially ever-present.

The main characteristic of the next, third, stage is initiative, which must, however, be tempered by a consideration for fellow men, especially parents and siblings. Thus, the child feels torn between his urge to action, curiosity, intrusiveness, and a sense of guilt when he "goes too far." Going too far may be differently defined in different civilizations. Indeed, each stage of the life cycle takes on a different hue, depending on "what a culture makes" of it, and specifically, how flexible the relevant adults in a child's life are about their hoped-for-gains in his or her socialization. The life-cycle theory thus takes cognizance of the variable aspects, as well as those which are biologically fixed and invariant, in each person's progressive adaptation from birth to old age.

Men's and women's development to adulthood (generativity) and old age safeguards the survival of our species. The life cycle's phylogenetic implications are in the function of older people as the concerned guardians of the young.

The resolution of each conflict, in the eight stages of the life cycle, also supplies the developing person with a measure of mastery over his own environment, as well as a measure of insight into and mastery of his inner self. Or, to relate this theory to a much discussed issue, conflict changes a person's view of himself and, thereby, changes his identity.

In 1942, Erikson joined the University of California at Berkeley as professor of psychology, an appointment which afforded him a great deal of clinical observation. It was during his Berkeley years that he was able to consolidate the mutual connection, the biological web, as it were, of culture-family-child as laid down in his first major work, *Childhood and Society* (1950). From this first work, and continuing to the present, Erikson's wife, Joan, has been an able editor, collaborator, and supporter of his efforts. Herself, a lucid author as well as a professional dancer and artist, Joan Erikson has confirmed and enhanced Erikson's clinical understanding and clarity of style.

The life-cycle theory developed during Erikson's Berkeley period, was completed in 1950 during the political "witch-hunting" period in the United States known as the McCarthy era. Refusing to sign the loyalty oath then demanded by the Board of Regents of the University of California, Erikson became part of an exodus of faculty members, moving to the Austin Riggs Center in Stockbridge, Massachusetts. There, the Eriksons' work with young, so-called borderline patients led them to an appreciation of a phenomenon which Erikson termed "identity crisis." This conflict or crisis is perceived by him as an exacerbation of the normal developmental problems characteristic of adolescence and young adulthood. The concept of identity crisis (the notion for which Erikson is most widely known in the general population), is now embedded in psychoanalytic theory and practice. The concept was first explicated in Erikson's book, *Young Man Luther: A Study in Psychoanalysis and History* (1958). Erikson traces the coming into being of this kind of crisis as a widespread phenomenon to the sixteenth-century upheaval of European culture and the birth of the passionate and powerful reformer, Luther. The mutual influence of an exceptional man

(the greater the man the more powerful his own identity crisis) and the times in which he lives is quite possibly nowhere else as well described as in this book. Erikson followed this book with another historical-biographical study: *Gandhi's Truth* (1969), in which Gandhi is also revealed as a great man who altered the course of history by changing himself. To put it simply, just as Erikson termed the policy of nonviolence (civil disobedience) to effect social change, *Gandhi's Truth*, so, the internalized conscience might be termed Luther's contribution to Western civilization, or Luther's truth.

By the time he worked on the Gandhi book in 1960, Erikson had returned to Harvard, "in order to learn how to teach my whole conception of the life cycle—including the identity crisis—to people normatively very much in it." Not that the identity crisis is limited to adolescence or young adulthood; like all developmental crises, it is often re-experienced from time to time throughout life, though usually in a less dramatic form.

In 1975 the Eriksons left Harvard and "retired" to Tiburon, California, where, as generative people, they are dealing with a number of theoretical problems and their applications. One of their main interests is play: its biological function, its role in inventiveness, its healing and integrative functions, and its practical and artistic uses in the framework of community centers. The Eriksons' joint community ventures are designed to break down the segregation of people according to social class, age, and sex, as well as between the "mentally disturbed" and "normal people."

In sum, the three Eriksonian concepts generally regarded as most influential and important are the *life-cycle theory*, the *identity theory*, and the *relationship between individual history and the historical period* in which one lives.

As a young clinician, Erikson found that the psychological problems his patients complained of were frequently the very ones he felt himself. The "I don't know who I am" feeling reported by his patients was sometimes experienced by them as a persistent, vague malaise, at other times as an outright confusion, sometimes as a frightening discrepancy between self-perception and the way others perceived one.

However, identity, as Erikson sees it, is by no means the exclusive estate of humans or higher animals, but, of all living things. Every creature, be it centipede or oak tree, is a member of a species with which he shares a number

of characteristics; yet every creature is also different from all others, identifiably unique, and, therefore, has an identity.

The uniqueness of each living being is, in a seemingly paradoxical way, what all have in common. What they also share—people, plants, and animals, alike—is a life cycle, evolving in predictable stages. Even very primitive creatures live through a stage of childhood (however brief or long), a mature and in some way reproductive or generative period, and a time of decline ultimately leading to death—of the individual, but not of the species as a whole. Not for a long time. Thus each individual identity constitutes a link in the phylogenetic chain. How well this living link supports the viability of the links to come depends on (1) its unique genetic endowment; (2) the care and nourishment it has received from the environment; and (3) chance. It might happen that an apple tree descending from a long and healthy line is hit by lightning, while all neighboring trees are spared. Identity thus comprises genetic endowment, shaped by environment throughout life, and mitigated by chance events. What distinguishes human identity from all others is our superior ability to other living beings to cope with our environment and ourselves in ingenious and flexible ways, and to observe ourselves, reflecting on our observations. By means of these abilities we have become, probably, the only creatures who can assume a measure of responsibility for our own and our fellow men's fate. Other living things have an identity, but only we have a *sense* of identity, and an awareness that we can, up to a point, change this identity at will. As already indicated, the gains in individual mastery (or the failure to achieve such gains) accomplished through the resolution of developmental conflicts, add to a person's growing sense of identity. Since these gains are largely due to identification with meaningful adults, and occur within the framework of a cultural setting, they differ according to the groups to which the parents—caretakers—educators belong. Adult models may be Japanese, Norwegian, or Maori, members of a nation, tribe, church, labor union, multinational corporation, or, indeed, a Christmas Club. The fact that they “belong” shapes their own and their children's identities and constitutes the element referred to as a person's group identity.

Erikson also distinguishes between this learned and culturally differentiated *ego* identity, on the one hand, and the universal or species-related

capacity to look at oneself as a creature who changes unceasingly in time (and often in space as well) from infancy through old age, yet experiences self-sameness, in spite of all changes.

The most frequently discussed, and frequently misunderstood, element of Erikson's identity theory is the *identity crisis*, occurring during the fifth stage of the life cycle, typically in late adolescence or young adulthood. Because our culture changes so rapidly, parental values frequently are or seem to be outdated or inconsistent to young persons. Because our culture lacks definite, universally accepted rites of passage to delineate developmental stages, young persons are frightened by the thought that it is up to them to decide when and how to make the leap into adulthood. Also, because everyone in contemporary Western culture is exposed to so many different faiths, life styles, ways of making a living, there are many directions in which one may leap. Added to this is geographic mobility, which can widen horizons and our acceptance of cultural variation, but also can add confusion and uncertainty about where one belongs.

It is for these reasons that the identity crisis has proliferated in the twentieth century. Every developmental stage is accompanied by conflict, but the one we call identity crisis can be so especially painful, that it has caused us to redefine our concept of mental illness; the inability to align oneself with any life style can be so painful and disruptive that the condition becomes indistinguishable from severe psychological disturbance. Yet the prognosis for adolescents and young adults suffering an identity crisis as part of their developmental stage of life is far more auspicious than a deep depression or schizophrenia (which the crisis may resemble) would be at a much earlier or later time in life.

For some, an identity crisis is evidenced by no more than somewhat erratic, highly charged behavior, say, exaggerated antagonism against parental standards or customs, or by a prolonged period of seeming inactivity. Erikson calls this kind of inactivity the “moratorium,” a time during which a person's self-image, his more or less realistic appraisal of his potentialities, limits, and allegiances, and, therefore, the way he should live as an adult, all slowly consolidate.

Erikson's holistic approach to the question of individual identity has contributed immeasurably not only to the understanding of this complex time of life, but also to the understanding

of humankind in the context of whatever time and space they inhabit. Philosophically, his approach to the unfolding of the future of mankind runs parallel to the model of his developmental conflicts in individuals. Erik H. Erikson is fully aware of the global dangers should mistrust prevail over trust, as in wars and other inhumane actions, but even so he hopes that the prevalence of trust over mistrust will help mankind, as it does the individual, toward maturity and survival.

EVANS-PRITCHARD, E. E.

Edward Evan Evans-Pritchard (1902–1973) is a major figure in British social anthropology who, along with Raymond Firth, Edmund Leach, and Max Gluckman, dominated the immensely productive and influential period of British field work and theorization following World War II.

Evans-Pritchard was born in Crowborough, Sussex, the son of John Evan Evans-Pritchard, a clergyman of the Church of England, and his wife, the former Dorothea Edwards. He attended Winchester College (1916–1921) and Exeter College (1921–1924), Oxford University, where he took a B.A. in modern history. He did graduate studies in anthropology at the London School of Economics, where he received his PH.D. in 1927 and where he taught from 1928 to 1936.

Evans-Pritchard's thesis was based on his field work among the Azande of the southern Sudan, and he continued his work in this region intermittently through 1938. In 1930 he made his first visit to the Nuer, also of the southern Sudan, and worked off and on with that people until 1936. In 1935 he also prepared an ethnographic survey of the Anuak of the southern Sudan, and in 1937 a survey of the Luo of Kenya. In 1932, while studying the Nuer, Evans-Pritchard accepted the professorship of sociology at Fuad I University of Cairo. Two years later he resigned this post to become research lecturer in African sociology at Oxford University, a position he held from 1935 to 1940, during the time when Oxford anthropology was dominated by A. R. Radcliffe-Brown. In 1940 Evans-Pritchard enlisted in the army serving first in Ethiopia and the Sudan, and later in the Near East and north Africa, mainly in Cyrenaica, Libya, leaving military service a major. During his military duties he collected ethnographic data, the most important being a study of the Sanusi religious order among the bedouin of Cyrenaica. While in Libya, Evans-Pritchard was converted to Roman Catholicism, a decision which some contend influenced his later work. In 1945 Evans-Pritchard returned to England to become reader in anthropology at Cambridge University. In 1946 he became professor of social anthropology at Oxford University upon Radcliffe-Brown's retirement. In 1970 he retired from the chair at Oxford and was knighted the following year.

Evans-Pritchard's own acknowledged teachers were C. G. and B. Z. Seligman, to whom he owed his initial interest in the peoples of the

Sudan. As a graduate student, he also took courses with Bronislaw Malinowski and knew and liked A. M. Hocart. He rejected Radcliffe-Brown's quest for a science of society and his somewhat simplistic functionalism, although he may have owed to him some of his interest in the French sociological tradition. While rarely citing Malinowski in later life, Evans-Pritchard may have in part derived from him his initial interest in the nature of magic and his profound commitment to an empiricism demanding prolonged field work. Evans-Pritchard's study of the Azande was the first intensive study of an African people by a trained social anthropologist.

Evans-Pritchard's intellectual roots lay in the classic tradition: the interdependent influences of the Scottish rationalists and their descendant, William Robertson Smith, and those of the French sociologists, such as Émile Durkheim and his school. Evans-Pritchard's immensely influential writings on magic, witchcraft, and religion derived from an enduring concern with questions about rationality and belief raised by James George Frazer, Edward Burnett Tylor, Lucien Lévy-Bruhl, Durkheim, Marcel Mauss, and Vilfredo Pareto. Aside from the French school and Pareto, Evans-Pritchard made few references to other sociological classics or to American or continental anthropologists, and he rarely cited his contemporaries. Much to his loss analytically, Evans-Pritchard virtually ignored Max Weber throughout his career, despite their common concern with religious and political institutions or their interest in history.

For Evans-Pritchard, ethnography was the true measure of one's worth as an anthropologist. He produced rich ethnographic accounts of two African societies, the Azande and Nuer; an innovative historical study of an Islamic brotherhood (Sanusi); a study of the Anuak; and numerous briefer surveys and essays on other peoples. Unlike many other anthropologists, Evans-Pritchard never approached theory through the parochial path of only one society.

Evans-Pritchard believed that the key problem in cultural anthropology is translation (1965*b*). This involves two complex, interrelated issues: the difficulty of entering into the mental world of an alien, exotic culture, and the problem of making that world understandable and thereby comparable to that of other societies, especially in terms of modern Western thought. This problem occupied him throughout his career.

His first book on the Azande (1937) is one of the most profoundly original and influential

studies in all social anthropology. Its value lies in its uncommonly acute employment of rich ethnographic data towards a usefully narrow, yet profoundly important, set of sociological ends. The questions had been raised before, but no one had previously gone to the field to confirm or refute the points involved. These issues revolved around the question of whether preliterate peoples think as literate people do. Evans-Pritchard's predecessors provided various answers, but none did field work or utilized sufficient data to sustain the arguments. Evans-Pritchard's research provides a clear and extended exposition of the ideas behind Zande beliefs in witchcraft, magic, and sorcery. While supplementary concepts such as those involving gestation, kinship, and causation are also brought in, Evans-Pritchard centers his attention upon beliefs in the supernatural, precisely because such notions had elicited the greatest disdain and misunderstanding from his predecessors. He indicates the systematic, enclosed, and self-perpetuating qualities of these ideas and demonstrates how such views are consistent with rational, workable, everyday experience. He further indicates that these are no more open to the onslaughts of alien criticism than are other philosophical beliefs and religious faiths easily vulnerable to the attacks of opposing believers and atheists. In the course of his exposition, Evans-Pritchard indicates how such notions sustain and confirm the forms of authority and power within a society. Not only does he maintain that allegedly irrational, exotic beliefs make sense within the experience of a particular society, but, conversely, that all societies hold existential beliefs nearly impervious to the demands of logic and consistency, as these are more rigorously defined by the supposedly scientifically minded. His study begins by presenting the thought of one society; it proceeds to use these data to re-evaluate and correct earlier anthropological conceptions about the nature of thought in all preliterate societies; it ends by implying that common features of rationality, nonrationality, existential assumptions, and conventional compartmentalization characterize all thought systems everywhere. Never before had the beliefs of a preliterate society been considered so carefully or with such empathy, yet Winch (1964) has convincingly shown that even this study reveals traces of ethnocentrism. For example, Evans-Pritchard denies that witches exist, even though there is no way within Zande thought that such existence can be dis-

proved, while his own disbelief requires a commitment to our own Western assumptions, which are different, but by no means necessarily more rational than those of the Azande.

In his next important work, Evans-Pritchard approached the problem of the sociology of knowledge from a different perspective. His study of Nuer time-reckoning (1939) provides an account of the subtle and complex relations between perceptions of time and space and their connection with various aspects of social experience and needs. In part this is shown to be the result of aspects of lineal and cyclical time connected to seasonal events and personal careers. Such notions are demonstrated to extend no further than their social utility requires for providing a coherent mode for thinking about both social solidarity and difference as required by features of demography, economy, and political affairs. For Evans-Pritchard, cosmologies are thus bounded by the needs of society and extend no further than are socially necessary in time and space. Evans-Pritchard's data sustain a Durkheimian view of knowledge, even though he elsewhere wrote somewhat disparagingly of both Durkheim's and Mauss's propositions on such issues (1965b).

The Nuer (1940a) is undoubtedly Evans-Pritchard's best-known book. It appeared in the same year as his analysis of Anuak political institutions and *African Political Systems* (Fortes & Evans-Pritchard 1940). These three works revolutionized social anthropological research in Africa and had a deep, although not entirely beneficial, impact on the discipline. *The Nuer* remains the classic exposition of a segmentary system of acephalous lineages. Evans-Pritchard opens the book by asking how a society can have law and order without the conventional institutions of government, such as chiefs, courts, and police. The key again lies in an overarching system of beliefs and values. The work subtly emphasizes the integrative aspects of conflict (peace in the feud) and the changing relativity of meaningful social alliances (fission and fusion) expressed in terms of lineal affiliations. Evans-Pritchard conceded (though never in print) that the model derived largely from W. Robertson Smith's *Kinship and Marriage in Early Arabia* (1885). Although the work enabled many subsequent fieldworkers to make sense out of the social life of lineage based societies, it is unfortunate that the very brilliance of the model seduced many into an oversimplification of material which was sometimes forced into seg-

mentary schemes. While such models may have proved useful, at least initially, for digesting much of the African material, where kin and political institutions are often closely connected, these models obstructed insights into most societies in the Pacific and New World, where other organizing principles are often at work. Such a view even obscured some aspects of the actual workings of societies in Africa, even among pastoralists. Peters has produced the most telling critique of such segmentary models (1967). The best features of Evans-Pritchard's analysis of the interconnections between political, kin, and religious beliefs are incisively combined in his Frazer Lecture of 1948 on the Shilluk (1948, in 1962).

In his second Nuer volume (1951a) Evans-Pritchard examines Nuer kinship and marriage. Although the weakest of the Nuer trilogy, it contains extremely interesting expositions of Nuer practices which were initially disarming to many analysts: ghost marriage, woman-woman marriage, and the levirate. The manner of exposition derives much from Henry Sumner Maine, but is considerably weakened by a restriction to normative, ideological explanations and a failure to fit social actions within the varying details of property, demography, and personal manipulation. Women's roles in social life also receive remarkably poor attention (Beidelman 1971), nor are the complex relations between Nuer and the neighboring Dinka adequately drawn (Southall 1976).

Evans-Pritchard's final work on the Nuer (1956) was the first scholarly study to present the religious beliefs of a preliterate people in a manner suggesting that these bear theological significance and profundity comparable to the religious thought of more complex societies. Various aspects of Nuer religious beliefs—totemism, classification, sacrifice, body symbolism—are examined in many of their dimensions. Evans-Pritchard's mastery of the French sociological classics and his appreciation of Semitic and biblical studies provide a useful framework for his exposition of a system of normative ideas and values so that sophisticated theologians and philosophers can cite this with relevance (MacIntyre 1964). Despite its implicitly Durkheimian position of presenting religious and cosmological awareness as a refraction of social experience, the monograph ends on a note of deferring to theologians, an inconsistent position which some have ascribed to Evans-Pritchard's own religious sentiments. Nowhere in such later work is there

any substantial discussion of how religious or other beliefs provide avenues of power and coercion for certain groups or individuals, even though Evans-Pritchard's own data and that of other writers on the Nuer, including Paul Howell, B. A. Lewis, and Father Crazzolaro, suggest otherwise (Beidelman 1971). Nor is there much attempt to examine ritual or symbolism beyond their manifest content (Lévi-Strauss 1962; Beidelman 1966; Beidelman 1968). In his later survey of various sociological interpretations of religion (1965*b*), Evans-Pritchard appears to reject even those moderate sociological methods he himself had put to such brilliant use in his previous work.

Probably as an outcome of his earlier historical training, Evans-Pritchard promoted the historical perspective in British social anthropology. Radcliffe-Brown and Malinowski had left British social anthropology preoccupied with functional analysis and unable to appreciate fully the advantages that historical material may provide both for understanding contemporary societies and for analyzing social change. Evans-Pritchard's contribution to historical anthropology has three aspects: (a) he revived interest in oral history, his publications on Zande history extending over his lifetime and culminating in his penultimate book (1971); (b) his study of the Sanusi (1949) combines the social perceptions of a social anthropologist trained in the analysis of religion and politics in a pastoral society with the study of events temporally using oral and archival sources; (c) Evans-Pritchard appreciated, as did increasingly some historians, that epistemological problems posed by historical studies closely resemble those confronting a comparative sociologist or anthropologist. Here, again, his indifference to Weber as well as to Marx is perplexing.

Few British anthropologists since Malinowski have done more than Evans-Pritchard to elevate the study of oral literature from neglect by social anthropologists, who are preoccupied with social structure. Evans-Pritchard stressed that texts be studied as literature, his view being epitomized in his analysis of ambiguity in Zande proverbs (1956, c.f., 1962). Evans-Pritchard published a large collection of Zande texts (e.g., 1967) and in 1964 helped found the Oxford Library of African Literature which has published many monographs by an international group of scholars.

Evans-Pritchard excelled in drawing attention to topics for the most part ignored by his colleagues. He was the first to provide a truly

sociological analysis of the dance among primitive societies (1928, in 1965*a*) and to write thoughtfully about the social functions of ritual obscenity (1929, in 1965*a*). He pioneered the reconception of the functions of marriage payments and stressed the need for replacing the term *brideprice* with *bridewealth*. He presented the most searching and complex exposition of concepts of marriage and paternity since Maine and wrote the first sensible and detailed analysis of the practice of blood brotherhood (1933, in 1962). Few anthropologists have displayed such a wide range of interests combined with such a wealth of rich and dependable ethnography. Consider, for example, such diverse and unlikely topics as how children are socialized into using kin terms, rituals for twins, terms of address, naming, deviant sexual behavior, iron working, string games, onomatopoeia, and cannibalism and its relation to nutrition.

It has often been remarked that it was Radcliffe-Brown who resuscitated the French sociological classics for social anthropologists; Evans-Pritchard continued and extended this mission not only by lecturing, but also by encouraging the translation and publication in English of the works of Durkheim, Mauss, Henri Hubert, Célestine Bouglé, Lévy-Bruhl, Arnold van Gennep, and others. It is to him initially that we owe a renewed appreciation of Robert Hertz, whose seminal essays on death and body imagery exerted a deep influence on Evans-Pritchard's own work.

Much can be learned by considering the manner in which Evans-Pritchard presented his work, both in terms of his style of writing and in the strategy behind the forms, places, and schedules of his publications. He published in an immensely varied number of journals, from major periodicals to obscure serials. This reflects his own deep commitment to the catholicity of anthropological scholarship. His schedule of publications suggests a carefully considered plan whereby each of his books was preceded by an extended series of essays, sometimes over a decade, which presented either theoretical considerations of a fairly narrow set of problems or exposition of valuable yet cumbersome supplementary ethnography. When the book ultimately appeared, the arguments initially advanced acquired a polished, condensed form, and much ethnographic detail, essential yet distracting from the main thrust of the arguments, would have been recorded elsewhere. This procedure produced proportioned monographs, but ones whose full significance requires considerable lit-

erary and intellectual backtracking by scholarly readers. Evans-Pritchard's style also merits consideration, for while the prose is forceful, it is also deceptively lucid, terms often being pregnant with ambiguities. His works rarely contain summaries or conclusions indicating his points; instead, his theories and reasoning flow modestly within the narrative, and the analyses and conclusions must be searched out from the exposition. In this, his works conceal values which are revealed only through intensive and repeated consideration.

F

FAIRBANK, JOHN K.

John K. Fairbank was born in South Dakota in 1907 and educated at Phillips Exeter Academy, the University of Wisconsin, and Harvard University. He received his Harvard A.B. in 1929, *summa cum laude*, in history. By this time, he had already decided to pursue a scholarly career and study the Chinese language and Chinese-Western relations. The turn to scholarship was based soundly on a brilliant academic career, but the turn to China was at that time an almost unilateral aberration for a professional historian. Certainly most academics in 1929 would have considered an investment in Chinese language and history a hazardous undertaking for anyone interested in a university professorship. That Fairbank used his Rhodes scholarship first at Balliol College, Oxford, and then in Peking, China, to study nineteenth-century Chinese relations with the West was at least in part a response to intellectual trends of that time.

Fairbank's professional interest in China was aroused by C. K. Webster, who suggested to a Harvard audience in 1929 that new documentation on China's foreign relations would presumably throw light on the "ominous problem of east Asia." The idea fell on fertile soil. Fairbank was one of the first to take advantage of China's decision to publish the 130 volumes of documents on its foreign relations from 1836 to 1874—the *Ch'ou Pan I Wu Shih Mo*. At the same time Webster was clearly reacting to stirrings in American intellectual life.

American neglect of east Asian studies had been pointed out by Paul S. Reinsch when he

was president of the American Political Science Association just after World War I. However, little was done until 1928, when the American Oriental Society came out in favor of promoting scientific Sinological research, and the Library of Congress initiated a division of Chinese literature, of which Arthur Hummel became director. About the same time Harvard announced the establishment of the Harvard-Yenching Institute. Very active in helping to create a favorable climate for American scholarship on Asia were Edward C. Carter of the Institute of Pacific Relations and Mortimer Graves and Waldo G. Leland of the American Council of Learned Societies (ACLS).

The foundations for an independent American approach to east Asian studies were being laid, therefore, during Fairbank's Harvard years. Several universities had for some time offered serious courses on China. American missionary Sinologues and officials such as Elijah Coleman Bridgman, Samuel Wells Williams, W. A. P. Martin, Arthur H. Smith, Justus Doolittle, William W. Rickhill, and Edward T. Williams had made substantial contributions to scholarship; some had held chairs in leading universities. But there was no professional academic standing for studies of China or Japan in any of the disciplines. Surveys made in 1928 showed that east Asia was far from being neglected as far as curriculum was concerned, but there were no American professionals in the field. In 1929 the ACLS set up standing committees for the promotion of Chinese and Japanese studies. The committees took on the task of stimulating the production of research tools and the provision

of fellowships to train scholars in these fields. At the same time the nationalist revolution in China, which brought Chiang Kai-shek to power, increased interest in that land. The age of American scholarship on east Asia had begun.

Fairbank's interest in China at this time was well within the framework of conventional diplomatic history. It was not political. At Oxford University he met Hosea B. Morse, who had been with the Chinese Maritime Customs Service and was author of *The International Relations of the Chinese Empire* (1910–1918). Fairbank found a thesis subject that combined Chinese with Western sources—a study of British policy in relation to the origin of the Chinese Imperial Maritime Customs Service, later to become his *Trade and Diplomacy on the China Coast* (1953). The influence of Morse was that of a scholar, as Fairbank put it, devoted to the ideal of scrupulous, impartial, and accurate presentation of the facts. T. F. Tsiang, the Chinese scholar who in a sense had launched all this activity by telling Webster about the new Chinese documentation, was a man of the same qualities as Morse in the field of scholarship. He was generous in his help to any scholar of whatever nationality who wished to work with Chinese materials. For Fairbank's needs while he lived in Peking, Tsiang had no equal. By the time Fairbank was appointed to the Harvard faculty in 1936, he had produced a study that was a model of Anglo-American historical scholarship. The pattern had been set.

Fairbank was one of the first to be aware that China must be analyzed as a society in its own right and that it was a society different in kind, rather than in degree, from our own. He was aware of the insights of German scholarship, of Max Weber and Karl A. Wittfogel in particular, and of the large theoretical concepts that these scholars produced. He acknowledged the debt, but he was cautious of Germanic world views. Bodies of theory, he said, are not magic formulas, but are broad avenues of approach that afford new insights into Chinese social behavior. In his view it was fundamental that all such theories assume that the record of events is basic to our understanding; conceptual schemes can inspire and guide research but are not meant to substitute for it. The moral? Our understanding of China must await painstaking monographic research. Exactly, but research without concepts?

Such a view of historical method and theory

was common among American historians of the period. It was not an area in which Fairbank came up with innovative ideas, in spite of his effort to identify new categories, such as "synarchy"—joint rule by two or more parties. His main intellectual contribution to the discipline of history was to overcome its ethnocentricity, to push it in the direction of absorbing the great independent self-regenerating civilization of China and eventually the whole non-Western world. He helped change the course of American scholarship on China with his illumination, through the use of Chinese documentation, of the role of the imperial court in the institutional development of the maritime customs.

In drawing attention to the urgency of understanding Chinese society, Fairbank pressed for the participation of the social sciences in that task. He was hospitable to theories of Chinese society, whatever their origin, but was not always quite sure where to place them. His insistence that the historian must proceed with his monographic work, steadily inscribing the record of events, was sound enough as far as it went. But the conventional training of the historian could not fully cope with the new pressures arising from the study of non-Western societies and the urgency of enlisting the aid of other disciplines, some of which were reluctant to give up their ethnocentrism. Some, in fact, held the view that ethnocentrism was the necessary basis of their theoretical position. Fairbank was aware of the theoretical stirrings in the social sciences as well as in the discipline of history, but this was not an area in which he felt obligated to contribute. He stayed with the muse of history as he knew her, took her to China, brought her home, and settled himself down with that grand old mother of the disciplines. That is sufficient for one lifetime.

The growth of serious academic interest in the non-Western world other than the Near East took a great deal of time, money, and power. Considerable forces in the American academic world were moving in this direction by 1928, and Fairbank benefited from their support during the 1930s. But important traditional academic forces were also indifferent or antagonistic to the new intellectual trends. The development of east Asian studies in particular and non-Western studies in general was neither easy nor inevitable. It is a matter of record that Fairbank, on the local scene at Harvard, on the national and eventually on the international

scene, made a forceful and distinguished contribution to this development.

In evaluating the contribution that Fairbank and others made to American scholarship, one must remember that interest in east Asia had for long been limited to the colonial and commercial interests of the major powers. It was the object, not the subject of academic interest. These attitudes were certainly changing, even in the 1920s, but there was not yet an independent American tradition; European influence was still strong. The French school, represented by Serge Elissieff, emphasized the textual approach to Sinology and Japanology and commanded the prestige and resources of the Harvard-Yenching Institute.

Many thought the institute was dead weight as far as the growth of modern Asian studies was concerned. The school of history to which Fairbank belonged, still strongly Europe-centered and Anglophile (e.g., Webster and William L. Langer), stressed the "scientific" use of documentation and was as suspicious of recent history as it was of other disciplines. But it provided the bridge, as it were, over which Fairbank made a professionally acceptable transition first to the inclusion of societies as independent entities, and finally to academic respectability for the contemporary scene. While the battle had to be won at Harvard if Fairbank were to have credibility elsewhere, it is to his credit that he put so much energy into the development of the field nationally, realizing presumably that the one strengthened the other. It is amazing that so much was achieved before 1941, when Fairbank moved to Washington, where he worked with the Office of Strategic Services and later with the Office of War Information during World War II.

The war took most of the country's Asian experts away from their universities, but the ACLS, with Fairbank always in the wings, plugged away with plans for the future. By the time the war was over it was obvious, of course, that the United States had to be serious about the study of the non-Western world. It was now possible to take advantage of the advances that had been made in the teaching of foreign languages, especially the contemporary colloquial. The climate for language and area studies was so propitious as a result of wartime training that it was possible to establish a Far Eastern Association (later to become the Association of Asian Studies) to promote the study of non-Western

societies and to keep together the many disciplines that had become involved in that enterprise. Fairbank played his part in establishing and fostering this mass organization.

Right after the war, the Social Science Research Council took the leadership in the crucial task of defining the academic role of area studies. An SSRC committee on world area studies, chaired by Robert Hall, the Michigan geographer, recommended that language and area studies be included in M.A. degree requirements, that there be at least five disciplines represented (with one of them to be stressed), and that all Ph.D. degrees were to be given in the discipline departments. Area studies were not to be separate disciplines. Fairbank played no particular role in this activity, but accepted, as did the rest of the field and the foundations, the SSRC guidelines. The American academic world, with the help first of the Rockefeller and Carnegie and later the Ford foundations was now on its way; today the sun does not set on American scholarship.

It is not surprising that when the challenge to become better acquainted with mainland China arose in 1959 Fairbank was in the front ranks of those who wanted to face it head on. He turned first to the Association for Asian Studies, a body that had been an appropriate instrument for many purposes, but when it became clear that not everyone thought it best for this particular goal, he turned to the SSRC, which set up, with the ACLS, a joint committee on contemporary China on which Fairbank served for several years.

Fairbank's contribution to American scholarship has been substantial. Intellectually he stood out among historians in his grasp of the significance of east Asian societies and among social scientists for his understanding of the need for interdisciplinary cooperation. He was active, with others, in helping to formulate the ways and means to shift academic attention on a national rather than a single institutional basis; thus he helped to prepare the way for the major foundations to participate in the development of area studies after World War II. He was active on all fronts, including the political, the most controversial of all and the most difficult to interpret. There was a debt perhaps to the La Follette Progressive movement in his championship of civil liberties and his strong anti-imperialism and more than a dash of populism in his interpretation of the Communist takeover of

China as a case of the Kuomintang betraying the "revolution." He tended to believe that the Communist party had inherited the leadership of the "revolution" because it was closer to the "people," a view that never commanded unanimous support. It explains both why the government of the People's Republic of China thought of him as a friend and why its leaders did not quite understand the roots of his intellectual and political composition. Their alleged interest in the "people" is instrumental, whereas Fairbank's was as genuine as it was inappropriate to the analysis of international affairs.

FELLMAN, DAVID

David Fellman, born in Omaha, Nebraska, in 1907, retired in 1978 from 45 years of teaching public law at the universities of Nebraska and Wisconsin. A political scientist, Fellman carried forward established traditions of public law by emphasizing authoritative rulings of appellate courts to elucidate his concerns for civil rights and liberties. He advanced these substantive interests through graduate and undergraduate teaching, as an adviser to public officials, particularly in Wisconsin, activity in the Wisconsin Civil Liberties Union, and dedication to the work of the American Association of University Professors. He was Vilas professor of political sci-

ence at the University of Wisconsin at Madison when he retired from active teaching.

Fellman's teaching and writing, his professional and public careers, grew out of a thoughtful commitment to principles of constitutional democracy. Treasuring a humane and liberal polity, he believed democracy "a method for arriving at decisions in the area of governmental activity" rather than a set of solutions. In sum, "democracy is thus mainly a method of avoiding violence by arriving at essentially tentative solutions to social conflicts through argument, persuasion, compromise and votes" (1966*b*). The fact that his writings were concerned chiefly with case law should not obscure his dedication to and interest in political parties, majority rule, and elected leaders like Senator Norris (1946). More than his younger contemporaries in the field of public law in political science after 1950, Fellman relied upon the liberal political theory of the utilitarians and the judicial opinions of Oliver Wendell Holmes, Louis D. Brandeis, Harlan F. Stone, Robert H. Jackson, and Felix Frankfurter in taking stands. He assumed constitutional law

must take chances because the best it can do is to discover points of equilibrium or balance between competing ideas, desires, needs or interests. This has been a central theme of American constitutional law. Our political system is a democracy, and our constitutional law is therefore an instrument of our democracy. Our democracy is basically a collective bargaining society and the judicial branch of government is one of the great instruments through which agreement is reached. It follows that our constitutional law rejects fanaticism or extremism and tends to move to the middle of the road. (1966*b*)

Many of Fellman's detailed studies of case law were aimed at understanding and urging the protection of the disadvantaged. In one of his earliest published studies, he deplored the tendency in American law to narrow the alien's right to work, believing it contradicted the aspiration of a truly modern civilization (1938). This impulse led him to make several of the most searching studies of the rights of defendants in his time ([1958] 1976; 1966*a*). Yet Fellman saw these rights in terms of the broad aims of a civilized society, and thus he wrote that "due process of law is not, primarily, the right of the accused. It is basically the community's assurance that prosecutors, judges, and juries will behave properly within rules distilled from long centuries of concrete experience. For procedural safeguards are abso-

lutely essential for justice. In fact, in large measure justice is fair procedure" ([1958] 1976, p. 6).

Fellman's innovations and receptivity to novel approaches by others are important attributes assessing his career in political science. He was among the first to see how the business of the Supreme Court after World War II would be dominated by issues of civil liberties and civil rights. At the University of Wisconsin, he was a pioneer in introducing these subjects in the late 1940s, both in the undergraduate curriculum and in graduate seminars designed to explore narrower topics among these issues. In guiding graduate students, Fellman set high standards of style, rigor, and craftsmanship while leaving open subjects to be addressed and methods to be employed. Beginning in 1950 several of his students made in-depth studies of interest groups in particular litigation, contributing to the burgeoning interest in the judicial process (Cortner 1964; Manwaring 1962; Vose 1959). His support for eclecticism in the discipline was also exemplified by his acceptance for publication of many articles with a behaviorist orientation while he was the founding editor of the *Midwest Journal of Political Science*.

Although Fellman's methods of analysis in public law have been consistent, the subjects he has addressed include all aspects of free expression, religious and academic freedom, racial equality, and freedom of association, as well as the rights of defendants. His many publications on decided cases in state supreme courts, as well as the Supreme Court of the United States, extended the style, quality, and approach of such scholars as Ernst Freund, Thomas Reed Powell, and Edward S. Corwin. Fellman also brought to his craft a deep knowledge of American political thought derived in part from his teacher at Yale University, Francis W. Coker.

Fellman's expressed concern for academic freedom resulted in his appointments as chairman of committee A of the American Association of University Professors for five years (1960-1964), national president (1964-1966), and chairman of the AAUP Legal Defense Fund (1975-1976). Applying his view of public law to this subject, Fellman believed the independence of scholars from college trustees and administrators was parallel to that of judges from those who appoint them. Concerned with the humblest, most provincial campuses in American higher education, Fellman exerted himself

and the AAUP to protect individual scholars through written rules of tenure and procedure, grievance procedures, and public censorship of wayward institutions.

Fellman's scholarship on a range of civil liberties conflicts continues since his retirement from the classroom.

FIRTH, RAYMOND

Raymond William Firth was born in 1901 near Auckland, New Zealand; he was educated at Auckland Grammar School and Auckland University College. Since 1932 he has resided in England, but he preserves his links with New Zealand relatives. The unpretentious style of living and the no-nonsense rationalism which have been characteristic of Firth throughout his academic life have their roots in the modest simplicity of his colonial background.

At Auckland University College Firth specialized in economics, and his first publication was a short monograph on the economics of the kauri-gum industry (1924). In 1924, he came to England to work for a higher degree in economics at the London School of Economics (L.S.E.); his planned field of research was the frozen meat industry of New Zealand. At that time, Bronislaw Malinowski had just been appointed to a readership at the University of London, tenable at the L.S.E. Malinowski's various writings on the *kula* exchange system prevailing in the archipelagoes of eastern New Guinea had been published between 1920 and 1922, and had aroused great interest among economic historians, notably R. H. Tawney, who was at that time an influential member of the L.S.E. academic staff. It was probably a combination of Tawney's breadth of vision concerning the scope of economics, Malinowski's personal magnetism, and Firth's long standing interest in the ethnography and archeology of the New Zealand Maori which led Firth to change the topic of his PH.D. dissertation to *The Primitive Economics of the New Zealand Maori*. It was completed in 1927 and published as a book in 1929.

This thesis, written under Malinowski's supervision, is based on bookwork rather than field

work—that is to say, the facts of Maori ethnography derive from published records concerning the “traditional” society rather than from first-hand inquiry among present-day Maori. Malinowski’s influence on Firth’s general reading in anthropology can be seen from the bibliography, where more than three-quarters of the entries in the general non-Maori section are in German and refer to authors of whom Malinowski approved. The extension to this bibliography which appears in the substantially revised edition published in 1959 reflects not only the expansion of the field of economic anthropology, largely as a response to Firth’s own activities, but also the extent to which Firth’s anthropological vision had broadened out once he was free of the restricting influence of Malinowski.

During the decade 1925 to 1935, Malinowski’s celebrated graduate seminar became a magnet for young scholars of the most diverse backgrounds. Embryo anthropologists who were either regular or occasional participants included E. E. Evans-Pritchard, Raymond W. Firth, Isaac Schapera, Audrey I. Richards, Meyer Fortes, Reo F. Fortune, Ian Hogbin, and Gregory Bateson. From the start, Firth stood closest to Malinowski, and his subsequent achievements reflect most clearly the goals that Malinowski presented to his students. The memorial volume to Malinowski which Firth edited is an enduring expression of Firth’s indebtedness to his mentor (1957).

After obtaining his PH.D. Firth returned to New Zealand, where he prepared his thesis for publication and planned what proved to be one of the most important anthropological field trips ever undertaken. This was his 1928 visit to the tiny island of Tikopia, which is geographically located within the Solomon Islands, though its population, then numbering approximately thirteen hundred, are of Polynesian race and culture. Firth made further, briefer visits in 1952 and 1966.

Firth’s first three publications concerning Tikopia were a general field report and a paper on “Totemism in Polynesia” which appeared in the first volume of *Oceania* (1930–1931, reprinted in [1930–1931] 1967, chapters 1, 11), and a paper entitled “Marriage and the Classificatory System of Relationship” which first appeared in the *Journal of the Royal Anthropological Institute* (1930, in 1964, chapter 4). The first major monograph, *We, the Tikopia* (1936b), was concerned with kinship organization. Since then Tikopia has been the subject of five further monographs (1939; 1940; 1959b; 1961; 1970),

an essay collection (1967), and a score of uncollected articles.

Although these writings add up to a truly formidable achievement, Firth’s Tikopia studies have had less impact on the development of anthropological thinking than their bulk might suggest. Firth’s written style is sometimes florid, but seldom elegant. His closely packed paragraphs make no concessions to the novice reader. He hardly ever resorts to diagrammatic simplification of the argument; indeed he is opposed in principle to model building or reductionism in any form. Firth’s general view of the nature of culture remains close to that of Malinowski, but whereas the latter, while stressing the involuted complexity of the “system as a whole,” implied that the functional implications of cultural conventions are mutually consistent, Firth’s emphasis is on the inconsistencies. He presents his individual Tikopian as faced with a dense mesh of alternative avenues of cultural expression. Faced with such choices the individual makes decisions and it is this process of decision making within a cultural matrix that Firth claims to be able to analyze in his numerous writings on the theme of social organization. But Firth’s reader has to work hard to understand what is being said.

On returning from the field, Firth joined the staff of the department of anthropology at the University of Sydney, which was then headed by A. R. Radcliffe-Brown. Firth was active as editorial promoter of the newly established journal *Oceania*, which was based in the Sydney department. He was acting head of the department in 1931/1932.

Firth then returned to London to take up a post under Malinowski at the L.S.E. He had the status of lecturer from 1932 to 1935, and reader from 1935 to 1944. Malinowski died in the United States in 1942 and Firth was appointed to a full professorship in his stead in 1944.

In the immediate prewar period, Firth was a particularly active member of the Royal Anthropological Institute of which he was honorary secretary from 1936 to 1939. He was president from 1953 to 1955 and has played a prominent role in the institute’s affairs ever since.

In 1938, Firth completed the text of *Primitive Polynesian Economy* (1939), which is wholly devoted to Tikopia. Firth describes it as “in a sense a supplement to my *Primitive Economics of the New Zealand Maori* (1929),” and his next enterprise was designed as a further supplement. The idea was to study the economics of a

community still relatively "primitive" in terms of technological organization, but which was caught up in the world-wide monetary system and international trade in a way that the "traditional" Maori and the Tikopia were not.

In late 1939, Firth and his wife Rosemary Upcott, daughter of Sir Gilbert Upcott, embarked on field research in a fishing community in Trengganu on the northeast coast of the Malay Peninsula. The research was partially frustrated by the outbreak of World War II, but it resulted in a major monograph by Firth, *Malay Fishermen: Their Peasant Economy* (1946), and an additional volume, *Housekeeping Among Malay Peasants* (1943), written by his wife. Firth made brief return visits to Malaya in 1947 and 1963, and the 1966 revision of his book is substantially enlarged.

During the war, the L.S.E. was evacuated to Cambridge, where Firth was also posted in a subcenter of the Naval Intelligence Division of the British Admiralty, which was run by the geographer H. C. Darby and which was responsible for the production of a series of geographical handbooks designed as tools for the contingency planning of naval operations throughout the world. Firth was the principal compiler and editor of the four volumes of this series which relate to the Pacific islands. Originally issued as internal Admiralty documents in 1943, 1944, and 1945, they became more generally available ten years later. Much of the information which they contain would still be hard to obtain from any other source (Great Britain . . . 1943-1945).

As the war progressed, the British authorities began to consider the effects that the war would have on the far-flung British colonial empire. While few people foresaw the rapidity of postwar colonial dissolution, there was a widespread appreciation that radical changes were impending. Yet it was apparent that in many of the colonial dependencies sensible planning for the future was hopelessly prejudiced by a basic lack of information concerning fundamental social and economic facts. Through his work on the Admiralty handbooks, Firth understood the seriousness of these gaps in information and he actively promoted a consciousness of this situation in government circles. The outcome was the formation in 1944 of the Colonial Social Science Research Council, of which Firth was the first secretary. In the immediate postwar period an immense amount of really first-class anthropological research was carried out under the aus-

pices of the British Colonial Office on the recommendations of this body. Its successor, the centrally financed Social Science Research Council, of which Firth was again a founding member, continues to be the principal agency for funding the field research of British social anthropologists.

By the end of 1945, the L.S.E. had been re-established in London, and Firth took on the full responsibility for running Malinowski's former department, which he chaired until his retirement in 1968. During much of this period he was the guide and sponsor of an ambitious long-term project to study, by the methods of social anthropology, the operations of kinship in urban settings in London. The publications which have resulted from this enterprise were disappointing (1956; Firth, Hubert, & Forge 1969).

Firth has subsequently been a visiting professor at universities in the United States, Canada, and New Zealand. Earlier in his career, he was a visitor at the Australian National University at Canberra, where he played a leading part in the discussions that led to the establishment of the important chair of anthropology and sociology in the Research School of Pacific Studies. Since 1965, Firth has accumulated a notable string of honorary degrees, has been a fellow of the British Academy since 1949, and was awarded a knighthood in 1973.

In postwar Britain, the number of graduate students working for research degrees in social anthropology grew rapidly, and before long a vigorous rivalry developed between the two leading centers, Firth's department at the L.S.E., which became the stronghold of a slightly modified Malinowskian orthodoxy, and the Institute of Social Anthropology at Oxford, which was first directed by Radcliffe-Brown, Malinowski's long standing rival, and later by Evans-Pritchard. At a later date, the preeminence of the L.S.E. was challenged by the creation of a vigorous new department at the University of Manchester, under the leadership of Max Gluckman, and by the success of Meyer Fortes in reviving the fortunes of the long established, but languishing, department at Cambridge University. There was also a veritable mushroom growth of lesser institutions. By the early 1960s, social anthropology, which had been virtually an L.S.E. monopoly as late as 1939, was being taught in at least 18 different universities in the British Isles.

In intellectual terms, Firth responded negatively to the new styles of anthropological presentation represented in the work of Evans-

Pritchard, Fortes, Gluckman, and their students, but he recognized, more clearly than some of his senior colleagues, that despite their different approaches to the Durkheimian notion of the functional interdependence of institutions, the various emergent cliques of social anthropologists all had a great deal in common. Moreover he saw very clearly that, in the new postwar circumstances, the miniscule private trust funds through which most British anthropological research had been funded prior to 1939 would prove wholly inadequate. He also recognized that if social anthropologists were to gain access to the much more substantial resources at the disposal of the government research councils, they would have to demonstrate some degree of corporate identity. The point was not lost on his Oxford opponents and in 1946 all of the professional social anthropologists in the country—still numbering fewer than a score—met together at the L.S.E. to form the Association of Social Anthropologists of the Commonwealth, with Radcliffe-Brown as its first chairman. In 1962, Firth, then chairman of the association, took the initiative that led to the important international conference of social anthropologists held in Cambridge in 1963. As a result of this conference, a distinctive series of symposia publications known as the A.S.A. Monographs (subsequently A.S.A. Series, A.S.A. Essays) first appeared. This collection, in its variety and homogeneity, provides a specification of what British social anthropology is all about. Appropriately Firth is the life president of the association.

All of this might give the impression that Firth's principal historical significance for the history of the social sciences is that he showed the entrepreneurial and organizational flair that converted British social anthropology from being the brand name of a rather quirkish style of anthropological practice peculiar to a handful of individuals—which was the state of affairs in the 1930s—into an internationally accepted, widely practiced, and highly respected branch of study, which ranks high in the generally accepted hierarchy of the various social sciences.

Certainly this side of Firth's work deserves emphasis and is of sociological interest in itself. In the dialectical development of British social anthropology, the ancestral doctrine of Malinowski generated the rival creeds of Radcliffe-Brown, Evans-Pritchard, Fortes, and Gluckman. In this mêlée, Firth was from the start a peacemaker among the factionalists, a leader who was more concerned with the future of social anthropology

as an academic discipline than with his own academic reputation. But precisely because Firth chose to be a leader without disciples, it is difficult to spell out with any clarity just where he stands in the spectrum of anthropological opinion. He has not been the founder of a "school"; he has no immediate imitators.

The extraordinary detail of his description of Tikopia culture and society has been mentioned already and is a lasting monument. But though the Tikopia can be cited as examples (or perhaps counterexamples) of all kinds of generalizing anthropological theories, Firth's Tikopia studies did not in themselves serve to break new theoretical ground.

The succession of monographs, essays, and editorial initiatives relating to economic anthropology (1929; 1939; 1946; Conference. . . 1967; Firth & Yamey 1964), and their revisions, are another matter. In the ongoing debate between the "formal theorists" and the "substantivists," Firth has consistently adopted a "formal theorist" stance—that is to say he has maintained that economics is a unified science containing basic principles that have world-wide application. Any persisting mode of human organization, whether primitive or sophisticated, monetary or nonmonetary, market-oriented or subsistence-oriented, capitalist or socialist, has an economic aspect, and general principles relating to such factors as production, distribution, and exchange, the ownership of goods, and command over the means of production are comparable right across the board. In particular, Firth holds that economics is the study of the allocation of scarce resources among alternative ends and that the concept of scarcity is essential to any meaningful study of economics. Firth has viewed with persistent skepticism the various contrary opinions, many of which have their roots in Marxist ideology, which argue that scarcity is simply a product of the particular social formation with which we are most familiar—that of the world-wide, capitalist, market economy—and that there are different types of economy which differ as do species.

The formidable corpus of Firth's writings includes contributions to almost every aspect of social anthropology. Apart from economics, the most prominent themes are social change and religion. A crucial element in his treatment of these topics is the special meaning that he attributes to the concept of social organization.

Firth began to use this expression as early as 1930, but in the period from 1949 to 1960, he

employed it as a polemical weapon of attack against "the rigidity and limitations of a simple structuralism" alleged to be propounded by the Oxford followers of Radcliffe-Brown (Firth 1964, chapters 4, 5, 6). If viewed in its historical context, this phase of Firth's writings was an attempt to rescue from oblivion certain undervalued individualist aspects of Malinowski's functionalism, and in this regard it must be rated a failure. Admittedly structuralism in social anthropology has now become the brand name of the anthropology of Claude Lévi-Strauss rather than that of Radcliffe-Brown, but this transformation was not brought about by the empiricist criticisms that Firth leveled against the latter. But the importance of the concept of social organization for an understanding of the distinctive characteristics of Firth's personal brand of anthropological argument may be inferred from the fact that the expression appears not only in the title of his textbook (1951), but also in that of the *Festschrift* offered to him by his former pupils shortly before his retirement (Freedman 1967).

Two quotations may serve to introduce our discussion of this key concept.

(1) A theoretical framework for the analysis of social change must be concerned largely with what happens to social structures. But to be truly dynamic it must allow for individual action. . . . (1951, p. 83)

(2) . . . so far from the religion of the Tikopia merely reflecting or maintaining the social structure, in some of its aspects it offers avenues of *escape from* society, into personal fantasy, which is then allowed social recognition and credited with social functions. (1964, p. 254)

These are both typical examples of what Firth means by social organization. It is a concept which has a binary relationship with Radcliffe-Brown's social structure. *Structure* is here conceived of as a stable, inflexible system of jural rules; *organization* is the set of cultural conventions which allows individuals to interpret the rules with sufficient flexibility to make the system of structural rules viable at the level of empirical behavior. Changes in these conventions over time provide Firth with his principal tool for the analysis of social change both in the secular and religious spheres of practical activity.

Firth, like Malinowski, has consistently assumed that the core of every serious piece of anthropological research must consist of the detailed field study of a particular culture considered as a total system. The task of the an-

thropologist is to show not only how the system fits together but how it works. Most of Firth's younger colleagues now interpret the "how it works" component of this doctrine very loosely. The mechanistic notion that particular social institutions have particular identifiable functions which can be shown to serve the egocentric needs of the individual (Malinowski) or the sociocentric needs of society (Radcliffe-Brown) have been abandoned. Indeed, the word function seldom appears in any of their writings. Firth's position, on the other hand, is a compromise between the two earlier standpoints, with "social organization" serving as the mediating term.

Closely linked with this special brand of functionalism, which puts so much emphasis on the individual as decision maker, is Firth's consistent empiricist bias, which is reflected in an equally consistent antipathy towards psychoanalytic and structuralist (i.e., Lévi-Straussian) explanations of symbolic action, which emphasize unconscious rather than conscious motivations on the part of the individual. The weakness of such arguments from Firth's point of view is that they evade the guiding principle that speculation must always be tested against the fieldworker's direct and detailed observations.

This empiricist commitment has proved inhibiting. Thus, Firth's restudies of Tikopia and Trengganu culture, after an interval of years, are contributions to the particular histories of these two societies, but they have not led to conclusions about the general processes of cultural change which are other than commonplace. It should be noted, however, that Firth has entered into direct and well-informed debate with the Marxists over their treatment of anthropological data (1972).

Much the same applies to Firth's writings on primitive religion, which are based on Tikopia data. As an atheist, Firth assumes that any honest anthropological fieldworker must start out from the premise that in "real" terms, all religious belief is illusion. The task of the functional anthropologist is therefore to discover utility (or disutility) in the social consequences of religious performance.

Firth is very far from being insensitive to the aesthetic nuances of religion, but he has repeatedly attempted to separate aesthetic activity from religious activity, apparently because, while he approves of the former he views all forms of the latter as a kind of self-deception (Firth 1964, pp. 138-139).

Here is a paradox. Although Firth is clearly

fascinated by the relationship between art and religion, he remains deeply skeptical about all discussions of intangible reality. The overall point of his most recent major monograph, *Symbols* (1973), is that because there have been a plethora of general anthropological theories about symbolism (both religious and other), and because it is easy to find ethnographic counter-examples to any scheme which postulates a general systemic ordering of human symbols, the anthropologist's proper role should be to demonstrate the nonlogical inconsistency rather than the logical consistency of this major aspect of human self-expression, which "not only blurs relationships in the orders of reality; [but] it also has historically been a potent trigger of social conflict" (1973, pp. 427-428). Sometimes one has the impression that Firth looks upon current structuralist fashions of the Lévi-Straussian sort as manifestations of religious superstition, and evil at that!

Finally, there remains for consideration Firth's role as a teacher. Here his influence has been very great indeed. Firth is not at his best in the setting of a formal lecture. He has too many facts at his disposal and his empiricist honesty drives him to put too many of them on show at the same time. But, as the chairman of a seminar discussion, his performance is superb. During his years at the L.S.E., it was above all through the medium of the academic seminar that Firth made his influence felt. In this setting, he treats the contributors to a debate as if they were informants in an unstructured session of Tikopia field work. He manages to extract sense from the ramblings of even the most uninteresting informants. Over and over again, as scores of participants can bear witness, Firth's summing up of a long discursive argument has had the magical effect of converting what had seemed to be a tediously pointless discussion into an innovating discovery procedure of real significance. If he had done nothing else, and he has of course done a very great deal, Firth would by this competence alone have demonstrated that he was a thoroughly worthy successor to the formidable Malinowski.

FORDE, DARYLL

Daryll Forde, who died in 1973, exerted a profound influence on social anthropology in

England. Throughout its period of expansion, he counteracted the tendency to insularity and narrowness with a broader, more international vision of the subject, made possible partly because of his close relations with American anthropology. He always tried to maintain the initial ties between physical anthropology, archeology, and the cultural and sociological studies of man; to preserve the tradition of wide-ranging inquiry; and to keep abreast of new work in many related disciplines. His early training in geography gave him the bias towards ecological analysis that became the hallmark of his thought, making him a pioneer in a field whose importance is only now being recognized.

Daryll Forde was born in 1902 in England. His first degree was in geography at University College London, where he later wrote his doctoral thesis on prehistoric archeology and, from 1923 to 1928, held the post of lecturer in geography. He received his doctorate in 1928. For the next two years he was a Commonwealth fellow at the University of California, and then, in 1930, he was appointed to the Gregynog chair of geography and anthropology at the University of Wales, the youngest full professor in the United Kingdom. His particular theoretical interests and his association with American studies were evident in his early publications, which stress the balance between human geography and archeology. *Ancient Mariners* (1927) was followed by articles on megaliths and prehistoric metallurgy, and reports on excavations in England, Scotland, Wales, and Brittany.

In the career of any anthropologist, the important benchmarks are the field expeditions. Forde worked in Arizona and New Mexico between 1928 and 1929, and returned to New Mexico later in 1929. In 1934 he published *Habitat, Economy and Society*, an exercise in comparative human geography that instantly became a classic. As the title suggests, the book pays special attention to the interaction of technology with environment. If at this point he had decided to stay in America, his work would probably have continued to combine the antiquarian and contemporary perspectives in American field work. However, his 1935 field trip to southeastern Nigeria was a watershed. There he started the intensive field work among the Yakö of the Cross River that he followed up with another expedition in 1939. The rich data he gathered resulted in many publications on Yakö studies. This field work also led him away from a sustained archeological approach. He

welcomed the full impact of modern Africa. Although always interested in basic theoretical issues, he enjoyed the opportunity to broaden the scope of his academic work that this program of African research provided. Just at that point World War II imposed a moratorium on anthropological field work. But opportunities reappeared as soon as the end of the war was in sight.

In 1944 Forde was appointed administrative director of the International African Institute. A year later he returned to University College London to a newly founded chair of anthropology. The first of these appointments led to the most comprehensive program of publishing and organizing research that any one British anthropologist has ever achieved. The other involved the teaching and reflection by which he worked out his own intellectual position.

Some impression should be recorded of Forde's personal style. Roguish wit, iconoclasm, and abounding joy in life are not surprising in a clever young professor in a provincial university. Normally they would be modified through the years to the austere presence expected of the head of internationally renowned institutions. But in Daryll Forde those very qualities of youth were joined with vision, intellectual power, and warm human concern. Little of his personal magnetism was reflected in his written work. There his style was always correct and impersonal. He became increasingly concerned with covering all aspects of whatever subject he was treating, leaving no careless loopholes in his argument and making no concessions to the poorly educated reader.

His publications on the Yakö came out in specialized articles, starting with "Land and Labour on the Cross River" (1936). Gradually, over the next thirty years, he covered kinship, descent, marriage, local politics, and religion in essays that were republished in one volume, *Yakö Studies* (1964). By then he had published and edited so much of other people's work that his own writing had evidently taken second place. Yet his field studies represent a distinct contribution. He described the complex system of double unilineal inheritance, which has subsequently been reported in other parts of west Africa with interesting variations. He described an oligarchical system of government in which various ties of cult and descent affiliation cut across each other. This work antedated the many analyses of African descent systems and cross-cutting political influences that appeared in the

two decades after the war. The features that distinguished his more comprehensive studies of west Africa also marked his Yakö studies: careful measurement, an eye for internal adaptations, and a fervent belief that anthropological analysis could not be made in a vacuum, but must include the effects of environmental or external political pressures.

One of the most impressive of these large-scale studies was his lecture to the New York Academy of Sciences in March 1953, "The Cultural Map of West Africa," a superb example of his wide synoptic view, mastery of detail, and controlled argument.

Interestingly, his later writings on west Africa showed a slight relaxing of his restrained impersonal style. The Yakö came to life as competitive, wealth-seeking individualists in his 1960 lecture "Death and Succession" (1962). Whereas his first study of Yakö ritual (1951) emphasized its socially integrative aspects, his lectures on *The Context of Belief* (1958a) and "Spirits, Witches and Sorcerers in the Supernatural Economy of the Yakö" (1958b) were concerned with bringing out the elements of individual choice and calculation which he felt were neglected by contemporary accounts of religion. Again, in his introduction to *West African Kingdoms in the Nineteenth Century* (Forde & Kaberry 1967), he emphasized the scope for entrepreneurial talents and leadership as well as the incentives to accumulate riches. In a way, his work can be seen as contrapuntal to the structural functionalism of his day. At many points ahead of his contemporaries and at others correcting their bias, the more they left reality for the sake of elegant abstract models, the more he doubted their fundamental assumptions and questioned their data base.

In each decade he summed up his position in a major statement reiterating his principles. In 1947 "The Anthropological Approach in the Social Sciences" was delivered as his presidential address to the Association for the Advancement of Science. In 1957 a magisterial review article in the *Encyclopaedia Britannica* gave a summary of the whole history of the subject. In 1967 his lecture on "Anthropology and the Development of African Studies" repeated, in the specialized context of Africa, his concern that anthropology keep its broad perspective, remain concerned with biological and historical evolution, and focus always on adaptive processes. He cited approvingly the studies of John Barnes on the Ngoni, Michael

G. Smith on Hausa–Fulani, Jan Vansina on the Kuba, G. I. Jones on the Oil Rivers States, and Igor de Garine on the Massa. This impressive list of younger Africanists, each with his train of students, testifies to the growth of the subject as well as to Daryll Forde's influence. For years no scholar would think of going to Africa for the first time without calling in London to pay respects to Forde and receive his advice. By the 1950s African anthropology had grown enormously in volume, but it grew as an unusually coherent body of communications. It flourished so well largely because of Forde's tireless leadership as director of the African Institute.

When Forde was appointed the institute's director in 1944 and succeeded Edwin Smith as editor of the quarterly journal *Africa*, both the organization and the journal had suffered eclipse and suspension during the war. His task was to build up an international fellowship of Africanist scholars versed in linguistic and ethnographic skills. Frans Olbrechts from Brussels, Vinigi L. Grottanelli from Rome, Germaine Dieterlen from France, together with Portuguese, Spanish, and German scholars, acted together with Max Gluckman as council members in an amity and purposefulness that achieved much. Publishing in French and English, the circulation of *Africa* grew to 2,300 by 1970. At the same time other vehicles of African scholarship also grew. *African Abstracts*, founded to keep track of new information, contained more than one thousand abstracts in its 1969 volume. It was closed then because the sheer scale of operations had grown beyond the scope of the institute. In the same period the Ethnographic Survey of Africa published 82 monographs, 8 handbooks of African languages, and 10 monographs on African languages. Overcoming the tendency for colonial boundaries to circumscribe the range of scholarship, the International African Institute developed international research: The North Bantu language survey was a partnership of British, French, and Belgian linguists, the Africa marriage survey was conducted by a team of anthropologists from the same countries, the Fulani research project was the product of Franco–British collaboration. With the growth of African studies in the world, the International African Institute saw new tasks for itself. One was to help the new African universities by keeping research and teaching staff in touch with each other over the conti-

nent. For ten years beginning in 1959, with the support of the Ford Foundation, it organized international seminars in Africa and published an important series of books on issues of common African interest.

These bare figures and dates suggest the productive energy that Daryll Forde poured into his work. Accordingly, African anthropology held a dominant place in British and world anthropology through its volume and high theoretical initiatives, both nourished by Forde's entrepreneurial talents and scholarship.

FORTES, MEYER

Meyer Fortes, who was William Wyse professor of social anthropology at Cambridge University from 1950 to 1973, is best known for his work on kinship and religion in nonindustrial societies. He has also written on anthropological aspects of psychoanalysis. His field research has been conducted largely in Ghana, among the Tallensi and Ashanti peoples, and ethnographic data from his research formed the starting point for most of his discussions. His theorizing, however, has extended beyond these research sites to include all societies.

Born in 1906 in South Africa to immigrant Jewish parents, Fortes was exposed to considerable cultural diversity. As a university student in Cape Town, he became interested in the education of Cape Coloured adolescents, and that concern led to his choice of a doctoral dissertation theme in psychology at University College London: the cross-cultural testing of intelligence. He also did research relating juvenile delinquency in the east end of London to sibling rank, under the sponsorship of psychoanalyst Emanuel Miller (1933).

Bronislaw Malinowski then invited Fortes to join the anthropological seminar at the London School of Economics as a psychologist, and it was in this capacity that C. G. Seligman arranged for him to undertake field work in Africa. One of his earliest ethnographic publications was in developmental and educational psychology (1938). However, stimulated by E. E. Evans-Pritchard, Raymond Firth, and other members of the seminar, Fortes expanded his professional interests to social and cultural institutions. His commitment to anthropology was strengthened by his friendship with Isaac Schapera and by his meeting in 1931 with A. R. Radcliffe-Brown, whose exponent he became after Radcliffe-Brown died in 1955.

Fortes' interest in the connections between political and domestic relations, first exhibited in his two works on the Tallensi, *The Dynamics of Clanship* (1945) and *The Web of Kinship* (1949), persisted through many, often controversial, articles to culminate in the book based on his Lewis Henry Morgan lectures, *Kinship and the Social Order* (1969). Although one of his earliest articles was on Tallensi ritual (1936) it was not until 1959 that he published *Oedipus and Job in West African Religion*, setting Tallensi beliefs and practices in a broad regional

and comparative context. His various analyses of social institutions, cultural norms, and religious beliefs were all based on principles that are basically psychological, and in his later writings Fortes began to focus more directly on psychological processes. His early studies of sibling rank in the east end of London, his personal experience as a first-born son, and his lifelong association with the theory and practice of psychoanalysis were synthesized in his papers on "The First Born" (1974) and "Custom and Conscience in Anthropological Perspective" (1977).

Fortes said that his instinct was "to shy away from methodological discussion" (1961, p. 211), but this preference displayed itself in a distinctive style of exposition rather than in an effort to avoid using or generating anthropological theory. His achievements as a descriptive ethnographer are manifold; he has made a substantial contribution to the ethnographic mapping of west Africa. But the categories used for description, though derived largely from the cultures themselves, are also partly of Fortes' own devising, and his analysis is innovative rather than conventional, reflecting his own theoretical interests and convictions. His theoretical pronouncements are presented as if they had been arrived at inductively from his field data and are given no explicit abstract formulation; hence his general theoretical position must be reconstituted piecemeal. Indeed, Fortes has stressed the continuous interplay between observation and analysis, between field work and theory, as basic to the scientific status of social anthropology.

Fortes' studies of kinship and political institutions are firmly rooted in the main structural-functional tradition of British social anthropology. Both the societies he studied in detail, the Tallensi and the Ashanti, had political systems described by their members largely in the language of kinship. Appropriately, therefore, Fortes paid close attention to the similarities and differences between what he called the domain of the domestic group and the politico-jural domain. The domain of kinship, extending in these societies well beyond the domestic family, is characterized by a rule of amity or prescriptive altruism, but this rule operates with greatest moral force in domestic relations, while in the politico-jural domain more emphasis is placed on rights and duties. This contrast applies even in societies, like that of aboriginal Australia, in which the widest political order is a kinship polity.

In all domains, a key concept is that of complementary opposition. It is realized in the opposition between patrilineal and matrilineal kin relations or in complementary filiation, whereby a patrilineage is differentiated internally and linked externally by matrilineal connections. Domestically, there is complementarity in the socialized roles of men and women. Fortes also distinguished between descent, a jural concept whereby a person may be linked to others through specific types of genealogical ties, and filiation, the familial linking of a person to a parent by virtue of birth under socially accepted conditions. The two contrasting domains of the family, with its moral imperatives, and of the polity, with its jural imperatives, work together to produce some kind of balance, and in many nonindustrial societies, are united by a polysegmented lineage structure.

Fortes' analysis was typically neither strictly static nor strictly diachronic. He paid relatively little attention to long-term trends but pioneered the analysis of what came to be called the developmental cycle of the domestic group. The various forms of household found in a community at any point of time are categorized as different phases in a repetitive cycle of formation, expansion, and dispersion. Filiation, which unites individuals in this cycle, also divides them into opposed generations.

The opposition and unity generated by filiation, as well as by sex and sibling rank, are regulated in customary practice and belief. Here Fortes stressed particularly the relation between a man and his eldest son, crucial because the birth of his first child makes a man irrevocably a father and hence, in many societies, a potential ancestor. The ultimate source of the rivalry between a man and his son is, however, the Oedipus conflict postulated by Freud, for the foundation of every kinship system is the culturally recognized physical bond between a woman and her child. This constitutes the value for which men in successive generations compete, father against son, brother against brother, and husband against wife's brother.

Fortes has maintained that he has only modest theoretical aims, that he has sought merely "to seek out directly observable mechanisms that play a formative part in social structure" (1969, p. 73). But he has often written as if he were enunciating general propositions, and he has been criticized by Rodney Needham, not so much for trying prematurely to construct grand theory as for giving the impression that he had already

done so while asserting merely vague, commonplace generalizations (Needham 1971). Louis Dumont has accused him of reifying descent groups and of treating them as logically prior to the interpersonal kin relations that sustain them (1971). Edmund Leach, less convincingly, has bracketed him with other structuralists who have overemphasized institutional forms and neglected the importance of the decisions of social actors (1961).

Fortes' influence on the development of social anthropology has been direct, through the work of his students at Cambridge, and indirect, through his publications. The introduction that he wrote with Evans-Pritchard for *African Political Systems* (1940) established the analytic categories used by British social anthropologists for the next two decades. His cyclical model of domestic development has been adopted in many branches of social science, and his emphasis on the distinctive features of various interdependent domains has been incorporated into many subsequent analyses of nonindustrial societies. His readiness to use explanatory mechanisms taken from psychoanalysis, and to look at clinical evidence on mental illness, has encouraged many younger social anthropologists to look beyond narrowly circumscribed social limits of data and analysis. *Oedipus and Job* has appeared in several translations and, along with Fortes' other writings on religion, has had considerable influence on the study of religion, particularly with reference to ancestor cults.

FREUD, ANNA

Anna Freud was born in Vienna, Austria, on December 3, 1895. The youngest daughter of Sigmund Freud, she is the only one of his six children to take up psychoanalysis as a profession. She is trained as an elementary school teacher and psychoanalyst and became a member of the Vienna Psychoanalytic Society in 1922. She has practiced and taught psychoanalysis since that time and has also actively participated in the affairs of the International Psychoanalytical Association, of which she is an honorary president.

Anna Freud's education as a teacher was inspired by the methods advocated by Maria Montessori. Her psychoanalytic training during those early years in Vienna, however, was unorthodox. In fact, she herself has described her "apprenticeship" as "a haphazard affair" (*Writings of Anna Freud*, vol. 5, p. 511; hereafter cited as *Writings*). She functioned as Sigmund Freud's companion, nurse, and secretary during his prolonged illnesses, and as his confidante and even collaborator in all matters of psychoanalysis. He was not only her father but also her scientific mentor, who watched over her progress with

obvious delight (see *Letters . . .* 1968; *Sigmund Freud . . .* 1966). As an active participant in the early psychoanalytic movement, Anna Freud was exposed to its struggles as well as its pioneering exponents, many of whom, especially Lou Andreas-Salomé, also influenced her work, as did Dorothy Burlingham, her lifelong friend and co-worker.

Having acquired much of her knowledge in the clinical practice of psychoanalysis, Anna Freud helped to initiate the more formal training of others. In 1926 and 1927 she presented her lectures on the technique of child analysis (*Writings*, vol. 1, pp. 3–69) at the newly founded Vienna Institute of Psychoanalysis and soon thereafter established and participated in the first seminar on child analysis, a regular meeting in which cases were presented, technical innovations described, and theoretical conclusions put up for discussion. In this group, such well-known analysts as Erik H. Erikson and Margaret S. Mahler had their first analytic learning experiences.

Even in these formative years she showed her lifelong interest in applying the findings of psychoanalysis to other fields in the hope of preventing unnecessary suffering and future mental illness in growing children. In 1929, at the invitation of the Board of Education of the City of Vienna, she presented a series of lectures for educators and parents in which she "translated" the complex psychoanalytic hypotheses concerning the role of the unconscious, the child's sexuality, the stages of instinctual development, the Oedipus complex, infantile amnesia, and the beginnings of the superego into ordinary language (*ibid.*, vol. 1, pp. 73–133). In 1937 she organized what is probably the first day care nursery for underprivileged children, run on analytic principles. Here, she and Dorothy Burlingham cared for one-year-old to two-year-old infants who came from families living in the worst slums of Vienna.

In 1938 Anna Freud left Austria for London, where she still resides. During World War II, she established and directed, together with Burlingham, the Hampstead War Nurseries, a residential center for homeless and evacuated children. The daily care of more than two hundred children throughout the war years posed a series of practical and administrative problems—such as the procurement of food, housing, and medical care, and the special training of the staff—all of which Anna Freud undertook. But it also provided her with a unique opportunity to make

new observations, which she recorded (on nights when the German bombers were over London and she could not get much sleep in any event) in monthly reports (*ibid.*, vol. 3). In this setting, she and Burlingham grasped the overriding importance of the role of the mother in the mental life of the developing child. They observed that children can withstand the most gruesome experiences so long as they are with their mothers and the mothers do not show fear. Separated from their mothers, however, children receiving even the best physical care and benign treatment by substitute caretakers will show profound developmental lags.

After the war, Anna Freud founded the Hampstead Child-Therapy Course and Clinic, of which she has remained the director. The organization of the clinic reflects her humanitarian and scientific concerns. It began as a training program for child therapists, and in 1952, the central clinical facilities that provide diagnostic services and analytic therapy to children and adolescents were added. There is, furthermore, a well-baby clinic where at any one time sixty children receive pediatric care and their mothers practical and psychological guidance during the infants' first two years of life. The children then progress to a nursery school for normal children, but the educational department also includes classes for the underprivileged and handicapped children and a special group for the blind.

In this setting both trainees and staff are exposed to a great variety of children at different stages of their development, for Anna Freud believes that "no analyst can consider himself *fully trained* so long as his clinical experience and technical skill are confined to only one age or stage of development" (*ibid.*, vol. 7, p. 217). All of the staff members, in addition to providing services and training, are encouraged to record their findings, pool the knowledge they have gained in such systematic endeavors as the Concept Groups or the Psychoanalytic Index, referred to as "a collective analytic memory" (*ibid.*, vol. 5, p. 484), and participate in the extensive research projects carried out at the clinic.

In addition to her activities at the Hampstead Clinic, Anna Freud has lectured to professional and lay audiences throughout Europe and the United States. For several extended periods of time during 1963, 1964, 1969, and 1970, she was visiting professor at the Yale Law School and Child Study Center. She has received honorary degrees from many universities, including

Clark, Chicago, Columbia, Jefferson, Yale, Sheffield, and Vienna. She was also honored by the White House with the first Dolly Madison award, and in England, she received the award of the Commander of the British Empire.

Anna Freud is the author of several books and more than one hundred papers, which are collected in the seven volumes of her *Writings* (see also Bergman & Freud 1965; Goldstein et al. 1973). Apart from her own writings, she collaborated with Strachey in the preparation of *The Standard Edition of the Complete Psychological Works of Sigmund Freud* (1886-1939) and has been an editor of *The Psychoanalytic Study of the Child* since its inception in 1945.

It is characteristic of Anna Freud's entire scientific career that she not only provided needed services for children and training for child care personnel and child analysts, but also used every opportunity to make new observations, reflect on them, raise new questions, and propose new conceptualizations. Firmly rooted in the traditions of classical analysis, she has always sought and accepted data derived from the direct observation of children in a great variety of settings. She applied what she learned in the treatment room to child rearing and education, the care of the physically ill, handicapped, and orphans, and the child who is subject to legal disputes. In turn, she brought what she learned from these settings back to the psychoanalytic situation. In her own words, she has used every "opportunity to maintain a close connection between theory and practice, to check constantly on theoretical ideas by practical application, and to widen practical handling and practical measures with the growth of theoretical knowledge" (*Writings*, vol. 7, p. 227).

As a consequence of this basic attitude, her work has had a wide influence both inside and outside of the field of psychoanalysis. Its impact was no doubt enhanced by her style of writing—her clarity and lucidity, the felicitous phrase, and the ease with which she can express complex thoughts in simple and generally intelligible language. She always cuts through to the central issue, and she invariably throws new light even on familiar problems. Moreover, Anna Freud writes like the great educator she is, leading the readers from what they can personally observe and know into the previously unknown.

Contributions to psychoanalysis. Anna Freud's work has influenced psychoanalytic theory and technique as well as psychoanalytic research. Her slim book on *The Ego and the Mechanisms of*

Defense (*ibid.*, vol. 2) has had the most profound and far-reaching impact of all of her writings. It is required reading in a great variety of undergraduate and graduate programs in medical and law schools and courses on child development, psychology, and social studies. Translated into many languages, it is read all over the world and is one of those rare books in the history of science that for more than forty years has remained of fundamental importance to the basic understanding of the specific area with which it deals.

Building primarily on Sigmund Freud's revisions of psychoanalytic theory, made between 1920 and 1926, Anna Freud scrutinizes the ego's ways of dealing with the conflicting demands of the instinctual drives, the superego, and reality. She concludes that the defense mechanisms chosen by a person depend on the source of danger and on the developmental level he or she has reached. Thus, the little boy who is afraid of being scolded by his parents begins to berate his puppets and soldiers for their misdeeds (identification with the aggressor). As the child develops, the source and the nature of the danger change, and so do the ego's capacities for dealing with it. For example, the immature ego of the child will simply deny what it fears in action, fantasy, or word. The older child's ego will ward off dangers by restricting its own activities and avoiding anxiety-producing situations—tendencies that are most frequently seen in learning difficulties and the common childhood phobias and fears. The adolescent, who is confronted with an intensification of instinctual impulses, will resort to asceticism and intellectualization.

With this book Anna Freud introduced a new developmental perspective on one of man's basic mental operations that are in part observable in his behavior. She thus opened the way to the following novel findings and approaches:

(1) In studying the general tendencies of the ego at different developmental periods, well-marked mental mechanisms and their exaggerations come into view. While some may produce morbid distortions of character, inhibitions, or neurotic symptoms, others are essentially normal means of dealing with phase-appropriate conflicts. She demonstrated that what is appropriate and normal behavior at a particular stage of development no longer can be so considered a few years later. Conversely, some of the most pathological behavior of the adult not only originates, but has a normal counterpart, in the life of the child. Her book thus provided a bridge from

pathology to the study of normality, a major contribution toward establishing psychoanalysis as a general theory of psychology.

(2) Viewing observable behavior against the background of normal developmental processes, Anna Freud provided a new classification of the mechanisms of defense and new insights into their varieties and combinations. In altruism, for example, she described the positive and valuable aspects of displacement and projection which enable people to form attachments. Having repressed and repudiated their own wishes, such persons can nevertheless gratify them by employing projection and identification and by actively seeking to fulfill such wishes in others.

(3) By postulating that "the proper field for our observation [in the psychoanalytic situation] is always the ego" (*ibid.*, vol. 2, p. 6), Anna Freud opened the way to a whole series of innovations in psychoanalytic technique.

These advances in the technique of adult analysis were preceded by the particular technique of child analysis that Anna Freud introduced in 1927 and which she and her followers have continued to practice and to refine. More than most analysts, she has remained concerned with defining the proper field in which analytic therapy is applicable. She has some doubts about "the widening scope of psychoanalysis" (Symposium . . . 1954, p. 608), and still insists that analytic therapy is most usefully applied to what it originally was designed for—the treatment of neuroses in children and adults. In her repeated discussions of the indications and contraindications of child analysis, she has questioned many of the generally accepted criteria and instead offered one essential consideration: children need treatment when their development in one or several areas has come to a halt, and they need analytic treatment when the lack of progressive development is due to an "internalized" conflict, which by definition is inaccessible to external manipulations.

The determination of what an individual child is suffering from requires diagnostic considerations, to which Anna Freud devoted a large part of her second major book *Normality and Pathology in Childhood* (*Writings*, vol. 6). She found that the usual classification of disorders derived from adult psychopathology is not applicable to the child, and a mere listing of symptoms does not give the diagnostician helpful clues since the same symptom—for example, a sleep disturbance—has very different meanings at different developmental levels, while the same

basic disturbance may be expressed by diverse symptoms. She has therefore introduced a new method of developmental assessment, the diagnostic profile. Based on all aspects of psychoanalytic theory, and giving attention to all constituent parts of the child's personality, the profile is far more than a mere diagnostic aid. It is a practical "instrument which imposes balance, completeness, and comparability—not only comparability in assessment of factors within an individual case and between individual cases, but comparability of *reliable* assessment between analysts, with each other and in time. This is an instrument with many potential uses. These include assessment of change over time, compilation of similar cases, comparison of differing conditions, and as a training aid" (Lustman 1967, pp. 821–822).

The comprehensive assessments that the profile permits led to a new classification of childhood phenomena—from the normal developmental processes and the typical developmental difficulties to the various manifestations of childhood pathology. These in turn opened up a new view of the relationship between childhood and adult disturbances, as well as an emphasis on the "variations of normality."

These methodological innovations reflect Anna Freud's continuing commitment to empirical research. She always advocated the use of "experiments provided by nature and fate" (e.g., *Writings*, vol. 4, pp. 141, 224–229, 510–523, 623–624). Thus she highlighted the role of the mother in the young child's development by conceptualizing the observations made in the Hampstead War Nurseries, where children were separated from their parents. She and Dorothy Burlingham studied the role of vision in normal development by investigating blind children (see *ibid.*, vol. 5, part 1, for the research projects inspired by her).

Her own major theoretical contribution, deriving in part from empirical research, is the concept of developmental lines, a central organizing concept that attempts to integrate the various constituent elements of the personality that previously had been studied in isolation. While she herself has worked out only some of the prototypical developmental lines, the full impact of her concept has not yet made itself felt. Its importance was grasped by Seymour L. Lustman who, stressing the scientific leadership of Anna Freud, stated that the concept gave a new direction to theory building and research (1967). Yet this concept, too, has direct prac-

tical applications. It can provide answers to such questions as when is a child ready for school, and point to specific areas in which teachers can be helpful. In order to arrive at an answer one will look at the lines leading from full psychological dependence on others to emotional self-reliance; from full physical dependence in matters of eating and sphincter control toward responsible management of the body; from egocentricity to companionship; and from play with the mother's body to play with toys and from constructive play to work. Each of these lines is influenced by the instinctual drives, the ego, and the superego, as well as by the external social reality as represented primarily by the important persons in a child's life. Viewing regression as a principle in normal development, Anna Freud would also examine the child's regression rate, the specific circumstances, such as fatigue, frustration, in which a child's behavior tends to fall apart, and how rapidly he or she will do so and regain the previously achieved level of functioning. This overall view of children highlights whether or not they have reached the status required for a particular activity, such as entry into school, and discloses harmonies and disharmonies in their development that would often be less visible without an integrative perspective.

Contributions to other fields. Anna Freud's efforts to apply psychoanalytic thought to the practical problems of child rearing and child care go back to her early days in the experimental day care center for underprivileged children. Subsequently she seized the opportunity provided by World War II to extend psychoanalytic principles to the group care of children. When Anna Freud found that the children's development lagged, that they were slow in overcoming reverses, she "attributed these difficulties to the lack of a stable mother relationship" (*Writings*, vol. 3, p. 220) and accordingly introduced small "family groups," in which about four children were assigned to specific workers who, as substitute mothers, were solely responsible for the physical care of these children. According to Anna Freud:

The result of this arrangement was astonishing in its force and immediacy. The need for individual attachment with the feelings which had been lying dormant came out in a rush and in the course of one week all six families were completely and firmly established. But the reactions in the beginning were far from being exclusively happy ones.

Since all these children have already undergone a

painful separation from their own mothers, their mother relationship is naturally burdened with all the effects of this experience. To have a mother means to them equally the possibility of losing a mother; the love for the mother being thus closely accompanied by the hate and resentment produced by her supposed desertion. (*ibid.*, vol. 3, p. 220)

The children showed all the signs of possessiveness, anxiety, and jealousy that arise when attention has to be shared, and the "formerly peaceful nursery reverberated with the weeping of children whose 'mother' has left the room, for instance, to get something from the next room, and whose absence was mourned as if she would never return. Fights among the children multiplied in frequency and intensity" (*ibid.*, vol. 3, p. 221).

Under these conditions few workers would have had the courage to persist in their conviction, but Anna Freud did. Gradually the children realized that their new "mothers" really belonged to them and the frenzy subsided. "At the same time the children began to develop in leaps and bounds" (*ibid.*).

This example has been given in detail because it demonstrates her capacity to make observations, conceptualize what she observed in terms of her previous knowledge, and not only to find a remedy applicable to the specific situation but at the same time to test her conclusions. In addition, this example illustrates an essential, but frequently overlooked, step in the application of psychoanalysis. Psychoanalytic theory is a complex and large body of propositions. In order to apply it to a particular concrete situation, the overridingly important proposition that fits this situation must be singled out. Anna Freud's simple statement, "we attributed the children's lagging development to the lack of a stable mother relationship," represents the selection of the essential element from a vast body of psychoanalytic knowledge, which would readily lend itself to suggest a variety of courses. Her ability to choose that which is most relevant and appropriate has been characteristic of all her endeavors to translate psychoanalytic theory into actual practice outside of the psychoanalytic situation.

She has lectured to, and written for, medical students, pediatricians, teachers, child care workers, nurses, lawyers, and judges. In each instance, her choice of what psychoanalysis can contribute is deceptively simple. For example, in working out guidelines for legally contested child placements, she put the emphasis on "the

child's need for continuity of relationships," and on "the child's sense of time," which differs radically from that of adults. Her collaboration with Joseph Goldstein, a professor of law at Yale University, and Albert J. Solnit, professor of pediatrics and psychiatry and an analyst, who is the director of the Child Study Center at Yale University, resulted in the small book, *Beyond the Best Interests of the Child* (1973), which in a very brief time has had an enormous impact. The concepts introduced in this book, such as "the psychological parent" or "the least detrimental alternative," have only a few years after its publication become part of the legal language used by courts and legislators in widely scattered countries, many of which are in the process of changing their laws governing adoption and custody assignments.

Her lifelong efforts with pediatricians and nurses, however, have been less successful. Repeatedly she has stressed the physician's readiness to accept the idea that emotional factors influence physical processes and their reluctance to realize that bodily pain and discomfort and medical and surgical interventions have a profound impact on the emotional development of children.

All of her teachings to allied professions have been guided by one basic assumption: the unity of the growing child's personality. Repeatedly she has stressed that physicians and nurses see only the sick child, teachers deal only with the well child, nursery school teachers have contact only with the young child, while high school teachers know little about toddlers. Repeatedly she has questioned the existing divisions along age lines, between education and upbringing, theory and practice—in brief, the specialization of training in the children's field. To remedy this situation she has proposed the establishment of a new profession of child experts, who would be knowledgeable in all aspects of child development and care.

Summary. In her long productive life as an analyst, Anna Freud has made vital contributions to psychoanalysis and allied fields. She pioneered in the development of child analysis and in ushering in psychoanalytic ego psychology. She contributed to the development of psychoanalytic theory and to putting that theory into practice. She has trained several generations of analysts and exerted a direct influence on the far larger number of people to whom she has lectured. For she combines in her own person a unique blend of secure knowledge, a relentless

quest to learn from whatever life has to offer, boundless energy, an independent mind, a willingness to look at facts, and an unyielding commitment to put these into practical efforts to help all children. Her personal impact as an inspiring model has been so great because "she is a benevolent, humanitarian scientist and a scientific humanitarian" (Lustman 1967, p. 814).

FREUND, PAUL A.

Paul Abraham Freund was born in St. Louis, Missouri, on February 16, 1908. He received his

A.B. from Washington University in that city in 1928. In 1938 he graduated from Harvard Law School, where he was president of the *Harvard Law Review*, the zenith of student achievement. After graduation, he stayed on for a year as a graduate assistant to Felix Frankfurter, while he earned his s.J.D. degree.

When he left Harvard, Freund went to Washington as a law clerk to Justice Louis D. Brandeis. As Owen J. Roberts, a member of the Court when Freund was there, said: "In his intimate relation to one of the Justices and to the entire personnel of the tribunal, he had the opportunity to appraise the effect of judicial judgment on varying policies and values, political and economic." That was the beginning of Freund's unbroken commitment to study and analysis of the role of the Court and the constitution in American life.

Following his clerkship at the Court, Freund joined the cadre of bright young men invited to participate in the first Franklin D. Roosevelt administration; young men responding to the needs for creativity and ingenuity that this novel American exercise in national power demanded. There, he served as counselor and advocate, first on the legal staffs of the Treasury Department and the Reconstruction Finance Corporation, from 1933 to 1935, and then as special assistant to the Attorney General, in the Office of the Solicitor General, from 1935 to 1939. He returned to the Solicitor General's office for another tour of duty during World War II, from 1942 to 1946, on leave from the Harvard Law School, where he had been appointed a lecturer in 1939 and a professor in 1940.

The primary business of the Solicitor General's office is to assert and protect the interests of the United States in litigation before the Supreme Court. In the Solicitor General's office, Freund had a command post among those engaged in the making of a constitutional revolution, bringing to fruition the conception of national hegemony first judicially conceived by Chief Justice John Marshall, but thereafter thwarted by decades of states' rights and laissez-faire jurisprudence. The great depression and World War II required flexibility in constitutional meaning and a constitutional theory to match the needs for power to meet and resolve successfully both cataclysms. The Solicitor General's office, with Freund as an intellectual leader, proffered the necessary arguments and convinced what was at first a reluctant, but later a willing, Supreme Court to bring about

the necessary constitutional changes. As advocate before the Court, Freund had the opportunity to argue to jurists who had had experience in taking his counsel. Brandeis was still a justice when Freund first appeared before the Court. And during Freund's career at the Department of Justice, Felix Frankfurter, his teacher, and Stanley Reed and Robert H. Jackson, under whom Freund served in the Solicitor General's office, became Supreme Court justices.

Freund participated in oral argument or in writing briefs in a multitude of cases, some of which still find their way into the law school casebooks and which provided a background of experience that surely enhanced his teaching of them: *United States v. Carolene Products* (304 U.S. 144, 1938), where Justice Harlan F. Stone first adumbrated the distinction between economic legislation, which the Court should treat with great deference to the legislative will, and alleged infringements on civil liberties, which calls for a good deal less obeisance to legislative or executive discretion; *Electric Bond & Share Co. v. S.E.C.* (303 U.S. 419, 1938), in which the government outmaneuvered the public utilities in securing Supreme Court sanction for the Public Utility Holding Company Act; *Coleman v. Miller* (307 U.S. 433, 1939), defined, at least temporarily, a need for judicial abstention from "political questions"; *Tennessee Power Co. v. T.V.A.* (306 U.S. 118, 1939), established the validity of the national government's Tennessee Valley Authority experiment. The cases establishing the constitutionality of the wartime regulation of prices and wages and the validity of the procedures for their effectuation were *Bowles v. Willingham* (321 U.S. 498, 1944); *Davies Warehouse Co. v. Bowles* (321 U.S. 144, 1944); *Yakus v. United States* (321 U.S. 414, 1944). These are but a few examples of a very long list of important Supreme Court decisions in the shaping of which Freund played a role as advocate.

The range of cases revealed a catholicity that has always typified Freund's legal interests. Not all the cases in which he participated, of course, were so fundamental. What may have been his first argument before the Court concerned the question whether a jigsaw puzzle was a game within the meaning of a provision of the tax law. Freund contended that it was and lost (*White v. Aronson* [302 U.S. 16, 1937]).

After the war, Freund abandoned the career of barrister and returned to his role as teacher at the Harvard Law School, where he remained,

except for occasional leaves, until his retirement in 1976. He was appointed Fairchild professor in 1950 and Royall professor in 1957. In 1958, he received the accolade of a university professorship, the Carl M. Loeb chair. This gave him the opportunity to expand his student audience beyond the law school to the undergraduates of Harvard College. This was a recognition by the university that while the law was Freund's profession, he infused its content with insights from wide learning in literature and poetry, philosophy and art, and even from the sciences. His mission, however, was more to bring an understanding of the role of law in a democratic society to undergraduates and graduates alike, than to bring these other subjects to the attention of students of law. From 1946 through 1976, Freund was, in the phrase so frequently invoked by his faculty brethren, the "quintessential teacher." Even during his teaching days he was described by *Time* as a "legend" among law teachers.

Twice he left the classrooms of Harvard during his tenure there: Once to serve as Pitt professor of American history and institutions at Cambridge University (1957/1958); once to be a fellow at the Center for Advanced Study in the Behavioral Sciences, in Palo Alto, California (1969/1970). He also became the director of the Salzburg Seminar in American Studies, where American jurists and scholars taught seminars in American law to European students, during summer sessions. He was a particularly appropriate director for such studies since, at the Harvard Law School, he served for many years as chairman of its program of graduate studies.

In the fall of 1971, Chief Justice Warren Burger, as chairman of the Federal Judicial Center, appointed a committee to study the case load of the Supreme Court and to make recommendations as to what steps should be taken in light of its discoveries. Not unnaturally, as the nation's leading scholar on the Supreme Court, Paul Freund was appointed chairman of the study group, which reported in 1972 that the Court's process of selecting cases for adjudication was swamping it and seriously detracting from its capacities to render judgments and opinions in the cases that it undertook to decide. *The Report of the Study Group on the Case Load of the Supreme Court* (1972) recommended the creation of an intermediate court to pass on petitions for review and to undertake resolution of some of the cases appropriate for additional

review but not calling for Supreme Court judgment. Instead of calming the surprising furor over this fairly technical subject, the *Report* exacerbated it. The report was never effectuated, but the issue it addressed and the resolution of it remained a matter of controversy, with justices of the Court frequently taking to the hustings to defend or attack the study group's proposals.

Like two of his predecessors and mentors at the Harvard Law School, Thomas Reed Powell and Frankfurter, Freund's commitments to legal scholarship largely invoked the oral tradition, outside the classroom as well as within it. He has written no treatises and but a single monograph. His subjects, the Supreme Court and the Constitution, do not lend themselves to encapsulation in one or two volumes. For one who had, what he once described in another as, "a dialectical mind—recognizing principles in collision," it was not possible to write a pseudodefinitive elucidation of the ever-changing constitution and the everchanging causes of the changes. Even his myriad articles have been largely derived from the spoken word. Three of his books—a fourth is a constitutional law casebook which he coedited with colleagues—*The Supreme Court of the United States* (1961), *On Understanding the Supreme Court* (1948), and *Religion and the Public Schools* (1965)—all derive from lectures. He was also the editor of *Experimentation With Human Subjects* (1970).

Freund was in demand everywhere that there was a gathering to discuss and analyze the intellectual issues of the law, and particularly where the subject was the Constitution, the Supreme Court, or its justices. And he responded to these demands with a generosity that has marked no other constitutionalist. His talks ranged from the Jefferson lecture, delivered at the instance of the National Endowment for the Humanities to a prestigious audience of Washington dignitaries, to conversations with small groups of students at the almost infinite number of law schools where he was making his substantial contributions to their extracurricular programs. Freund was a professor at Harvard, but he in fact served as teacher to law students everywhere.

Nor was his service to the life of the mind limited to his classroom teaching or his discourses on important subjects in lecture halls all over the nation. Thus, he was, *inter alia*, president of the American Academy of Arts and Sciences; vice president of the Massachusetts

Historical Society; a member of the Council of the American Law Institute; a member and chairman of the Harvard Society of Fellows.

Like the other truly great legal essayist of our times, Judge Learned Hand, his name came to the forefront as a nominee for the Supreme Court every time a vacancy on that Court occurred. It has been said that President John F. Kennedy, among whose campaign advisers he was numbered, failed to appoint him as successor to Felix Frankfurter because Freund had declined Kennedy's tendered appointment as Solicitor General of the United States. That Freund was never nominated to the Court should come as no surprise. Justices of the Supreme Court get there largely because of their political contributions or as reward for services on lower courts. Scholarship has never been a qualification for that high office. The only two justices to be appointed directly from an academic chair to the Supreme Court have been Felix Frankfurter and William Howard Taft, the first a close political adviser to Franklin Roosevelt and the latter a former president of the United States. The failure to appoint Freund has proved a great loss to the nation, for the Supreme Court has suffered during the Warren and Burger years primarily from the absence of just such scholarly credentials as Freund would have brought to it.

The great bulk of Freund's work has been all but buried in law reviews and in many volumes of collected papers and speeches where it tends to escape the study of many scholars and jurists because his name is not to be found on the spines of the printed volumes or in the catalogues of the libraries that contain them. The Freund canon will someday be collected and published so that future generations are not denied the wisdom and counsel he offered his contemporaries.

On retirement from the Harvard Law School faculty in 1976, Freund turned to completion of a volume of the history of the Supreme Court, the volume devoted to the period of the Hughes Court. Freund, at the time of the creation of the Oliver Wendell Holmes Devise project—the writing of a history of the Supreme Court—was appointed editor in chief of the multivolume series. As with all his work, Freund has been conscientious about the task, a real editor not merely a titular one. Here, as elsewhere, he has raised the quality of the writings of others, to which he has contributed without stint. When brought to fruition, the history will be a re-

markable tribute not only to Oliver Wendell Holmes, but to Paul Freund as well.

Law professors, even the greatest of them, are not the stuff of history, unless like Joseph Story they are both jurist and professor at the same time, or like Justices Holmes, Stone, Frankfurter, and William O. Douglas, they move directly or indirectly from the chair to the bench. It is not that law professors do not affect the course of legal history as much as their legal colleagues on courts, in legislatures, and as executive officials. It is rather that their effects are more subtle and less palpable. As Frankfurter once put it: "The ultimate accomplishment of a thinker is found not in his books nor in his opinions but in the minds of men." Certainly the accomplishments of Paul Freund are to be found in the minds of many men. His is a life of teaching: at Harvard University, where thousands of the brightest and best students were exposed to his wisdom; to Supreme Court justices, governors, cabinet officers, senators, and congressmen; and, not least, to his professorial colleagues, who came to Freund for advice and counseling. And his writings afford light to thousands whom he has never met. As a teacher, however, he left no cult, he taught no dogma. His faith was compassion; his formula was intelligence; his profession was honesty; his weapon was wit; his goal was civility.

FRIEDMANN, GEORGES

At the time he entered the École Normale Supérieure in 1923, Georges Freidmann (1902–1977) was 21 years old. Not long before, in 1921, the French Socialist party had undergone its split at the Congress of Tours. The two par-

ties, one socialist, the other communist, did not attempt an alliance until fifty years later, and at the time Friedmann died there was every indication that the alliance of these parties would form the next government of France. During those fifty years, communism ran its course in the Soviet Union. Its destiny would first enrapture and later disenchant the European intelligentsia of which Friedmann was an eminent member.

At the École Normale, he played the older brother to Jean-Paul Sartre and Claude Lévi-Strauss, and in her book *The Mandarins*, Simone de Beauvoir evokes this wary, uneasy figure. The first temptation for this scion of solid middle-class Jewish parents was literature, and in three years (1930–1932) he published three novels (which he never allowed to be reprinted) which traced the portrait of an adolescent in search of his own way. He had learned how to write, and all of his sociological works were marked by a quality and clarity of expression rare among sociologists. Having passed his advanced examination in philosophy, he taught at the lycée of Bourges during 1929/1930. Then he became a research assistant at the Center for Social Documentation of the École Normale Supérieure, an early version of the social science sections of the Centre National de la Recherche Scientifique (CNRS).

This was the epoch when three currents marked French thought: surrealism, existentialism, and Marxism. Friedmann's allegiances were with the last. He collaborated on the reviews *Clareté*, *Europe*, and *L'Esprit* (1926/1927) with Pierre Morhange, Norbert Guterman, Henri Lefebvre, and Georges Politzer. This tiny group initiated the intellectual debate on Marxism in France—a debate that had not yet been widely disseminated. Two highly polemical books came out of this period: *Problèmes du machinisme en U.R.S.S. et dans les pays capitalistes* (1934) and *La crise du progrès* (1936). These two books laid the foundation for all of Friedmann's thinking.

In the first, he showed the consequences of the division and mechanization of labor for the life of workers. The Soviet Union, by proposing five-year plans that were debated in factories and collective farms, permitted laborers to overcome the disastrous effects of the parceling out of specific tasks. The standard of living increased. For the intelligentsia of the West, there appeared to be few shadows on the far side of Europe, while all seemed gloomy in the capital-

ist countries, which were immersed in great crises. In 1930 a translation of Henry Ford's *Progress* was published in France; it justified Frederick W. Taylor's system of time and motion efficiency studies, promoted "scientific management," and offered a vision of a brilliant future for free enterprise societies. To this book and to others of a similar philosophy, Friedmann responded with his virulent *La crise du progrès*, a severe, well-documented depiction of the seven plagues besetting the kingdom of silver. Here the author took on not only labor as such, but the entire economic and financial structure of capitalism.

In the meantime, Friedmann was offered the position of instructor at a vocational school where trades such as carpentry and cabinet-making were taught, and for a start, he apprenticed himself to learn machine tools. At the same time, he conducted investigations on the evolution of labor, learned Russian, and traveled several times to the Soviet Union. Based on these travels, he wrote a book that quickly acquired notoriety, *De la Sainte Russie à l'U.R.S.S.* (1938). Here he set himself at a distance from the Soviet Union, while etching a picture of rare precision and discernment. His criticisms of the Soviet Union, intermingled with high praise, were not accepted by his French Marxist friends; Politzer and Lefebvre would not spare him, as he himself recalled in a footnote to his final book, *La puissance et la sagesse* (1970).

Then came the war. Mobilized as an officer in 1939/1940, he returned after the Armistice to the region of Toulouse, where he joined an underground network of the resistance. Of this period, when he saw many friends (notably Marc Bloch and Maurice Halbwachs) tragically die, he wrote:

The War and the Occupation, shattering the orderly confines of my bourgeois existence as an academician, stirring a new life in insecurity and sometimes in danger, at the low point of a frightful period, were marked by the worst degradation and depravity; but they also caused me to discover in people I did not know, through unforgettable experiences, courage, modesty, benevolence, the active love of my neighbor. During halts for retreat and meditation, the flame was suddenly rekindled. The four "dark years" were, I daresay, great years in my life, in the absence of which what was least mediocre in me might perhaps have been lost for good. . . . (1970, p. 363)

After the liberation of France, he was named inspector general of technical instruction. In

1946, he published his major work, *Problèmes humaines du machinisme industriel*. In this compendium, published close to twenty years before the pathbreaking *Work in America* (Special Task Force . . . 1973), Friedmann raised what would constitute, for two decades, the problematics of the sociology of work. He resumed his discussion of Taylorism and of Fordism, a discussion enriched and deepened by twenty years of reflection and observation, and by intimate acquaintance with what was being done and published in all the industrial countries. In this book, he also introduced Europeans to the most recent works in American social psychology, adding to them a critique that is always subtle in its nuances. To some, he recalled that "human relations" and "industrial relations" always played their part inside global social structures; to others, for whom all that mattered were changes in the macrostructure, he emphasized that these would be swallowed up if the microorganisms of change were not brought into play.

From 1946 to 1960, he occupied the chair of history of labor at the Conservatoire des Arts et Métiers in Paris, a celebrated engineering school, where he taught evening courses, thus permitting workers and technicians to become familiar not only with history, but with contemporary sociology. From 1949 to 1951, he was also director of the Center for Sociological Studies, a section of the CNRS. He appealed to young scholars, to whom he never stopped offering advice and support, and in this position he was one of the great sponsors of sociology in France. Under the common rubric of investigating the problems of industrial society, he enlisted among his collaborators V. and F. Isambert, J. R. Tréanton, J. D. Reynaud, R. Pagès, A. Touraine, M. Crozier, E. and V. Morin, J. Dumazedier, S. Moscovici, B. Mottez, J. Frisch-Gauthier, L. Brams, H. Mendras, R. Barthes, Marie Thérèse Basse, and Jacques Dofny. They went with Friedmann first to the Center for Sociological Studies, and later to the École Pratique des Hautes Études, a graduate research center, of which he became a director in 1948. He also formed, with Fernand Braudel and Charles Moraze, the editorial board of the celebrated journal *Les Annales*.

During his career, he published two more books on the problems of industry, *Où va le travail humain?* (1950) and *Le travail en miettes* (1956), in which he continued to explore the same themes. From 1950 on, he placed

his emphasis on the rotation of workers to different places on the assembly line, on the multivalence of machine workers, and on the enlargement of their tasks. Friedmann regarded all of his experiences—whether in a factory, a restaurant, or an office—with an inquisitive, enthusiastic eye. His books were translated into English, Italian, German, Spanish, Polish, Serbo-Croatian, Czech, Slovakian, Dutch, Portuguese, and Japanese. It therefore was no surprise when the International Sociological Association, of which he had been a charter member, elected him its third president at the time of the Amsterdam Congress (1956). Shortly afterward, the United Nations Educational, Scientific and Cultural Organization named him president of the Latin American faculty of social sciences in Santiago. In 1959 and 1961, he published two volumes of his *Problèmes d'Amérique latine*.

Then, in 1961 and 1962, he published *Traité de sociologie du travail* with the assistance of Pierre Naville and Jean René Tréanton. It involved the collective efforts of students who had sat in on his graduate seminars for ten years and had become his friends. The book was a compendium of research and it traced the outlines of French industrial society in particular, but with reference to other industrial societies. In the same period, he presided over the founding of the journal *Sociologie du travail* (1959).

After 1960, he abandoned the field of work and helped establish a Center of Studies of Mass Communications, with E. and V. Morin and R. Barthes as his principal collaborators. The center undertook to publish a journal, *Communications*, which rapidly became authoritative in this field.

Georges Friedmann was Jewish in his origins and an agnostic in practice, but he wrote a penetrating book on Israel, *Fin du peuple Juif?* (1965). In the preface, he wrote:

In 1940, I received a first shock on discovering the unsettling importance which the fact of being labeled "Jewish" could have for me. I have kept the paper with the letterhead of the Secretariat for Public Education of the Vichy government, informing me that from now on I would be relieved under particular laws. Unless, they suggested to me, I were to beg to be granted special treatment, I could not go on exercising my trade as a professor. I had up to that time been one of those whom the Jewish faithful call "marginal" or "peripheral" Jews. Born in Paris into a family detached from traditional observances, in which "mixed" marriages created no problem, profoundly assimilated to France, to its

styles of life, its culture, I had been surrounded by friends and colleagues, not one of whom raised questions about my "ethnic" origins or my religious beliefs. I had never, though designated as Jewish by my name, suffered from antisemitism. I had never felt, even in school, discriminated against in French society. I had never participated in a rite at a synagogue and, I honestly believe, never met a rabbi.

The theme of the book is a questioning of the history of the Jewish people and the creation of a modern state. Did the history of that state, which was just beginning, put an end to the history of the people of the Diaspora? Those who knew Friedmann knew that he felt solidarity with the destiny of these people. He concluded his preface by underlining: "I have felt all that I owe and wished to pay a part of my debt."

In 1970, he finished his last book, a kind of testament, entitled *La puissance et la sagesse*. It is a curiously composed book, with biographical passages and restatements of such essential themes in his work as the concept of technological civilization, the destruction of the natural milieu, science, and the spiritual revolution. This is followed by a long reflection on Christianity, Judaism, Hindu spiritualism, Marx, and subsequent varieties of Marxism and Communism. He repeated what he never stopped saying, that no revolution in structures would succeed unless it was accompanied by what he called true education: "man taking himself in hand."

Friedmann died suddenly. He was in his home, rereading the maxims of Chamfort, a French moralist of the eighteenth century, that century of Enlightenment to which Friedmann was greatly indebted (he was similarly indebted to Leibniz and Spinoza, to whom he had devoted his doctoral thesis [1946b]).

In the foreword to a collection of essays entitled *Une nouvelle civilisation* (1973), which constitutes an homage to Friedmann, these words can be read: "The school of Durkheim had withered during the period between the wars and, after World War II, there was a kind of sociological 'no man's land.' . . . After the Center for Sociological Studies was created, it achieved its high point with G. Friedmann."

Friedmann had been a forerunner. Well in advance of a large part of the sociologists and economists, he had rejected every doctrinal orthodoxy that would exclusively connect the human problems of industrial work to one or other of the great economic and political systems of his time. He had spoken since before

the war of "technological civilization." Long before the phrase came into use, he discovered the ecological problem that was posed by the "technological milieu" and the degradation of the "natural milieu."

His works have also been defined as the association of the observations of a historian of the present with the queries of the moralist of all times. Rarely have we seen a mind so ample in its breadth, never ceasing until the last day to question, to place in question all over again, his own values, the results of his labors, his ideals. He probed the boundaries of old and new societies, discarded the vague and the conventional, and was always happy to see those who followed him undertake new research with the spirit that always animated his own.

FRIEDRICH, CARL J.

The story is told of a colloquium at Harvard University in the early 1940s, at which one scholar after another told his colleagues what the "Unity of Science" meant to him. Finally, Carl Joachim Friedrich, who was to succeed Charles H. McIlwain as Eaton professor of the science of government at Harvard, answered by reading the entries appearing in the library card catalogue under his name. Even then, Friedrich's works comprised efforts in the disciplines of history, philosophy, jurisprudence, economics, and communications, in addition to political science proper, which he conceived in Aristotle's terms as "the master science." During the next three decades of his very active life, he deepened his scholarship in all these areas, extended it to aesthetics, and applied it successfully to the practical concerns of constitution building at all levels—e.g., winning, together with Talcott Parsons and others, the greater Boston contest, and helping to design constitutions for the Federal Republic of Germany, the Commonwealth of Puerto Rico, and the European Community. Carl Friedrich was a man of enormous, almost overwhelming erudition, whose keen awareness of the problems of communication (he always assigned Aristotle's *Rhetoric* in his course on the history of political theory) kept him from being obscure or arcane.

Friedrich was born in 1901 in Leipzig. His father, a distinguished professor of surgery, had pioneered a technique for the excision of the lung, and during the Balkan Wars, he developed a new method for cutting out wounds. His mother was the daughter of a president of the highest judicial court of the second German Empire. Friedrich considered this background an important factor in his intellectual development. He attended the universities of Marburg, Frankfurt, and Vienna, where he studied medicine and heard a course of lectures by Sigmund Freud. The experience of studying medicine led him later to denigrate the alleged methodological advantages of the natural over the social sciences. At the university in Heidelberg he turned to the social sciences and studied under Edgar Salin. He also worked with Alfred Weber; his first published book was a translation of and introduction to Weber's *Standortlehre der Industrie* (1929). It was characteristic of his loyalty to persons and institutions that, in Weber's lifetime, he returned to Heidelberg and participated in the Alfred Weber Institute of

Economics, and also organized and financed the Institute of Political Science, over which he presided for several years.

Friedrich's most important contributions to political science were made in the fields of comparative politics and political theory. He was among the first to write comprehensively about both constitutional democracy and totalitarianism, and his elaborations, refinements, and applications of both concepts were systematic without being procrustean. He thought of these two forms of government as opposed to one another, as suggested by the parallelism of the titles of the two influential books, *Constitutional Government and Democracy* (Friedrich 1937) and *Totalitarian Dictatorship and Autocracy* (Friedrich & Brzezinski 1956) suggest. Never doctrinaire, he adjusted his teachings to changes in the real world and his understanding of it, as reflected in the successive titles of his basic book in this area, from *Constitutional Government and Politics: Nature and Development* (1937) to *Constitutional Government and Democracy: Theory and Practice in Europe and America* (1950; 1968). Similarly, he revised his earlier, pioneering views of totalitarianism, in *Totalitarianism in Perspective* (Barber, Friedrich, & Curtis [1963] 1969).

Friedrich's catholicity of spirit, breadth and depth of knowledge, and ability to communicate with his students both actively and passively—in the sense that they understood him and he understood them—prevented the growth around him of the kind of discipleship that emerged with later European immigrant scholars in the United States, several of whom Friedrich, who had arrived in 1922, helped with their immigration. His influence was widespread, not because he taught a single method or a particular set of substantive views, but because his scholarship and teachings, oral and written, were respected by his colleagues and students. (He liked to address his student audiences as “my fellow students.”) His profound yet comprehensible scholarship combined with considerable organizational and political talents resulted in his elections to the presidencies of the American and international political science associations, the Institut de Philosophie Politique, and the American Society for Political and Legal Philosophy, which he founded to bring together scholars of politics, philosophy, and the law.

Friedrich understood theory to mean “valid generalizations upon observed matter of fact,” and he taught political theory in this sense.

Plato, Aristotle, Cicero, Thomas Aquinas, Althusius, Rousseau, Kant, and Hegel all had arrived at certain generalizations based upon the political “facts” that they had observed, and it was up to the student of political theory and the political practitioner to test or to apply these theories anew. It must have been this understanding of theory that made Friedrich so useful to as diverse a group of practitioners as the creators of the West German constitution and their American military government sponsors after World War II; Governor Muñoz Marín and his associates, who created Puerto Rico's commonwealth status; and the founding fathers of the European communities. He always thought that the plan for greater Boston, which he originated and worked out with the help of Parsons, Walter Bogner, Charles Cherington, and George Walker, was too original to be implemented, although some of its components, like an underground garage, were constructed many years later.

Friedrich, as constitutional consultant, self-consciously placed himself in a tradition that goes back at least to Aristotle. He told his students that as an adviser to the United States military governor of Germany (1946–1949) he was doing exactly what Aristotle and his disciples in the academy had done for the Greek rulers who consulted them. He treated his government clients much as he treated his “fellow” students. He refused to tell them what to do, preferring instead to lay out a number of options and suggesting the probable consequences of each. The choice—whether it was a particular constitution device, a policy, or a course of study—was the responsibility of the client, whether he was a chief of government or a graduate student.

Because he had the gifts of listening and speaking persuasively, he was able to generate innovation in the deliberative groups to which he belonged. Friedrich has been given credit for inventing article 67 of the Basic Law of Bonn, the constitution of the Federal Republic of Germany, which provides for the “constructive vote of no confidence,” according to which parliament cannot dismiss a chancellor unless it first agrees by a majority of its votes upon his successor. This original idea could not have been enacted into constitutional law had he not been as authoritative and persuasive as he was, in German, English, French, and Italian, both in small groups and to large audiences, as well as with the readers of his publications. Similarly,

his many contributions to the constitutional construction of the European community, starting with *Studies in Federalism* (Bowie & Friedrich 1954), in which a number of scholars extrapolated from the range of possible federal functions exhibited in five historic federal systems (Switzerland, Germany, Canada, Australia, United States), and concluded with *Europe: An Emergent Nation?* (1969). In this as in his other works on federalism, he was able to draw on his profound historical knowledge, going back at least to his second published book, which included a one hundred page introduction on the "consociational" theory of Johannes Althusius of the early seventeenth century (1932). Like his predecessor as Eaton professor, Charles H. McIlwain, Friedrich helped to reintroduce historical considerations into American political science, which had developed an ahistorical or even anti-historical bent after World War I. At the same time, he took full intellectual advantage of contemporaneous concerns, for example, in his works on bureaucracy, which helped provide a foundation for later scholarship on bureaucratic politics and organization theory.

To his work as a practical consultant—an adviser to practical men of affairs—Friedrich brought not only his profound historical knowledge, but also philosophical depth and conviction. He was firmly grounded in the Greek and Roman classics, and in his courses he always included lectures on the political theory of the Old and New Testaments. He approached every practical problem of government with a careful, indeed a cautious, weighing of normative concerns. Thus, his writings on foreign policy and on problems of war and peace were informed by his Kantian preferences, as expressed in *Inevitable Peace* (1948). But in this as in all things scholarly, he was scrupulously fair to other philosophical persuasions, e.g., producing one of the clearest English editions not only of readings in *The Philosophy of Kant* (1949), but also of its counterpiece, *The Philosophy of Hegel* (1953), in the introduction to which he declared his own lack of philosophical sympathy with Hegel.

Because of the enormous scope of his work, Friedrich's influence is hard to measure—a circumstance that might have pleased him, because he remained skeptical, in the Aristotelian sense, about measurable precision in politics, and was therefore a critic of quantitativism in the social sciences. He wrote more than forty books, edited more than thirty, and was the

author or coauthor of more than two hundred articles, not counting book reviews. During 45 years at Harvard and 15 at Heidelberg, he taught thousands of students, including future prime ministers, secretaries of state, diplomats, leaders of major political parties in Europe and North America, and other leading public servants, in addition to scores of prominent scholars of successive generations. He was too learned and too wise to be either monocausal or monothematic in his teachings. His influence was exerted more generally through his thorough, impeccable scholarship, the critical brilliance with which he could apply his knowledge to novel problems in original ways, and his lasting commitment to what he called the "humanist core of constitutionalism." Its "detailed formulation," he wrote,

will vary from community to community . . . [but will] contain . . . a common core: the recognition of man's self as a person possessing intrinsic dignity and hence entitled to an opportunity for fulfilling the potentiality of his being. The emphasis may shift from self-preserving to self-asserting and again to self-developing manifestations of the individual human being. Independence, participation, and creativity are universally valued, but their rank order is not fixed nor based on settled, absolute knowledge. Political communities will, therefore, differ in the degree to which they will leave each man alone in the pursuit of his happiness, allow him to participate in the government or undertake in free association with fellow men what is needed for man's self-development. . . . The battle for human rights is a never-ending struggle; we need not hope in order to act, nor need we to succeed in order to persevere. It can be carried forward, if the belief in man which a transcendent justice calls for is maintained as part of the Western heritage. (1964, pp. 115–116)

FRISCH, RAGNAR

Ragnar Frisch was born in Oslo in 1895. His father was the owner of a gold- and silverwork firm in Oslo, and it was assumed that Frisch would follow the family tradition. He started as an apprentice in a gold- and silverwork shop in Oslo, completing his probation work and receiving a certificate as a goldsmith in 1920. At the same time, he also attended the University of Oslo, where, according to his own description, he studied economics because it seemed the shortest and easiest subject. He graduated in economics in 1919. In the 1920s, he went abroad to study economics and mathematics more earnestly, spending nearly three years in France. In 1926 he received his PH.D. from the University of Oslo on a mathematical–statistical subject, semi-invariants and moments used in the study of statistical distributions. He lectured at several foreign universities, including Yale, having established himself as a pioneer in the application of mathematical and statistical methods to economic research—i.e., the trend that Frisch named “econometrics.” In an effort by members of the Norwegian Parliament and others to bring him back to Norway, a new professorship was established at the University of Oslo to which Frisch was appointed in 1931. He held the chair until his retirement in 1965, and continued his research and writing up to his death in 1973. His position as a leading economist of the world was symbolized in 1969 when, jointly with Jan Tinbergen, he was the first to receive the Alfred Nobel Memorial Prize in economic science.

Frisch's publications are not fully representa-

tive of his activities or of his influence on the development of economics. He has published only a few books and a number of scientific papers. Some represented significant advances in the application of mathematical and statistical methods to economic research and have become "classics" in the literature. However, he probably influenced research trends just as much through his lectures at various universities, through the circulation of research memoranda, lecture notes, and various drafts that he more often than not did not trouble to polish and publish in conventional form. (When he had clarified a problem for himself, he was more interested in taking up new problems than in preparing final versions of preliminary manuscripts.) Through his organizational activities, too, he greatly stimulated the development of econometrics. A founder and driving force in the organization of the Econometric Society, which has become one of the most important scientific organizations in economics, he was also, for a long period, the editor of the journal *Econometrica*.

When Frisch became a student at the University of Oslo, economics was not a well-developed subject in Norwegian academic teaching. However, he studied some of the old masters very carefully, especially David Ricardo, Alfred Marshall, and Knut Wicksell, and continued to hold them in high esteem. In his teaching he prepared notes on Marshall's *Principles* (1890) that were based on a very close reading of Marshall's work and that were used for decades in teaching in Norway. He also wrote one of the most penetrating analyses of Wicksell's theories. Nevertheless, he soon felt that a new start was necessary in economics to free it from vagueness and obscure reasoning and to establish it as a science more similar to the natural sciences. The main instruments would be the use of mathematical methods and statistics. After his appointment at the University of Oslo, economics became quite different; the introduction of methods, created largely by Frisch himself, soon destroyed the notion that economics was the shortest and easiest course of study.

Through his teaching and research, Frisch strongly influenced all economists educated at the university. Several of his students have held central positions in government and public administration. At times, Frisch also took an active part in the public discussions of economic policy and—particularly in the later years—from

a radical position. After World War II he also served as an adviser to governments in developing countries, especially India and Egypt.

When Frisch started to study economics, the theory of consumer behavior was characterized by obscure reasoning and concepts devoid of operational content. At the same time, quantification based on various kinds of empirical data seemed feasible and attractive. This is probably why Frisch turned to this field in his first important work, "Sur une problème d'économie pure" (1926). Attempting to establish a new and firm basis for the theory and empirical work, he constructed a system of basic axioms from which the other parts of the theoretical structure could be derived by means of strict logical and mathematical deductions. For instance, the existence of a utility function was derived as a consequence of the axioms rather than being directly postulated, and its properties, including its degree of determinateness, were also derived from the axioms. In this way one could rid the theory of much of its earlier obscurity. Frisch was the first to use the axiomatic approach in this field, and though his article was long ignored in the literature, today it must be seen as an early model of a "modern" approach to economic theory. Consistent with his aim of turning economics into a science based on measurement and quantification, Frisch did not rest with an abstract formulation of the theory. Even in this early work, he linked the theory to empirical studies aimed at measuring the main characteristics of the utility structure of consumers. There is a logical thread from this early work through his *New Methods of Measuring Marginal Utility* (1932), to his well-known article "A Complete Scheme for Computing All Direct and Cross-demand Elasticities in a Model With Many Sectors" (1959). This article proposed a method for estimating all the elasticities in a complete system of demand functions—a very large practical task because of the many cross-influences of some commodity prices on the demand for other commodities. Frisch's ideas in this field have formed the basis for numerous practical applications in connection with large-scale planning and forecasting models.

Frisch also contributed to the other main branch of microeconomics, production theory. In his lecture notes from the 1920s on, he improved and expanded production theory by carefully distinguishing between technological

and economic concepts. The main part of his text was published in English in 1965 and is now a standard reference work. Had it been published in an international language when it was first presented in Norwegian, it would have had a much greater impact upon the development of production theory. As early as the 1930s, Frisch included in his Norwegian lecture notes several aspects of dynamic production theory and of the theory of production with several outputs. His approach in the latter field pointed in the direction of what has later come to be known as mathematical programming—i.e., a mathematical approach to optimization for problems in which there are side conditions not only in the form of equations, but also in the form of inequalities.

Influenced by the economic crisis of the 1930s, Frisch turned toward macroeconomic problems. The first prerequisite to the construction of consistent and quantifiable theories in this field is a well-developed national accounting system, and Frisch contributed greatly to this field in the 1930s and 1940s, with regard to both basic principles and to detail. On the basis of macroeconomic conceptions, he soon developed fully dynamic, determinate trade cycle models, the most famous of which was presented in "Propagation Problems and Impulse Problems in Dynamic Economics" (1933). He also took an active part in discussions of economic policy in the 1930s. In several ways his ideas resembled the "Keynesian" ideas developed in England and other countries. Directly, and through some of his students and associates, he influenced Labour party policy, first its policy on the depression after the Labour party government was formed in 1936, then its reconstruction policy in the first years after World War II. Throughout there was a close interaction between his theoretical ideas and his contributions to economic policy.

From a methodological point of view Frisch's analysis of trade cycles led to two innovations as well as to a general approach to studying development in terms of a determinate dynamic system. The first was a clarification of the concepts of equilibrium and disequilibrium, statics and dynamics, and other related concepts. Frisch had worked on these problems for several years, but his ideas became internationally known through his brief article "On the Notion of Equilibrium and Disequilibrium" (1936*b*), which has contributed much to methodology

and terminology in dynamic economics. The other innovation was to combine dynamic structural equations with random shocks in explaining the trade cycles (inspired by, and parallel with, works by Eugen Slutsky and G. Udny Yule). Frisch showed mathematically and by simulations how the structural equations of the dynamic system would act as a system of weights, transforming random shocks into wavelike movements very similar to business cycles. Both the theoretical idea and the analytical methods used by Frisch in this regard have become standard elements of modern trade cycle analysis.

Frisch's Nobel Prize citation made specific reference to his "having developed and applied dynamic models for the analysis of economic processes." After World War II much of Frisch's work was related, directly or indirectly, to problems of economic planning. His interest in the field had started, however, in the 1930s, and in 1934 he published an article on "Circulation Planning" that contained many elements of modern planning theory, pointing toward input-output analysis and mathematical programming. The article, however, was concerned more directly with methods of organizing a sort of exchange system outside the ordinary market system, so as to revive economic activity and use the potential production capacities left idle by the depression. The article did not draw interest at the time, partly because of its unfamiliar mathematics, probably also because its theoretical ideas were presented in the context of proposals for practical and institutional arrangements that were artificial, and that could hardly have seemed attractive either to theorists or politicians at that time.

In the 1940s and early 1950s, Frisch developed the methodology of what he called "decision models" for economic policy—fairly large, empirically specified, mathematical models relating economic variables that are the main concern of economic policy, and for which government may have certain targets, with variables that are used directly as instruments to influence economic development (see especially his paper 1950*b*). Later his planning models took a new form, based more on input-output analysis and mathematical programming, with explicit objective functions or preference functions for optimization. His models started a development that has led to practical applications of large-scale models based on input-output systems,

and supplemented with demand functions, equations representing the structure of taxation, and so on, to national budgeting in Norway. He also developed models especially intended for developing countries, and he took a keen interest in the development of planning methodology in the socialist countries in eastern Europe. (In the latter context it is interesting to observe that a long paper by Frisch on an economic planning model was included, in Russian translation, in the second volume of an important series of books on mathematics in economic research and planning which was published in the Soviet Union in 1961.) Much of Frisch's writing on planning models has never been published in final versions, but there exist a couple of volumes with selected papers (1960; 1976). An important aspect of Frisch's writing on economic planning was his emphasis on optimization. As a consequence, he had to tackle the problem of establishing preference functions. For this purpose, he devised various interview techniques. Used for experimental purposes, they have not yet been put to serious practical use. However, similar methods are now used increasingly in various branches of management science (for a survey and for references to Frisch's work in this field, see Johansen 1974).

Quantification, and, in the end, practical applications were constant goals of Frisch's research program. This emphasis had several consequences for the direction of his research. In the first place, he was concerned with statistical and econometric methodology. He was not satisfied with taking over classical statistical methods, which were designed more or less for experimental situations and for measurements of natural phenomena. He soon perceived the complications stemming from the fact that most economic processes were determined by the simultaneous operation of several equations, so that it was difficult to trace the cause-effect direction in an unequivocal manner. In this connection he emphasized the concept of autonomy of economic relationships—i.e., whether a specific relationship in an economic system continues to hold even when other components of the system change. He also pointed out the identification problem in economic relationships—i.e., whether an economic relationship can be detected and estimated on the basis of observations generated by means of sets of more than one relationship. In his *Statistical Confluence Analysis* (1934*b*), Frisch proposed methods of solving some of the statistical prob-

lems raised by the simultaneous operation of several relationships (and at the same time the existence of measurement errors or "errors in variables"). Although his methods have been superseded by others, his perception of the special statistical problems raised by the interactions in an economic system and his approaches to solving the problems, have had fundamental importance for the development of modern econometric methodology.

Frisch's concern for quantification and applications also led him into the field of computational methods. Methods of computations were always part of his statistical and econometric studies, but he became particularly absorbed in computational problems in connection with his mathematical planning models. Since he emphasized optimization, mathematical programming was his main concern. At the time he started constructing large-scale mathematical planning models, mathematical programming methods and computations equipment were not well developed, and he felt that economists themselves would have to tackle many of the technical problems in the field. He developed methods of optimization for quite general situations, involving many sorts of awkward curvatures of functions and forms of feasible sets. His works in this field contain many interesting ideas and insights, but the methods he developed tended to be complicated and unsuitable to full mechanization, and they have seen only limited application.

This survey of Frisch's work has stressed aspects that absorbed his energies over longer periods of time. The resultant picture is necessarily incomplete, for Frisch's important work ranged over many other fields, including, for example, economic welfare theory, index number theory, oligopoly theory, international trade, and population theory. His scientific productivity was great, although only a fraction was ever published. (His best collection of papers was published in Hungary in 1974.) Some of his publications are hard to read and digest, partly because of his preoccupation with computational aspects, a certain tendency to pursue analytically challenging, but economically less interesting, sidetracks, but also because his development of these ideas was outside the main currents or fashions in economics, and moreover, employed his own terminology. The latter fact was, however, partly the result of his great originality. His enthusiasm and ambition in research were almost always far beyond what

could be humanly accomplished in limited time; thus his research career was full of uncompleted projects. Nevertheless, his ideas profoundly influenced the direction of modern economic science and contributed greatly to its great leap forward in the last several decades.

FROMM, ERICH

Erich Fromm, psychoanalyst, has developed his widely read ideas on man and society by integrating psychoanalysis with the humanistic tradition in philosophy, social science, and religion. Throughout his career, he has also been concerned with translating theory into practice as a psychoanalyst, social scientist, and political activist in the prophetic mode. Born in Frankfurt, Germany, on March 23, 1900, he studied psychology, sociology, and philosophy at the universities of Frankfurt and Heidelberg, receiving his PH.D. from Frankfurt in 1922, and was trained in psychoanalysis at the Berlin Institute. In 1932 he published his first articles on social character, proposing the integration of Freud's theory of character with Marx's theory of social forces, thus explaining how people develop the motivation required by a particular economic system and why they are attracted to particular ideas, ideals, and ideologies.

From 1928 to 1938 Fromm was associated with the Institute for Social Research, first at the University of Frankfurt, then at its residence in exile, Columbia University. In 1934 Fromm emigrated to the United States to escape the Nazis and lectured at the New School for Social Research, Yale University, Columbia University, and Bennington College. He later served as chairman of the faculty of the William Alanson White Institute of Psychiatry, Psychoanalysis, and Psychology, which trains psychologists as well as psychiatrists in psychoanalysis.

Fromm first gained a large general readership with *Escape From Freedom* (1941), which explained man's unconscious fear of freedom

and the appeal of authoritarian political systems. This book influenced generations of college students and helped to shape intellectual consciousness in America. He became identified as a leading neo-Freudian, together with Karen Horney and Harry Stack Sullivan. Fromm has written that although the three differ considerably among themselves, they share an emphasis on social and cultural factors and a critical attitude to Freud's theory of the primacy of the sexual instinct.

In 1951 Fromm became a professor at the National University of Mexico, where he founded the Mexican Institute of Psychoanalysis. His main reason for moving to Mexico was his response to a group of socially committed psychiatrists who sought psychoanalytic training from him. For the next twenty years, he spent most of his time in Mexico, traveling regularly to the United States to lecture and give seminars. In 1971 he moved to Switzerland where he has continued research and writing.

Over the years Fromm has developed several key themes, progressively elaborating and refining his ideas. His work may be grouped into four general areas. The first is social character, probably his most original concept, which relates the psychoanalytic theory of dynamic motivation to socioeconomic factors. The second is his revision of Freud's theory of psychoanalysis and psychopathology, with particular attention to the issues of aggression and destructiveness. The third includes his critique of industrial society. The fourth is his analysis of religion and its relation to human development.

Social character. Fromm builds his theory on Freud's concept of the dynamic nature of character traits. Character structure explains actions, thoughts, and ideas; it determines what motivates the individual, what he finds most satisfying or frustrating. Although Fromm accepts Freud's clinical description of character orientations—e.g., the anal or the oral-receptive character, he rejects libido theory as explaining character development.

Fromm holds that, although physiological needs must be satisfied, they are not the basic inner forces that determine man's actions, feelings, and thoughts. He wrote:

Only by considering the specific conditions of human existence, and its inherent contradictions, can we understand the basic human forces and passions. Man is a "freak of nature"; lacking the instinctive equipment which regulates the life of all animals, but gifted instead with reason, imagina-

tion and self-awareness, life becomes for him a problem which must be solved. He has to relate himself to others, to find a new rootedness to replace those roots in nature which other animals have; he must acquire a sense of identity (self) and a system of orientation and an object of devotion. (1955a, p. 379)

Character, for Fromm, is the equivalent of the animal's instinctive determinism, which humans have lost. It is the (relatively permanent) way in which human energy is channeled and structured in the process of assimilation and socialization, to satisfy needs for physical survival—the need to acquire and assimilate things, and for emotional survival—the need to be emotionally related to others for defense, work, material possessions, sexual satisfaction, play, the upbringing of the young, and the transmission of knowledge.

The social character is the nucleus of the character structure and is shared by most members of a culture or a social group. It is not a statistical measure or the traits shared by a majority; rather, it is a functional concept to be understood in relationship to the socioeconomic system, particularly the dominant methods of production. According to Fromm, it is the function of the social character to shape the energies of the members of the society in such a way that their behavior is not a matter of conscious decision whether or not to follow the social pattern, but one of wanting to act as they have to act and at the same time finding gratification in acting according to the requirements of the culture. In other words, the concept of social character describes the molding and channeling of human energy within a society for the purpose of the continued functioning of this society.

For Fromm the family is the "psychic agency of society," the institution with the function of transmitting the requirements of society to the growing child.

As an example of social character, Fromm (1951) has revised Freud's concept of the anal character, which he calls the "hoarding orientation." This syndrome of traits includes inner drives for orderliness, saving, punctuality, and respect for authority that meet the economic needs of the middle class in the nineteenth century. In the twentieth century in advanced capitalistic societies, this social character is being replaced by another type oriented to consumption and to fitting into bureaucratic structures through easy adaptation to their rules and regulations. Such a "marketing personality," accord-

ing to Fromm, reduces the capacity for genuine and profound feeling and thought.

The concept of social character helps explain social conflict as well as adaptation. As conditions change, a social character may no longer fit, and the resulting resentment and frustration transform social cement into an explosive force. Moreover, Fromm holds, social needs can, and often do, conflict with needs stemming from the nature of man and its inherent need for love, human solidarity, and the development of reason and creative talents. Fromm has maintained that insofar as a given society does not satisfy these human needs it will cause a "socially patterned defect."

Fromm first experimented with a new method of studying social character in 1931 at the Institute for Social Research at the University of Frankfurt. His immediate interest was knowing how many German workers and employees were reliable fighters against Nazism. In their political opinions respondents were all anti-Nazis. However, a different picture emerged when Fromm and his co-workers distinguished opinions from convictions rooted in the character structure. Their main interest was not social character in its broad sense, but that aspect most relevant to the Nazi challenge: the authoritarian as against the democratic character. To explore character, Fromm developed an interpretive questionnaire using open-ended questions. These were analyzed and coded as a psychoanalyst examines a patient's communications, seeking the unconscious or unintended meanings that reveal character structure.

That study was never published, but the concept of the authoritarian personality was later made the basis of a study carried out by Theodor W. Adorno and his colleagues (1950) that was influential in social research. In Fromm's point of view, that study did not sufficiently distinguish between convictions rooted in the sadomasochistic authoritarian character and conventional conservative or ethnocentric ideology rooted in a different character structure.

In Mexico, with the collaboration of his students, Fromm initiated a study of social character using a more developed version of the interpretive questionnaire (Fromm & Maccoby 1970). All the adults and half the children in a rural village were interviewed. The researchers explored relationships between character structure and such socioeconomic factors as work, methods of farming, and family relationships. Fromm and Maccoby concluded the

analysis of the data by describing a process of "social selection" by which certain character types, in this case the more entrepreneurial, "productive-exploitive" villagers, were better adapted to modern agriculture and the developing capitalistic society; their ascendancy to power, however, was at the expense of other character types less able to adapt. The result was the emergence of negative character traits and behavior (including alcoholism and violence) in those whose character did not fit. The village study also included experiments in change that demonstrated the importance of taking account of character. This methodology was later used in a study of corporate managers in the United States (Maccoby 1976).

Psychoanalysis and psychopathology. Much of Fromm's professional life has been devoted to the clinical practice of psychoanalysis and the supervision of psychoanalysts. A gifted clinician and teacher, he has inspired generations of students with his combination of penetrating understanding of the unconscious, demystification of concepts, and tough-minded compassion. Fromm stresses the importance of understanding the patient's experience and of using language that expresses experience. He demonstrates this approach to dream interpretation in *The Forgotten Language* (1951), where he describes analysis as liberating creativity and critical knowledge about self and others as well as uncovering psychopathology.

Fromm's relationship to Freud and his work is complex. For ten years he practiced as an orthodox Freudian and was a member of the International Psychoanalytic Association. His criticism of Freud includes both Freud's theory and his tendency to turn psychoanalysis into a semipolitical movement demanding ideological purity (1959). However, Fromm's aim in both his teaching and his critique of psychoanalytic theory has been to preserve and develop what he considers to be the essential elements in Freud's discoveries: the art of making the unconscious conscious and the science of the irrational. Despite his critique of Freud, he believes that many of Freud's orthodox followers have diluted the more critical elements of psychoanalysis, transforming the radical exploration of the unconscious into an overly cognitive "ego psychology."

Fromm (1970) criticizes Freud's model of man as overly determined by his social views, including his belief in patriarchy and his bourgeois view of man as basically egoistic. Because

he limited his criticism of social norms to the area of sexuality, Freud was handicapped in developing the full implication of his discoveries. In reexamining the case history of "Little Hans," Fromm argues that Freud's model of man caused him to misinterpret clinical evidence, and especially to underestimate the importance of the child's pre-Oedipal relationship to the mother. Fromm's view of personality was influenced by Johann J. Bachofen's nineteenth-century work on mother right and the war between the sexes (1849). Unlike Freud, Fromm sees mature love as requiring equality between the sexes.

In rejecting Freud's instinct theories, Fromm conceives of psychopathology as rooted in character. In *Escape from Freedom* he describes sadism and masochism as outcomes of a basic need for relatedness, "springing from the inability to bear the isolation and weakness of one's own self. I suggest calling the aim which is at the basis of both sadism and masochism: *symbiosis*. . . . People are not sadistic or masochistic, but there is a constant oscillation between the active and the passive side of the symbiotic complex. . . . In both cases individuality and freedom are lost" (1941, pp. 158-159).

For Fromm, man's inability to endure feelings of powerlessness, uncertainty, and separateness lead to psychopathology. In *The Heart of Man* (1964), he describes the three main pathological forces of the psyche. Two of them, incestuous fixation and narcissism, are elaborations of Freudian concepts, though presented in a new context of relatedness. The third, *necrophilia*, is Fromm's own discovery, elaborated in *The Anatomy of Human Destructiveness* (1973).

In contrast to Freud's view, presented in his later years, that man's destructiveness is innate and rooted in a death instinct necessarily directed either against the self or against others, Fromm sees destructiveness as a result of unfavorable conditions in the child's development leading to sadism or necrophilia. Sadism is the passion for total control over a living being, including the desire to hurt and torture. Necrophilia is the malignant form of the character structure of which Freud's anal character is the more benign form. It is the ultimate perversion, just as its opposite, *biophilia* or love of life, represents the orientation to unification and integrated growth: "Necrophilia in the characterological sense can be described as *the passionate attraction to all that is dead, decayed, putrid, sickly; it is the passion to transform that*

which is alive into something unalive; to destroy for the sake of destruction; the exclusive interest in all that is purely mechanical. It is the passion to tear apart living structures" (1973, p. 332; italics in original).

For Fromm, mental health is rooted in biophilous development and a productive orientation. Few people are pure necrophiles or biophiles: "The pure necrophile is insane; the pure biophile is saintly. Most people are a particular blend of the necrophilous and biophilous orientations, and what matters is which of the two trends is dominant" (1964, p. 48).

Critique of industrial society. Fromm evaluates society according to whether or not its institutions stimulate healthy character development. From this point of view the normal is not the ideal, since normality may describe a social character with pathological elements. In a number of his books, especially *The Sane Society* (1955*b*), Fromm analyzes modern industrial society—both its capitalistic and socialistic versions, and concludes that bureaucratic-mechanistic institutions cause dehumanization and alienation from self.

For Fromm the total practice of life—at work, in the family, as a citizen, and in cultural activity—influences character development. Human development requires above all a society that satisfies needs for security, justice, and freedom—freedom not only from exploitation and tyranny, but freedom also to participate actively and responsibly, to create and construct.

In 1959 Fromm wrote a manifesto for the Socialist party of the United States, and in 1965 he edited a collection of papers by sociologists and philosophers on socialist humanism. Here and in his essay on Marx (1961*a*), Fromm sees "authentic Marxism" as "perhaps the strongest spiritual movement of a broad, nontheistic nature in nineteenth-century Europe." He views Marx as a humanist whose ideal was "a man productively related to other men and to nature, who would respond to the world in an alive manner, and who would be rich not because he *had* much but because he *was* much" (1965, p. ix). He believes that Marx's concept of man and society has been misinterpreted both by those who felt threatened by his program, and by many socialists, led by those in the Soviet Union, who believed that his goal was exclusively material affluence for all and that Marxism differed from capitalism only in its methods, which were economically more efficient and could be initiated by the working class. Fromm's view of

Marx has been endorsed by a group of eastern European philosophers, especially in Yugoslavia, with whom he has been in correspondence.

Along with criticizing the industrial-bureaucratic systems in both the West and the Communist world, Fromm has been active as a leader of the peace movement. In the early 1960s he spoke out for arms control and disarmament and opposed the war in Vietnam. An advocate of détente, he disagrees with the cold war view of the Soviets as a revolutionary society, arguing that since Stalin the Russians have been supporters of the status quo. In *May Man Prevail?* (1961*b*), he debated the leading American theorists of military and foreign policy, challenging their view of human motivation and their understanding of social change:

Our present thinking is a symptom of a deep-seated, though unconscious defeatism, of a lack of faith in the very values which we proclaim. We only cover up this defeatism by concentrating on the evil of communism and by promoting hate. If we continue with our policy of the deterrent and with our unholy alliances with dictatorial states in the name of freedom, we shall defeat the very values we hope to defend. We shall lose our freedom and probably also our lives. (1961*b*, p. 252)

Fromm has been criticized (Schaar 1961) as a utopian whose view of human nature is overly benign and who does not take sufficient account of the realities of power. In fact, while optimistic about human nature and its capacity for creative growth, Fromm, as much or more than any other psychologist of his time, focuses on destructiveness and the potential for ending human life on this planet. Although his concept of health is demanding and his view of the good society seems sketchy at times, Fromm supports positive moves in the direction of health and sanity, particularly reforms in work and education that stimulate active participation. However, he believes that today, in an age of nuclear weapons and dehumanizing bureaucratic organizations, the danger of destruction from detached and overintellectualized leaders is great. Preserving the world will ultimately require radical changes in the social system to increase economic democracy and affirm a human ideal based on "being" rather than "having."

Religion. As a youth Fromm was a devout Orthodox Jew. When he gave up religious ritual and practice in his late twenties, he did not lose his faith in the truth of religious teachings about the nature of man. Unlike Freud, who saw

religion only as an illusion, a wish for an all-powerful protecting father, Fromm (1950) distinguishes between the authoritarian, infantilizing and the humanistic, liberating aspects of religion. Fromm's view of human development is essentially that of the great humanistic religions: to overcome greed, hate, arrogance, and egocentrism; to develop a strong, courageous, and compassionate heart; to experience the fullest truth, including one's deepest despair, in order to love life more fully.

He wrote:

Mental health, in the humanistic sense, is characterized by the ability to love and to create, by the emergence from the incestuous ties to family and nature, by a sense of identity based on one's experience of self as the subject and agent of one's powers, by the grasp of reality inside and outside of ourselves—that is, by the development of objectivity and reason. The aim of life is to live it intensely, to be fully born, to be fully awake. To emerge from the ideas of infantile grandiosity into the conviction of one's real though limited strength; to be able to accept the paradox that everyone of us is the most important thing there is in the universe—and at the same time no more important than a fly or a blade of grass. (1955*b*, p. 203)

In *You Shall Be as Gods* (1966), he interprets the development of Biblical concepts as a struggle toward humanistic awakening and the overcoming of idolatry. In an open letter to humanistic Christians (1975), he wrote:

Idolatry is not the worship of certain gods instead of others, or of one God instead of many. It is a human attitude, that of the reification of all that is alive. It is a man's submission to things, his self-negation as a living, open, ego-transcending being. . . . The modern concept of alienation expresses the same idea as the traditional concept of idolatry. The alienated man bows down to the work of his own hands and the circumstances of his own doing. . . . Today's idols are the objects of a systematically cultivated greed: for money, power, lust, glory, food and drink. Man worships the means and ends of this greed: production, consumption, military might, business, the state. The stronger he makes his idol, the poorer he becomes, the emptier he feels. Instead of joy he seeks thrills, instead of life, he loves a mechanized world of gadgets, instead of growth he seeks wealth, instead of being he is interested in having and using.

Fromm believes that these religious statements are truths that would be experienced by anyone who challenged illusions and was willing

to face the roots of his anxiety, depression, and hopelessness. For him the ideal of liberation, of being rather than having as expressed in the Old Testament prophets, in Master Eckhardt, in Zen Buddhism, and in the humanist philosophers, points to a development of character and practice of life that is not only more humanly rewarding but is also the only direction toward human survival in a world of limited resources and unlimited possibilities of destruction.

FURNIVALL, JOHN S.

John Sydenham Furnivall (1875–1960) completed the natural science tripos at Cambridge University in 1899; passed the relevant examinations to enter upon probationer's training for the vaunted British Indian Civil Service (ICS); and in December 1902 arrived in British Burma still under training. For the next twenty years, he went up the ladder of that extraordinary bureaucracy. From subdivisional officer to district commissioner to settlement officer and finally to district commissioner (i.e., chief magistrate of a "state" or "province"), Furnivall, completely bilingual, traveled throughout Burma and studied the country's history from the beginning of the British connection in the 1820s. Upon his formal retirement from the ICS in 1923, he briefly returned to England, but almost immediately, in 1924, he decided to return to Burma as a lecturer at several colleges, later amalgamated as the University of Rangoon, and as the founder and organizer of book clubs, magazines, and adult educational enterprises. In 1931, he again returned to England to embark on a series of studies in Holland and Dutch Indonesia; to serve as ICS lecturer on Burmese language, history and law at Cambridge; and to undertake research for the British Burma Government during World War II. After Burma's

independence was formally declared on January 4, 1948, the newly independent régime invited him to return to serve the Prime Minister's office, chiefly as advisor on planning. There he remained until the spring of 1960 when once again he retired to Cambridge. Although he planned to return to Burma as a special professor of economics, he died later that year.

Throughout his official career, Furnivall wrote a large, and to some extent unknown, number of official and classified papers. His published writings, begun in 1909, in the *Economic Journal* (London), continued indefatigably until 1959. At his death, he left a considerable body of unpublished manuscripts, chief of which is "A Study of the Social and Economic History of Burma" (1959).

The corpus of Furnivall's writing has two main foci: the history, culture, and political and economic administration of British and Independent Burma, and an intensive and extensive examination of the roles and missions of the colonial systems in southeast Asia. He started with the British colonial system in Burma, and to a lesser extent with that in Malaya, worked on the Dutch system in Indonesia, and had begun to examine the United States colonial experience in the Philippines as well as the French system in Indochina. This effort became part of a "grand design" of which he completed and published two major components (1939; 1948).

Although his social philosophy appears to have been an amalgam of nineteenth-century British liberalism and Fabian socialism, Furnivall was never concerned with sociopolitical labels. Social science concepts of efficiency, progress, plural society, welfare, social justice, and cultural integration dominate his writings and served him as tools of inquiry and norms for judgment. He found that colonial powers frequently brought some progress and efficiency to their colonial empires, but at the expense of cultural disintegration and alienation. Alien domination—political, economic, and cultural—gave rise to nationalist movements seeking to oust the colonial power. Frequently, in colonial empires, different groups of individuals live together geographically, but maintain separate cultures and organizations. Thus, its members have difficulty developing common values and institutions. Anticolonial success, he indicated, is therefore followed by the difficult search for both the individual and collective autonomy that is necessary to reintegrate the formerly alienated or plural colonial society. How to rid the inde-

pendent society of the ill-effects of the forces set in train by the colonial past, and how to bring about freedom and cultural integration were, he insisted, the essential tasks for the emergent independent régimes.

Furnivall was profoundly aware of the fact that independence alone could not bridge the gap between the precolonial and colonial experiences. Tirelessly he reiterated his liberal, non-Marxist, social democratic prescription:

The task of the new government was to weld the component peoples into a united nation; to re-integrate social life from the village upwards in an organic national society; to instill into Burmans [and the nationals of other emergent states] the discipline of social and economic life in the modern world; and to equip Burma [and other states] with the political and economic institutions of a modern [democratic] state. The process was certain to impose irksome restrictions, arouse resentment and engender resistance; yet . . . [the regime] could not enforce the restrictions without the consent of the people, even when these did not appreciate the need for restrictions. ([1958] 1960, pp. 130–131)

Thirty years after independence took root in the states of southeast Asia, after incessant years of insurrection and civil and international wars, after years of analysis and prescription by others, the basic Furnivall analysis and prescription are still valid. What more could one ask of any single scholar-activist?

G

GALBRAITH, JOHN KENNETH

He is among the preeminent gadflies of the Western world and can claim more readers than most other economists put together. He is the leading antitheoretical theorist of our time, who has attacked conventional economic abstractions as empty, but who has not hesitated to propose bold generalizations to describe the workings of technological society. He is, consequently, the only contemporary economist whose words are followed by squads of critics prepared on a moment's notice to write lengthy refutations.

John Kenneth Galbraith was born in 1908 near Iona Station, Ontario, in a Scotch farming community. He survived an indifferent rural education, went to the Ontario College of Agriculture at Guelph, then to the University of California at Berkeley for a PH.D in agricultural economics (1934). He arrived at Harvard University as an instructor the following year, in time for the intellectual fireworks ignited by the publication of John Maynard Keynes's *The General Theory of Employment, Interest and Money* (1936). Between 1941 and 1943 Galbraith presided in Washington as the country's chief price fixer (deputy administrator) at the Office of Price Administration. In 1945 he was a director of the U.S. Strategic Bombing Survey, set up to determine the effectiveness of Allied air raids on Germany and Japan. He returned to Harvard as Paul M. Warburg professor of economics until his retirement in 1975.

Intellectual influences. At Berkeley, Galbraith found the free-wheeling discussions conducted by Leo Rogen, Robert A. Brady, and Ewald

Grether a revelation. Berkeley in the 1930s abounded with radical ideas, Marxist in particular, but it was the new heresies then being propounded by authors with legitimate pedigrees that Galbraith found persuasive. A. A. Berle and Gardiner C. Means came out with their celebrated book, *The Modern Corporation and Private Property* (1933), which documented the control of more than half the industrial economy by two hundred nonfinancial corporations. Joan Robinson and Edward H. Chamberlin began to build the theoretical apparatus to study the much neglected phenomenon of market power. At Harvard Galbraith encountered Alvin Hansen and Seymour Harris, evangelists of the new Keynesian activism. In reading he found kindred spirits in such disparate personalities as Thorstein Veblen and Evelyn Waugh, both detached and acid.

Principal writings. The evolution of Galbraith's leading ideas can be traced in four books conceived over a period of twenty-odd years. *American Capitalism: The Concept of Countervailing Power* (1952a) was written in the flush of postwar prosperity and, not implausibly, the author set himself the task of explaining why the system worked. Characteristically, he began by attacking the conventional explanation. The system did *not* work, as adherents of the competitive model proclaimed, through the rough and tumble of many small buyers and sellers trading in the marketplace. The days of laissez-faire had ended with the great depression. Decisive parts of industry, trade, and banking were now concentrated in the hands of a small number of large corporations. Prevailing theory had

simply become irrelevant. In the spirit of Joseph A. Schumpeter, Galbraith recognized concentration as inevitable. The development of modern technology required huge masses of capital. That capital had to be protected from the vagaries of the market. Size protects. The antitrust view—and this was a theme to which Galbraith would return again and again—was hopelessly archaic. No serious person could contemplate the disestablishment of half the economy.

Since reference to the invisible hand did not explain the operation of a modern economy, another explanation had to be sought. Here Galbraith introduced the theory of countervailing power. Large organizations, such as the giant firm, begat large counterorganizations, such as the industry-wide union. Private economic power was held in check by the countervailing power that arose on the other side of the market. Where countervailing power did not arise on its own, it was the duty of government to nurture it. Government had, in fact, done this in the case of farmers. The same could be done for others.

Countervailing power belongs to the genus of the self-regulating mechanism. It was—and was explicitly offered as—a new rationale for non-intervention in corporate life. Galbraith noted one flaw, of no small consequence in light of subsequent events. The mechanism does not work in times of inflation. Then, businesses and unions form a coalition and mutually exploit the public through price and wage increases.

The next title, *The Affluent Society* (1958a), was an ironic comment on a nation that produced an increasing abundance of goods, but in which cities declined; transportation deteriorated; education, housing, and medical services sank into crisis; and the poor remained poor despite annual increases in the gross national product. By 1958, the so-called beneficial effects of the Korean War had worn off. By that time Galbraith had set aside his preoccupation with countervailing power and had taken a stance that was to remain typical for the rest of his career: that of mocking critic of a system that is out of balance. The criticism extended liberally to defenders of that system, particularly teachers of economics.

Orthodox Keynesian policy bore the brunt of Galbraith's attack. It was wrong to assume that government merely had to ensure full employment and that the allocation of resources would then take place automatically in optimal response to consumer demand. It was also wrong to assume that economic growth would solve all

problems. The composition of increasing output was distorted by imbalances, impossible for very long in the classical world of the sovereign consumer, inevitable in the Galbraithian world of the large corporation which engaged in want creation through the devious arts of advertising and salesmanship. The result of this shift Galbraith emphasized as the dependence effect: consumer demand was not independent; it was dependent on the blandishments of the producer. The quest for social balance, he concluded, lay in increasing public expenditures for deficient social services. A large part of the funds could come from cuts in excessive military budgets. The New Class of the educated and affluent, as Galbraith saw it, was the prime candidate to lead the fight. It was simply in their own interest to do so.

After serving as ambassador to India (1961–1963) during the Kennedy administration, Galbraith completed a detailed examination of the mature corporation, the archetype for several hundred firms which make up the concentrated, and dominant, part of the economy. The results appeared in *The New Industrial State* (1967b). The mature corporation has no inherent upper limit in size, since size is an advantage in the deployment of technology, the amassing of capital, and the mastery of the market. The entrepreneurial corporation was run by a single individual, often the founder or one of his heirs, but the mature corporation is too complex for such management and requires direction by an interdependent group of upper and middle level administrators and technicians who collectively command an enormous range of knowledge. This group Galbraith called the technostructure. The technostructure plans the firm's sources of supply, internal operations, the sale of products, and, in fact, seeks by all means within its power to replace the market with planning. Above all, the technostructure works for its own survival and decision-making autonomy. This manifestly includes freedom from stockholder intrusions. Survival and autonomy are served by growth, and growth replaces profit maximization as the chief goal in the industrial system.

In this system, the producer manages the consumer, albeit imperfectly. But the point is crucial, for it reverses a basic sequence in economic reasoning: the origination of instructions with the consumer; their transmission through the market; compliance by the producer. The reverse, or revised sequence (compare the dependence effect), engineered through advertising

and salesmanship, plainly means that no optimum consumer satisfaction is possible. The larger implication is that the system of mature corporations sells not only goods but a way of life—one that increases the revenues of sellers, but not necessarily the well-being of consumers.

The industrial system is closely dependent on the state for: regulation of aggregate demand; support of research and development; and control of unemployment and inflation. The logic of Galbraith's model leads to policies he has frequently advocated, namely, wage-price controls and state action to fill planning lacunae, as in housing and health. It also leads to a profoundly skeptical attitude toward the military establishment which, as part of the industrial system, also seeks growth and finds all the necessary rationalizations to justify it. In commenting, Galbraith offers the hope that the monopoly of the industrial system on social purpose can be broken; that the industrial system will become a diminishing part of life; that aesthetic goals will command increasing attention. "The danger to liberty lies in the subordination of belief to the needs of the industrial system," not in the association of corporations and government ([1967*b*] 1971, p. 401). That association is a *fait accompli* and must be accepted as the inevitable outcome of sophisticated technology and large-scale organization.

Galbraith's political activities led him to the chairmanship of Americans for Democratic Action from 1967 to 1969. Despite widespread discomfort among economists, they extended due recognition in electing him president of the American Economic Association in 1972. Galbraith's next major work, *Economics and the Public Purpose* (1973*b*), is the definitive statement of his mature views. He now uses the term planning system instead of industrial system to call attention to the problems of coordination characteristic of a modern economy. The planning system has about 1000 firms; the market system 12 million. The 1000 produce more than the 12 million combined. Power resides in the planning system: the power to plan prices and outputs; to dispose of modern technology and to grow; to sway consumers and the state; and to extract favorable terms of trade from the market system. The two systems develop unevenly. The strong go to the state and get the services they need. The weak do without. Hence the highly uneven development of public services. Power and uneven development have no place in neoclassical, or textbook, economics but

are central features of present-day reality. "Left to themselves"—and this statement epitomizes the difference between Galbraithian and neoclassical views—"economic forces do not work out for the best except perhaps for the powerful" (1973*b*, p. xiii).

Galbraith's theory of reform turns on the emancipation of belief from the thralldom of the planning system. That system can deliver more and more commodities but cannot deliver us from the pain caused by uneven development, grossly unequal incomes, environmental disruption, inflation, inadequate public services—the well-known social ailments. Pain, aided by persuasion, can produce public cognizance, which is awareness that the needs of the public are not the same as those of the planning system. The job is to pry the state loose from the grip of the planning system and place it at the disposal of the public. This is the central issue facing the electorate.

An adequate program would have to include elements of what Galbraith calls democratic socialism. We must, he argues: (1) run the weak parts of the market economy—housing, urban transportation, health care—by public authority; (2) encourage small and weak firms to merge and equalize their terms of trade with the planning system; (3) nationalize the military contractors; (4) replace the stock of the largest corporations with public bonds; and (5) plan the planning system—supply the coordination needed in the absence of a self-regulating mechanism.

Galbraith's influence. By the time *Economics and the Public Purpose* was written, a marked split had taken place in the economics profession. The neoclassical majority continued to believe, with suitable qualifications, that the concept of a self-regulating market was still a sufficient description of reality. The post-Keynesians, as they came to be called, still a minority, held that the task of economists was to chart the decline of the market and the passage of power to large organizations—in short, to devise theories and policies in conformity with the current reality. Galbraith must be regarded as one of the chief formulators of the post-Keynesian point of view, and one of the most telling critics of orthodoxy.

Galbraith's position can be contrasted with that of Keynes. Keynes believed in managing the level of effective demand but otherwise in letting the market alone. Galbraith believes in managing the market itself and replacing parts of it with

planning. Galbraith's wit and derisive style, together with a deep abhorrence of technical jargon, have won him a vast public—not to mention professional—audience, to whom he has brought home the fact that textbook economics is beyond doubt in a sorry state and that, as he would have it, a greatly improved alternative exists.

GALLUP, GEORGE

The man whose name is most closely identified with public opinion research once described his life as a series of happy accidents. George Horace Gallup has always considered himself a pragmatist and technician rather than a scientist or theoretician. He built his career by asking such questions as: What data are needed to solve the problem? How can one best obtain these data? The Gallup Poll came about through the coupling of his lifelong interest in politics and democracy with his working experience in journalism and marketing.

Born in 1901 in the small town of Jefferson, Iowa, Gallup attended the local high school and the University of Iowa, where he pursued his interests in psychology and journalism. He was introduced to the world of surveys as an under-

graduate, when he was hired to interview readers of a St. Louis newspaper. In the custom of the time, the survey asked: "Do you read the editorials? . . . the international news? . . . the classified ads?" To Gallup this technique seemed a faulty means of measuring readership. Reflecting on the matter, he decided that a better measure of actual readership would be to show the reader yesterday's paper and go through it with him column by column. As a graduate student he persuaded the Des Moines *Register & Tribune* to sponsor such a survey, and he used this survey for his doctoral dissertation. His findings were sharply different from those obtained by the earlier method. Editorials, for instance, had low readership; advice to the love-lorn and obituary columns were surprisingly high. Gallup's method of measuring newspaper and magazine readership became widely adopted and was still in use more than fifty years later.

After earning his doctorate at Iowa in 1928, Gallup spent two years on the faculty of Drake University and a year at the Northwestern University School of Journalism. During these years he continued his experiments in measuring newspaper, magazine, and radio audiences by means of sample surveys, and his work earned him the attention of national advertising agencies. In 1932 he was persuaded to abandon his academic career and go to New York as director of research and marketing for Young & Rubicam.

His interest in politics had been whetted as a result of his marriage. His mother-in-law's narrow election as secretary of state in Iowa prompted Gallup to think of applying his survey methods to politics. Although many newspapers conducted local "straw polls" at the time, the only generally accepted forecast of national elections was that in *The Literary Digest*. This magazine had successfully predicted every presidential election winner from 1916 through 1932 by means of mass mailings of ballots to millions of telephone subscribers and automobile owners throughout the country.

Gallup was well aware of the potential bias that could result from the relatively affluent sample provided by telephone and automobile listings in the 1930s and from the differential response rate among various categories of respondents that the *Digest* would receive. He was convinced that accurate results could be achieved by systematic selection of much smaller samples and by expanded questioning through a longer questionnaire. He found support at this time from a newspaper syndicate

that agreed to test his ideas in the 1934 congressional elections. On the basis of past voting records, a few "barometer areas" were selected and mail questionnaires addressed to a quota sample of households. These were supplemented by personal interviews where response rates from particular income groups were disproportionately low. The experiment was successful, and on the basis of a contract to provide the syndicate with a weekly column, Gallup established the American Institute of Public Opinion. Its first release appeared October 20, 1935.

Though other market researchers had also begun to take political surveys at about this time, Gallup's regular exposure in newspapers around the country made his name better known. When the November vote was in and it was clear that Gallup had correctly forecast the Roosevelt landslide, while the *Digest* had predicted a Landon victory, the new sample survey methods were vindicated and the American Institute of Public Opinion, now referred to increasingly as the Gallup Poll, became a national institution.

In 1939 Gallup sent a colleague, Harry H. Field, to Europe to establish institutes of public opinion in Great Britain and France. Though interrupted by World War II, both resumed operation after the war and continued to thrive. In the postwar years, similar institutes were established in other countries and the Gallup organization became world-wide in scope. In the United States, Gallup's reputation brought him many contracts for marketing and audience research surveys.

The 1948 presidential election, in which Gallup, in common with other major polls, incorrectly forecast victory for Thomas E. Dewey, provided a sharp setback to the success story. Gallup steadfastly upheld the validity of his methods and systematically began to search for what had gone wrong. The major reasons soon became clear. First, quota sampling methods had resulted in a slight Republican bias. Then, polling had stopped too soon to catch a last-minute tide toward Truman. The polls had overconfidently predicted an outcome that was, in hindsight, far from certain. Applying these lessons to his future work, Gallup improved and refined his procedures, and the 1948 election mistake, far from signaling the end of polling, became a mere incident in its continued progress.

Gallup has been a strong publicist for his methods and his views of their importance. He

sees polls as "The Pulse of Democracy" (his title for a 1940 book)—a source of enlightenment that presents an alternative to the clamor of contending pressure groups claiming to represent public opinion. Although he accepts his role of election prognosticator as an opportunity to demonstrate the reliability of his techniques, he feels that the real value of polls lies in their ability to provide a vehicle for popular expression: a means of measuring and publicizing public satisfactions, concerns, fears, knowledge, beliefs, wants, and intentions. He was among the first to discern the value of asking the same question repeatedly over time to gain information about trends in opinions. Opinions on "the biggest problem facing the country" and approval of presidential performance, for example, have been regularly monitored since 1940 or earlier and provide a rich source of historical data.

Both the man and the poll have been subjects of criticism ever since 1935. Those who oppose majority opinion as revealed by Gallup are quick to attack the wording of his questions and other aspects of his methodology. Some have suspected him of latent Republican or Democratic bias. Academic critics consider his approach to social research to be simplistic and his poll mere journalism. Others argue that public opinion is more (or less) than the mere summation of individual responses to a question. But the frequency and fervor of these attacks has diminished over the years, as Gallup has steadfastly continued to do just what he set out to do.

The enormous growth of sample surveys since 1935 would of course have occurred without Gallup. Market researchers, behavioral scientists, and others were all developing sampling and questionnaire techniques at the same time, and the pressing need for fast, economical data collection in a rapidly expanding society would have guaranteed the same result. But Gallup, as the earliest and most articulate spokesman for public opinion polls, and the Gallup Poll, as the first and most widely circulated continuing survey, became identified with the industry, and the industry with Gallup. This role he has played with eloquence and honor.

GERSCHENKRON, ALEXANDER

Alexander Gerschenkron (1904-1978), Harvard University economic historian and social scientist of encyclopedic range, was born in Odessa, Russia. Shortly after the Bolshevik revolution of 1917 his family moved to Vienna, where Gerschenkron completed his secondary and academic education. The University of Vienna, at which he received his doctor's degree in 1928, was one of the major strongholds of neoclassical economics on the European continent, with the spirit of the famous "Austrian School" very much alive. Yet, Vienna was also the cradle of "Austro-Marxism," the most vibrant and sparkling variety of all European socialist thought. The sensitive young academic could not remain untouched by these intellectual crosscurrents and by the unique cultural ambience of the central European "City of Light."

At the time of Hitler's invasion of Austria in March 1938, Gerschenkron was an associate of the Austrian Institute of Business Cycle Research. He managed to escape and to make his way to the United States. He spent six years at the University of California at Berkeley, at first as research assistant and subsequently as lecturer in economics. In 1944 he accepted a position on the research staff of the Board of Governors of the Federal Reserve System in Washington; he became chief of the foreign area section two years later. In 1948 Gerschenkron joined the faculty of Harvard University. He taught European economic history and Soviet economics, and was director of the economics division of Harvard's Russian Research Center until 1956 when he gave up this position and withdrew from teaching in the Soviet area. At the time of his retirement in 1974, Gerschenkron held the title of Walter S. Barker professor of economics, and was director of the Economic History Workshop. In the same year he was

awarded an honorary D.LITT. degree at Oxford University.

Early work. Gerschenkron's first two monographs, which dealt with major issues of post-war policies, gave some premonition of his enduring scholastic concerns. *Bread and Democracy in Germany* (1943) was an eloquent plea for breaking the economic power of the Prussian Junkers as an indispensable precondition for the democratic development of post-war Germany and for a peaceful Europe. In his work on *Economic Relations With the U.S.S.R.* (1945), Gerschenkron was guardedly optimistic about the prospects of cooperation between the wartime allies after their victory over Nazi Germany. In both cases events did not develop as expected, yet this did not affect in the slightest the soundness of Gerschenkron's basic diagnosis. *Bread and Democracy in Germany* remains to this day a most reliable and lucid account of a crucially important episode in modern European history. The slim booklet on problems of Soviet-American economic relations stated with hitherto unprecedented clarity the basic institutional and economic facts defining the foreign trade potential of the Soviet Union, and laid a groundwork for all later work in the field.

The "Gerschenkron effect." The rise of the Soviet Union to the position of one of the two superpowers brought an upsurge of interest in its economic growth. The problem of measurement was among the first on the agenda. In view of the wartime performance of the Soviet Union, it was hard to maintain the view that the economic expansion of the late 1920s and the 1930s had been a mirage. Yet the rates of over-all growth as depicted by official Soviet statistics seemed to be much too high and inconsistent with some data on physical outputs to be accepted at face value, although there were good reasons to assume that, in Abram Bergson's words, no "double book-keeping" was involved.

Gerschenkron, along with Bergson, led the efforts to resolve this difficult problem. His contribution to the 1947 symposium in the *Review of Economic Statistics* constituted an important step in this direction; yet the major breakthrough came with *A Dollar Index of Soviet Machinery Output, 1927-28 to 1937* (1951). Gerschenkron took as his point of departure two propositions, which had been adumbrated in some earlier writings on the subject but had never been fully explored. He pointed out that the Soviet index

of industrial production, which was based on the preindustrialization prices of 1926/1927 as its weights, was bound to yield a higher rate of growth than an index based on prices of a later year marking a more advanced stage of industrialization: the fastest growing items, whose costs would show a relatively stronger decline over the period in question, would be affecting the total index more powerfully when measured in prices of the early year. (It would be the other way round, one might add, if the period under consideration had been short enough to make the increase in output come from a more intensive utilization of existing capacity rather than from new plant.) This difference, known to statisticians as a Laspeyre-Paasche discrepancy, is compounded whenever goods that had not been produced during the base year are allowed to enter the index at prices which are set at the (relatively high) cost of the first year of their mass production *and* which reflect a powerful inflation that took place during the period under consideration. Gerschenkron next tested these propositions. He focused on performance of Soviet machine building, which was the fastest growing branch of the rapidly expanding Soviet industry and which underwent the most drastic change in its output composition during the first decade of Stalinist industrialization; more particularly, it showed the highest incidence of new goods introduced after the base year. In setting up his alternative "Paasche"-type index, Gerschenkron chose 1939 dollar prices as weights; this was, he explained, analytically equivalent to using Soviet late period prices. The results were striking; while the official Soviet index showed a fourteenfold increase in machinery output during the years 1927/1928-1937, Gerschenkron's "dollar index" showed a slightly more than five-fold increase. The point was reinforced when Gerschenkron used American machine building in the years 1899-1939 as a control group and found the same high sensitivity of the index to the change of weights from early year prices to the late year prices for the whole period as well as for particular subperiods (in one particular instance such a change of weights resulted in a difference between pronounced growth and marked decline). His subsequent application of the same approach to the Soviet iron and steel industry and to the oil industry brought confirmation of the "Gerschenkron effect" from the opposite end: indices of industries, which were well-established on the eve of the industrializa-

tion drive, and showed a less spectacular growth as well as a smaller incidence of entirely new products, proved much less sensitive to change in price weights. The same was true, to a lesser extent, of the index of electrical power output which grew very rapidly but was relatively homogeneous. No doubt, the rate of Soviet industrial growth during the period under consideration would remain impressively high also under the Paasche regimen. But its edge over Western growth rates which were likewise derived from indices based on late year prices would be markedly reduced.

"Advantages of backwardness." The *Dollar Index* whose findings quickly gained acceptance among students of the Soviet economy was followed within a year by a pathbreaking effort in a larger problem area. In his "Economic Backwardness in Historical Perspective" (1952, in 1962), Gerschenkron argued that backward countries of late nineteenth-century Europe had the ability as well as the incentive to grow faster than older industrial countries have done in the past and in the present because the late-comers could make a shortcut to levels of technology that early arrivals had attained through a sequence of intermediate stages. This implied that new members of the club had yet another advantage over their seniors: the capital stock of their rapidly expanding modern sector would tend to be, on average, younger and more up-to-date. Besides, while the new and largely capital intensive technology was superior to the old over a range of scarcity relationships, its attractiveness was enhanced by the fact that, contrary to conventional assumptions, labor in the sense of a seasoned industrial work force was scarce rather than abundant in underdeveloped areas. Gerschenkron credited Thorstein Veblen for having recognized the role of borrowed technology. He pushed the argument a step further by setting up a "gradation of backwardness" and by arguing that the ability to grow rapidly was positively correlated to the size of the gap between the average level of technology of the country in question and the best-practice technology of advanced countries. Yet he pointed to a grave dilemma when he noted the presence of significant indivisibilities and complementarities which made the great spurt both crucially important and exceedingly difficult to carry out. The situation called for a catalyst that would spark the industrialization process and—in Gerschenkron's terms—act as a substitute for such "normal" prerequisites as adequate private

funds and ample domestic markets. At medium levels of backwardness this role was performed by investment banks as in France, Germany, and Austria; in Russia and Hungary, which were further behind the English front runner, active intervention of the state had to do the job. (In the case of Russia, the state intervention showed an added twist: retrogressive institutional arrangements which existed in agriculture were utilized, and even tightened, in order to promote the accelerated modernization in the urban sector.) Another characteristic trait of the catching-up processes was a stronger stress on producers' goods than on consumers' goods as compared with the English prototype; this was due, in Gerschenkron's view, to the fact that technological progress in the second part of the last century had been more rapid in the first group than in the second. Eventually, and true to the best form of Marxian—Hegelian dialectics, the drastic "substitute" strategies would eventually outlive their usefulness as a result of their successes, and give way to more moderate ones.

The ingredients of this ingenious construct had multiple origins. There had been increasing stirrings within the established theory, with strong attempts to upgrade the importance of the concepts of economies of scale and of externalities and to use them in the analysis of economic development. Another major influence stemmed from Gerschenkron's early exposure to Marxism in its most refined Austrian version. He had high praise for Marx's sense of discontinuities in technological progress and in capital accumulation as well as for the emphasis on the active role played by the state in breaking the logjams in development, although he felt that the insights of the last mentioned category did not fit well into the standard "basis-superstructure" scheme. Naturally enough, such ideas were resisted. The concept of "advantages of backwardness" and of "substitute" strategies went strongly against the grain of the *natura non facit saltum* approach based on assumptions of smooth interaction between steady extension of scientific knowledge and gradually shifting factor proportions. Hence, while Gerschenkron's breadth of vision, originality, and elegance of presentation were widely acclaimed, his argument was often misunderstood. Although he emphasized the significance of differences in natural endowments, and noted the role of foreign trade in promoting transfer of technology, he was reproached for ignoring both.

Nor did Gerschenkron ever deny, Stephen L. Barsby's (1969) and Richard L. Rudolph's (1973) allegations to the contrary notwithstanding, that "a leisurely growth" was possible, but he did insist that a failure to exploit advantages of backwardness to the full was bound to let the sluggish country fall more and more behind others which had risen to the challenge. Moreover, Gerschenkron never implied that the "tension between potentialities and actualities" was bound to trigger rapid growth in a quasiautomatic way. He expected it to provide opportunities which could be used or mishandled; and in essays on Austria, Bulgaria, and Italy, he convincingly portrayed several spurts which never got off the ground because of halfhearted and misguided governmental policies.

Comments by economists who were in sympathy with the major thrust of Gerschenkron's reasoning had more substance. Ronald Findlay (1978) pointed out that the notion of advantages of backwardness held true only within a certain range of development: it could not possibly apply to primitive societies. Gerschenkron would undoubtedly agree; he was careful not to claim validity for his construct beyond the limits of Europe at the turn of the century. Indeed, he also made it clear that in a country like Russia the possibility of developing a modern machine tool industry was severely restricted by a shortage of requisite skills. Henry Rosovsky (1961), who tested the Gerschenkron model against the realities of Japanese development and found the concept of the state-promoted industrialization spurt fully applicable, argued that the shortage of industrial labor did not exist in Japan or in western and central Europe, for that matter; moreover, Japan's high comparative advantages in textile production, coupled with a deliberate policy of fostering small-scale technology whenever feasible, postponed the shift toward producers' goods until another round of big spurts at a later stage of industrialization. (Interestingly, a strong support for the concept of "gradation of backwardness" with all its implications came from a writer who was evidently unaware of Gerschenkron's work when he first stated his own position [Gomulka 1971].) A few additional remarks may be in order. It is arguable that the leading role of producers' goods in the Russian industrialization of the 1880s and 1890s was not so much a result of particularly great advances of foreign technology in that area as a natural response to a steep increase of demand for these goods that was generated by the

massive state-directed program of railroad construction; it was this upsurge in investment activity that provided a vehicle for the large-scale infusion of modern technology into the Russian iron and steel industry. (No one described this more illuminatingly than did Gerschenkron.) Moreover, a faster rate of industrial growth is bound to go with a greater share of producers' goods in total output unless there is a decline in the capital-output ratio—a point that Gerschenkron readily recognized with regard to the world as a whole, but which would also have validity for individual countries with a modicum of appropriate natural resources and with a nonnegligible capacity in the producers' goods sector at the beginning of their great spurts. Lastly, some of Gerschenkron's initial formulations could be somewhat relaxed. "Development blocks" might come in smaller and larger sizes; complementarities could be loosened in spots by less than complete synchronization in investment programs, with foreign trade and varying capacity utilization playing their part; the cutting edge of the economies of scale is not equally sharp everywhere—a circumstance that allows for a measure of economic dualism. Actually, Gerschenkron took note of most of these qualifications whenever he discussed specific cases; and none of them could invalidate the thesis about the importance of discontinuities in industrialization, particularly when the indivisibility-*cum*-complementarity argument is linked with the notion of wide technological gaps and of the crucial role of investment in filling them.

The stability of dictatorship. Gerschenkron's treatment of Soviet economic development after 1928 was another variation on the general theme of backwardness. He viewed the Stalinist industrialization drive as the most striking example of the great spurt, both in its unprecedented rapidity and in the extent of coercion used to effect it. Yet he expected the post-Stalin relaxation to be much more limited than that which had followed earlier great spurts in Russian history. The reasons for it were political. The new revolutionary régime, as distinguished from its age-old Tsarist predecessor, was in dire need of legitimation; the call for discipline and sacrifices in order to catch up with the advanced and fundamentally hostile capitalist West would serve the purpose. Under such conditions, to slow down would be asking for trouble. Here was another paradox that seemed to fly in the face of common sense. The notion that greater

deprivations could mean more stability seemed odd; yet it was profoundly true. One might argue that countervailing tendencies should have received more emphasis. As was repeatedly pointed out, the costs of the brutal and crude methods of Stalin's "initial socialist accumulation" were bound to become intolerably high as the reserve of the unutilized peasant manpower was approaching exhaustion, pressures for higher living standards coming from the increasingly urbanized population were gaining strength, and economic burdens of the "competition of two systems" in the nuclear age were mounting. The vested interest in tension and in ordering people around as much as possible still persisted. Yet neither considerations of static and dynamic efficiency, nor consumers' demands could be relegated to the back seat much longer without pushing stresses and strains beyond safety limits and without inhibiting the attempts to narrow the gap in technology. Gerschenkron did not deny that concessions to consumers had been made and that there was a modicum of over-all decompression. Yet he viewed it as a harbinger of growing instability—although in the introduction to his *Continuity in History* (1968) he noted that unsettling effects have not yet materialized.

A brief sketch cannot conceivably provide more than an inkling of the richness of Gerschenkron's work. Only a few salient points have been discussed. The finely chiseled details had to be left out, although, in this particular case, great spurts of innovative thought must certainly not be allowed to overshadow the extensions, refinements, and explorations in depth; suffice to mention the learned essay on philosophical foundations of the continuity concept, the fascinating debate with Rosario Romeo on problems of Italian industrial development, or the seminal paper on the agrarian policies of prerevolutionary Russia. Gerschenkron's scholarly interests ranged across the whole spectrum of social sciences and beyond: the beautiful essay on *Doctor Zhivago* and the devastatingly erudite review of Nabokov's translation of *Evgenii Onegin* have become classics. He will be remembered as one of the great poly-histors of our time.

GEYL, PIETER

The career of Pieter Catharinus Arie Geyl (1887-1966), one of the most outstanding Dutch historians of the twentieth century, embodied a deep paradox. When in 1940 he was interned as a hostage by the Germans, he had already transformed the understanding of the history of the Low Countries, yet he was virtually unknown outside the Netherlands except to a handful of specialists. Only his activity as a Dutch supporter of the Flemish movement in Belgium during the 1920s and 1930s had brought him local notoriety, especially when he was expelled by the Belgian government. After World War II, he quickly gained international recognition as a historical critic and essayist, while at home his innovative ideas, which a few decades before had been attacked by traditional

historians, became part of the generally accepted historical picture.

Geyl was of mixed German and Dutch origin. His father was a medical doctor in Dordrecht, and his early retirement, due to mental illness, created emotional and financial hardship during Geyl's youth. The family moved to the Hague, where he attended a Gymnasium. In 1906 he entered the University of Leiden as a student of Dutch language and literature, but he was drawn to history by C. H. T. Bussemaker, and turned to this field after a novel he wrote was devastatingly faulted by the distinguished critic Albert Verwey. He completed his doctorate in 1913 under the guidance of P. J. Blok, a sound and somewhat dreary scholar, but probably the best Dutch historian of his generation. His dissertation on Christofforo Suriano, the Venetian resident at the Hague from 1616 to 1623, was a traditional work, a study in political history drawn directly from the sources, but it was already notable for the swiftness of its research and writing.

Geyl then gave up his embryonic career as a Gymnasium teacher and in 1914 moved to London as correspondent for the *Nieuwe Rotterdamsche Courant*, the preeminent daily newspaper of the Netherlands. This post gave him direct contact with outstanding political leaders in Britain and a reputation as a quick, lively writer. As a result, he was soon well known among intellectual and political circles in England. A year after the end of World War I, a chair in Dutch studies was created for him at the University of London, with the support of the Dutch government. His salary was not munificent and he supplemented it with work as an unofficial press attaché for the Netherlands embassy. Insecurity, however, did not keep him from taking up the controversial Flemish question in Belgium, to the annoyance and sometimes dismay of the Dutch government.

The Flemish issue provided Geyl with the theme of his early writings. Viewing the Flemings as brothers of the Dutch, he soon challenged the interpretation of Low Countries history that had been most clearly expressed in the *Histoire de Belgique* (1900–1932) by that country's most eminent historian, Henri Pirenne. According to this view, Belgium since its earliest history had been essentially a separate country from Holland, and the implication followed that the Netherlands had no fundamental ties to Belgium and therefore to the Dutch-speaking Flemings in Belgium. In this interpretation, the

separation of the northern and southern Netherlands into distinct countries and peoples during the late sixteenth-century revolt of the Low Countries is seen as the culmination of their historical development over many centuries; by contrast, their unity under the Burgundian dukes in the fifteenth and early sixteenth centuries had been a historical accident. Pirenne's view, which most historians in Holland accepted and adapted to their own national history, was to Geyl essentially inaccurate. He had publicly rejected it in lectures at University College London in 1920, and he published various articles and lectures expanding his argument in *De Groot-Nederlandsche Gedachte* ("The Great Netherlands Idea"; 1925). Geyl then began a monumental project based upon this idea that resulted in the publication of the three-volume *Geschiedenis van de Nederlandsche Stam* ("History of the Dutch Nation"; 1930–1937).

The "Great Netherlands" of these works was a nation in a special sense of the term: a linguistic community possessing or seeking political form and expression in its own state. Geyl therefore excluded from the "Great Netherlands" the Walloon provinces that had been part of the Burgundian Low Countries and that had become the culturally and politically dominant part of independent Belgium in the nineteenth century. He dismissed or disregarded other theories of the nation, both the view of the nation as the creation by states of a historic community of shared institutions and sentiments, and the anthropological view, which saw it as a community sharing an entire range of customs and attitudes, not merely language. What he did see, vividly and clearly, was that the speakers of Flemish in nineteenth- and early twentieth-century Belgium, where French was the language of culture and the chief language of government, suffered many deprivations and hardships. He failed to keep in mind, however, his own repeated warnings about anachronism—specifically, that before the modern age of mass politics and culture, those who spoke Dutch–Flemish in the southern Netherlands had suffered little or no disadvantage. His strong political commitment to at least the federal reorganization of the Belgian state—if not its actual breakup, with the Flemish provinces joining the Netherlands—is strongly reflected in his essays on Dutch–Belgian relations.

In his political activity, Geyl favored the Flemish activists, but the flirtation of extremists, some of whom were his close friends, with

theories of violence and with German racism led him to emphasize democracy as well as nationalism. The rise of the Nazi movement in Germany moved him to a passionate advocacy of political freedom and thus to an estrangement from those Flemish separatists who did not share this commitment.

Geyl's Great Netherlands idea was extensively developed in his strictly historical works. He demonstrated, with a wealth of evidence and argument, that the formation of separate states in the northern and southern Netherlands during the sixteenth-century revolt was not the result of profound cultural, religious, or political differences. Rather, it stemmed directly from the outcome of military events. Neither Catholicism nor Calvinism had been characteristically indigenous to south or north; each section had been consolidated by political and military victory—by the Spanish Habsburgs in the former case, and by the forces of independence in the latter. Geyl recognized that the two regions had grown apart over the next two centuries, and he deeply regretted that the experiment in unity under King William I had failed.

In all these studies, Geyl neglected the question of the status of the French-speaking provinces in a polity committed to predominance of Dutch-Flemish speakers. Although his views on the Flemish question in the nineteenth and twentieth centuries won anything but universal acclaim, his reinterpretation of the sixteenth-century revolt was so persuasive that within two or three decades it replaced the older picture.

While Geyl was working on his Great Netherlands theme in London, he began studies that became fundamental for a new understanding of the place in Dutch history of the House of Orange. Where it had been taken for granted, except by the minority of Dutch Catholics, that the country was essentially Protestant in character and that the Orange stadholders under the Republic and the kings after 1813 were the pure embodiment of Dutch nationhood, Geyl called attention to the dynastic interests pursued by the stadholders, from Frederick Henry to William V, in their relations with England and, to a lesser degree, Prussia. The republican ("States") party, far from being narrowly provincial and unnational, had performed a necessary national task in opposing Orange dynasticism, which fostered dependence upon the stadholders' foreign relatives (see 1924; 1939). The impact of Geyl's works on this theme upon Dutch historical writing was not as dramatic as

that of the Great Netherlands idea, but narrow Orangism was displaced by more balanced understanding of all the parties in the history of the Republic.

In 1936 Geyl was appointed professor of history at the University of Utrecht, despite the difficulties that stemmed from his reputation as a stormy petrel lacking the sedate dignity characteristic of the Dutch academic world and from his connections with the Flemish movement in Belgium. He did not become the founder of a school of disciples, partly because he favored in his students (of whom the best known are J. C. Boogman, A. J. Veenendaal, J. W. Smit, and D. J. Roorda) the same kind of independence of spirit that he himself possessed. He continued his warnings of the Nazi menace right up to the German invasion on May 10, 1940, and did not keep silent even afterwards. On October 7, he and approximately one hundred other eminent Dutchmen were arrested and sent to Buchenwald, where they were held as hostages in retaliation for the internment of Germans in the Netherlands West Indies. Thirteen months later, along with most of his fellow hostages, he was sent back to the Netherlands for continued internment. After several months' hospitalization during 1943 and 1944, he was released and permitted to return home in February 1944. He provided hiding places for resistance fighters in his home, barely escaping detection and arrest. At the same time he worked at his writing, although he had been dismissed from his professorship by the German authorities in 1942. After the liberation of Holland in 1945, he was restored to his chair.

Geyl's writing now largely changed character. His energy for primary research flagged, but he turned his attention to historical criticism, the philosophy of history (although he insisted that he was no philosopher), and comment on public events. At the same time he broadened the area of his writing from his native Netherlands to all of Europe as well as America. He wrote frequently for the weekly newspaper *Vrij Nederland*, using new books for the themes of essays on a great variety of subjects. Always concerned with the influence of contemporary events upon a historian's choice of subject and his interpretations, he began to look into the past for greater understanding of the turbulent era through which he was living. At the same time he drew upon his own experiences for deeper insight into the past. During the last months of the occupation, he had written a book on the

changing picture of Napoleon—an obvious parallel to Hitler—in French historical writing (1946*b*). To show, as he did, that French historians' views of Napoleon had changed over the decades, depending on their political and ideological commitments, was hardly novel; but to draw the conclusion that the understanding of Napoleon had been enriched by these different interpretations was to take up the cudgel against historical relativism, veering over into outright skepticism, which had characterized historical thought in the 1930s. History, he proclaimed, was "an argument without end" and was the better for it. This book was followed a year later by a short study (1947), which rehabilitated the democratic movement in the final decades of the republic of the United Provinces against the contention of H. T. Colenbrander that the Patriots had been no more than puppets in the hands of the French. He also carefully distinguished the leaders of the Batavian Republic, who put the Patriot principles into practice with the support of a French army of occupation, from the NSB'ers, the Dutch Nazis, noting that the Batavian leaders had sought to rebuild their country upon democratic principles and sought its welfare under complex and trying conditions, none of which could be said of the NSB'ers, traitors to their country and its historical traditions.

Geyl first began to receive wide attention in other countries, however, when he attacked the historical views of Arnold J. Toynbee as presented in *A Study of History* (1934–1961). He accused the English historian of twisting facts to fit his grandiose system, defended the legitimacy of nations and nationalism against Toynbee's universalism, and rejected the judgment that Christianity was the only true religion and the only salvation of mankind. Although accused of himself indulging in system making in his Great Netherlands historical writing, he asserted that he had been trying to take account of facts and to make his historical picture correspond to them, rather than twisting them to fit his preconceptions.

Geyl defined himself by argument with other historians, especially of the Netherlands. He had few strictly historical arguments with his greatest contemporary Johan Huizinga, who died in 1945, although his method of work and style of writing were very different from that of the subtle esthete Huizinga. Where Huizinga's view of the contemporary world was deeply pessimistic, Geyl defended against him what he

called in his own final lecture on the occasion of his retirement "the vitality of Western civilization." Although himself as much a man of high culture as Huizinga, he was far readier to accept the coarse vigor of the common man, and he felt that the problems of Western civilization did not arise from democracy in government or society. He saw totalitarian barbarity not as an exaggeration of faults within democracy itself, but as an attack upon the central spirit of democracy. He was even more critical, therefore, of Jan Romein, a highly influential and respected Marxist at the University of Amsterdam, because his historical vision rested not upon evidence and argument but upon his strongly felt subjective convictions. Geyl had no sympathy for Marxism, accusing it of combining utopian dreaming with Machiavellian practice of power politics in the present. He only joined the postwar Labor party (the former Social-Democratic party) after it abandoned its prior Marxist doctrines, feeling that it had become the best defender of liberal democracy. Although he has sometimes been described as a socialist because of this membership, there is no sign that he believed in socialism as a pattern for the future organization of society; indeed, he continued to proclaim himself a liberal, but not a defender of the capitalist status quo.

In the polemical and journalistic essays of the last two decades of his life, he reaffirmed his own vision of history and life. Even as death neared, he did not fall back on either traditional religion or the mysticism with which many intellectuals replaced it; he accepted the rational structure of the universe and the ability of man's rational mind to comprehend it, and he saw rationality as the basis for a healthy emotional life. His vision of the world was this-worldly. Quite unreligious himself, he defended the rights of Catholics and other non-Calvinists to full membership in the Dutch community. His belief in liberal democracy, separated from the tie established in classical liberalism between political democracy and free-enterprise capitalism, was only intensified by the attacks upon it from right and left. He was not as sensitive as many others to the social and economic problems faced by democracy, but he thought all totalitarian alternatives were false solutions. These ideas were never brought together into a full-scale exposition and therefore hardly present a neatly coherent picture. His significance lies not in the originality of his beliefs, which cannot be asserted, but in the extraordinary

vigor with which he defended them at a time when advocates of the middle way seemed to have lost their certitudes and their self-confidence.

His primary impact, however, remained his revisions in Dutch history and his historiographical and critical writings. As these became known in the Western world, he was invited to visiting professorships and lectureships in the United States, England, and other countries, and he became the best-known Dutch scholar in the postwar world. He died at his home in Utrecht on the last day of December 1966.

HERBERT H. ROWEN

WORKS BY GEYL

- 1913 *Christofforo Suriano, resident van de Serenissime Republiek van Venetië in Den Haag, 1616–1623* (Christofforo Suriano, Resident of the Most Serene Republic of Venice in The Hague, 1616–1623). The Hague: Martinus Nijhoff.
- 1924 *Willem IV en Engeland tot 1748* (Vrede van Aken) (William IV and England Until 1748 [The Peace of Aachen]). The Hague: Martinus Nijhoff.
- 1925 *De Groot-Nederlandsche Gedachte* (The Great Netherlands Idea). Vol. 1. Haarlem (Netherlands): Tjeenk Willink.
- 1930 *De Groot-Nederlandsche Gedachte* (The Great Netherlands Idea). Vol. 2. Antwerp (Belgium): De Sikkel.
- (1930–1937) 1948–1958 *Geschiedenis van de Nederlandsche Stam* (History of the Dutch Nation). 3 vols. Amsterdam: Wereldbibliotheek. → Revised and reprinted in six volumes in a paperback edition in 1961–1962. Volume 1 was translated as *The Revolt of the Netherlands, 1555–1609*, 2d ed., rev. & enl., published by Barnes & Noble, New York, 1966 (the first edition was published in 1932 in London by Williams & Norgate). The translation of the second volume was published as two volumes: *The Netherlands in the Seventeenth Century*, part one, 1609–1648, published by Benn in London, and Barnes & Noble in New York, 1966 (first published as *The Netherlands Divided, 1609–1648* in 1936 in London by Williams & Norgate), and *The Netherlands in the Seventeenth Century*, part two, 1648–1715, published by Benn in London, and Barnes & Noble in New York, 1964.
- 1936 *Revolutiedagen te Amsterdam, Augustus–September 1748* (Revolutionary Days in Amsterdam, August–September 1748). The Hague: Martinus Nijhoff.
- 1937 *Kernproblemen van onze geschiedenis* (Central Problems of Our History). Utrecht (Netherlands): Oosthoek.
- (1939) 1970 *Orange and Stuart, 1641–1672*. New York: Scribners. → First published in Dutch.
- 1946a *Eenheid en tweehed in de Nederlanden* (Unity and Duality in the Netherlands). Lochem (Netherlands): De Tijdstroom.
- (1946b) 1963 *Napoleon, For and Against*. New Haven: Yale Univ. Press. → First published as *Napoleon. Voor en tegen in de Franse geschiedschrijving*.
- 1946c *Patriotten en N.S.B.ers* (Patriots and N.S.B.ers). Amsterdam: J. van Campen.
- 1947 *De Patriottenbeweging, 1780–1787* (The Patriot Movement, 1780–1787). Amsterdam: P. N. van Kampen.
- 1948 GEYL, PIETER; and TOYNBEE, ARNOLD J. *Can We Know the Pattern of the Past? Discussion . . . concerning Toynbee's book "A Study of History."* Bussum (Netherlands): F. G. Kroonder.
- (1949) 1968 GEYL, PIETER; TOYNBEE, ARNOLD J.; and SOROKIN, PITIRIM *The Pattern of the Past: Can We Determine It?* New York: Greenwood.
- 1950 *Tochten en toernooten* (Campaigns and Tourneys). Utrecht (Netherlands): Oosthoek.
- 1952a *From Ranke to Toynbee: Five Lectures on Historians and Historiographical Problems*. Northampton, Mass.: Smith College, Department of History.
- 1952b *Reacties* (Reactions). Utrecht (Netherlands): Oosthoek.
- 1954 *Historicus in de tijd* (A Historian in His Own Time). Utrecht (Netherlands): W. de Haan.
- (1955a) 1964 *Debates with Historians*. Cleveland, Ohio: World Publishing.
- (1955b) 1970 *Use and Abuse of History*. Hamden, Conn.: Archon.
- 1958 *Studies en strijdschriften* (Studies and Polemical Writings). Groningen (Netherlands): J. B. Wolters.
- 1959 *Geschiedenis als medespeler* (History as a Fellow Player). Utrecht (Netherlands): Spectrum.
- (1961) 1963 *Encounters in History*. London: Collins.
- 1963 *Van Bilderdijk tot Huizinga: Historische toetsingen* (From Bilderdijk to Huizinga: Historical Evaluations). Utrecht (Netherlands): Spectrum.
- 1964 *History of the Low Countries: Episodes and Problems*. London: Macmillan; New York: St. Martin's.
- 1971 *Pennestrijd over staat en historie. Opstellen over de vaderlandse geschiedenis aangevuld met Geyl's levensverhaal (tot 1945)* (A Pen-and-Ink War Over the State and History. Articles on National History Together With an Account of Geyl's Life [to 1945]). Groningen (Netherlands): Wolters-Noordhoff.

GHURYE, G. S.

Govind Sadashiv Ghurye was born into a Saraswat Brahmin family in Malvan, India, in 1893. He completed his high school and college education in Bombay, where he studied English and

Sanskrit. Ghurye was throughout a brilliant student and he won the coveted Chancellor's gold medal as the best student at the M.A. examination in 1918. After reading Ghurye's unpublished essay on "Bombay as an Urban Centre," Patrick Geddes, who had started the sociology department at the University of Bombay, recommended him for a foreign scholarship, and Ghurye went to London. Dissatisfied with the atmosphere at the London School of Economics, and uninspired by L. T. Hobhouse, Ghurye registered for the Ph.D. program at Cambridge University, where he planned to study with W. H. R. Rivers. Unfortunately, Rivers, for whom Ghurye developed an enormous regard, died in 1922, and he completed his work under Alfred Cort Haddon. He returned home in 1923. Appointed reader and head of the sociology department at the University of Bombay in 1924, he became a full professor in 1934, and at his retirement at the age of 65, he was named the first professor emeritus of the university.

Ghurye's first book, *Caste and Race in India* (1932), in which he skillfully combined historical (Indological), anthropological, and sociological approaches, established his reputation. He was as much concerned with the historical origin and the geographical spread of the caste system as with its contemporary features, including the impact of British rule. He recorded insightfully the persisting, the changing, and the emerging features of this complex system. Though firmly opposed to the caste system and hopeful that it will weaken in the urban environment, he also regretfully noted the growth of caste consciousness and the transformation of the caste into a community. In subsequent editions, Ghurye fully developed such themes as the role of the caste in politics. This book will rank as Ghurye's most lasting contribution to Indian sociology.

Though at the height of his intellectual powers, Ghurye did not publish another major work for ten years. Then, he published *The Aborigines—"So-called"—and Their Future* (1943) to refute Verrier Elwin's thesis that the separate identity of tribal groups should be maintained by enforcing their continued isolation. Ghurye argued in favor of their assimilation into the larger community. Essentially, Ghurye was directing his attention to the critical problem of nation building in a heterogeneous society, a theme to which he has returned repeatedly in his later writings. In *Social Tensions in India* (1968b), he examined, in a historical context,

the deeply divisive role of culture, language, and religion in India. Concerned about the bleak prospect of national solidarity, he expressed his dissatisfaction with the gradual amoral, manipulative drift in Indian politics in *Whither India?* (1974). In *India Recreates Democracy* (1978), however, he celebrated the restoration of democracy to India in 1977. These works show Ghurye's abiding concern with the problems of his society.

During these years, more general themes and a cosmopolitan approach to sociology were exhibited in Ghurye's broader works on culture. In *Culture and Society* (1947), he dealt with a universal theme—what makes a culture great?—and assigned universities a major role in preserving, enhancing, and disseminating culture in society. In a subsequent work, *Occidental Civilization* (1948), he focused on the reasons for peaks and clusters of creative energy. Ghurye's lifelong intellectual fascination with cities found detailed expression in *Cities and Civilization* (1962a). These works show his intimate knowledge of Western literature.

In his remaining works, Indian themes have predominated. Ghurye tried, in *Indian Costume* (1951), through a historical survey, to arrive at a position on the question of national dress; a hopeless undertaking for a country as vast and varied as India. Again, the effort was aimed at finding homogeneity in extreme heterogeneity. His deep interest in urbanization was expressed in many writings. For example, he discussed the impact of the urbanization process on a given rural hinterland (1963a). Taking an 1819 monograph on an Indian village as his base, Ghurye restudied the area and analyzed its development (1960a). He also examined literary sources to produce evidence of social change in his home state (1952b; 1954a).

The sociology of religion has been another of his major intellectual concerns. His *Indian Sadhus* (1953b) traced the role of ascetic organization. He wrote two studies of Indian gods (1962b; 1977), and prepared an analysis of the role of religion in the historical civilizations of Mesopotamia, Egypt, and India (1965a). He wrote an authoritative study of kinship (1955). His papers are many and varied, covering such subjects as dual organization in India, cross-cousin marriage, age at the time of marriage, marriage and widowhood, Egyptian affinities of Indian funerary practices, disposal of the human placenta, salary and working conditions of clerks, friendship, megalith remains in India,

population growth, sex habits of the Bombay middle class, birth control in Bombay, untouchability, explorations in pre- and protohistoric Sindh culture, and so on. A minor work deserving consideration is *Vidyas* (1957*b*), in which Ghurye paid homage to Comte on the centenary of his death. That an Indian sociologist was mindful of this event is itself remarkable; that Ghurye recognized Comte as a sociologist of knowledge is more so. Ghurye, doubtless imitating Comte, suggested a new name for sociology—humanics, a term borrowed from Roger Williams, on his own admission.

In addition to his research, Ghurye has found time to be a successful teacher. Approximately 80 dissertations (25 for the M.A.; 55 for the Ph.D.) have been completed under his guidance (1973) and his former students still teach in various Indian universities. Although he taught at a time when doctoral fellowships and funding organizations were scarce and professional employment prospects dim (Srinivas 1973), Ghurye attracted many students and inspired them, by his scholarly stature, to pursue the painstaking process of sociological research. His students often tackled new topics, including village studies, urban studies, kinship studies, community studies, regional studies, and nationalism. He allowed each student to pursue his or her own interest and showed great tolerance. One could do almost any kind of research, subjectwise and methodwise, provided standards set by Ghurye were met. Ghurye was an exacting adviser but did not impose his views. Few have equalled him and none has surpassed him in India in this respect.

In 1952, Ghurye founded the Indian Sociological Society and launched its journal, *Sociological Bulletin*. He served as the society's first president until 1966. Though there were other pioneers, no single person has done as much for sociology in India as Ghurye.

As a student of Rivers, Ghurye was influenced by diffusionist ideas that are reflected in many of his early works. K. M. Kapadia (1954) and M. N. Srinivas (1973), both Ph.D. students of Ghurye, refer to it. In later life, he either outgrew or rejected these ideas. Did he use the ten "fallow" years to secure his intellectual independence? If so, Ghurye has never surrendered it again and has been his own mentor. Deeply rooted in Indian culture, he has not allowed anything to deflect him. Ghurye has chosen to be a recluse in order to preserve his freedom to do what he thinks best. The one abiding les-

son he learned at Cambridge, and sought to transmit to his students, was respect for facts. When he began his career, very little work had been done in sociology in India, and it was salutary to insist on facts. Ghurye's commitment to facts has both a positive and a negative side. Positively, it has given him and his students a firm empirical base, curbing the speculative tendencies that are especially tempting in the absence of concrete information. Srinivas (1973) rightly compliments Ghurye for conducting a one-man ethnographic survey of India from his chair in Bombay. Negatively, Ghurye's prolonged neglect of all theoretical positions, however tentatively, has deprived his writings of a powerful thrust. It is puzzling that a mind so vital and aware should have remained indifferent to the fierce controversies in the West. Was this indifference (it was not ignorance) a mechanism to protect himself from an interminable and seemingly profitless exercise? If so, his accomplishments may attest to the value of his strategy.

GLASS, D. V.

David V. Glass (1911-1978) was a pioneer in the study of population, population policy, demography, social mobility, demographic history, and historical demography. For fifty years he was associated with the London School of Economics (L.S.E.) as a student and an influential teacher.

David Victor Glass, a tailor's son, was born in London's East End in 1911 and was thus by birthplace a true cockney, though few would

recognize this later. He attended a state elementary school and Raine's Foundation School before enrolling at the L.S.E. in 1928.

The L.S.E. was founded as, and has remained, a place of heightened political awareness; in the 1930s, politics was an obsession. The Houghton Street that Glass walked daily was a marketplace of socialist ideas and ideals. Among those who contributed to the intellectual climate of the time were Beatrice and Sidney Webb, the founders of L.S.E. and early advocates of pragmatic socialism; the sociologist and philosopher, L. T. Hobhouse; the social and economic historian, Richard H. Tawney; the social anthropologist, Bronislaw Malinowski; the sociologist, Karl Mannheim; and the legendary political activist, Harold Laski. Although politics did not figure in Glass's later professional work, he did continue to hold strong convictions on social justice and inequality and on independence and self-sufficiency for the Third World. Throughout his life he remained a socialist, refusing a knighthood on this principle.

While a student, Glass was active in leftist student politics and, after graduation, he nearly became a regional organizer for the Workers' Educational Association. William Beveridge wrote in 1932: "As a student Glass was regarded as one of the most promising men of his year"; and if he only received an upper second it was "because he occupied himself too much with the activities of the Student Union" (*The [London] Times*, Sept. 27, 1978, p. 16).

In 1931 Glass graduated with a B.Sc. in economics and then worked as a research assistant to Beveridge, who years later would be the architect of Britain's national insurance system—the basis for Britain's welfare state providing coverage "from the womb to the tomb." During this time Glass also worked with the statistician Arthur Bowley.

In 1935 Glass wrote *The Town and a Changing Civilization*, an analysis of the historical development of towns as social institutions from Sumer to modern times. The work traced the origins of urban problems in an attempt to establish a precursor for a system of town planning. The book concluded that there was little value to "using economics to achieve more efficient production if the bulk of the production is to go to a minority among those individuals. In the face of such problems and such aims, there is only one way of obtaining the society we need—by building a Socialist State" (p. 141). The work was published in a series edited by

Krishna Menon, later India's Minister of Defense and Glass's lifelong friend.

In the same year, Glass joined the department of social biology to work with Lancelot Hogben. Hogben's work, and especially his edited book *Political Arithmetic* (1938) to which Glass contributed, combined empirical social research with a wide-ranging social investigation. "My own approach to social research," wrote Glass, "was very considerably affected by discussions with Professor Hogben" (1973*b*, p. 175). Glass retained this broad but empirically based intellectual style throughout his life, at a time when many others in his field adopted a more narrow, specialized approach. His work showed superb skill in the analysis of new facts within a comprehensive framework while avoiding trends toward either blind empiricism or grand theorism. Years later, in his landmark study on *Social Mobility in Britain* (1954), he acknowledged that the "approach to the study of social selection and differentiation has clearly been influenced by the investigations which [Hogben] promoted before World War II" (p. vi).

Glass's development in demography and statistics was also influenced by Robert R. Kuczynski, then also working in the department, who had earlier helped to develop and apply indices of population replacement (net and gross reproduction rates). These indices were important in that they showed the potential implications of a sustained fertility decline upon the size and age structure of the population. Because Kuczynski's indices were widely publicized and adopted by the League of Nations' *Statistical Yearbook*, considerable attention was drawn to the falling birth rates. The technical appendices of some of Glass's later work made extensive use of Kuczynski's methods.

In 1936 Glass was appointed research secretary of the newly formed Population Investigation Committee, which included Alexander M. Carr-Saunders as chairman, as well as Carlos P. Blacker, Juliet E. Rhys-Williams, and Grace Leybourne. As more attention was focused on Europe's falling birth rates, the committee asked Glass to study the family allowance system in France and Belgium as well as other pro-natalist policies in fascist Italy and Nazi Germany. This work was summarized in his second book, *The Struggle for Population*. It was published in 1936 along with Carr-Saunders' *World Population: Past Growth and Present Trends*, and Kuczynski's *Population Movements*. The three books, reviewed together in *The* (London)

Times, drew considerable attention in the press and in Parliament to the declining birth rates. The research findings and the resulting public discussion contributed directly to the passage of the Population (Statistics) Act of 1938, which greatly expanded the scope of vital registration in Britain by including background questions on age and other characteristics of the mother. This information enabled the precise calculation of reproduction rates and allowed an analysis of current changes of fertility.

Concern over the possibility of a declining population was heightened by the spreading war in Europe and by Nazi Germany's purported success in raising marriage and birth rates. Glass undertook a major study of the formulation and implementation of government policies affecting marriage and fertility in England and Wales, France, Belgium, Italy, Germany, and Scandinavia. The family allowance systems were studied in great detail because they were increasingly being used as a pro-natalist population policy. "The record of governmental attempts to stimulate fertility shows one significant and constant fact," wrote Glass, that "however urgently governments may have declared their desire to increase the supply of births, they have nevertheless persistently tried to buy babies at bargain prices" (1940, p. 371). The study, which was also his PH.D. thesis, was published in 1940 in a single volume, *Population Policies and Movements in Europe*, and was regarded as the definitive work on population policy. Nearly thirty years later, when there was concern that population was growing too rapidly, the book was republished; it remains a major classic in the study of population.

Glass went to the United States in 1940 as a Rockefeller fellow; but because of the war he was recruited as deputy director of the British Petroleum Mission in Washington. At the end of the war, Glass was appointed director of the Family Sample Census of the Royal Commission on Population, established at a time when there was still concern about low fertility. Glass directed the largest population survey conducted in Britain. It included a ten per cent sample of ever-married women who were asked complete fertility and marriage history questions (Glass & Grebenik 1954). This was one of the first large-scale studies of fertility which employed the methods of cohort analysis.

The Royal Commission found that family size had remained relatively stable at around 2.2 children per married couple and, though this

was close to the level of replacement, population was likely to increase for some time. It recommended a number of governmental social policies to reduce the cost burden on large families while also suggesting that the National Health Service distribute contraceptives. Most of the recommendations were ignored by later governments, but the reports did influence the public discussions and subsequent investigations of population changes. By the mid-1950s, fertility dramatically increased in Britain and population projections had to be revised upward.

In 1945 Glass replaced R. R. Kuczynski as a reader in demography at the L.S.E., and by 1948 he became professor of sociology, a position he retained for the rest of his life. He also served in the late 1940s as the United Kingdom representative to the United Nations Population Commission and to the United Nations Educational, Scientific and Cultural Organization. In 1947 Glass founded and coedited with E. Grebenik what became the leading journal in the population field, *Population Studies*. These two personally reviewed all the submitted manuscripts until Glass's death in 1978.

During these years, Glass worked increasingly in sociology and history because, as he said in the *Introduction to Malthus* (1953), "population is not itself an independent variable." In the 1950s a number of Malthusian arguments were proposed by different writers. In response, Glass wrote and edited some of the most incisive work ever done on Malthus, relating that theorist to his times and analyzing the relevance of Malthusian arguments to the contemporary world.

In the 1950s and 1960s many historians became increasingly interested in the role of population growth in economic and social change, and at the same time many demographers became interested in history. In an attempt to integrate work in the two disciplines, and employing their combined approaches, Glass contributed to and edited two landmark books on demographic history. The first, *Population in History* (1965), was coedited with D. E. C. Eversley, and the second, coedited with Roger Revelle, was *Population and Social Change* (1972). These books contributed greatly to our knowledge about the demographic transition in preindustrial and industrializing Europe, and perhaps shed some light on the relevance of these experiences to other countries.

Glass was interested not only in demographic history but also in the history of demography, particularly in Britain. He wrote papers on

Gregory King's estimate of the population of England and Wales in 1695 and on John Graunt's development of the life table. Published with two companion volumes of historical reprints, *The Population Controversy* (1973c) and *The Development of Population Statistics* (1973a), *Numbering the People* (1973b) was one of his major works in this area. It analyzed in great detail the eighteenth-century population controversies and the development of the census and vital statistics in Britain.

Perhaps his most important work, inspired partly by Hogben, Marshall, and Ginsberg, was his study on *Social Mobility in Britain* (1954), conducted with J. R. Hall and others. This was a pioneering investigation of intergenerational mobility; it was the first national study undertaken anywhere to examine systematically social mobility over the entire community, and its methodology remains a model on which studies are still based. After first establishing a scale of occupations by social status on the basis of empirical research, the investigators then obtained life histories of a random sample of ten thousand adults representing Great Britain. An Index of Association was employed to measure the extent to which mobility between two occupational groups went beyond that of "chance." A value greater than unity indicated that more subjects were found in their fathers' status category than would be expected assuming statistical independence. A wide range of analysis was then undertaken by a number of colleagues, while Glass himself examined the relations between social origins and education; changes in social status between fathers and sons; and the way in which education affects the social mobility of individuals of different social origins. Much greater social mobility was found in Britain than many, including Glass, had expected, in what was thought to be a more rigid class structure. Glass took a leading role within the International Sociological Association to promote similar studies in other countries, all designed for international comparability, and he strongly influenced Gösta Carlsson's study of Sweden and Kaare Svalastoga's study of Denmark. A remarkable similarity was eventually found in the general pattern of social mobility of Western industrialized countries.

Glass participated in many other special study groups and helped found the British Society of Population Studies. He was elected president of the International Union for the Scientific Study of Population (1963–1965); fellow of the British

Academy (1964); fellow of the Royal Society (1971); foreign honorary member of the American Academy of Arts and Sciences (1971); and foreign associate of the National Academy of Sciences (1973). He also received honorary doctoral degrees from the universities of Michigan and Edinburgh, and from Queen's University Belfast.

Despite his public activities, Glass was, in many ways, a lone scholar, trying not to be distracted by the popularity of his field. Yet in 1965 he created one of the world's leading population training centers which combined an orientation to the Third World, a study of population within a broad social context, and the most sophisticated of demographic techniques. He demanded the highest standards of scholarship from himself and his students. His superbly substantive and witty lectures were always crowded, with every continent well represented. Glass encouraged his students to return to their own countries, where many have moved into key governmental and university positions; thus his influence as a teacher and a scholar have extended far beyond the shores of the British Isles.

GLUCKMAN, MAX

Max Gluckman, a major figure in social anthropology, was born in Johannesburg, South Africa, on January 26, 1911. He died in Jerusalem, Israel, on April 13, 1975, while serving as the Lady Davis distinguished visiting scholar at the Hebrew University.

Career. Gluckman's South African youth was decisive in determining his view of anthropology, although most of his research and his entire teaching career postdated his departure from South Africa in 1938. He was to visit that country only for brief periods afterwards, and he became increasingly critical of its political development. He opted for British rather than South African citizenship and spoke out publicly against the deepening shadow of apartheid. It was the South African experience that molded him into a firm champion of black Africans throughout the continent, a championship that led to his exclusion for many years from field

work in south or central Africa. He returned to the latter area only after northern Rhodesia became independent Zambia in 1964.

Gluckman also felt a deep emotional commitment to Israel. This devotion, too, went back to his childhood. Although his parents did not practice the Jewish religion, they were prominent members of the South African Jewish community and strong Zionists. They and most of their children ultimately emigrated to Israel. Gluckman never carried out intensive field research in Israel as he did in south and central Africa, but in his later years the majority of his students were sent to work in Israel, as earlier the majority of them had gone to work in central Africa. Much of this later work was carried out as part of the Bernstein Israel Research Project, which was initiated through the University of Manchester in 1963 under Gluckman's direction. That project has been called "the first concerted effort by a group of social anthropologists to explore an industrialized state since Warner's Yankee City studies" (Marx 1975, p. 131).

Although Gluckman spent much of his working life in England and encouraged his students to do research on its factories, shops, and housing estates, he himself did little research in that country except on the subject of sport. A fine athlete from boyhood, Gluckman turned naturally to the examination of the role of football and other sports within the context of contemporary life.

Gluckman was educated at Witwatersrand University (B.A., 1934) and at Oxford University, where he went in 1934 as a Transvaal Rhodes scholar. He received his D.PHIL. in anthropology at Oxford in 1938. From 1936 to 1938 he carried out field work in Zululand, and then, in 1939, he went to northern Rhodesia (now Zambia) as a research officer of the Rhodes-Livingstone Institute. He immediately began field work among the Lozi of Barotseland, that work being interrupted when he became director of the institute in 1941. Thereafter he was able to return to Barotseland twice for short periods during which he concentrated on the working of Lozi courts. He also spent a few weeks in research among the Tonga and Lamba peoples before he gave up the directorship in 1947. In that year he became university lecturer in social anthropology at Oxford, a post he left in 1949 when appointed the first professor of social anthropology at the University of Manchester.

Leaving the institute did not end Gluckman's

close involvement with its development. For many years he continued to train the majority of those appointed as research officers, and he gave them an academic home at Manchester when they returned from central Africa. The first reports of their research were usually given in his famous Manchester seminar, which was devoted to the analysis of field data.

At Manchester, Gluckman founded a school of social anthropology stamped with his own standards of excellence and his characteristic research interests. These emphasized the necessity of relating what happened in particular situations to the context of the total system within which the situations developed. They focused upon action guided by a concern for reputation and social values rather than upon such subjects as cognitive systems. Situational analysis, the extended case method, and the social drama were all terms used to express the essence of his method with its focus upon human interaction. F. G. Bailey, Victor Turner, Ronald Frankenberg, Arnold L. Epstein, Scarlet Epstein, William Watson, and Jaap Van Velsen were among the first of the stream of distinguished anthropologists whom he trained.

When Gluckman became a special fellow of the Nuffield Foundation in 1971, he handed over the chairmanship of the Manchester department, but continued to teach. Part of his strength as a teacher depended on his deep interest in his students and in their work. He gave time and intellectual energy to helping them develop the theoretical implications of their data, and delighted in their discoveries, which he saw as an extension of his own work. Although primarily associated with the University of Manchester in his later years, Gluckman also traveled widely and frequently served as visiting professor at universities throughout the world. He returned most consistently to the Yale University Law School, where he was honored for his work in comparative law and found congenial companions who shared with him his interest in jurisprudence. His colleagues recognized him by awarding him most of the honors that can come to an anthropologist.

Intellectual development. Although Gluckman's youthful experiences influenced his later career profoundly, his theoretical development was determined by experiences at Witwatersrand and Oxford. When Gluckman entered Witwatersrand in 1928, he expected to study law and become a lawyer like his father. A lecture course in anthropology taught by Winifred

Hoernle, however, turned him away to social anthropology. Hoernle's theoretical approach was strongly influenced by Émile Durkheim and A. R. Radcliffe-Brown, but she was also one of the founders of the South African Institute for Race Relations, created to provide factual information on the multiethnic population of South Africa. She and Isaac Schapera, who also taught at Witwatersrand for a year, saw anthropology as involved with living people. They believed that anthropologists in South Africa had an obligation to study the impact of the social conditions under which Africans were being forced to live in the reserves, on farms, and in towns and cities. Reconstructing cultural practices of the African past was a legitimate anthropological enterprise, but it was of less crucial concern than documenting and analyzing the contemporary multiethnic scene. Hoernle and Schapera, and the young men and women drawn by them into anthropology, translated the functional doctrines then dominating social anthropology under the influence of Bronislaw Malinowski and Radcliffe-Brown into a statement about the interrelationships between such phenomena as the high standard of living of South African whites, pass laws, low wages for Africans, malnutrition in the reserves, dilemmas of chieftainship, eroding agriculture in the reserves, and so on. Taking a stand by no means acceptable to most white South Africans, who thought in terms of separate cultural universes, they described Africans and Europeans as belonging to a single social system.

Gluckman was strongly drawn to this view of anthropology. Beginning with his first professional writing, he examined interethnic situations within which blacks and whites encountered each other (1940), and he encouraged colleagues and later students to study contemporary industrial society, which he saw as including the rural areas of Africa. When in 1943 he drew up a seven-year research plan for the Rhodes-Livingstone Institute, he took industrialization and labor migration as the focus for the work of all research officers to be appointed by the institute to work in northern Rhodesia (Zambia), southern Rhodesia (Zimbabwe), and Nyasaland (Malawi). He saw these two forces as both disruptive of old patterns and providing the basis for regrouping, and he wrote: "as part of this study we shall analyse the formation of new groups and relationships, in both urban and rural areas . . ." (1945, p. 9). For him, anthropology thrust forward from the

present into the future. In much the same terms some twenty years later, in 1963, he planned the Bernstein Israel Research Project, but this time the focus was to be upon industrialization and immigration.

At Oxford Gluckman studied under Robert R. Marett, E. E. Evans-Pritchard, and later Radcliffe-Brown. In the 1930s the latter two were closely associated intellectually and it was to them that Gluckman gave his allegiance. Their ideas about social structure, functional relationships, social cohesion, and political order were congenial to him, since they referred back to Durkheimian formulations already familiar to him from Hoernle's teaching. Gluckman agreed with Radcliffe-Brown and Durkheim that society is a moral order that manages to maintain itself despite conflict among its members who follow their competing interests and sometimes rebel against whatever symbolizes social constraints. However, he departed from Radcliffe-Brown increasingly as he came to emphasize the pervasiveness and bitterness of the conflicts with which society has to contend. He looked to law and ritual as the great upholders of the social order, seeing in them the mediating mechanisms that permit harmony to be restored after breaches of the peace have occurred or when people have shown themselves to be fundamentally at odds. He was to make major contributions to the study of both law and ritual.

Gluckman published two influential books based upon his field study of Lozi courts, *The Judicial Process Among the Barotse of Northern Rhodesia* (1955b) and *The Ideas in Barotse Jurisprudence* (1965a). Critics in his own discipline were later to accuse Gluckman of having imposed English and Roman Dutch legal categories upon the Lozi judges. He defended himself against his accusers, maintaining that he had the obligation to explicate Lozi ideas in terms comprehensible to the legal scholar as well as to the anthropologist, but that he was translating concepts familiar enough to Lozi litigants and judges. It was the Lozi who used the standard of "the reasonable man" in weighing the evidence; he had only the pleasure of recognizing a familiar legal concept in an unfamiliar setting. In these books, and in various articles dealing with Lozi courts and legal procedures, he dealt with technicalities of law in a fashion that suggests his early legal training. But his over-all concern with the courts was with their role as moral agents.

Gluckman's doctoral dissertation for Oxford

was entitled "The Realm of the Supernatural among the Southeastern Bantu." It was based on library research and at first glance seems an uncongenial subject for a man who as a professed agnostic admitted that he found religious belief difficult to understand. Gluckman never published the dissertation, but he mined from it a number of articles on ritual that relate to his primary interests. They examine what for him were to be perennial questions, how ritual reflects the social order and in symbolizing it reaffirms its rightness. He was to write of ritual again and again in these terms, describing the ceremony of the opening of a bridge in Zululand as symbolizing both the divergent and the common interests of those who attended (1940); of the war between the sexes during Wiko circumcision ceremonies as leading to a reaffirmation of social continuities (1949); and of rituals of rebellion in Swaziland and elsewhere as maintaining the state (1954). His final statement on the subject was made in the last article he published: "In ritual . . . the ultimate emphasis is that harmony among people can be achieved despite the conflicts, and that social institutions and values are in fact harmonious—ultimate statements that are belied to some extent by the ritualization itself. Ritual can do this since each ritual selects to some extent from the gamut of moods, of cooperative links, and of conflicts" (Gluckman & Gluckman 1977, p. 236).

In the late 1930s, Gluckman was closely associated with E. E. Evans-Pritchard and Meyer Fortes. At that time they were laying the groundwork for the study of political anthropology in the discussions that gave rise to the volume *African Political Systems* (Fortes & Evans-Pritchard 1940), which was to initiate a spate of studies of segmentation and balanced opposition. Gluckman was strongly influenced by this volume, to which he was a contributor, and also by Evans-Pritchard's *The Nuer* which appeared in the same year. He thought of himself as developing the implications of these volumes in such books as *Custom and Conflict in Africa* (1955a) and *Politics, Law and Ritual in Tribal Society* (1965b). He may have been unaware of how far he had moved in other directions in his own analysis of conflict and order. Where Evans-Pritchard and Fortes emphasized the existence of stable cognitive structures and balanced opposition of social units, Gluckman looked to the individual and recognized that the rules by which people are expected to live are

themselves often contradictory or ambiguous: people therefore are in conflict with themselves as well as with their fellows and society. The different roles they fill make conflicting and equally valid demands upon them and right behavior in one role leads to bad behavior in another. In his thought the moral dilemmas were likely to be more complex in less complex societies, for in such societies each individual must simultaneously enact a variety of roles and face the various expectations of the other members of society. He described such societies as multiplex and believed that it was within them that ritual functioned most effectively, both to mark the roles and to persuade people that despite all conflicts, they shared overriding values of fertility and harmony.

In more complex societies, he looked to legal rather than to ritual solutions, for he saw them as mobilized in terms of class or sectional interests that did not bow to some greater value placed upon the larger society. The playing out of conflict in ritual was no longer effective and could not be permitted, because there were no ritual symbols that could override the conflict. At one time Gluckman had read much of Karl Marx, and he saw the sweep of history in Marxian terms. The influence of Marx upon him later waned, and he never showed much interest in the dialectical method, but his view of the role of ritual in contemporary industrial society derives from his earlier thinking.

Other interests were spin-offs from his central concerns. He lectured and wrote on the functions of gossip (1963a), where again he faced the criticism of younger anthropologists who looked at gossip as a system of communication. Gluckman's own interest was more restricted, for he was concerned with the way in which social standards were enunciated through gossip and the way in which gossip served as a means of social control. His controversial article on the sources of marital stability (1950) led to a great deal of research on divorce rates and the various social factors that might correlate with them. It was more peripheral to his central interests, but derived from his concern to discover the conditions under which frequent marital break-ups can occur without endangering the stability of the encompassing social system.

The thread that runs through Gluckman's work is the study of conflict contained within some higher order, though threatened by the unwillingness of men and women to accept compromises that injure their immediate de-

sires. Because of this emphasis on conflict and his focus on situations, Gluckman has been seen as following in the footsteps of Georg Simmel, but he developed his ideas independently before reading Simmel. Although he was adamant that as a social anthropologist he did not deal in psychological explanations, his debt to Sigmund Freud appears to have been significant in that he placed conflict within as well as between individuals. He himself, after the early interest in Marxism, held that he belonged in the camp of Durkheim and those who believe that societies are moral systems, rather than simply collectivities of competing, calculating individuals.

GLUECK, SHELDON
AND ELEANOR T.

Sheldon Glueck was born in Warsaw, Poland, on August 15, 1896. He came to the United States in 1903 and became a naturalized citizen in 1920. He attended Georgetown Law School, George Washington University, the National Law School, and Harvard University, and earned the degrees of A.B., A.M., LL.B., LL.M., S.S.D., PH.D., and sc.D. In 1948 the University of Thessalonika (Greece) made him an honorary doctor of laws. During his long and distinguished career Glueck taught at Harvard University. In 1950 he was appointed Roscoe Pound professor of law, an honor that he prized greatly because of his close association with Pound, whose influence is seen in much of Glueck's writings. In 1963 Glueck retired to become professor emeritus.

Glueck's interests ranged from the development of modern research in delinquency prediction to the practical world of delinquency prevention. He was invited to advise governments on a wide variety of matters relating to the prevention and eradication of these important social problems. So respected was his scholarship and judgment that on the occasion of the Nuremberg trials he was appointed adviser to Justice Robert H. Jackson on law governing war crime criminals. In recognition of his many outstanding contributions to criminal justice he received numerous honors including the Isaac Ray award of the American Psychiatric Association in 1961; the August Volmer award of the American Society of Criminology in 1961 (with Eleanor Glueck); the gold medal of the Institute of Anthropology, University of Rome in 1964; and the Beccaria gold medal of the German Society of Criminology in 1964. The Sellin-Glueck award of the American Society of Criminology was established in 1972 to honor, *inter alia*, Glueck's contributions to criminal justice.

Eleanor T. Glueck (1898-1972) was born on April 12, 1898, in New York. She studied at Barnard College, the New York School of Social Work, and Harvard University, where in 1925 she received a doctor of education degree. She met Sheldon Glueck when both were graduate students at Harvard and they were married on April 16, 1922. From 1925 to 1928 they both taught at the Harvard department of social ethics and then moved to Harvard Law School. There they staked a claim and established a sound base from which to conduct a lifelong study of crime and delinquency. Eleanor Glueck was research associate in criminology for 36 years until her retirement in 1964. Her work did not stop here and she worked along with her husband until her untimely death in 1972.

The Gluecks of Harvard, as they grew to be known by their friends, operated on the growing edge of knowledge. They were pioneers and they examined the social indicators hoping to bring sense and solution to the problems of criminology. Each brought a special type of knowledge and unique skills to the joint effort. They studied "the fog-enshrouded borderland of psychiatry and law" and it was inevitable that through them the social sciences should help to redirect the law and in its turn the law should issue its caution when intrusions into the sensitive and private affairs of men and women seemed necessary. The Gluecks looked to all of

the disciplines in their search for answers in the highly controversial areas of etiology, prediction, prevention, punishment, correction, and the individualization of justice. Their studies reflect a pragmatic determination to relate theory to practice. Some critics have claimed that on occasion they have rushed too early to conclusions, particularly with respect to causation and in their creation of a prognostic device to foretell probable delinquency and crime.

In an attempt to trace the roots of delinquency and crime the Gluecks examined the home and school in a number of studies and wrote widely about their findings. The titles of some of their publications indicate the direction taken in this early research: "Working Mothers and Delinquency" (Glueck & Glueck 1957), "Role of the Family in the Etiology of Delinquency" (E. Glueck 1960), and "Family Environment and Delinquency in the Perspective of Etiologic Research" (Glueck & Glueck 1963). However, as they studied the puzzle of causation their data led them to the conclusion that the specific influences in home and school could only be understood in the context of broader social factors.

The Glueck studies coincided with the focus upon the uniqueness of the individual during the first part of this century. In the United States William Healy had written *The Individual Delinquent* (1915), while in England Cyril Burt had brought forth his definitive psychological analysis of delinquency in *The Young Delinquent* (1925). The juvenile court was attempting to apply its *parens patriae* philosophy to troubled children one at a time. The Gluecks were eager to know how well this approach was faring. In Boston the court was regularly referring cases to the prestigious Judge Baker Guidance Center for diagnosis and advice. The Gluecks made a careful examination of a large number of delinquent boys who had been treated in this way. The results were published in *One Thousand Juvenile Delinquents* (1934b). They showed that 88 per cent committed further delinquencies during a 5 year follow up period. Notwithstanding the debate that ensued the Gluecks took a realistic position and argued in favor of the court pointing out that it was a clearing house for many of the unresolved problems of society. In their own inimitable way they described the situation in these words:

The juvenile court stands at the converging point of many of the unwholesome trends in society. The

delinquent is a microcosm in whom is reflected a tangle of vicious circles of poverty, alcoholism, inadequate education, mental deficiency, and other unhealthy conditions. However efficient a juvenile court and clinic may be in their day to day activities, they are fighting . . . conditions which may and do very easily counteract their efforts. . . . A judge cannot complaisantly regard his court as an ivory tower of aloofness, nor his particular job as an end in itself. Whether he recognizes it or not, he and his work are but elements in the intricate texture of socio-economic, biologic, and psychologic conditions. Many of these conditions he can of course not affect in any fundamental sense; a few are capable of some control, and hence it is the judge's duty to galvanize the community into action looking to their amelioration. ([1934b] 1939, pp. 273-274)

The Gluecks saw the experimentation of the juvenile justice system as providing answers that might ultimately be emulated in the adult courts. The individualization of justice was the goal. They felt that professional disciplines such as psychiatry, psychology, social work, and education should become integrated components of the criminal justice system. The Gluecks envisioned a board of qualified practitioners supplementing the judiciary in writing prescriptions for crime and delinquency. The principle of flexibility would prevail and the rights of the individual offender would be safeguarded.

The Gluecks were early pioneers in the field of prediction. They saw teachers equipped with prognostic information as being in a unique position to recognize the early signs of delinquency and thus able to establish preventive action while time was still on the side of the young person. The Gluecks also saw prediction tables as valuable to judges. Dispositions could be more wisely made based upon open knowledge of prevailing negative factors. In 1950 the Glueck social prediction tables were presented in *Unraveling Juvenile Delinquency*. Five predictive factors of social background all focused within the home were presented. These were as follows: discipline of the boy by the father; supervision of the boy by the mother; affection of the father for the boy; affection of the boy by the mother; and the cohesiveness of the boy's family. A number of scholars criticized and challenged the tables. The Gluecks proceeded to replicate their research and verify their results in such places as Australia, India, Europe, and Japan. It cannot be denied that the Gluecks with steadfast purpose, sincere scholarship, and sense of social purpose pursued a course of ac-

tion that put them in the forefront of criminological pioneers, who recognizing a need to extend our intellectual foresight did not capitulate under the pressure of intellectual contest.

It was appropriate that Harvard University created the Sheldon and Eleanor Glueck classroom in the Law School's Pound building. In it are housed many of the Gluecks' books, papers, photographs, and memorabilia. The school's archives contain the full creative product of these two prolific careers. There are approximately three hundred books, articles, and miscellanea available for study and research across the full range of the Gluecks' interests. They cover the continuum that leads from the child in distress to the adult confined.

In addition to his research, Sheldon Glueck wrote several plays. While at George Washington University he was director of the University Players Dramatic Club and was offered a lead role with a professional company that was about to produce *Disraeli*. The Harvard Law School Bulletin published a condensation of his musical play *Mister Littlefellow* in 1972.

The Gluecks of Harvard, sometimes controversial, often provocative, always ahead of the times, will be remembered as leading criminologists, great humanitarians, and inspired teachers.

GOODMAN, NELSON

Henry Nelson Goodman is an American philosopher whose work has fundamental importance for social and other human sciences and for the philosophy of social science. The reference to other human sciences is intended to mark the fact that his work has been important for the psychology of cognition and the psychology of perception, as well as for social and cultural anthropology and sociology. The foundational importance of his work in these areas stems from the fact that his works have constituted classic contributions to basic issues in the philosophy of science, the philosophy of language and the theory of symbols, and the theory of conceptual systems and theory construction. They have thus borne on the central problems of the theory of knowledge. His contributions are classic in the precise sense that no subsequent work claiming significance can be reasonably expected to be adequate unless it takes account of Goodman's achievements.

More specifically, Goodman's contributions are to areas that include aspects of inductive logic involving the justification of hypotheses and theory acceptance. Those contributions pertain also to the analysis of causal and, more broadly, nomological regularity, dispositionality, possibility, resemblance, and similarity, as well as to the theory of psychological (especially sensory or phenomenal) orderings. Of similar importance have been his contributions to the theory of definition and explication, to constructional methods for systematic theorizing in science and philosophy, and to the theory of conceptual systematization in its most general aspects. One contribution, especially noteworthy because of its prospects for relatively direct applicability to the social sciences (e.g., see Rudner 1966, pp. 40-53), is his provision of a rigorous theory of the measurement of the formal, structural simplicity of conceptual systems (a theory which may be applicable to the assessment of the relative simplicity of rival conceptual systems). His theory of reference in various modes of symbolization (and particularly in the arts), developed in his later writings, has particular significance for problems of relativism and objectivity in the social sciences, including problems of the scientific penetrability of alien symbol systems.

An aspect of Goodman's work, which has kept him very much a philosopher's philosopher and relatively unstudied outside of a small (but, in his later career as may now be seen, widening) circle of philosophers, scientists, and critics, has been his remarkable combination of rigor, precision, and clarity in presenting insights and arguments—typically, counterexamples—that, while complex and subtle, are profoundly radical. The effect of such results, once their radical import is understood, is to force other philosophers, scholars, or scientists concerned with the subject matter to reevaluate basic conceptions of the field; and it has sometimes led to a major restructuring of the field or its problems. The publication and subsequent discussions of his *Fact, Fiction, and Forecast* (1954) and *Languages of Art* (1968a) provide two examples for the fields of inductive theory and the theory of symbol systems respectively of just such effects.

Goodman was born in Massachusetts in 1906, received a B.S. from Harvard University in 1928, and a Ph.D. in philosophy of science in 1941. His doctoral dissertation, "A Study of Qualities," became the substantial basis for his first pub-

lished book *The Structure of Appearance* (1951). An indication of the importance of this work is the fact that several years before it was published, the dissertation was cited in a survey essay by Herbert Feigl (1943). During the more than ten years that "A Study of Qualities" was in preparation, Goodman worked as an art dealer and operated an art gallery in Boston. His strong professional ties with the art world have been a pervasive part of his life as well as of his philosophic thought. These ties have not been confined to the world of painting. During the early 1970s, for example, he conceived, staged, and directed multimedia productions at the Dance Center at Harvard.

Among the philosophers who have been primary influences—and whom, it must be added, Goodman reciprocally influenced—have been Henry S. Leonard, W. V. Quine, Rudolf Carnap, and Carl G. Hempel. (C. I. Lewis, one of Goodman's teachers who influenced his concern with inductive theory, was perhaps more impervious to such reciprocal influence.) Although Goodman has had important substantive differences with all of these philosophers (including Quine, to whom he is closest philosophically) and has written penetrating, sometimes devastating, critiques of their views, he has shared with them a dedication to clarity and rigor in analysis and a conviction of the efficacy of constructional methods in philosophy and science.

Among Goodman's earliest published works in philosophy, "The Calculus of Individuals and Its Uses" (Leonard & Goodman 1940) and "Elimination of Extra-logical Postulates" (Quine & Goodman 1940) sound themes and exhibit concerns that are enduring and pervasive in his work.

Several generations of distinguished students, collaborators, or colleagues have been interpreters, extenders, or even critics of Goodman's work. The group includes, but is not exhausted by, Robert Ackermann, Jerome S. Bruner, Noam Chomsky, Lawrence Foster, E. Galanter, E. H. Gombrich, Vernon Howard, Paul Kolers, Howard Kahane, Sidney Morgenbesser, Hilary Putnam, Beverly Robbins, Robert Schwartz, Wolfgang Stegmüller, and Morton G. White. Three persons who also belong here could be singled out: first, Geoffrey Hellman, whose introduction to the third edition of *The Structure of Appearance* ([1951] 1977) provides both a helpful interpretation of that work and also points out the unity of Goodman's philosophy; second, Israel Scheffler, who has provided illuminating

explications and extensions of Goodman's work (especially Scheffler 1963; Rudner & Scheffler 1972) and who has collaborated with Goodman on important advances (Goodman et al. 1970); third, Joseph Ullian, who has coauthored with Goodman (1977) an important article that, among other things, integrates Goodman's earlier results on recalcitrant semantical concepts with Goodman's later work on the philosophy of symbolism.

In the course of his career, Goodman's honors have included invitations to visit and to deliver special lectureships (e.g., the Sherman lectures at the University of London in 1953 which formed the basis for *Fact, Fiction, and Forecast*; the A. N. Whitehead lecture at Harvard in 1962; the John Locke lectures at Oxford University in 1962 which formed the basis for *Languages of Art*; and the Immanuel Kant lectures at Stanford University in 1976 which furnished a substantial part of *Ways of Worldmaking* [1978b]). Recognition of his work was also signaled by a Guggenheim fellowship in 1946, his elections as vice president of the Association for Symbolic Logic (1950–1952) and as president of the eastern division of the American Philosophical Association (1967). His academic posts include an instructorship at Tufts College (1945–1946) and an associate professorship (1946–1951) and professorship (1951–1964) at the University of Pennsylvania. In 1964 he accepted the Harry Austryn Wolfson professorship at Brandeis University and remained its incumbent until 1967, when he organized and became director of "Project Zero," whose locus was Harvard's Graduate School of Education and whose aims involved basic studies in education for the arts. He remained director of "Project Zero" until 1971. In 1968 he accepted the position of professor of philosophy at Harvard, with joint membership in the departments of philosophy and psychology.

Goodman's philosophical, methodological, and scientific views are complex, far reaching, and insightful. In *Problems and Projects* (1972) and *Ways of Worldmaking*, Goodman reflects on his own work—particularly in the latter, which shows self-consciousness of its span to date. These reflections clarify the interconnections of themes and results in the entire body of his work. Secondary sources of commentary, explication, and criticism are copious, but few commentaries have dealt with comprehensive stretches of Goodman's work, and even fewer have seriously explored its unity.

The study of Goodman's comprehensive philosophy involves attention to at least three of its major aspects: his inductive theory, his constructionalism, and his radical epistemological relativism.

Inductive theory. The core of Goodman's inductive theory is presented in *Fact, Fiction, and Forecast*. It embodies three achievements: (1) a brilliant analysis and dissolution of the "old" problem of induction; (2) a radical critique of the concepts of *confirmation* and *confirming instance of a hypothesis*, which shows that extant theories of confirmation or evidential support of general hypothesis by instances are profoundly vulnerable to classes of devastating counterexamples; (3) the foundation for a positive theory of *projection*. (The notion of projection is more general than that of prediction.) Where scientific prediction may be construed as an inference, from examined cases in the past or present, to future unexamined cases, a scientific projection would be an inference to *any* unexamined cases from *any* examined instances. The theory includes, pivotally, his analyses of the concepts of similarity and of natural kind; these analyses are given important refinement and articulation in the "Seven Structures on Similarity" (1970, reprinted in [1972] 1977), *The Structure of Appearance*, and *Languages of Art*.

Constructionalism. This aspect of Goodman's philosophy is often held to be *methodological*, as distinguished, presumably, from *substantive*. Goodman himself holds that the techniques and principles for the construction of conceptual systems, systems of definitions, and constructions of theory are, in a certain sense, neutral. That is, they can be neutrally employed by widely divergent, or otherwise conflicting, philosophical positions. On the other hand, Goodman would not hold that his constructionalism was merely "methodological" in the sense that it was neutral among *all* philosophical positions. More characteristically, he would reject the method-substance distinction as an untenable dichotomy and look, rather, for the specific reasons why some techniques of theory construction remain neutrally applicable across disciplines and positions while others do not. Goodman's constructionalism places him in a tradition that not only includes Bertrand Russell, Ludwig Wittgenstein, and Rudolf Carnap, but also, along with them, in a tradition that includes Gottfried W. von Leibnitz, George Berkeley, David Hume, Immanuel Kant, and John Stuart Mill, and surely stretches back to the Eleatics and Pythagoreans,

and surely embraces Plato, Aristotle, and the Stoics. This is the tradition concerned with conceptual systematization—system building—while not eschewing the resources of formal logic (in contemporary times, the resources of the first-order predicate calculus) in fashioning systems of definitions and systematically related principles or statements. Goodman's results in providing principles and methods of systematization and in furnishing varieties of systems, are powerful and far reaching. They are presented in *The Structure of Appearance* and in a set of important auxiliary essays including "Steps Toward a Constructive Nominalism" (1947), "A World of Individuals" (1956), and "On the Way the World Is" (1960), all reprinted in *Problems and Projects* ([1972] 1977). Intimately connected with these essays is the brief but pivotal "On Relations That Generate" (1958) and a later comprehensive and daring essay that breaks much new ground, "Words, Works, Worlds" (1975*b*). These essays contribute greatly both to Goodman's theory of system building and to the final aspect of Goodman's philosophy considered here: his epistemological relativism. Another landmark contribution stemming from Goodman's concern with the theory of systems, however, is his theory of the formal or structural simplicity of theories. The calculus of simplicity presented in *The Structure of Appearance* underwent considerable refinement (for a tracing of the subsequent discussions and criticisms in the literature, see chapter 7 of Goodman 1972) and appears in an improved version in the third edition. Here Goodman develops a rigorous technique for measuring the relative simplicity of explicitly formulated conceptual systems (e.g., systems of definitions or constructional systems which effect systematic analyses of concepts)—a measure permitting judgments of the degree of systematicity or the degree of systematization of such systems.

Epistemological relativism. A striking feature of Goodman's first book is its epistemological antiabsolutism. Although Goodman shares a long tradition of constructionalist penchant for systematizing through the use of the techniques of formal logic, he breaks radically with much of that tradition by denying that there are any empirical or rational (incorrigible) "givens." He has sometimes erroneously been assimilated to the camp of the early logical positivists because the central system he constructs in *The Structure of Appearance* is (not accidentally) like the phenomenalist system of Carnap's *Logische*

Aufbau (see Carnap 1928). But Goodman makes it abundantly clear that the choice of a phenomenalist basis—i.e., the choice of phenomenal predicates as systematically primitive—carries no commitment to a doctrine of the epistemological primacy of the phenomenal. Any inference to such a conclusion is at the least a *non sequitur*. The *Structure* in fact furnishes a lucid analysis of the difficulties that must beset attempts to found any systematic theory of knowledge on any foundations claimed to be epistemologically uniquely incorrigible or uniquely warranted. But Goodman's radical relativism goes beyond epistemological relativism—at least of the sort that deals just with phenomenal or physical or other systematic theories of the world. For theories are linguistic systematizations, and in *Languages of Art*, Goodman, attempting to fashion a general theory of symbol systems which will govern nonlinguistic and nonverbal, as well as verbal or linguistic, systems of symbols, addresses problems connected with symbolic processes that are referential without thereby describing. These are symbolic processes that, like paintings or diagrams, may (still systematically) show the way the world is rather than describe it. The penetrating analyses and creative verve of *Languages of Art* provide Goodman with precise and rigorous means for presenting, in *Ways of Worldmaking*, the theses that make up his radical relativism. In this view, truth can be neither a necessary nor a sufficient condition for the acceptability of accounts of the world. Truth is not sufficient because many other criteria, like simplicity or systematicity, must be satisfied for an account to be acceptable. Nor is it necessary, since truth—a criterion applicable to linguistic symbols—cannot be characteristic of nonverbal symbolic accounts of the world. A central tenet of his position is that there is no uniquely correct way of “rendering” the world (“constructing a world”). Goodman holds that even two incompatible, or otherwise conflicting, accounts or versions may both be acceptable. But his radical relativism is “under rigorous restraints”; thus he is at considerable pains to point out that it is not the case that “anything goes.” Not every version of the world—or, more precisely, not every world-version—or some aspect of it is as acceptable as every other world-version. He meticulously develops criteria that permit rejection for good cause. Although there can be no uniquely acceptable version, many versions are rationally rejectable as inadequate.

Ways of Worldmaking puts together a daring philosophical system, which is likely to have profound effects on the work and thought of intellectuals who encounter it. It by no means solves all the problems it poses, which are at least as numerous as the “answers” it provides. Goodman continues to work on these problems.

GOTTSCHALK, LOUIS

Born in 1899 in Brooklyn, New York, Louis R. Gottschalk graduated from Cornell University with an A.B. in 1919 and a Ph.D. in history in 1921. After teaching briefly at the universities of Illinois and Louisville, he became associate professor of history at the University of Chicago in 1927, chairman of its history department for a five-year tour of duty in 1937, and president of the American Historical Association in 1953. At his retirement from the University of Chicago in 1964 he was Gustavus F. and Ann Swift distinguished service professor. After his retirement he taught full time for several years, and then part time, at the University of Illinois at Chicago Circle. He died in Chicago on June 23, 1975.

Methodologically, he was a transition figure from the "Rankean" tradition of writing narrative history of the political elite from critically analyzed documents to the social scientific history of a moving synthesis of social forces. At Cornell, Gottschalk had been taught in the Rankean

tradition by several professors, but chiefly by Charles Hull, whose historical seminar emphasized the intense, critical scrutiny of the evidence. "I learned historical method from Hull," Gottschalk later remarked, using the term "historical method" in a very special sense. In his view historians endeavor to recreate only so much of the past as "can be meaningfully reconstructed" (1950*b*, p. 48). That means that they (1) seek out the records and survivals of mankind's past; (2) critically examine those records and survivals; (3) from the information the records and survivals provide endeavor to imagine what the past was like; and (4) present the results of their imaginative reconstruction of that past in ways that do no violence either to the records or to the canons of scientific imagination. According to Gottschalk: "The process of critically examining the records and survivals of the past is called *historical method*. The imaginative reconstruction of the past from the data derived by that process is called *historiography* (the writing of history)" (*ibid.*, p. 48). Historical method, then, included the analytical procedures for testing the authenticity of documents, restoring the text, identifying the author, establishing the approximate date and place of composition, and determining the author's general credibility. Those procedures Gottschalk learned in Hull's seminar, and he applied them and taught them throughout his scholarly career.

At Cornell, Gottschalk also absorbed ideas about *historiography*: that is, about historical interpretation, synthesis, and writing. Here the major influence was Carl Becker, who was interested in all sorts of ideas, from the formal ideas of abstract speculation to the images, common prejudices, and half-spoken notions of everyday life. However, he was not interested in ideas apart from the individuals who held them. In these years he was also conducting another crusade against the naïve assumption that there was a one-to-one correspondence between the statement of the historian and what had actually occurred. Becker crusaded in addition for excellent writing—for a perfect matching of each word with the image in the historian's mind, for a perfect fusion of form and content, of sound and sense, in a composition that flowed.

Anyone who attended Becker's seminar in those years could not fail to emerge with a lasting interest in the role of ideas in history and in writing well. Anyone who had the seminars

of both Hull and Becker could not fail to have an abiding concern with the practical and theoretical aspects of historical method. The two teachers gave Gottschalk questions to ask of history, and some of the means for answering them. They endowed him with an initial philosophy to exploit, before he developed one of his own.

Gottschalk began his first two studies of Jean-Paul Marat and of the Marquis de Lafayette while he was still under the dominating influence of the Cornell experience. His biography, *Jean-Paul Marat: A Study in Radicalism* (1927), was distinguished by its nonpartisan tone, the cool, competent appraisal of contradictory evidence, and lucid exposition. It was in essence a discriminating delineation of the interplay of temperament, events, and ideas in the evolving career of a popular leader. In this evolution, temperament and circumstances counted for somewhat more than ideas. A successful one-volume biographical study of radicalism in the person of Marat suggested to Gottschalk the preparation of a similar one-volume biographical study of liberalism in the person of Lafayette. However, events involving this hero of two worlds were so numerous and the sources so voluminous that a one-volume essay burgeoned into a monumental multivolume enterprise. Gottschalk published six volumes, carrying Lafayette from 1754 to July 1790. One or two additional volumes covering his career to July 1792 are scheduled to appear posthumously. Although the book on Marat, when necessary, displayed the skill in handling sources that Gottschalk had learned from Charles Hull, its dominant interests were Becker's—the interrelations of personality, formal ideas, and events. The Lafayette series smoothly fused the thoroughness and techniques of technical historical method with the interests of Becker. The Lafayette story presented several technical historical problems—the authenticity of documents, the dating of letters, the accuracy of memoirs, the question of intent, the reliability of oral tradition. These problems were solved in the Lafayette volumes with professional assurance and proficiency, in the best traditions of the Rankine school. One reviewer observed that the manner in which Gottschalk managed to gather his material and sift it "by the most enlightened processes is a model for all research historians." However, the verity of historical statements was not established simply from delight in establishing verities. The statements were used to pre-

sent a full-bodied biographical narrative of an elite figure and to define delicately and subtly the moving interrelations of ideas, characters, and events in the evolving destiny of a historical personality.

While Gottschalk was working on the Marat and Lafayette volumes, he was as a scholar having a series of maturing experiences that led him to become a leader in the comparative study of revolutions, and methodologically, a specialist on generalizations in history. When he entered the academic world in the 1920s the predominant mode of historical understanding, old as Herodotus, was still the narrative story of events, of persons and their motivations and actions, considered in their unique aspects and assumed to be connected. In this world of persons, contingency, and accident, the narrative explained as it described and had its own dignity and importance. It did not need the aid of the social sciences. This was the establishment view, and a young scholar who affronted it was considered bold, daring, and perhaps suspect.

However, from 1923 to 1926 Gottschalk prepared six booklets on the history of the French Revolution, which were later expanded into a textbook, *The Era of the French Revolution* (1929). Preparation of this general work, along with his own research and teaching, led him to reflect on the causation of the French Revolution. The results of these reflections were published, notably, in four works: "The French Revolution: Conspiracy or Circumstance?" (1931), "Some Recent Countersocialistic Literature" (1945), "Philippe Sagnac and the Causes of the French Revolution" (1948a), and *The Place of the American Revolution in the Causal Pattern of the French Revolution* (1948b). Reflections on the comparative study of revolutions and the generalizations that might be derived therefrom were scattered throughout his writings but appeared notably in four articles, "Revolutionary Analogies" (1926), "Leon Trotsky and the Natural History of Revolutions" (1938), "Revolutionary Traditions and Analogies" (1939c), and "The Causes of Revolutions" (1944).

In 1933 he began to collaborate with several colleagues at the University of Chicago in teaching a "Laboratory Course in Historical Method." Several years later he took over a course in modern European historiography. In the 1940s and 1950s he became associated with the Social Science Research Council in various capacities. He was present at the charter conference of November 8, 1942, when a group of historians

met with members of the SSRC's Committee on Problems and Policy to consider some of the relations between historical studies and other fields in the social science area. He was also a member of the SSRC's first Committee on Historiography which grew out of the conference. Other members of the committee included Merle Curti, chairman, Charles A. Beard, Shepard Clough, Thomas C. Cochran, Jeanette Nichols, Richard H. Shryock, and Alfred Vagts. For the SSRC Committee on the Appraisal of Research, he helped to prepare Bulletin 53 on *The Use of Personal Documents in History, Anthropology, and Sociology* (1945). As member of the Committee on Historiography he participated in the preparation of Bulletin 54, *Theory and Practice in Historical Study: A Report of the Committee on Historiography* (1946). Later, as chairman of the Committee on Historical Analysis, he edited a report on *Generalization in the Writing of History* (1963). The fruits of this teaching and committee discussion appeared in the above publications and also in remarks at a round-table discussion on "Generalization in the Social Sciences" (1940), in a manual for apprentice historians, *Understanding History* (1950b), in his presidential address to the American Historical Association, "A Professor of History in a Quandary" (1954), and in three articles, "The Scope and Subject Matter of History" (1941), "The Historian's Use of Generalization" (1956), and "Categories of Historiographical Generalization" (1963).

So far as can be judged from the published evidence, Gottschalk played a mediating role in this ongoing methodological discussion. During the 1940s, 1950s, and the early 1960s, historians who were interested in the social science approach to history felt it important to define their terms, to define their approach, and to crusade for their point of view, against the narrative-establishment school. This they did, most notably in SSRC Bulletin 54 (1946). In this movement to social science history, Gottschalk insisted that social science historians incorporate into their approach what seemed most useful in the Ranke tradition: the intense scrutiny and validation by well-tested procedures of each source and statement. Much of his essay in Bulletin 53 on the use of personal documents in history as well as much of his manual on understanding history is devoted to these procedures for testing authenticity and credibility. On the other hand, to the establishment-narrative-of-unique-events school, he led a

personal crusade in behalf of generalization in historical study. In the use of generalization Gottschalk divided "historians" into six categories: "the school of the unique," the narrative-descriptive historians of very limited generalization, the "school of generalizations on the bases of trends," the comparative historians, the nomothetic historians, and the cosmic "philosophers of history" (1963, pp. 113-114). Gottschalk's favorite tactics showed that even historians of the unique inevitably generalize if they use language, while other types and levels of generalizations, if analytically tested, are useful for the insights they yield. "The world has room and the profession has need for all kinds of historians" (1963, p. 129). He himself had operated in all categories except the last. By 1963, when *Generalization in the Writing of History* appeared, the double crusade for incorporation of the best traditions of critical analyses of documents into the social science approach and for an ever-widening hospitality to generalizing historians in the profession had been won, and to younger historians Gottschalk's remarks seemed platitudinous. To a degree the reputations of Gottschalk and his associates as methodologists were the victims of their success. Once their battles had been won, people forgot there had ever been any enemies to fight. Gottschalk was aware of this; his crusading stances and phrases had become familiar, but as he once remarked: "the familiar is not always contemptible."

By the 1950s and 1960s Gottschalk was articulating the working eclecticism of the American research historian of those decades. In so doing he altered some of the questions that had been traditionally asked of historical writing. Instead of asking, "Is history an art or a science?" he assumed that writing history is now a profession and inquired, "How can historians maintain high professional standards?" With apologies to the Dutch historian, Johan Huizinga, he offered another definition of history as an intellectual form whereby each individual renders unto himself an account of his past, including the past of his civilization. Some accounts will be better than others. To assure that a historical account was the best possible and met the highest professional standards, Gottschalk recommended the Ranke-like critical evaluation of evidence. He also adopted the fundamental observation of Becker and other relativists that the historian writes in the present, and that in selecting and arranging his validated statements he is necessarily affected by present conditions,

including his own biases. However, according to Gottschalk, to minimize the distorting effect of the present, the professional historian "will try to give to each piece of testimony in his collected data its full and no more than its full weight"; he "will also make a conscious effort to lean over backward against his own national, religious, racial, party, class, professional, or other biases"; "in cases where the testimony is unavailable or, if available, inadequate for a definite conclusion, he will be careful . . . to suspend judgment"; "finally, he will studiously avoid gratuitous assumptions or inferences and will endeavor to present only such conclusions as logically proceed from the evidence." Gottschalk also adopted the view of Frederick Jackson Turner, James Harvey Robinson, and others that history is not only past politics and past economics, but also past literature and past religion, in fact, past everything. In reconstructing this comprehensive past, the historian will seek the aid of social scientists. He will check their generalizations against his data and utilize them when they seem valid and relevant. Indeed, he himself will "attempt contrasts and comparisons of historical episodes, situations, and institutions and advance generalizations of his own." A comparison of the major revolutions in Western civilization would seem to reveal that back of each one lay a class or classes that were dissatisfied with the existing order, ideas about what a new order might be like, and a government incompetent for discipline or reform. Gottschalk would contend that of the three conditions, formal ideas are the least important: "Though intellectuals usually have a role to play in causing revolutions, it is seldom decisive." They are primarily critics. They do not "father new intellectual attitudes but work upon the raw material of independent hostility" around them. They stimulate, energize, verbalize, and organize this material, and only secondarily add to it. The American Revolution obviously aggravated all three basic conditions in France. The example of a freer society intensified dissatisfaction with the Old Régime; the state constitutions suggested measures of reform; the expenses of French participation in the war rendered unmanageable the recurring deficit and the royal debt, and this weakened the royal government.

If in his mediating role between the old historiography and the new, Gottschalk in the methodological statements of his middle years may have sown seeds for the new, in his later years he may have tended to return to the faith

of his scholarly fathers. In the preface to the 1967 reprint of his biography of Marat, he referred to his "increasing conviction that the indeterminables (perhaps indescribables) which for want of a better name we call *chance* and *choice* or *free will* play roles—sometimes large, sometimes small, but rarely negligible—in historical and particularly in biographical developments." Of all his works, perhaps those that will endure longest will be the most old-fashioned: the narrative volumes on Lafayette. They may have errors or disputed judgments, but because of their vast and intelligently critical erudition, scholars will have to refer to them for years to come. If there is a lesson in this, let others figure it out.

GUILFORD, J. P.

Joy Paul Guilford was born on March 7, 1897, on a farm in Nebraska. After teaching in public schools and serving a stint in the U.S. Army during World War I, he completed his B.A. (1922) and his M.A. (1924) at the University of Nebraska. In 1927, he received his doctorate in psychology from Cornell University, where he studied psychology with Edward B. Titchener and Kurt Koffka. He taught briefly at the University of Illinois and the University of Kansas before returning to his alma mater, the University of Nebraska, where he headed the psychology department until 1940. In that year, he moved to the University of California and remained there, except for his service in the U.S. Army Air Force during World War II, until his official retirement in 1969.

Guilford has dedicated his life to making psychology a quantitative, rational science. Not only has he made numerous contributions to experimental psychology, psychometric and statistical methodology, the measurement of human abilities, and the assessment of personality, he has also written two classic texts, *Psychometric Methods* (1936) and *Fundamental Statistics in Psychology and Education* (Guilford & Fruchter 1942) and influenced generations of students.

Early in his career, the emphasis in Guilford's research was on experimental psychology and psychophysics, and the publication of *Psychometric Methods* culminated this period. He also reviewed previous investigations and carried out experimental studies on the fluctuation of attention, working with weak visual stimuli, eye movements, and apparent motion phenomena, pointing out the implications of his findings for current theories. Other experiments during this period concerned visual perception, reaction time, color preferences, facial expression, memory, and experimental aesthetics.

Then, in 1940, he began to gradually shift the emphasis of his work toward the measurement of personality traits and mental abilities, mental testing, statistics, and factor analysis. This trend was accelerated, and perhaps in part motivated, by his assignment during World War II to direct a psychological research unit of the U.S. Army Air Force in the development of group aptitude tests for the classification of cadets (1947). In this historic test development research program, Guilford put to large-scale practical test, often for the first time, the best available psychometric techniques, theories, and procedures of the day.

In addition, he developed innovative procedures, statistical techniques, and research methods. For example, he showed that after determining the criterion necessary successfully to complete a specific task, factor analysis could be used to determine the components of that criterion, and test batteries could then be developed that would mirror the factor structure of the criterion under consideration. These procedures substantially improved the chances of finding the best test measures for predicting the degree to which an individual met any particular criterion.

After the war, Guilford continued his work with aptitude tests and factor analysis. Many of these later studies were published by the Psychological Laboratory of the University of Southern California (e.g., Guilford et al. 1960) and were supported in part by a series of contracts with the Office of Naval Research. These postwar studies increased psychologists' knowledge of human abilities in the areas of spatial perception, reasoning, evaluation, planning, problem solving, and creativity. Guilford's approach to human abilities, like that of L. L. Thurstone, contrasted sharply with that of Alfred Binet, C. E. Spearman, Lewis M. Terman, David Wechsler, and Raymond B. Cattell. The latter have emphasized the importance of general intelligence as the dominant concept in the measurement of human abilities. Although they acknowledge the need to divide intelligence into its component parts to some extent—e.g., verbal versus quantitative, fluid versus crystallized—only a few scores are deemed necessary to describe the intellectual status of an individual.

Although recognizing the possibility of a general factor of intelligence, Guilford has preferred to break down intelligence into finer constituents, as well as to measure variables not covered by intelligence quotient tests. He maintains that an adequate description of human intellectual capacity requires the measurement of more than one hundred variables. To provide a theoretical framework for his findings, Guilford has constructed his famous structure of intellect model (1959), which does for human abilities something analogous to what the periodic table does for the chemical elements. Any given factor occupies a cell within a box representing a three-dimensional classification of factors. Each factor deals with a certain type of material, called "contents": visual, auditory, symbolic, semantic, and behavioral; deals with a certain type of operation: evaluation, convergent production, divergent production, memory, and cog-

niton; and involves a certain type of product: units, classes, relations, systems, transformations, and implications. This box allows for 150 factors. A good deal of work since the middle of the 1950s has been devoted to developing measures that would define relevant factors that should exist in the model, but that have not yet been identified in empirical research studies. Guilford's views on abilities and intelligence, as well as summaries of his and his collaborators' work in these areas, are summarized in *The Nature of Human Intelligence* (1967b), *The Analysis of Intelligence* (Guilford & Hoepfner 1971), and *Way Beyond the I.Q.* (1977). In the 1970s, Guilford has also turned his attention to using the structure of intellect model in the development of an operational-informational point of view for understanding many important phenomena in cognitive psychology. He has shown the relationship between many traditional points of view in psychology and his more comprehensive theoretical system (1974).

Although Guilford has devoted less of his energy to the study of the nonintellectual aspects of human personality than he has to the study of abilities, his work in the former area began in the early 1930s. He first proved that the then popular concept of extraversion-introversion could be broken down into several distinct and relatively independent component factors. This work was followed by the research and test development that led to the *Guilford-Zimmerman Temperament Survey* (Guilford & Zimmerman 1949) and the personality taxonomy upon which it was based. Again, factor analytic procedures were used to develop these tests, just as in the area of human abilities. His work in personality and that of other investigators is presented in his book *Personality* (1959). Guilford's multiple-factor personality taxonomy contrasts markedly with Cattell's 16 factor taxonomy (1950) and with Hans J. Eysenck's 2 factors of personality, extraversion-introversion and neuroticism (1953). The differences in these competing taxonomies result at least in part from different factor analytic philosophies in research and test development. Eysenck extracts few factors in his analyses, whereas Guilford and Cattell extract many; Cattell relies on blind rotation to oblique simple structure, whereas Guilford leans toward orthogonal constructs and uses simple structure as a guide only when it does not contradict other knowledge he has about the test variables. The test of time alone will determine

which of these competing typologies will ultimately prove to be the most useful.

During his long career, Guilford has authored more than three hundred books, monographs, and articles on a wide variety of scientific topics in psychology and related fields. Although he has never been inclined to seek recognition for himself, wide appreciation of his outstanding contributions has resulted in his being honored again and again. He has been president of the Psychometric Society, the Midwestern Psychological Association, the Western Psychological Association, the California Color Society, and the American Psychological Association. He is one of the comparatively few psychologists elected to the National Academy of Sciences and is the first president of the International Society for Intelligence Education.

H

HALLOWELL, A. IRVING

Although the bulk of Alfred Irving Hallowell's scholarly career was devoted to the study of the Northern Ojibwa, a people whose society, culture, and thought he described and analyzed in meticulous detail, his primary concern in this ethnographic effort was to discover and display the general through the particular. When one also considers the remarkable array of theoretical issues to which he made original and pioneering contributions—social organization, culture and personality, acculturation, behavioral evolution, law, religion, myth, world-view, cultural ecology, and the history of anthropology, among others—it becomes clear why his influence has been felt in disciplines beyond his chosen field of cultural anthropology.

Hallowell was born in Philadelphia in 1892, an only child in an old Philadelphia family, and he died in that city in 1974. His early education did not augur the pursuit of a scientific career. After graduating from a manual training high school, he enrolled in the Wharton School of Finance and Commerce of the University of Pennsylvania, and upon receiving his degree he became a social worker in the Family Society in Philadelphia. While employed as a social worker, Hallowell took graduate courses in sociology and anthropology. Under the influence of Frank G. Speck, his teacher in anthropology (and a distinguished American Indianist), Hallowell developed his interest in American Indians and decided to become an anthropologist. From Speck and from Franz Boas (the leading anthropologist of his time, whose weekly seminar

Hallowell attended at Columbia University), Hallowell acquired his lifelong view of anthropology as a holistic discipline, embracing ethnology, archeology, physical anthropology, and linguistics.

Hallowell's work can be chronologically divided into three phases: an early ethnological phase; a middle "culture and personality" phase; and (toward the end of his career) a "historical" phase centering on the history of anthropology and on behavioral evolution. Although the achievements of each phase were both original and (especially in the cases of the last two) pioneering, those of the middle phase were perhaps the most significant. His delineation of the relationships between culture and personality—in particular, his analysis of the interpenetration of the "inner world" of social actors with the "outer world" of the social order—constitutes a signal contribution to the understanding of the cultural dimension of human experience and the psychological dimension of human culture.

In a period in which behaviorism was a dominant intellectual mode in the social and behavioral sciences, Hallowell was attempting to show, using Ojibwa data as his vehicle, that social action is not so much a function of the properties of the physical and social environments, as objectively described by natural and social scientists, as of the meanings these properties have for the social actors. Taking his point of departure from the gestaltist notion of the "behavioral environment," Hallowell went beyond the gestaltists in his demonstration that perceptions are mediated not through perceptors

alone, but through cognitive orientations that organize and shape them, and that these latter orientations are acquired in large part from cultural symbol systems. From this demonstration it then followed that the *human* behavioral environment was (as he put it) "culturally constituted." In demonstrating how the various members of a social group, each initially encapsulated in the privacy of his own inner world, nevertheless come to share a common behavioral environment, Hallowell identified and described the process by which an aggregation of private individuals becomes a group of social actors. In brief: through the explication of his concept of a culturally constituted behavioral environment, he also demonstrated, in part, how a human social order becomes possible (1955).

Unlike many social scientists, however, for whom the social order is a given, Hallowell always saw it as problematic. While stressing that regularities in social behavior are made possible by culture, Hallowell (who had early discerned the importance of Freud for anthropology) also stressed that there are dimensions of the inner world of social actors—impulse, affect, imagination, fantasy, and the like—that are not derived from (and that indeed elude the influence of) the outer world of culture. These dimensions are a potentially disruptive threat to the social order, for even when they do not lead to the construction of private behavioral environments (as they do in mental illness), they may lead to contemplated action that violates the normative requirements of the social order. To cope with this problem, Hallowell elaborated his seminal concept of the "self," a concept correlative to, and as important as that of, the behavioral environment (*ibid.*).

Calling again upon his detailed knowledge of the Ojibwa, Hallowell argued that the self, a cognitive structure unique to man, develops by means of a set of basic orientations acquired from cultural symbol systems. Lying at the intersection of the inner and outer worlds, and mediating between them, the self protects the social order from the potentially disruptive threat of the former world in two ways. First, as a result of achieving self-awareness, and thereby the ability to distinguish inner and outer stimuli, social actors can both adapt their perceptions to culturally constituted cognitions and monitor their behavior by reference to cultural norms. Second, when the demands of inner urges give evidence of becoming more powerful

than those of outer norms, the attendant moral threat to the actor's self-conception typically assures the enactment of norm-governed action.

Although Hallowell was a prolific scholar, the bulk of his work consisted of research papers and theoretical essays rather than of books and monographs. This work is typically marked by a bifocal perspective because even when focusing on a specialized topic, Hallowell is aware of the widest focus of anthropological inquiry, the nature of man. Hence, although much of his writing dealt with specific ethnographic contexts, his concern with the uniquely contextual was based on and informed by an interest in the generically human; and the latter interest projected a vision of what anthropology at its best, as "the study of man," could be.

HANCOCK, WILLIAM KEITH

William Keith Hancock, known for his research and teaching in Australian and Commonwealth history, was born in Melbourne on June 26, 1898, the son of an Anglican clergyman. He studied at the University of Melbourne, where Ernest Scott and Harrison Moore were among his most influential teachers. After a brief period as assistant lecturer at the University of Western Australia under Edward Shann, he received a Rhodes scholarship that took him to Balliol College, Oxford. Soon afterwards he became the first Australian fellow of All Souls College, where he wrote his first book, *Ricasoli* (1926), a study of the Risorgimento in Tuscany.

In 1924, he returned to his native country as professor of history at the University of Adelaide, where his seminal work *Australia* was published in 1930. He returned to Britain in 1934 as professor of history at the University of Birmingham, where he began a massive *Survey of British Commonwealth Affairs* (1937–1942) for the Royal Institute of International Affairs. In 1941 he began editing the Civil Series of the official *History of the Second World War*, contributing an initial volume on the *British War Economy* (Hancock & Gowing 1949). In 1949, after five years as Chichele professor of economic history at Oxford, he became the first professor of British Commonwealth affairs in the University of London, and director of the newly founded Institute of Commonwealth Studies.

He returned again to Australia in 1957 as director and professor of history of the Research School of Social Sciences at the Australian National University. Before his retirement he completed a two-volume biography of *Smuts* (1962–1968), and he later published *Discovering Monaro* (1972), a new departure into ecological history. He also published two volumes of memoirs and reflections, *Country and Calling* (1954) and *Professing History* (1976), and selected essays in *Politics in Pitcairn* (1947). His 1960 Wiles lectures at Queen's University Belfast were published as *Four Studies of War and Peace in this Century* (1961). He was knighted in 1953, being known as Sir Keith Hancock.

Hancock's one excursion into policymaking, outside of his work on the official war histories, took place in 1954, when he accepted an invitation from the governor of Uganda to mediate in a crisis that had arisen over the governor's withdrawal of recognition of the Kabaka of Buganda. In effect, Hancock's role was that of a constitutional expert who would persuade the leaders of Buganda to agree to constitutional revision and to reconciliation with the governor's hopes for self-government for Uganda as a whole. Hancock was successful in this enterprise, but later developments in both Britain and Uganda rendered his work futile.

Such a long, varied, and productive career gave Hancock a reputation in more than one field, based not only on his ideas, but also on his pioneering achievements in Australian and Commonwealth history. To this research, he brought a fresh eye, a rigorous method, a special concern for economic influences, a wide range of allusion, and a determination not to be fet-

tered by conventional wisdom. His treatment of the springs of action of contemporary Australian society contrasted sharply with earlier narratives of discovery, settlement, and constitutional change. Forty years later, *Discovering Monaro* gave Australians a new insight into their impact on the land. His *Survey* had a profound effect on the study of the dominions and colonies and their relations with Britain. He wrote with a firm underpinning of economic fact, shrewdly analyzed prevailing political trends, and placed constitutional issues in a perspective that had been previously lacking.

Hancock's ideas, from his thirties to his seventies, show remarkable consistency. They can be summarized in terms of his doctrines about history, his dominant themes, and his sense of morality, all of which are united in his writings.

Three cardinal virtues, in Hancock's view, distinguish the great historian. They are attachment, justice, and span. Attachment is "getting close to people, getting inside situations." Justice is fairness—"fairly to report each point of view . . . ; fairly to relate this point of view to the situation in which it arose; fairly to measure its effect upon the new situation that was arising." Span is remoteness; it involves a full awareness of backgrounds and the capacity to extricate oneself from the particular and see it in relation to other things: "Getting inside the situation is the opening movement; getting outside it is the concluding one" (1954, pp. 220–221). These three virtues are antecedent to moral judgment, which Hancock sees as a necessary function of the moral sense, but as applied to men, not to situations. The historian's job is first to establish a situation by using attachment, justice, and span, and then to decide how to judge it in terms of approval or condemnation. The situation is analyzed in terms of what is; the men involved in terms of what ought to be. Thus Hancock introduces morality, but not at the expense of realism. Once we know what happened, we can judge it, but we should not exercise judgment in ways that prevent us from discovering the true situation.

In the writing of history, Hancock distrusts reliance solely upon documents. He is fond of quoting R. H. Tawney's remark in the 1930s that "what historians need is not more documents but stronger boots"—i.e., that they should see things and people, and not confine themselves to libraries. He exemplified this maxim in his many travels to Commonwealth countries before writing his *Survey*, and in his frequent

trips over the ground surveyed in *Discovering Monaro*. He respects documents and is glad that he was properly schooled in their use, but "the historian needs also a lust for life" (1954, p. 95). Moreover, the historian should remember his obligation to see every situation in its entirety. He may, for example, be a more useful person in some situations than the economist, "because he is rather less of a scientist, rather more of a humanist; his concern is not with economic man but with men and women in the round" (1976, p. 91). He may use the material and sometimes the language of the social sciences, but he should concentrate upon simplicity in his own narrative exposition: "to split the *ism* demands clarity of thought and constant watchfulness" (1954, p. 227).

Although Hancock's writing is always about concrete matters—colonial policy, economic development, nationalist urges, constitutional issues—in quite specific situations, two broad themes animate most of it: that of man for and against his environment, and that of man for and against himself. The environmental theme did not become dominant in Hancock's work until comparatively late in his career with *Discovering Monaro*, but it appeared much earlier in his life and writings. In Tuscany, he wrote about Ricasoli's agricultural innovations as well as his political leadership. And, although the first volume of his *Survey* was almost exclusively political in its focus, Hancock in the second volume wrote as much on economic problems from an ecological perspective, and this enriched his discussion of such issues as soil erosion in South Africa and swollen shoot disease in the Gold Coast. When, after retirement, he studied the land use in a small highland area of his own country, he thus had many bases of comparison as well as a deep belief in ecological preservation. Putting his ideas to practical effect, he led a campaign to prevent the Australian government from erecting a vast tower on Black Mountain, overlooking Canberra, where he lived. Significantly *The Battle of Black Mountain* (1974) is the most passionate of his works.

A more important theme, however, is Hancock's concern with man for and against himself, especially in a national context. Here his starting point is Machiavelli, on whom he wrote essays in the 1930s—essays that anticipated the later debate about "idealism" and "realism" in the study of international relations (1947, pp. 18–50). Although recognizing the force of Machiavelli's explanations of international con-

duct in terms of necessity and interest, Hancock repudiated the notion that might should be regarded as right and pointed out the contradictions in Machiavelli's own formulation, particularly Machiavelli's need to abandon his own compelling analysis in designing his ideal commonwealth. Force and fraud were powerful but not the whole of the story. The Hobbesian situation "exists, and it deserves far more rigorous study than it usually gets; but it is never the whole historical situation, which contains from one historical moment to another a varying blend of force and idea, of interest and obligation, of predestination and free will" (1954, p. 208).

Hancock saw the theme of man for and against himself in the political arrangements of the British Empire—particularly where the British had striven to establish liberty under law in their dependencies; but he found the doctrines of self-government and racial impartiality difficult if not impossible to combine in so many different situations. Communalism was a feature of many of the British dominions and colonies, subdued in some, but a constant danger in others. Especially in situations like those of Palestine and southern Africa, Hancock accurately predicted in the 1930s the dilemmas that would continue to be disturbing in the 1960s and 1970s. Nevertheless, he saw British rule as broadly beneficent. Britain had ruled, but in most cases it had not divided: the divisions were there to begin with. The Commonwealth, as "a group of sovereign nations whose members have developed to an unusual degree the habit of mutual consultation" (1961, p. 113), provided an opportunity for amelioration of otherwise troublesome divisions, but it was no cure-all.

Hancock once wrote: "I cannot rid myself, I do not wish to rid myself of my very British preoccupation with right conduct. After all, I belong to a people which by Machiavelli's own tests remains 'uncorrupted', a people which lives in liberty under the law, and for all its conflicts of material interest is capable of passionate response to the call of civic duty" (1947, p. v). The preoccupation with right conduct is fundamental to his basically Christian approach to moral issues, but it is always informed by awareness of the intricacies of politics and the compelling force of economics. Moral judgment is confined to the actions of individuals, especially those in authority. Situations at large, especially those involving large bodies of people

driven by what they conceive to be necessity, are analyzed with compassion and understanding. Hancock balances moral, scientific, and aesthetic concerns more firmly and effectively than do most historians. This balance is aided by Hancock's style. He moves from plain statement to quirky allusiveness, but persistently writes with lucidity, delicacy, and imagination.

HANKE, LEWIS U.

Lewis U. Hanke possesses a fundamental belief in the contemporary importance of historical inquiry. By his actions and his statements, he has expressed the conviction that knowledge of the past represents a basic key to human self-awareness and global understanding and can help in the formulation of messages with profound and practical meaning for the present. He has remarked on more than one occasion: "All history is contemporary history," and he sees the social role of the historian as one of grave responsibility.

Hanke has revealed this commitment throughout his scholarly work, most conspicuously in

his writings on Spanish attitudes and behavior toward Indians in colonial Latin America. In his best-known work, *The Spanish Struggle for Justice in the Conquest of America* (1949), he stressed the efforts of Spanish theologians to define and defend the humanity of the indigenous population. Central to his theme was the description of a debate in 1550-1551 between Juan Ginés de Sepúlveda and Bartolomé de Las Casas, a subject to which Hanke frequently returned in subsequent work. Drawing upon the Aristotelian notion of "natural slavery," Sepúlveda had argued that the Indians were naturally inferior and therefore subject to outright domination and enslavement by Spaniards. Emphasizing the ideal of a universal Christian community, Las Casas insisted that Indians were rational beings, capable of persuasion, and that they should consequently be converted peacefully.

The mere occurrence of such a debate sharply modifies the stereotypical "Black Legend" about Spanish cruelty, and the contradiction between Sepúlveda and Las Casas helps explain the evolution (and vacillation) of sixteenth-century royal policy toward the Indians. But Hanke does more than refine our comprehension of the past. Sometimes citing present-day instances of neocolonial domination, racial turmoil, and ethnic discrimination, he openly expresses his admiration for Las Casas' vision, courage, and tenacity. He has taken a quotation from the friar as the title of a recent monograph (1974): "All Mankind Is One."

Hanke's writings on this subject have prompted excitement, research, and dispute. Some critics have charged that he has replaced the "Black Legend" with an equally simplistic "White Legend" of Hispanic benevolence, where in reality Indians languished in misery. Others have claimed that his focus on ideas and theology has ignored base human motives and the clash of material interests. Still others have alleged that his textual interpretations have overlooked some critical distinctions, specifically the difference between "serfs" and "slaves." But Hanke seems to have thrived on such controversy, and he has remained a dominant figure in the area of colonial Latin American history.

A prolific researcher and writer, Hanke has published on other topics as well. He made extensive investigations into the urban history of Potosí, the colonial mining center of what is now Bolivia, anticipating and precipitating the modern analysis of social history in Latin Amer-

ica. Recently he coedited a massive, multivolume series of Spanish viceregal reports on the Indies. These documents provide rich, detailed, and thorough information on political institutions and everyday life, on individuals and collectivities, and their publication will greatly facilitate historical investigation. The project also reflects Hanke's reverence for primary sources and his insistence that students of the past work, whenever possible, with complete and original records.

Throughout his professional life Hanke has striven to develop Latin American history as a legitimate field of serious scholarship, sometimes in the face of collegial condescension and institutional reluctance. He has served as editor of the *Hispanic American Historical Review*, written a college text, supervised the Alfred A. Knopf Borzoi series on Latin America, and brought together two large anthologies. He has also trained scores of Latin American historians, many of them now prominent scholars in their own right, and has expressed continuing interest in methods of undergraduate teaching.

Hanke was born in 1905, received B.S. and M.A. degrees from Northwestern University, taught for three years at the American University in Beirut, and earned his Ph.D. from Harvard University in 1936. After two years of post-doctoral study he was appointed director of the Hispanic Foundation at the Library of Congress in 1939. In 1951 he assumed a professorship at the University of Texas, in 1961 moved to Columbia University, in 1967 went to the University of California at Irvine, and in 1969 became the Clarence and Helen Haring professor of history at the University of Massachusetts—a position from which he retired in 1975. He has received many awards and distinctions, including honorary degrees from the University of Bahia, Brazil (1965); the Tomás Frías University of Potosí, Bolivia (1965); and the University of Seville (1966). In 1965 he was decorated by the Bolivian government with the Orden del Condor de los Andes and was made a corresponding member of the Royal Historical Society in London.

In 1974 he served as president of the American Historical Association. In his presidential address, he pronounced apprehension about the writing of self-centered "tribal" history and urged his professional colleagues to develop intellectual perspectives and working relationships on a wide international scale. As an example he

cited the case of Bernardino de Sahagún, a sixteenth-century Franciscan whose careful investigations of Aztec customs have left a faithful and sensitive account of precolombian indigenous civilization. There is an urgent need for United States historians to broaden their knowledge of other cultures, Hanke declared, for foreign historians to learn more about the United States, and for all to see that no single history can be properly understood in isolation. "Americans will then be ready for an even more difficult step," he concluded,

the initiation of fundamental revisions in their own views of the world, man, and the future, which began in the century of the great discoveries and for which Bernardino de Sahagún showed the way by his studies of Aztec culture. If American historians are fully aware of their opportunities and responsibilities in the world today, they can exert a powerful influence by their teaching and research to the end that we are able to appreciate the history of other peoples without losing allegiance to our own. By studying the history of their own tribes and other tribes as well, historians should be in the forefront of all those who would seek to understand the common elements in all cultures. (1975, p. 20)

In keeping with his own counsel, Hanke would later formulate a proposal for the compilation of a bibliographical guide to the writings of foreign historians on the history of the United States.

In a time when many historians feel unsure of their role and vague about their sense of social purpose, Lewis Hanke remains optimistic and enthusiastic. He is a man of humor as well as fervor. In his mind history lives.

HARLOW, HARRY F.

Harry F. Harlow was born in 1905 in Fairfield, Iowa. Most of his undergraduate and all of his graduate education was at Stanford University, where he received his PH.D degree in psychology in 1930. His chief mentors there were Calvin P. Stone, a comparative psychologist, and Lewis M. Terman, who is best known for his development of the Stanford-Binet intelligence test and his studies of gifted children. Neither figure, however, seems to have exerted a dominating influence on Harlow. Indeed, although Harlow (1977) credits Stone with teaching him scientific techniques, many of Harlow's own students will recall his own reaction against Stone's methodological biases. The latter emphasized the systematic but slow process of pushing back the frontiers of science "step by step and stone by stone," whereas Harlow, noting that progress in science has often come in quantum jumps, vehemently downgraded parametric research and tried to instill in his students the knack of simply identifying and attacking important problems in behavioral research. Harlow credits Terman as his primary tutor in scientific theory, but since Harlow has never displayed a strong appetite for formal theorizing, Terman's influence seems to have been mainly on Harlow's choice of topics to study, best represented by his lifelong interest in primate intellectual capacities.

Harlow spent his entire academic career up to his semiretirement in 1974 at the University

of Wisconsin in Madison. He taught the introductory psychology course during most of those years, and it seems likely that this constant contact with diverse areas of human psychology eventually had a greater effect than did his graduate training upon his choices of subjects in the latter part of his research career. Although his doctoral dissertation dealt with social facilitation in rats, and a few studies with cats and even goldfish can be found among his more than three hundred articles, virtually all his research has been conducted with rhesus monkeys. In an informal autobiography, Harlow (1977) recalls that the lack of facilities for rodent research when he arrived in Madison prompted his initial primate studies at the local zoo. Soon afterwards, in 1932, the Primate Laboratory was established on the campus. In the course of thirty years, the laboratory was transformed into a large and interdisciplinary research complex that included the Wisconsin Regional Primate Research Center as well as the psychology department's Primate Laboratory; from 1961 to 1971 Harlow directed the entire complex.

In his first two decades of research Harlow carried out more than fifty studies of learning and cortical lesions in rhesus monkeys. This work laid down many of the standard procedures of laboratory primate learning research, later applied by researchers to species ranging from rats to children. During these years, Harlow and his students also produced many valuable empirical findings that shed light on the nature and limits of rhesus monkey intelligence; their animals performed impressively on high-order multiple-sign learning problems that had been thought to be beyond the learning capabilities of rhesus monkeys (e.g., Harlow 1943).

By far the most significant discovery of this period was the formation of learning sets (Harlow 1949). Departing from the usual procedure in research on rodent learning, of testing many animals on only one or two learning problems, Harlow trained each of a few monkeys on literally hundreds of visual discrimination problems and found that each monkey "learned to learn" new problems of the same type in a single trial. This learning set principle helped bridge the gap between slow, trial-and-error learning and rapid, insightful learning, a dichotomy that had been puzzling learning theorists for some time. Characteristically, Harlow called attention to the probable operation of this principle in everyday learning by humans in the socialization process,

suggesting that the achievement of high social intelligence may require the acquisition of multiple learning sets relating to classes of social stimuli and social-emotional reactions.

The learning set phenomenon itself presented a challenge to the formal stimulus-response theories that were being developed out of simple conditioning principles at the time by Clark L. Hull, Kenneth W. Spence, and others: Could the extremely rapid learning exhibited by learning-set-experienced animals be derived from the postulates of such theories? Not satisfactorily, according to impartial referees (e.g., Mackintosh 1974), and in fact it was not until conditioning-based theories shifted to more explicitly cognitive assumptions in the early 1970s that they could begin to handle the learning set phenomenon, which many theorists have come to believe requires a concept of strategy-learning for its explication. Harlow himself was led to some quasiformal theorizing on what he called "error factor theory" (Harlow 1959*b*), which was extended by others (e.g., Levine 1965) to strategy-learning conceptions (e.g., the monkey acquires and generalizes a "win-stay, lose-shift" strategy in ordinary discriminations) in mathematical form; however, empirical applications were probably more important.

Species comparisons in many different laboratories showed that learning sets were acquired with great difficulty, at best, in most subprimate species, in contrast to the relative ease of their formation by macaques, apes, and children. When Harlow established a breeding program in his laboratory in the 1950s, work on the ontogeny of learning capacities (Harlow 1959*a*) became possible, and it quickly demonstrated that learning set formation is possible in the rhesus only after a certain age (one to two years, depending on testing procedures). Thus, after similar species and age comparisons were made with respect to other learning tasks, it was only natural for Harlow to construct a battery of tests for monkey intelligence measurement in which discrimination learning set was a major ingredient. This test battery proved useful in his work on the effects of early brain lesions (Harlow, Thompson, Blomquist, & Schiltz 1970) and of enriched versus impoverished social rearing conditions (Gluck, Harlow, & Schiltz 1973), and in his collaboration with Harry Waisman, a biochemist and pediatrician, on studies of simulated phenylketonuria in rhesus monkeys (Waisman & Harlow 1965). The array of tasks, known as the Wisconsin General Test Apparatus stan-

dard battery, is probably the nearest thing to human intelligence quotient testing that exists in animal behavior research.

Harlow added another line of work, on curiosity and manipulation motives (Harlow 1953), soon after the learning set discovery. His collaborative studies with Robert A. Butler showing the extreme persistence with which monkeys will work on mechanical puzzles or open windows to observe other animals, without the conventional food or water incentives, presented a challenge to adherents of the homeostatic model of motivation, and gave Harlow another opportunity to polemicize against the myopic views of learning and motivation that were emerging from rat psychologists' work. As significant as the curiosity-exploration-manipulation research was, it now appears as a relatively small point against the homeostatic model compared to Harlow's voluminous contributions in the area of affectional systems, undoubtedly his best-known work.

The latter began with the surrogate mother studies (Harlow 1958). With little ambiguity, these showed that an infant monkey's strong attachment to its mother is based much more upon tactile sensations ("contact comfort") provided by the mother than upon the association of the mother with the reduction of such primary drives as hunger or pain. This conclusion probably came as no surprise to human mothers around the world who, through countless magazine articles and television presentations, became acquainted with Harlow's wire-and-terry-cloth mother surrogates, but it clearly ran counter to the position held by many psychologists and sociologists at a time when both Hullian learning theory and Freudian psychoanalytic notions were predominant.

For Harlow, the main significance of the surrogate studies was that they opened up the whole realm of primate affectional (love) systems to experimental dissection in laboratory settings. His wife, Margaret Kuenne Harlow, who was highly respected for her work at the University of Iowa, where she tested Spence's transposition theory in children (Kuenne 1946), and who had occasionally shared authorship with her husband in reports from the Wisconsin Primate Laboratory (e.g., Harlow & Harlow 1949), joined him fully in these social behavior studies. Until her death in 1971, she contributed immensely to the planning and execution, as well as the publication, of the affection studies. The direction of these researches was clearly given

by the Harlows' classification of the affectional systems into mother-infant, maternal, peer, heterosexual, and paternal types.

Inevitably, artificial and real monkey mothers had to be compared in their effects upon infant monkeys' social development, and from this work came detailed analyses of maternal love and of infant love for its mother (Harlow 1963). Besides demonstrating the superiority of the real monkey mother for the healthy social development of the offspring, and indicating several reasons for this, the studies articulated a crucial role of the real mother in regulating her infant's early play activities so as to foster effective peer interactions. The all-importance of play in the socialization process generally was emphasized in further studies concentrating on peer attachments (Harlow 1969). These studies also yielded the conclusion that peer interactions were more important than mother-infant interactions in terms of the monkey's whole life span, because of the role of social interactions with agemates in determining basic social roles, inhibiting aggression, and sexual maturation. The Harlows also described the heterosexual affectional system in adolescent and adult monkeys (Harlow 1962; Harlow & Harlow 1965), detailing its dependence on prepubescent peer interactions. The paternal love system was studied in a "nuclear family" setting designed by Margaret Harlow (1971). With the usual degree of planned serendipity that characterized the Harlows' social researches, this setting provided fringe benefits in the form of novel data on sibling interactions, the influence of offspring upon parental sexual motivation, and the effects of an unusually enriched social rearing environment upon learning capacities, social adjustment, and heterosexual maturation in offspring.

Certainly more dramatic than the normal social interactions described in the love researches were the forms of maladjustment discovered when social deprivation conditions were imposed. It is here that the Harlows exploited most effectively the laboratory control of antecedent conditions in psychosocial development. Reared for the first 6 or 12 months in total social isolation, and thus unable to form normal infant-mother or peer attachments, monkeys displayed severe and permanent social impairments, including stereotypes resembling autism, extreme fear, inappropriate aggression, and sexual ineptness (Harlow & Harlow 1965). Even partial isolation, in which the monkeys were reared alone in wire cages but allowed to see and hear other

monkeys nearby, was found to be deleterious in many of the same ways. "Motherless mothers"—that is, isolation-reared females forcibly impregnated in adulthood—proved to be grossly deficient in maternal care of their first-born infants, usually ignoring and often abusing them.

Harlow's social isolation studies ended on a happier note—successful psychotherapy. After some years of assuming that isolation-reared monkeys were hopelessly incurable, and after some fruitless attempts at rehabilitation by others, the Harlows and their students Melinda A. Novak and Stephen J. Suomi devised a procedure in which monkeys isolated from birth to six months were exposed, immediately after the isolation period, to socially normal monkeys only half their age. The younger "therapist" monkeys were still at an age of persistent contact clinging, in the early developmental stage of play, yet too young to display aggression. Over another six-month therapeutic period, these attributes, plus, probably, the smaller size of the therapists, gradually converted the isolates from fearful retreat and stereotyped rock-and-huddle to nearly normal agemate attachment behaviors, vigorous and mutual play, and essentially complete and lasting rehabilitation (Suomi, Harlow, & Novak 1974).

Related to the isolation studies was a research program on depression that occupied most of Harlow's attention in his last five years at Wisconsin, but that had really begun with the earlier mother-infant separation studies (e.g., Seay, Hansen, & Harlow 1962). The separation studies had disclosed a characteristic pattern of reactions by infant rhesus monkeys after removal from their mothers that consisted of a highly vocal, agitated protest phase followed by withdrawal and despair. In the despair phase, the infants became less active, and their social interactions, including play with agemates, declined sharply. The behavioral depression in these animals closely resembled the "anaclitic depression" described by René Spitz (1946) and others in human infants separated from their mothers. In the later depression studies, severe protest-and-despair reactions were observed in peer-reared infant monkeys when they were separated for four days from their playmates, and these reactions persisted over twenty weekly separations (Suomi, Harlow, & Domek 1970); long-lasting depressions were also produced in young monkeys when they were housed in stainless steel chambers that severely limited their visual exploration and vertical locomotion

(Suomi & Harlow 1969). By the time of Harlow's departure from Wisconsin in 1974, the research on depression was well advanced, with possible monkey models of human depression being examined in terms of neurochemical correlates and effects of antidepressant drugs, and of behavioral variables (McKinney, Suomi, & Harlow 1971).

Harlow's over-all research accomplishments exhibit not so much a theory or a "school," but a series of empirical discoveries, descriptions, and generalizations that are remarkable in number, scope, and impact. His greatest discovery, in a sense, may have been the rhesus monkey itself as an experimental subject, for he showed that virtually any topic of human behavior that might appear in an introductory psychology textbook could be profitably researched with monkeys, often producing results of seemingly undeniable applicability to humans. Here, of course, is where the main impact of Harlow's work lies—his findings demand the attention of anthropologists, sociologists, and psychiatrists, as well as psychologists—and where much controversy is centered. In hundreds of speeches and articles, Harlow has boldly generalized from monkey to man (or vice versa; see Harlow, Gluck, & Suomi 1972), and at times, as when he has presented evidence that sex-typing of behavior in monkeys has a genetic rather than a learned-imitational basis, he has not exactly endeared himself to certain groups. (On at least two occasions, feminist groups demonstrated at his public lectures on this topic.) He has, however, indicated where limits to generalization from nonhuman to human animals may lie, and how these limits may differ from one behavioral category to another (Harlow, Gluck, & Suomi 1972).

Professional recognition and honors came to Harlow well before his researches on the affectional systems. In 1951 he was named to a twelve-year term as editor of the *Journal of Comparative and Physiological Psychology*. In the 1950s he was also awarded the Howard Crosby Warren medal by the Society of Experimental Psychologists, and was elected president of the American Psychological Association. Shortly thereafter he received that organization's distinguished scientific contribution award, was elected to the National Academy of Sciences and the National Academy of Arts and Sciences, and was twice named Sigma Xi National lecturer. In later years he was awarded the national medal of science (1967), the gold medal award of the American Psychological Foundation (1973),

and the International Kittay Scientific Foundation award (1975).

HARROD, ROY F.

Roy Forbes Harrod was born in Norfolk, England, on February 13, 1900, and died there on March 8, 1978. He considered himself best qualified as an economist in the workings of the international monetary system; his most important contributions to economics, however, have been in the development of the theory of imperfect competition, the promulgation of Keynesian economic thought, and the formulation of a theory of macrodynamics. Despite his acknowledged expertise in the theory and practice of economics, Harrod maintained that his most important achievement was a contribution to philosophy—his attempt, in the *Foundations of Inductive Logic* (1956), to refute the skepticism of David Hume.

Born into a literary and artistic home in which good conversation was deemed a noble pursuit, Harrod found college life appealing. By the time he was thirty he had become a university lecturer, a member of the governing body of Oxford University (the Hebdomadal Council), and, effectively, the head of his college (senior censor of Christ Church). Eschewing the belief that universities were solely the providers of courses and examinations, he displayed a pen-

chant for the company of aesthetes who could discourse knowledgeably in the fields of arts and letters. In his early days at Christ Church he associated extensively with the undergraduate "Oxford Set" surrounding Harold Acton, and by dining regularly at the Cranium Club he maintained contacts with the "Bloomsbury Set" quite apart from his association with Keynes.

Although his education at Westminster School and New College, Oxford, had been in classics, philosophy, and modern history, Harrod, at age 22, was appointed to a lectureship in economics and modern history at Christ Church, Oxford. Before taking up this post, however, he chose to spend some time studying economics and, through a fortuitous introduction by Walter Runciman, was able to spend one term at King's College, Cambridge, under the tutelage of John Maynard Keynes. At Cambridge he came into contact with a brilliant circle of students (including Frank P. Ramsey, Richard Braithwaite, Adrian Bishop, and Steven Runciman) and also with Keynes's flourishing Political Economy Club. Apart from a few months spent studying in Germany in 1923, this was his only formal education in economics, but it made a lasting impression on him. Greatly impressed by the theoretical knowledge and practical expertise of the members of the Political Economy Club, Harrod determined never to retreat from the problems of the world. Though he rejected pragmatism as a philosophy for action, he remained a realist, and all his economic theories had to be tested for the realism of their assumptions.

His academic output was immense. In one nine-year period (1951-1959) when his "stamp collector's urge to be inclusive" allowed a count of his publications, Harrod published seven books and 349 signed articles—a count that did not include the numerous unsigned memoranda he submitted to the European League for Economic Cooperation, his anonymous book reviews for *The Times Literary Supplement*, and his monthly letters circulated by a firm of stockbrokers. Somehow this prodigious output left time for him to be coeditor of the *Economic Journal* and an economic adviser at both the national and international level.

Harrod was a Keynesian economist who believed in free trade, but his loyalty to Keynes came first, and he strongly opposed what he termed "Cobdenite laissez-faire." These beliefs often placed him in the role of a political gadfly, but he played the role with the same energy he

applied to his academic work. For most of his life he was a member of the Liberal party (being in the Liberal Shadow Cabinet and running, unsuccessfully, for Parliament in 1945). In the 1930s he spoke on Labor party platforms (against the deflationist policies of the National government), and ultimately he joined the Conservative party. During World War II he served under Lord Cherwell on Winston Churchill's private statistical staff, at first in the Admiralty and later in the Prime Minister's office.

Imperfect competition. Harrod's interest in imperfect competition stemmed from his concern for the macroeconomic aspects of the expansionist policies proposed by Keynes in the 1920s. Keynes was advocating public works as a solution to unemployment, but a strong opposition developed based on the notion that any such increase in demand would lead to increased prices. This view was greatly bolstered by the publication of Piero Sraffa's famous article (1926) claiming that only in the presence of monopoly was equilibrium compatible with decreasing costs of production. This conclusion seemed wrong in the light of Harrod's practical knowledge of industry. Conducting his own survey of business, he found that even businessmen in competitive industries believed that increases in demand might lead to reductions in prices. Harrod's findings led him into a research of the pricing policies of industry, a research that resulted in many significant contributions to the theory of imperfect competition, the drawing of the marginal cost curve, the correct drawing of the long-run average cost curve as the envelope of the short-run average cost curves, and a solution of the duopoly problem.

It is common to attribute the discovery of the marginal revenue curve to several people working independently in the 1930s (see Robinson 1933), but Harrod could claim some priority in the matter, inasmuch as the publication of his article "Notes on Supply" (1930) had been delayed for two years because of a misunderstanding by the referee, Frank Ramsey. Harrod had originally called the curve "the increment of aggregate demand," but it was later renamed at the suggestion of Austin Robinson. The mathematical concept had been known to at least Antoine Augustin Cournot and to Alfred Marshall before him (see Shackle 1967), but it was Harrod who first drew the familiar textbook diagram that locates profit-maximizing output at the intersection of the marginal revenue and marginal cost curves.

The marginal revenue curve and the long-run

average cost curve were the basic tools used in the discussion of imperfect and monopolistic competition, and Harrod was at first optimistic of the uses to which the concepts had been put (1934). He was greatly impressed by the way it could be shown that with free entry under conditions of imperfect competition, equilibrium output would be at the point of tangency of the demand curve and the short-run and long-run average cost curves. At this point the plant would be at less than optimum size, and would not be used to optimum capacity. In addition, if optimum conditions of production were achieved under imperfect competition, profits would have to be above the standard level.

Harrod's optimism, however, gave way to a feeling that there was something wrong with a theory that had much of modern industry operating either under conditions of supernormal profit or under a tendency to build up an excessive number of businesses. In what Edward H. Chamberlin chose to call a "recantation," but Harrod preferred to call an extension of the theory ("Theory of Imperfect Competition Revised," in 1952*a*), Harrod proceeded to revise the basic concepts of imperfect competition, under the influence of the famous "Oxford Interviews" of businessmen in which he had participated. Harrod thought it would be irrational for firms to charge prices high enough to attract others into the industry to compete away their future profit. When maximizing profit, a firm would therefore take into account the present value of future receipts, so that output would be determined where the average cost curve was tangential to what he called the "average net proceeds curve." At this output the demand curve would intersect the average cost curve from above, and marginal revenue would be below marginal cost (see "Increasing Returns," in Kuenne 1967).

Keynes's *General Theory*. In 1935 the first draft of Keynes's *General Theory of Employment, Interest and Money* (1936), which had been written with "the constant advice and constructive criticism" of R. F. Kahn and Joan Robinson, was circulated for comments to Ralph G. Hawtrey, Dennis H. Robertson, and Harrod. Harrod immediately recognized the book as an important contribution but tried to temper Keynes's attack on classical economics. To his dismay, Keynes replied that Harrod must be "preoccupied with the old beliefs" and "only half shifted away from (the Classical School)." However, Harrod's response, stating what he thought to be the essentials of the *General Theory*, so im-

pressed Keynes that he absolved Harrod from all misunderstanding. Harrod became an official exponent of Keynes's thought. A diagram used by Harrod was appropriated by Keynes and stands as the only diagram in the final version of the *General Theory*. With Keynes's blessing, Harrod published "Mr. Keynes and Traditional Theory" (1937), a clear exposition of the differences between classical and Keynesian doctrine, and he also received the imprimatur of the master on his own extensions into dynamics. For the next ten years Harrod became so identified with Keynes and Keynesian thought that, even though an Oxford man, he was chosen as Keynes's biographer (1951*b*).

Macrodynamics. Even before the *General Theory* was published, Harrod recognized Keynes as the master of macrostatics—the investigation of the way the components of aggregate demand affect the utilization of productive resources. He realized from the beginning, however, that Keynes had no systematic theory of macrodynamics—the investigation of the determinants of the *rates of change* of the components of aggregate demand. Harrod's earliest attempts to fill the lacuna resulted in a theory of the trade cycle (1936) derived from a combination of J. M. Clark's acceleration principle (1917), referred to by Harrod as "the relation," and Keynes's multiplier. This same concept was later to be elaborated and refined by Paul Samuelson (1939) and J. R. Hicks (1950).

Within three years Harrod's views on the matter had matured considerably, and he presented a paper on the fundamental equations of economic growth (1939). These relationships were independently discovered much later by Evsey Domar (1946) and, as the Harrod-Domar relationships, laid the foundation for modern growth theory.

Harrod defined the rate of growth of income ($G = \Delta Y/Y$) as equal to the saving ratio ($s = S/Y$) divided by the incremental capital output ratio ($C = \Delta K/\Delta Y$). Thus $G = s/C$ is the dynamic version of the familiar static equality of saving (S) and investment ($I = \Delta K$). From this basic equation Harrod derived two normative growth rates: the warranted rate (G_w) and the natural rate (G_n):

$$(1) \quad G_w = S_d/C_r$$

$$(2) \quad G_n = S_\sigma/C_r$$

The warranted rate is derived when the saving ratio is s_d , the fraction of income that people currently wish to save, and the incremental

capital output ratio is C_r , the amount of additions to fixed capital and inventories that suppliers consider convenient in relation to the current or projected change in output. The saving ratio necessarily includes government saving, but the government's saving must be counted net of any saving or dissaving that is done to regulate the economy's output level. Given that this equation has savers content with their saving and investors content with their investing, the warranted rate of growth would obtain in a régime of laissez-faire capitalism.

Though there has been some argument as to whether the warranted rate can be called an equilibrium (see Alexander 1950), Harrod maintained only that, without some management the warranted rate would be unstable and that this instability was the fundamental explanation of the business cycle. The instability is clear from the definitions of G and G_w . If $G > G_w$, then $s > s_d$, $C < C_r$, or both, and the actual growth rate will move further away from the warranted rate. However, Harrod protested the notion that the instability was so extreme that the term "knife-edge" could be used. He believed that the instability principle would come into play only in cases of extreme deviations in s and C .

The natural rate of growth (G_n) is the social optimum rate of growth derived from the rate of increase in the working population (assuming full employment) and the rate of improvement in available technology. Thus equation (2) may be used to derive the socially optimal rate of savings (S_σ) to be brought about by monetary and fiscal policy. Emphasis was placed, however, on a *combination* of monetary and fiscal policy, inasmuch as large changes in private saving could be achieved only through monetary policy if there were excessive changes in the interest rate.

Once the place of the incremental capital output ratio in the fundamental growth equations is established, the relationship of technological progress to growth becomes clear. Using this relationship, Harrod was able to define a neutral stream of inventions as one that, for a given rate of interest, requires a rate of increase of capital equal to the rate of increase of the income to which it gives rise. If a stream of inventions requires capital to grow faster than income, then that stream is labor-saving or capital-requiring. If a stream of inventions requires capital to grow slower than income, then it is capital-saving or labor-requiring.

These definitions differ from those proposed

by Hicks (1932), where neutrality is defined as a stream of inventions that changes the marginal productivity of labor and capital in equal proportions. The differences in categorization may not be great, but Harrod claimed superiority for his method on the grounds that his classifications depended on the intrinsic character of the invention, whereas Hicks's depended on circumstances unrelated to the invention itself.

HAYEK, FRIEDRICH A. VON

Friedrich August von Hayek's work encompasses, besides economic theory and policy, the methodology of science; social, legal, and political philosophy; psychology; and the history of ideas. He has been a main protagonist of liberalism in the sense now called libertarianism, and a leader of the fourth generation of the Austrian school of economics.

Family background and education. Hayek was born on May 8, 1899, in Vienna, Austria, the son of August von Hayek, a senior municipal health officer who also taught biology (plant geography) at the University of Vienna, and of Felicitas, née von Juraschek, a daughter of a

professor of public law at the university who also was president of the Austrian Central Statistical Authority. In March 1917, Hayek was called to military service and became an artillery officer on the Italian front. In November 1918 he returned to Vienna and registered at the university to study law.

At that time, economics was taught only as part of the law curriculum. Hayek had earlier developed some interest in this field, had for a while been attracted by some moderate socialists (Karl Renner, Walter Rathenau), and even read a textbook on economics while in the army. At the university, he attended the lectures of Friedrich von Wieser and Othmar Spann but was more interested in methodology—inspired by reading Ernst Mach and Max Weber—and in psychology; indeed, in 1920 Hayek wrote a draft of a paper on psychology to which he returned 32 years later with a book on *The Sensory Order* (1952*b*).

Upon his return to civilian life, Hayek founded, together with some friends, the Association of Democratic Students—his first action in his life-long battle against the forces of nationalism and socialism. In November 1921, he obtained the degree of DR. JURIS and started to work in the war-claims settlement office, directed by Ludwig von Mises. At the same time, he continued to study at the university for a second doctorate, in economics. He wrote a dissertation on the theory of imputation and in March 1923 obtained the degree of DR. RERUM POLITICARUM.

Immediately afterwards Hayek took a leave of absence from his job in order to continue his studies of economics in the United States. He worked as a research assistant to Jeremiah W. Jenks of New York University, audited lectures and seminars of Wesley C. Mitchell and John Bates Clark at Columbia University, and assisted Willard Thorp with material for *Business Annals*. He returned to Vienna in May 1924, resumed his government work, finished articles on the incompatibility of stable price levels and fixed exchange rates (1924), American monetary policy (1925), and imputation (1926*a*), and worked on the concept of neutral money. In 1926 he married Helene von Fritsch; the couple had two children, Christine and Lorenz.

Vienna, 1924–1931. In 1921, still before his first university degree, Hayek had helped to found a circle of young scholars, whose influence on his thinking he often acknowledged. The group included not only economists (such as Gottfried Haberler, Fritz Machlup, Oskar

Morgenstern) but also social philosophers (such as Alfred Schutz), some members of the “Vienna Circle” of logical positivists, sociologists, historians, art historians, musicologists, literary critics, and lawyers (including Herbert Fürth, cofounder of the group). Of the twenty-odd members of the circle, many emigrated later to the United States and some of them exerted a strong influence on social science and philosophy.

In 1924, von Mises invited Hayek to join his private seminar, probably the most important center of economic discussion in Austria. It was a selected group of postdoctoral economists and methodologists, including many members of Hayek’s “circle,” all of them engaged in professional or avocational research. Its members later formed the core of the Nationalökonomische Gesellschaft (Economic Society), which was founded in 1927 at the initiative of von Mises and Hayek. The society met two or three times a month and many foreign visitors presented important papers.

Both Hayek and von Mises had seen, on their visits to the United States, the new empirical research programs on industrial fluctuations. Von Mises persuaded Austrian financial, industrial, and labor organizations as well as the government to join in the establishment and funding of the Austrian Institute for Business Cycle Research, with Hayek as its director. It started its monthly reports in 1927; after three years, with the help of an American grant, Hayek obtained Oskar Morgenstern as collaborator.

Von Mises, as Hayek’s patron and superior—first in the government office, then in the research institute—as his fellow officer in the Economic Society, and as discussion partner in the von Mises circle, could not help influencing Hayek’s thought and work. But far beyond these institutionalized associations go the intellectual ties of shared interests in specific economic and philosophical issues: the theory of money and the trade cycle, the problem of economic calculation under socialism, and the foundations of classical liberalism. These had been the major subjects of von Mises’ research and they became the foci of Hayek’s work. Three other economists were among Hayek’s closest associates in his Vienna period: Haberler, Morgenstern, and Machlup.

In 1929 Hayek submitted his book, *Geldtheorie und Konjunkturtheorie* as *habilitation* to the University of Vienna and was admitted as *Privatdozent* (lecturer). His trial lecture on “The

Paradox of Saving" (1929c) came to the attention of Lionel Robbins, who invited Hayek to present four lectures at the London School of Economics. These lectures on *Prices and Production* (1931b) led to the offer of a visiting professorship, which was followed by a regular appointment to the Tooke professorship of economic science and statistics at the University of London.

London, 1932–1950. Hayek's tenure at London began with a dramatic controversy with John Maynard Keynes. Hayek had been asked by Robbins to review Keynes's *Treatise on Money* (1930) for *Economica* (1931–1932), and Keynes had asked Piero Sraffa to review Hayek's *Prices and Production* for the *Economic Journal* (1932a). Keynes replied (1931) to Hayek's review, Hayek wrote a rejoinder to Keynes (1931c) and a reply to Sraffa (1932c), and Sraffa wrote a rejoinder to Hayek (1932b). The controversy was joined by Ralph G. Hawtrey, Arthur C. Pigou, Dennis H. Robertson, Arthur Marget, Alvin Hansen, and others in notes, reviews, and replies. In addition, Hayek published, between 1932 and 1937, ten articles on such controversial issues as the pure theory of money, the relation between saving and investment, the formation and maintenance of capital, and the causes of industrial fluctuations. The "drama," as John Hicks called it (1967), ended with a majority decision of the profession in favor of the modified expansionist views of Keynes, as expressed in his *General Theory of Employment, Interest and Money* (1936), which fitted the times of deflation and mass unemployment better than Hayek's monetary temperance did.

Although Hayek continued to work on the theory of capital, leading to his books on *Profits, Interest and Investment* (1939c) and *The Pure Theory of Capital* (1941b), he devoted increasing amounts of effort to philosophical problems and intellectual history. In 1935 he edited a volume on *Collectivist Economic Planning* for which he wrote two essays. In 1937 appeared his presidential address to the London Economic Club on "Economics and Knowledge"; in 1940, "Socialist Calculation: The Competitive 'Solution'"; in 1941, "The Counter-revolution of Science," largely an analysis of the teachings of Saint-Simon and Auguste Comte; in 1942–1944, in three parts, "Scientism and the Study of Society"; and in 1943, "The Facts of the Social Sciences." In 1944 Hayek published his bestseller, *The Road to Serfdom*, a severe con-

demnation of socialism in all its forms. The book, dedicated to "the socialists of all parties," was lavishly praised and roundly panned, and often distorted by admirers as well as critics.

In October 1940, the London School of Economics (L.S.E.) was evacuated to Cambridge, which afforded Hayek closer relationships with economists at Cambridge—including Keynes—when they were not involved in wartime duties.

In 1941 Hayek was awarded the degree of D.Sc. (Econ.) of the University of London. His closest associates at the London School of Economics were Lionel Robbins, Arnold Plant, and Karl R. Popper. Robbins was a faithful friend, an invaluable critic, and a treasure house of knowledge on the history of doctrines. Popper, the Austrian-born philosopher, was helpful in destroying the myth of the so-called scientific method in empirical disciplines. Plant earned Hayek's gratitude as the man who guided him towards rediscovering David Hume, who "not only laid . . . the foundation of the liberal theory of law, but . . . also provided an interpretation of English history as the gradual emergence of the Rule of Law" (Hayek 1978a, p. 124). Besides Hume, the voices of the past that seem to have had the most profound influence on Hayek's thinking on society, law, and liberty were John Locke, Bernard Mandeville, Adam Smith, Edmund Burke, Alexis de Tocqueville, Lord Acton, and Albert Venn Dicey.

In 1945 Hayek published an article on "The Use of Knowledge in Society," another fundamental disquisition on the division of knowledge in society. In a pamphlet on *Individualism: True and False* (1946a) he contrasted a voluntaristic, spontaneous, undesigned order of freedom of the individual with a rationalistically designed and constructed system. "True" was the undesigned individualism described and esteemed by Hume, Smith, Burke, Acton, and de Tocqueville; "false" the individualism designed and promoted by the encyclopedists, Jean Jacques Rousseau, and the Physiocrats. Most of Hayek's essays completed in these years were collected in a volume on *Individualism and Economic Order* (1948a).

In his last five years at the L.S.E., Hayek made several foreign trips, mostly to the United States. The success of *The Road to Serfdom* led to a lecture tour in the spring of 1945. He came again in 1946, to lecture at the University of Chicago in April and May and at Stanford and in Mexico during the summer. In

April 1947, Hayek convened a group of 39 liberal thinkers in a conference on Mont Pélérin, near Vevey, Switzerland. (The participants—economists, philosophers, jurists, historians, political scientists, literary critics, and publicists—founded the Mont Pélérin Society. Hayek served as president for more than 12 years, and as honorary president since 1960. This exclusive society has admitted some 400 members from 33 countries.) In 1948 Hayek spent the spring in Chicago and the summer at the University of Vienna; in 1950, January to March in Chicago and April at the University of Arkansas in Fayetteville. It was then that he obtained a divorce from his first wife to marry his Viennese cousin and childhood sweetheart, Helene Warhanek, née Bitterlich, and resigned from the L.S.E. to assume a professorship at the University of Chicago.

Chicago, 1950–1962. At the University of Chicago Hayek was professor of social and moral sciences and a member of the committee on social thought. He offered courses in the department of economics, but his major function was to conduct a seminar, mostly on intellectual history. It was attended by senior specialists in various fields, including physics, classical and modern literature, art, archeology, history, sociology, as well as economics (Letwin 1976). His closest associates were John V. Nef, Frank H. Knight, Aaron Director, George Stigler, and Milton Friedman. The first book Hayek published in this period was the product of research done previously in England and in America, *John Stuart Mill and Harriet Taylor: Their Friendship and Subsequent Marriage* (1951*b*). It was an “impartial presentation of documents,” virtually all letters they exchanged during the first 18 years of their friendship and some after her first husband’s death in 1849 and their marriage in 1851. Hayek had himself followed Mill’s itinerary on a journey through Italy and Greece, as described in Mill’s letters. Three other books followed in quick succession: *The Counter-revolution of Science* (1952*a*) containing his earlier articles; *The Sensory Order* (1952*b*), his tract in psychology elaborating his draft paper of 1920; and *Capitalism and the Historians* (1954), a collection, edited and introduced by Hayek, of essays by economic historians exposing the anticapitalist bias of much historical research. Important new articles and papers in epistemology, methodology, and political philosophy were completed in subsequent years

(1955*a*; 1956; 1958; 1963*c*). The chief work of Hayek’s Chicago period was *The Constitution of Liberty* (1960), an ambitious “restatement of the basic principles of a philosophy of freedom” (p. 3).

After 12 productive years in Chicago, Hayek returned to Europe in 1962 as professor of economic policy at the University of Freiburg im Breisgau, in Western Germany.

Freiburg, 1962–1968. Hayek’s inaugural lecture at Freiburg, on “The Economy, Science and Politics” (1963*a*), was a very personal statement of his scientific and political philosophy. He paid his respects to the late Walter Eucken, the eminent representative of libertarian economics, who had taught at Freiburg for many years, and to Max Weber, the influential social scientist who had forcefully explained the role of value judgments in academic teaching.

During his 6 years at Freiburg, Hayek published 2 books, 5 pamphlets, and 24 articles, not counting numerous reproductions and translations. Of the articles, 17 were collected in a volume of *Freiburger Studien* (1969*a*), and 6 of these were also included in an English volume of 29 collected papers, *Studies in Philosophy, Politics and Economics* (1967*b*).

In Freiburg, the Austrian Erich Streissler (later at Vienna) was Hayek’s closest associate. Both the university and the Walter Eucken Institute gave technical assistance to Hayek’s publishing activities.

Salzburg, 1968–1977. Professor emeritus of Freiburg University in 1968, Hayek accepted an invitation to the University of Salzburg. His inaugural lecture, on “The Errors of Constructivism,” was published (1970). The move to Salzburg proved rather unsatisfactory. The university had no degree program in economics, and few law students had serious interests in either economics or political philosophy. Thus he was cut off from the scholars who had everywhere been his stimulating and sympathetic discussion partners. This, combined with ill health, delayed completion of his ambitious three-volume work on *Law, Legislation and Liberty*. The first volume, *Rules and Order*, appeared in 1973, the second, *The Mirage of Social Justice*, in 1976; and the third, *The Political Order of a Free Society*, is expected in 1979.

The biggest event during Hayek’s Salzburg period was the award of the Nobel Prize for economic science, shared with Gunnar Myrdal. His Nobel lecture on “The Pretence of Knowl-

edge" (1975) was a fervent condemnation of the propensity of economists to predict on the basis of too limited knowledge macroeconomic results of expansionary policies. Hayek's prescription for ending the ongoing inflations of moneys and prices was to terminate the governments' monopolies in the creation of money, a *Denationalisation of Money* (1976). The Nobel award led to such a flood of invitations that even selective acceptances put Hayek "on the road" for large portions of the years, traveling to all continents.

Back to Freiburg, 1977. Disappointed with his working conditions in Salzburg, Hayek returned to live in Freiburg. Another volume of collected essays, *New Studies in Philosophy, Politics, Economics and the History of Ideas* (1978a), contains six pieces previously published in German in the *Freiburger Studien* (1969a), and other papers, including his Salzburg inaugural lecture and several contributions to intellectual history. In 1978, he also completed the third and last volume of *Law, Legislation and Liberty* with an epilogue on "The Three Sources of Human Values," which he regards as his intellectual last will and testament.

Honors and awards. Besides his three earned doctorates, Hayek received honorary doctorates from Rikkyo University (Tokyo, 1964), University of Salzburg (1974), University of Dallas (1975), Marroquin University (Guatemala, 1977), Santa Maria University of Valparaiso (Chile, 1977), and University of Buenos Aires (Argentina, 1977); he also was made honorary senator of the University of Vienna (1971). He became fellow of the British Academy (1945), honorary member of the Austrian Academy of Sciences (1976), honorary fellow of the London School of Economics (1976), fellow of the Econometric Society (1947), foreign honorary member of the American Economic Association (1976), and honorary fellow of the Argentine Academy of Economic Science (1977) and of the Academia Sinica (Taipei, 1969). After receiving the Nobel Prize in economic science in 1974, he was decorated with the Austrian medal of honor for science and art (1976) and the German order *pour le mérite* for science and arts (1977).

Highlights of Hayek's work

With a publication record of 185 titles—18 volumes of sole authorship, 10 volumes edited and/or introduced, 15 pamphlets, and 142 articles in journals and chapters in collective books (not counting new editions and translations)—it

would be impossible to give a digest of Hayek's ideas in a short space. Some highlights, however, may be noted.

Money, prices, investments, and fluctuations. Preoccupation with price levels and disregard of relative prices obscure the effects of money creation upon investment and the structure of production. Stability of the price level does not prevent credit expansion from "distorting" prices and production (1925; 1929b; 1931b). A rate of investment accelerated through monetary stimulus is not sustainable and the inevitable retrenchment generates unemployment of both labor and specific capital goods. Thus, monetary causes can lead to structural disturbances (1929b). The natural rate of interest (Wicksell 1898) is not the same as the rate that stabilizes the price level when physical output increases and increased demand for credit is met by a supply of loanable and investible funds in excess of voluntary saving (1931b). Changes in the ratio of demand for investment goods and consumer goods can cause prosperity and depression. Since the depression is usually associated with an induced reduction in investment, an additional extension of consumption is not the appropriate remedy; it may reduce employment even further (1931b).

Capital theory. Internal rates of interest are reflected in the margins between the costs of inputs and the prices of (intermediate) outputs in various stages of production. An increase in interest rates will be indicative of a need to widen the margins between costs and prices, and the production stages requiring relatively much capital become unprofitable (1931b). This is equivalent to a "shortening" of the period of production or investment (Böhm-Bawerk). Hayek's *Pure Theory of Capital* (1941b) provides lucid expositions of his notions of "inter-temporal equilibrium," the "physical productivity of investment," and the "vertical or successive division of labor" (pp. 72–73). Although Hayek rejects the concept of a "supply of capital" as a measurable quantity (p. 147), he derives a meaningful "marginal productivity of investment" (p. 179).

The popular notion that an expansion of consumer demand will always increase demand for and production of investment goods is shown to be a fallacy. Under conditions of full employment it is obvious that either of the two departments of production can increase only at the expense of the other. However, when wage rates behave as if there were full employment—

i.e., when they are raised whenever total demand is expanded—the same condition holds: an increase in consumption will reduce real investment (1969c, pp. 284–285).

Socialism, planning, and competitive capitalism. Hayek added important arguments to the problem of the possibility of rational economic calculation in socialist central planning (1935a; 1940). Although he had in 1935 anticipated the so called “competitive solution,” or “market socialism,” Oskar Lange and Henry D. Dickinson actually proposed this “solution” in 1937 and 1939. This prompted Hayek to explain why the required decentralization of decision making would be too complicated, and too unorthodox to be acceptable to hard-line socialists (1940). (One may hold that the Czechoslovakian events of 1968 proved this hypothesis.)

More fundamental was Hayek’s realization of the role of the “division of knowledge” in economic society (1937a; 1945b), not of scientific or technological knowledge but of the unorganized “knowledge of the particular circumstances of time and place.” Practically every individual “possesses unique information of which beneficial use might be made” (1945b, p. 521) but which “cannot be conveyed to any central authority in statistical form”; decisions based on such knowledge must be “left to the ‘man on the spot’” (p. 524). The problem is not that a unique rational solution *could* be derived from a complete set of data but “how a solution is produced by the interaction of people each of whom possesses only partial knowledge” (p. 530). The price system is the “mechanism for communicating information.”

As to the organization of competitive capitalism, Hayek is not impressed with the modern theories of imperfect and oligopolistic competition. Important are only the institutional and contractual obstacles to competition as a dynamic process, restrictions on entry and on attempts to “discover new ways of doing things better than they have been done before” (1948a, p. 101). He condemns the “mechanical extension of the property concept by lawyers” to non-tangible things such as inventions (p. 114). In a lecture on “Competition as a Discovery Procedure” (1968b), Hayek holds that competition is important “as a process of exploration in which prospectors search for unused opportunities that, when discovered, can also be used by others” (p. 188). Competition produces “a kind of impersonal compulsion . . . for numerous individuals to adjust their way of life in a man-

ner that no deliberate instructions or commands could bring about” (p. 189).

Liberty and the law. Hayek showed the conceptual and empirical links between an economic system based on free markets and a political system based on “liberty under law.” The latter rules out coercion and arbitrariness; the former, i.e., the impersonal mechanism of market prices, communicates dispersed knowledge to masses of free individuals acting and reacting to it without commands. These ideas were gradually refined, starting from the essays on the division of knowledge in society (1937a; 1945b) and a pamphlet on *Freedom and the Economic System* (1939a), continuing with the books *Road to Serfdom* (1944b) and *Constitution of Liberty* (1960), and culminating in *Law, Legislation and Liberty* (1973–1979). There he showed the fundamental contradiction between the idea of constitutionalism—“limited government”—and the [mis]conception of a democracy “where the will of the majority on any particular matter is unlimited” (1973–1979, vol. 1, p. 1); he emphasized the difference between the rules of a spontaneous order and the rules of organization (p. 48), i.e., between *cosmos* (“the law of liberty”) and *taxis* (“the law of legislation”).

Of all of Hayek’s pronouncements the one that most flagrantly negates the tenets of dominant schools of social philosophy is his claim that in a free society the concept of “social justice” is void of meaning. It may have meaning in a “command economy”; but where people are free, guided only “by rules of just individual conduct,” the notion of social justice—epitomized by a call for equality of incomes—is meaningless (1973–1979, vol. 2, pp. 62–100).

Philosophy of science. Hayek’s condemnation of “scientism” (1942–1944) was originally a protest against the fallacy of regarding certain procedures of the natural sciences as the only “scientific method.” Later he learned from Popper ([1935] 1959) “that natural scientists did not really do what most of them not only told us that they did but also urged the representatives of other disciplines to imitate” (1967b, p. viii). Hayek emphasized the differences between the kinds of “facts” observed, described, and explained by the physical and the social sciences. The facts of the social sciences are “opinions—not opinions of the student of social phenomena, of course, but opinions of those whose actions produce his ‘object’”; moreover, we cannot “observe” these opinions directly “in the

minds of the people but [only] recognize [them] from what they do and say merely because we have ourselves a mind similar to theirs" (1942–1944, p. 279).

In his essay on "Degrees of Explanation" (1955a), Hayek distinguished positive and negative predictions, with those of disjunctive alternatives between the two. He stressed the difficulty, in as complex situations as in economics, of ascertaining "by observation the presence and specific arrangement of the multiplicity of factors which form the starting point of our deductive reasoning" (1955a, p. 216). He did not, however, deny the possibility of testing and falsifying propositions about such complex situations. Yet he stressed the importance of "orientation" where prediction is not possible, and of "cultivation" where control is beyond our capacity (p. 225).

Hayek warned of the consequences of excessive specialization:

The physicist who is only a physicist can still be a first-class physicist. . . . But . . . the economist who is only an economist is likely to become a nuisance if not a positive danger. The degree of abstraction which the theoretical disciplines in our field requires makes them at least as theoretical, if not more so, than any in the natural sciences. This, however is precisely the source of our difficulty. Not only is the individual concrete instance much more important to us than it is in the natural sciences, but the way from the theoretical construction to the explanation of the particular is also much longer. (1956, pp. 463–464)

In an important paper on "Rules, Perception and Intelligibility" (1963c) Hayek pointed to "rule-guided perception" and "rule-guided action," neither of which presupposes that we can state or describe the guiding rules. He elaborated the existence of subconscious rules that guide perception and defended the proposition that perception of the concrete presupposes an organizing capacity of the mind. Against the numerous believers in the primacy of the concrete, Hayek went back to the tenet of major philosophers and psychologists who recognized the primacy of the abstract (1969b).

History of ideas

As a dedicated historian of ideas Hayek presented the descendancy of virtually every major issue that figured in the development of his thoughts. Besides such incidental intellectual history, he wrote about the lives and works of Mandeville (1961; 1966), Cantillon (1931a),

Thornton (1939b), Ricardo (1950), John Stuart Mill (1942; 1943b; 1945a; 1951b), Macleod (1934d), Gossen (1932a), Carl Menger (1934b; 1934c; 1968d; 1972), Wieser (1926b; 1929a; 1968e), and Philippovich (1934f); also obituaries for Cannan (1935b), Strigl (1944a), Mitchell (1948b), and Leoni (1968a); he appraised schools of thought such as the École Polytechnique (1941a), the L.S.E. (1946b), and the Austrian School (1965; 1968c); noted some parallelisms in Comte and Hegel (1951a); examined the methodological position of Mach (1967a) and the philosophical and historical ideas of Hume (1955b; 1960; 1963b; 1967a). Hayek's writings on intellectual history are testimonies to his profound and assiduous scholarship.

Memorable traits noticeable in almost all of his writings are Hayek's chivalry and tolerance in criticism and polemics, and his modesty and humility not only in acknowledging the contributions of his intellectual forebears but also in arguing against the views of his intellectual opponents.

Fritz Machlup

WORKS BY HAYEK

- 1924 Das Stabilisierungsproblem in Goldwährungsländern. *Zeitschrift für Volkswirtschaft und Sozialpolitik* New Series 4:365–390.
- 1925 Die Währungspolitik der Vereinigten Staaten seit der Überwindung der Krise von 1920. *Zeitschrift für Volkswirtschaft und Sozialpolitik* New Series 5:23–63, 254–317.
- 1926a Bemerkungen zum Zurechnungsproblem. *Jahrbücher für Nationalökonomie und Statistik* 124: 1–18.
- 1926b Friedrich Freiherr von Wieser. *Jahrbücher für Nationalökonomie und Statistik* 125:513–530.
- 1927 Introduction. In Hermann Heinrich Gossen, *Entwicklung der Gesetze des menschlichen Verkehrs und der daraus fließenden Regeln für menschliches Handeln*. 3d ed. Berlin: Prager.

HEBB, D. O.

Donald Olding Hebb, the Canadian psychologist who spurred the mid-century resurgence of neuropsychological theory, was born in Chester, Nova Scotia, in 1904. He received his B.A. degree from Dalhousie University in 1925 and worked for several years as a teacher in Canada. Having developed an interest in psychology through reading Sigmund Freud, he completed

an M.A. degree (1932) as a part-time student at McGill University, where he was influenced by the works of Ivan Pavlov, Wolfgang Köhler, and Karl S. Lashley. Deciding at the age of thirty on a career in physiological psychology, Hebb chose to study with Lashley, first at the University of Chicago, then at Harvard University, where he received his Ph.D. in 1936. Hebb's dissertation on the innate organization of visual perception included a comparison of rats partially blinded at maturity (through Lashley's cortical excision method) with rats reared in darkness. In its concerns and methods this study prefigured his later work.

Hebb's general orientation toward psychology has echoed that of his mentor, Lashley. Its main tenets are that psychology (including social psychology) is a biological science; that while psychological functions cannot be reduced to physiological functions, psychological ideas must demonstrably be compatible with physiological mechanisms; that the integration of functions is a more critical question than the localization of functions; and that organismic functions must be understood as shaped by both heredity and environment, both nature and nurture. However, new, distinctive problems and data that were to prove vital to Hebb's mature scholarship arose during two subsequent research appointments.

In 1937 Hebb became a research fellow at the Montreal Neurological Institute, where one of his tasks was to assess the effects of the excision of cortical tissue (by neurologist Wilder Penfield) on measured intelligence in human subjects. To his surprise, he discovered that removal of extensive portions of the frontal lobes of adult patients produced no decrease in Binet-type intelligence. Although this finding created little stir among psychologists, Hebb remained deeply puzzled by the fact that mature intelligence did not seem to depend closely on the amount of brain tissue.

This line of investigation also led Hebb into extensive psychometric research on the measurement of specific intellectual abilities. While serving as lecturer at Queen's University in Kingston, Ontario (1939-1942), he and N. W. Morton completed the development of the McGill Adult Comprehension Examination.

In 1942 Lashley became director of the Yerkes Laboratories of Primate Biology and recruited Hebb as a research fellow to undertake naturalistic studies of intelligence and temperament among captive chimpanzees. During this period

Hebb published a number of influential papers on the nature and study of emotions and intelligence in man and animal, a second enduring theme in his works.

Hebb's rise to eminence followed his appointment in 1947 as professor of psychology at McGill, where he assumed departmental chairmanship the following year and created a major research laboratory.

In 1949 his bold and creative *magnum opus*, *The Organization of Behavior*, appeared and immediately stimulated widespread scholarly interest. This work presented a comprehensive theory of behavior that was based as far as possible on the physiology of the nervous system; its central distinctive feature was a novel "physiological theory of thought." To Hebb, thought is psychologically a type of process that is not fully controlled by environmental stimulation, yet cooperates closely with that stimulation. Physiologically it is the transmission of excitation from sensory to motor cortex via association cortex.

The key concept in Hebb's theory of thought is the *cell assembly*, a closed system of recruited neurons within which neural activity can "reverberate" and thus continue after the initiating sensory event has ended. Such assembly activity is the simplest case of an image or idea. Any cell assembly will form neural connections with other assemblies through the mechanism of association, and may thus be activated by an associated assembly in the total absence of adequate sensory stimulus. Moreover, these representational activities of cell assemblies (each corresponding to some very specific property of environmental stimulation) will similarly form connecting links with, and tend to produce, particular motor activities.

Hebb's theory invokes a postulate of synaptic resistance to explain the formation of neural connections within and between cell assemblies: When an axon of cell A is near enough to excite a cell B and repeatedly or persistently takes part in firing it, some growth process or metabolic change takes place in one or both cells such that A's efficiency as one of the cells firing B is increased. As applied to the formation of a cell assembly (involving recruitment of a fairly large number of neurons), this postulate clearly implies that building up such numerous and complex interconnections is a very slow process, requiring many repetitions of the stimulating conditions. These conditions are quite specific and molecular, corresponding to dis-

crete perceptual elements, relations, and properties.

The very simple kinds of images or ideas constituted by cell assembly activity do not themselves go far toward explaining thought or behavior. Accordingly, a second key concept in Hebb's theory is the *phase sequence*,

a temporally integrated series of assembly activities [amounting] to one current in the stream of thought. Each assembly activity in the series might be aroused (1) sensorily, (2) by excitation from other assemblies, or (3) in both ways. It is assumed that the last, (3), is what usually happens in an organized flow of behavior. Each assembly must establish connections with a number of other assemblies, at different times; which of these others it will arouse on any specific occasion will depend on what other activity, and especially what sensory activity, is going on at that moment. Assembly A, tends to excite B, C, and D; sensory activity tends to excite D only, so A is followed by D. At each point in time, behavior would thus tend to be steered both sensorily and centrally, jointly controlled by the present sensory input and the immediately prior central activity. (1959, p. 629)

In Hebb's theory, attention (set, attitude, expectancy) is, physiologically, this influence of the preexisting central activity on the next link in the phase sequence. The motor response of an animal presented with a stimulus is in part selectively determined by excitation from cell assemblies already active.

Perception—of even a simple pattern—is the activation of a phase sequence integrating the perceptual elements, or cell assemblies, that correspond to the several parts of the pattern, through sequencing of the motor components of these assemblies into scanning behavior.

Hebb proposes that an animal's early learning involves a period of establishing perceptual elements, or cell assemblies, and a subsequent period of establishing perceptual and conceptual sequences, or phase sequences. The establishment of such neural structures, as noted above, is presumed to require many experiences of a particular, or of a closely similar, stimulus. Hebb regards this stage of primary learning as the period of establishing a first environmental control over the association areas of the cerebral cortex and thus, indirectly, over behavior. Among those animals in which the association areas are large, absolutely and relatively, primary learning will thus require a long period.

The characteristic learning of the mature

animal, on the other hand, is rapid and conceptual, seeming always to involve a recombination of familiar perceptions and familiar patterns of movement. Prompt learning—including insight—is possible only when stimulation sets off two or more well-organized phase sequences. Being organized, these phase sequences are capable of continued existence after stimulation ceases, thus providing time for the structural changes of permanent learning to take place. Further, the prompt learning of maturity does not involve the establishment of new connections but a selective reinforcement of connections already capable of functioning, based on association by conceptual similarity.

To Hebb, this contrast between types of learning has profound implications for the growth and decline of intelligence. He first distinguishes two meanings of "intelligence." The first is an innate potential, the capacity for behavioral development that resides in possession of a good brain and neural metabolism. The second meaning refers to the functioning of a brain already developing, hence in turn the average level of performance or comprehension of the partly grown or mature animal. Hebb then infers that an intact brain is vital to the first sense of intelligence but not necessarily to the second. The highly organized cell assemblies and, even more, the phase sequences of the adult are characterized by such levels of redundancy and overdetermination that a loss of neurons—for example through aging or brain damage—may not be seriously or permanently disruptive of familiar activities. The formation of new neural structures, however, is importantly a function of the number of potential connections, so that loss of cells does affect the capacity for development, or further development.

Motivation, in Hebb's theory, refers to (1) the existence of an organized phase sequence; (2) its direction or content; and (3) its persistence in a given direction—that is, its stability of content. Items (1) and (2) imply that the waking, normal adult animal always has some motivation, although its persistence in any one direction (3) is not always great. Pleasure is fundamentally a directed growth or development of a phase sequence, "a transient state of affairs in which a conflict is being reduced, an incipient disorganization being dissipated, or a new synthesis in assembly action being achieved" (1949, p. 232). Pain, on the other hand, is a cortically

disruptive activity, capable of channeling motivation by disrupting some phase sequences while facilitating others.

Emotional disturbance, too, is a disorganization of integrated central activities. Two or more phase sequences that are concurrently active may conflict in the sense that they may produce incoordinated behavior. For example, motor components belonging to one sequence may alternate randomly with those belonging to the other. Or one may inhibit the other, with the result that all motor outflow may be nullified in a paralysis of emotion.

Hebb's book marshalled an encyclopedic array of physiological and psychological data to lend impressive plausibility to his key conceptions and to the various theoretical implications drawn from them. Hebb's insistence on the central role of concepts in the behavior of animals (from rats to men), persuasively grounded in contemporary physiology, gave timely support to the growing interest in cognitive psychology and, among more traditional learning theorists, in mediating processes.

Almost immediately, however, new physiological data, particularly the discovery of the diffuse arousal system, and new psychological data, particularly the findings of sensory deprivation experiments conducted by Hebb's own laboratory, dictated significant reformulations of the theory with respect to specific relations among thought, motivation, and emotion. Over the next 25 years Hebb contributed heavily to reformulations of neuropsychological theory in a series of major papers and in successive revisions of his *Textbook of Psychology*, drawing particularly on the directed program of research of the McGill laboratory.

During this period, Hebb was increasingly concerned with the dependence of higher cognitive activities on a varied sensory environment. Animals reared in restricted environments during the primary learning stage were shown to be socially, motivationally, intellectually, and emotionally abnormal in adulthood. Normal mature animals subjected to short-term sensory deprivation were shown to develop temporary abnormalities in the same functional spheres. Hebb's interpretations of such findings contributed importantly to social psychology as well as to developmental and clinical psychology.

Hebb was elected president of the Canadian Psychological Association (1952) and the American Psychological Association (1959), and in

1961, received the APA's award for distinguished scientific contribution. He has received many scholarly honors from several nations.

After serving as chancellor at McGill from 1970-1974, Hebb retired near his birthplace in Nova Scotia, remaining professionally active after his formal retirement.

HEIDEGGER, MARTIN

Martin Heidegger was born in 1889 in Messkirch, southwest Germany. He showed an early religious inclination and studied Catholic theology and philosophy at the University of Freiburg, where he was deeply influenced by the eminent psychologist and Catholic philosopher Franz Brentano. After earning his doctorate, Heidegger was for many years closely associated with Edmund Husserl. He adapted Husserl's phenomenological method for his own purposes, but retained Husserl's sharp distinction between a purely phenomenological and a psychological or sociological study of man. He published his main work *Sein und Zeit* (Eng. trans. *Being and Time*) in 1927, but continued to write and publish all his life.

From his close study of the pre-Socratic philosophers, including Parmenides, Heraclitus, and others, Heidegger concluded that they had a profound insight into the special features of human existence, an insight that he attributed in part to the fact that their thinking did not yet basically separate poetry, religion, philosophy, and science from each other. If man were to regain an adequate understanding of himself and his situation in the world, this separation would somehow have to be overcome.

As a consequence, Heidegger largely rejected the terminology of professional philosophy, adopting an original style that requires special efforts to understand. Heidegger deplored this, but thought it necessary in order to erase preconceptions and avoid misinterpretation on the part of his readers.

He felt that Western man, in order to regain self-understanding and eliminate his profound alienation, had to seek deeper than did the political programs of liberalism and Marxism. Somehow the rebirth had to proceed through an awakening of the people ("*das Volk*") conceived along Germanic lines. This conviction explains in part why Heidegger in 1933-1934 gave speeches in favor of Hitler. He was, however, soon led to reject the possibility of cultural rebirth through National Socialism.

In 1945 Heidegger's association with National Socialism was investigated by a specially appointed tribunal. Not classed as an "activist," he was categorized among the "less responsible" and the "sympathizers," and he was permitted to retain his professional rights. He declared later that Hitlerism was a poison whose effect

would require a difficult and lengthy process to eliminate, and that it revealed a structural weakness in mankind as a whole.

Heidegger continued his work after the war until shortly before his death in 1976. He influenced European thinking profoundly, especially in the years of existentialism. In his later works his thought was deeply inspired by the German romantic poet Friedrich Hölderlin, the Danish existentialist Søren Kierkegaard, and by the critical genius of European culture, Friedrich Nietzsche.

The following formulations, written in part in his own kind of terminology, may offer some idea of Heidegger's philosophy: Man exists, stands out from things, in a sense projects, but he is nothing apart, he is no-thing. He finds himself thrown into the world as a being-there (*Da-sein*), always on the verge of being completely absorbed and of falling away (*Verfall, Aufgehen in*). Being absorbed, he is no one particular, nothing authentic, but "the they," *das Man*. However, through a mood of existential dread (*Angst*), an authentic, free way of being is disclosed (dis-closed) as a possibility. Man's finite existence is grasped as a continuous preparedness for his own death. All everydayness disappears when he faces death and no-thing-ness (*das Nichts*). He understands that as existing he is nowhere at home (*Un-heimlichkeit, Un-zu-hause*). But anxiety also reveals Being itself, as the light and the joyful (*das Heitere*). Man has the possibility of an active, knowing joy (*das wissende Heiterkeit*), a possibility of being the shepherd of Being (*das Hirt des Seins*).

Fundamentally Heidegger's basic question is what it means to be a human being. He tries to bring to light something that is so fundamental that it escapes notice and is hidden from both everyday and scientific consciousness. He invites the reader to ask with maximum engagement, and he does not intend to provide answers.

In his last writings, Heidegger's style is more poetic and oracular, retaining only traces of scientific phenomenology. He now presents himself as an interpreter of modern industrial society: Modern life relates to one and is only one way through which Being reveals itself. Man has at least temporarily lost contact with other possibilities and consequently suffers a profound estrangement from Being, as the source of those possibilities. The revealed world now is one of objects exploited technologically by sub-

jects. Nature has lost its dignity. Because man is basically the "shepherd of Being," his estrangement (alienation) is self-estrangement. The "path into the next world era" can be pointed out only by those who in the present "worldnight" are capable of seeing alternatives. Nature will reveal itself, with "earth, sky, mortals and gods" in an original unity. Poets like Hölderlin are best able to assist mankind in its present crisis.

Heidegger's interpretive approach, critical of Freud and stressing meaning relations, inspired philosophical anthropology and theological and psychiatric thinking. In psychiatry, Ludwig Binswanger used Heidegger's hermeneutic phenomenology in shaping an original conceptual and therapeutic approach. Ronald D. Laing and his school have been influenced through the mediation of Jean-Paul Sartre.

Hermeneutical approaches in cultural and social studies have been generally influenced by Heidegger, in part indirectly through his former students, notably Hans-Georg Gadamer. In the English-speaking world, his influence has, on the whole, been indirect, partly because of difficulties of translation. It can, however, be traced through the works of writers on the borderlines between philosophy and social science. One example is Herbert Marcuse's idea that "rationalization" in Max Weber's sense is also rationalization in Freud's sense of the term, and that scientific rationality is a historical phenomenon peculiar to technological society.

HEIDER, FRITZ

Fritz Heider was born in Vienna in 1896, spent his childhood in Graz, and received a classical education at the official state Gymnasium. Unable to serve in the army during World War I because of a childhood eye injury, he entered the University of Graz. He did not have a professional goal in mind, and in the European tradition, he attended a wide range of lectures open to all university students. His interests eventually centered on the study of philosophy and psychology.

As a student, Heider met Alexius Meinong, a widely influential and dominant figure in European philosophy, who suggested the topic of Heider's doctoral thesis with the question: Why do we say, we see the house and do not say, we see the sun? (The reflected rays of the sunlight are the stimuli which actually strike the eye.) In discussing this problem Heider distinguished between the "thing" or object and the "medium" or that in the environment which provides the information about the object, i.e., the mediators (1927). He carried this distinction into his later analysis of person perception. In Graz, Heider was also influenced by the psychologist Vittorio Benussi, who was one of the

first to conduct and publish experiments in the field of gestalt perception.

After Heider finished his dissertation, written during the winter months of 1919, he worked for a year as an applied psychologist, but soon became restless. He decided to go to Berlin where his uncle was a zoologist. Benussi suggested that while there Heider make contact with psychologists at the University of Berlin.

An air of excitement permeated the Berlin department of psychology. The lectures in perception, especially those of Max Wertheimer, were very popular among students and intellectuals from widely differing fields. There was a definite feeling that gestalt research and theory would have an important influence on the development of psychology. Heider attended the lectures of Wertheimer, as well as those of Wolfgang Köhler, and found many gestalt concepts, for instance laws governing "unit formation," useful in his later work on the perception of interpersonal relations. He also formed a lasting friendship with Kurt Lewin, a younger member of the Berlin faculty.

After Berlin came the *Wanderjahren*, a period when Heider spent a good deal of time reading philosophy, especially Spinoza and Nietzsche; psychology; and literature. Then, in 1927 he became assistant to William Stern at the University of Hamburg, and during this time came to know Heinz Werner and Ernst Cassirer; he learned a great deal from his contacts with all three. In 1930, he published "Die Leistung des Wahrnehmungs-systems," and took leave from Hamburg to accept what he thought of as a one-year position with the gestalt psychologist Kurt Koffka at Smith College in Northampton, Massachusetts. There his principal work was at the Clarke School for the Deaf, where Grace Moore, also a member of Koffka's research group, was working. They were married shortly after and Heider remained in the United States. In the years that followed he combined research at the school for the deaf with teaching at Smith College and published jointly with Grace Heider two monographs on the psychology of the deaf (1940; 1941). Observations that Heider made in attempting to understand the thought processes of children who were just beginning to learn speech inspired the film he later made with Marianne Simmel; findings based on this film were subsequently incorporated into his work on perception of personal causality. In his last year at Smith College, Heider was awarded a Guggenheim

fellowship to continue work on what was to become his widely read book on interpersonal relations.

In 1947 Heider went to the University of Kansas. Roger G. Barker, the new chairman of the psychology department, brought with him a group of people who, like himself, had been closely associated with Kurt Lewin. In the following years, Heider spent a semester at Cornell University, a year at the University of Oslo as Fulbright professor, and a year at Duke University as William Preston Few distinguished professor. In 1951 he received a second Guggenheim fellowship and in 1956 received a grant from the Ford Foundation which allowed him to complete his book *The Psychology of Interpersonal Relations* (1958). In 1959 he received the Lewin memorial award given by the Society for the Psychological Study of Social Issues; in 1963 he shared the Byron Caldwell Smith award given by the University of Kansas; and in 1965 he was also given the distinguished scientific contribution award by the American Psychological Association.

Heider's most influential contribution is *The Psychology of Interpersonal Relations*. In this work Heider applied the laws of perception of physical objects, developed by gestalt psychologists, to the perception and motivations of social "objects," or persons. Synthesizing object and person perception is one of Heider's important scientific achievements.

Two central and associated concerns that have been influential in the development of psychology were also articulated in *The Psychology of Interpersonal Relations*. One of these relates to the concept of balance. Heider reasoned that object configurations, including social objects, could be classified into those which are in a balanced (steady) or in an imbalanced (unsteady) state. Since balanced states are conceptually preferable to imbalanced states, new relations formed according to the principle of balance must be applied to any imbalanced structure. Furthermore, if an imbalanced state exists, there is a force to change it in the direction of balance. For example, in a two-person system, if a likes b and b likes a, the system is in balance. But if a likes b and b does not like a, there is disequilibrium. A force then exists in a to change the attitude of b, misperceive b's sentiments in a biased way, or change the attitude toward b. Configurations with three entities such as those involving two persons and an object are more complex. If, for example, a likes b and

object x (e.g., the elected president), then if b does not like x , the situation is imbalanced and a force will be created to bring the system into a state of equilibrium. In Heider's characteristic manner of integrating everyday observations, literary examples, and scientific analysis, he noted that many literary tragedies make use of balance principles (e.g., Romeo loves Juliet, Juliet loves and obeys her parents, but her parents do not accept Romeo). An example of "latent" imbalance which contributes to dramatic tension in Ibsen's *Wild Duck* occurs when a scrupulous husband loves his wife who, unbeknownst to him, has engaged in a dishonest act for his benefit.

Causal attributions, the second major focus of *The Psychology of Interpersonal Relations*, pertain to perceptions of causality, particularly the relations between actions or behavior and the motives and intentions of others. In a precursory experiment, Heider and Simmel showed experimental subjects three moving objects on a screen (a large and small triangle and a circle). They reported that interpretations of the film were almost always made in terms of interactions between persons with feelings, for instance impacts were interpreted as fights generated by jealousy, joint movements as evidence of liking and "belonging together," and so on. Thus, perceived causality organized perceptions and eliminated the distinction between physical and person perception.

Heider postulated that people are motivated to understand and to master their environment, partly because understanding is adaptive and instrumental to future behavior, but also because of a basic curiosity and desire "to know." Pursuing the distinction intimated in his thesis and in "Ding und Medium" (1927), Heider stated that we are often only in contact with immediate facts or raw data, but we search for the underlying core processes or dispositional properties to explain these facts. These more basic facts are the generally enduring aspects of the world. Heider suggested that in "naive analysis of action" the main causes of events are perceived as either internal to the person (ability and effort) or as external factors (particularly task characteristics). Attributions of causality to these disparate factors have far-reaching consequences. For example, if a person is enjoying his meal at a restaurant, it may make great differences in our behavior (e.g., deciding to dine at the restaurant) if the enjoyment is ascribed to his hunger or to the quality of the meal.

Scientific method. The sources of Heider's ideas were largely observational and literary; his method was often to begin by making "mental experiments" in which interpersonal situations were conceived and altered in a systematic manner (e.g., Romeo does not like Juliet, or Juliet does not care about her parents), and inferring the psychological consequences. The ideas generated in this way have led to further experiments, some by Heider himself, more by others, which in turn have stimulated him to further theorizing.

Scientific heritage. Since 1955, there have been two dominant paradigms in social psychology. The first was cognitive dissonance, a theory of cognitive dynamics proposed by Leon Festinger that was part of the general principle of balance. The second was (and remains) attribution theory, which received its impetus from the writings of Heider. Attribution appears to be the more robust of these paradigms. It dominates social psychology and has made inroads into the fields of motivation, personality, and clinical psychology. Part of the richness of attribution theory is to be attributed to Heider's personality. He has encouraged new directions and alternative paths, rather than dogmatically enforcing or insisting upon one particular set of ideas.

HEMPEL, CARL G.

Carl Gustav Hempel was born in 1905 in Oranienburg, Germany. After studying mathematics and physics, he turned to philosophy and was associated with the logical empiricist movement then centered in Vienna and Berlin. He studied at the universities of Göttingen, Heidelberg, and Berlin, where he received his PH.D. in 1934. Hempel then left Germany, did research in Belgium until 1937, and then came to the United States, where he taught at Yale University from 1948 to 1955 and then at Princeton University. Since 1977 he has been a university professor at the University of Pittsburgh. He has made contributions to logic, philosophy of mathematics, and philosophy of science; in the latter area, he has done important work on concept formation, confirmation, and explanation. His own views, worked out with characteristic precision and attention to detail, lie within the tradition of logical empiricism, but he has also been one of that tradition's most perceptive internal critics. On many points his views are similar to those of Ernest Nagel (1961), whose intellectual roots lie closer to American pragmatism.

The logical empiricists are so-called because they share an empiricist attitude toward epistemological problems and the belief that modern mathematical logic is a tool which can be employed to good effect in the analysis of philosophical problems. Apart from Hempel himself, some prominent figures in this movement have been Rudolf Carnap, Richard von Mises, Otto Neurath, Karl Popper, and Moritz Schlick. The scientific interests of most of these philosophers

centered on logic, mathematics, and the physical sciences.

Neurath, who was trained in economics and sociology, was the only one among them who had specialized knowledge of the social sciences. He believed that human individuals and societies were nothing more than complex physical systems, and for this reason, he envisaged a reformulation of all of empirical science in a unitary physicalistic language.

Carnap, in turn, tried to work out the analytical details of this physicalistic program. Although he began by maintaining that all scientific terms were fully definable by means of physical, observational terms, he soon discovered that it was impossible to construct such a definition for each scientific term. So he proposed that many scientific terms should be regarded as theoretical. Carnap eventually came to believe that all laws of nature, including those which hold for people and their societies, are logical consequences of the physical laws which explain inorganic processes. He has always tended to stress the logical unity of empirical science, and the main thrust of his physicalism has been that all empirical science is in principle reducible to physics, either by translation or by logical derivation.

By contrast, Hempel's work in the philosophy of science has consistently emphasized the methodological unity of the empirical sciences. He is acutely aware of the diversity of subject matters that are amenable to scientific study, and he does not insist that all empirical sciences can be reduced to, or will eventually be replaced by, one fundamental discipline such as a perfected physics. He does hold, however, that all empirical sciences have important similarities of method. His studies of the logic of scientific explanation are attempts to formulate general models of explanation that will reveal some of these similarities. The use of these models to answer certain much disputed questions about methods of explanation in social science constitutes Hempel's main contribution to the philosophy of social science.

The concept of explanation outside of science is vague. Broadly speaking, to explain something to someone is to make it plain or understandable to that person. So explanations are person-relative in the sense that what counts as a satisfactory explanation for one person will not do so for another. A satisfactory explanation for a given person will depend upon his antece-

dent beliefs, intelligence, and other personal idiosyncrasies. But scientific explanations are supposed to be independent of such personal factors. So Hempel proposes to explicate the notion of scientific explanation by replacing the ordinary notion with one more precisely characterized. Whether or not such an explication is successful depends upon whether the more precise notion accounts for cases which are generally agreed to be paradigmatic instances of scientific explanation and also provides a useful tool for analyzing the logical and methodological procedures actually used in science. In Hempel's view, a condition of adequacy for a scientific explanation of a particular event is that it provides information which shows objectively (i.e., in a person-independent manner) that the event in question was to be expected. Like other philosophers in the empiricist tradition, Hempel holds that such information has been provided only when the event to be explained has been subsumed under general laws.

Since laws may be either strictly universal or statistical, there will be two basic patterns of explanation for particular events. The first, worked out by Hempel (1948) in collaboration with Paul Oppenheim, is *Deductive-Nomological* (D-N) explanation. In a D-N explanation, the explanandum is a sentence which describes the event to be explained. The explanans consists of two kinds of sentences. Some state specific antecedent or initial conditions; others express universal laws. Many explanations in classical physics exemplify this pattern perfectly. An adequate D-N explanation must satisfy four conditions: (1) the explanans must be true; (2) the explanandum must be logically deducible from it; (3) at least one law in the explanans must be required for the deduction; and (4) the explanans must in principle be capable of being empirically tested. The first two adequacy conditions insure that the explanans provides information which shows that the explanandum-event was to be expected; this is because a valid deductive argument with true premisses guarantees the truth of its conclusion. The third condition insures that the explanandum-event has really been subsumed under a law, and the fourth guarantees that the explanans is subject to confirmation or disconfirmation by observational evidence.

The second pattern, which Hempel (1962a; 1965) elaborated later, is *Inductive-Statistical* (I-S) explanation. In an I-S explanation, the

explanandum is a sentence which attributes to a particular thing a certain characteristic A. The explanans comprises both a sentence expressing a statistical law to the effect that the probability that a thing has A, given that it has some other characteristic B, is close to one, and a sentence stating that the thing in question has B. Some explanations in genetics, for example, conform well to this pattern. In an adequate I-S explanation, the explanans must be testable and true. Moreover, because each of two incompatible explananda can be rendered highly probable by different true I-S explanations if these are cleverly selective, an adequate I-S explanation must be based on all available information of potential explanatory relevance to the explanandum. Hence, the adequacy of an I-S explanation is epistemically relative and may alter as the available information alters. Because the relation between explanandum and explanans in an I-S explanation is not one of logical deducibility, the truth of the explanans does not guarantee the truth of the explanandum. But the explanans does provide strong inductive support for the explanandum and, thereby, shows that the explanandum-event was to be expected.

In addition to explanations of particular events, scientists also explain laws. A universal law may often be deduced from the basic principles of an even more general theory. Sometimes such deductions succeed in showing that the original lawlike sentence was only an approximation. On the other hand, a statistical law may be deduced from others by means of the mathematical theory of statistical probability.

Hempel has applied this general philosophical analysis of scientific explanation to four topics that concern social scientists: (1) the function of laws in historical explanation; (2) the function of ideal types in sociological explanation; (3) the role of reasons in the explanation of human action; and (4) the problem of functional explanation in sociology and anthropology. In each case he argues that proposed scientific explanations are successful only to the extent that they can be understood as conforming to one of the patterns he has described.

Hempel (1942) holds that explanation in history must, as elsewhere in the empirical sciences, involve subsumption under laws. To be sure, historians do other things besides explaining events. Such activities as description, classification, and simple narration are the legitimate

province of historians, but they differ in logical structure from explanation. Hempel is not committed to the view that there are sweeping laws of historical development as proposed by Oswald Spengler or Arnold J. Toynbee. He recognizes that the laws explaining historical events are usually borrowed from such disciplines as economics, psychology, and sociology, or are common-sense generalizations based on everyday experience. Obviously, historical explanations are seldom, if ever, proposed in a form that fits one of the patterns Hempel has described, because, he suggests, historians usually set forth only sketches of explanations, which provide no more than vague indications of the laws and initial conditions considered relevant to the explanandum. Such sketches would have to be expanded before Hempel would regard them as full-fledged explanations. Hempel also argues that empathetic understanding of events and people is not a method of historical explanation; rather it is a heuristic device for suggesting psychological hypotheses which might serve as explanatory principles.

According to Hempel (1965), the intent of constructions of ideal types is to provide explanatory theories. When fully elaborated, they should consist of both a list of characteristics with which the theory proposes to deal and a set of sentences which purport to express laws, universal or statistical, connecting these characteristics. Such connections by means of laws are nomological connections. Hempel carefully shows that his interpretation is consistent with much of what Max Weber and Howard Becker have said about ideal types. But he explicitly rejects Weber's claim that the nomological connections in such a theory must be subjectively meaningful because many events of interest to social scientists can only be explained by reference to factors that have no subjective meaning. Hempel suggests that such ideal constructs might eventually be incorporated, as idealized approximations, into a comprehensive theory of social action, if and when one is constructed. In addition, he warns that if the requirement of testability is to be satisfied by the nomological sentences of such a construct, their empirical domain of applicability must be clearly specified.

Explanation of action in terms of reasons must refer to at least the following factors: (1) the agent's goals; (2) the agent's beliefs about the means available for attaining those goals; and (3) the agent's commitments to normative constraints on actions. Suppose all such

factors are put together and thought of as making up the agent's situation. Some philosophers have held that a rational explanation for an action shows why the action was the appropriate one for the agent to take in his particular situation. Hempel (1962c; 1965) argues that this is not sufficient for scientific explanation because it provides no grounds for thinking that the agent did, in fact, do what was appropriate. He construes the explanans of a full-fledged explanation in terms of reasons as consisting of two parts: (1) a sentence expressing a nomological connection between, on the one hand, being rational and in a certain type of situation and, on the other, performing a certain kind of action; and (2) sentences stating that the agent was rational and was in a situation of the specified sort. In this interpretation, explaining actions by reasons also involves subsumption under laws. Hempel notes that the characteristic of being rational must in such explanations be understood, not normatively but descriptively, as a broadly dispositional trait. Otherwise the testability requirement cannot be satisfied. He distinguishes between actions that can be explained in terms of the specific aspects of the situation that the agent consciously considers in his deliberations and actions that can only be explained by reference to unconscious motivational factors. But he emphasizes that attributions of unconscious motives must be subject to control by empirical testing, and so he takes such motives to be linked to behavioral dispositions. For example, attributions of unconscious motives of the Freudian sort are subject to empirical testing just insofar as they are related to such behavior as slips of the tongue and reports of dreams in a fairly precise manner.

Hempel (1959) takes the object of a functional analysis to be some item which is a relatively persistent trait or disposition occurring in a larger system. For example, the beating of the heart is a persistent trait of the body of a living vertebrate. Hempel argues that the analysis aims to show that the system is such that under specified conditions the item in question has effects which satisfy a condition necessary for the system to remain in adequate or proper working order. For instance, when the body of a living vertebrate is in normal conditions, the beating of the heart has the effect of circulating the blood, and this contributes to the satisfaction of certain conditions, such as supply of nutriment and removal of waste, which are necessary for the proper working of the or-

ganism. This is the content of the claim that the beating of the heart in vertebrates has the function of circulating the blood. Hempel notes that an item may have many effects that are not among its functions. For example, the production of throbbing sounds is an effect of the beating of the heart in vertebrates that is not a function because it normally contributes nothing to keeping vertebrates in adequate working order.

Anthropologists such as Bronislaw Malinowski and A. R. Radcliffe-Brown have supposed functional analyses to have explanatory import. Hempel shows that although functional analyses do presuppose nomological connections, they typically do not explain the presence of an item in a system because the presence of the item under analysis is sufficient but usually not necessary for maintaining the system in working order. In most cases there are other items functionally equivalent to the one under analysis which might have been present instead. Hempel also points out that unless precise empirical criteria for the application of terms such as "adequate or proper working order" are laid down, functional analyses will not be testable. For this reason, he suspects that what Robert K. Merton has called the postulate of universal functionalism—the view that every item in a culture has a function—may be empirically vacuous rather than merely premature. Hempel cautiously interprets functional analysis in social science as a research program aimed at determining the respects and degrees to which various systems are self-regulating and takes the pursuit of this aim to require the formulation of precise and empirically testable hypotheses about specific functional relationships.

Hempel's work on explanation has inspired an enormous body of philosophical literature and has also been taken seriously by social scientists, such as Paul F. Lazarsfeld, who are concerned with methodological problems. Some of the more instructive philosophical criticism of Hempel's views has come from William Dray (1957), Wesley C. Salmon (1971), and Michael Scriven (1959; 1962). The favored strategy of most critics has been to elaborate examples of explanations in some empirical discipline such as history or evolutionary biology that seem to be perfectly respectable and yet do not appear to conform to either Hempelian pattern of explanation. Adolf Grünbaum (1963) and John Passmore (1958) have defended some of the leading Hempelian ideas against such

objections. Hempel (1965) himself has responded to many of his critics. Nicholas Rescher (1970) has edited a volume of essays in Hempel's honor in which prominent philosophers discuss several facets of his work. Over the years, it has become increasingly clear that Hempel's work is a major contribution to the philosophical treatment of the logical and methodological problems of the empirical sciences.

HERRING, PENDLETON

(Edward) Pendleton Herring had two successive careers, first as an influential political scientist, then, after 1948, as head of the Social Science Research Council (SSRC), one of the leading research organizations in the United States.

Born in Baltimore, Maryland, in 1903, Herring received his A.B. (1925) and Ph.D. (1928) in political science from the Johns Hopkins University. He served as a member of Harvard University's department of government from 1928 to 1947, and as secretary of its Graduate School of Public Administration from 1936 to 1947. In the latter capacity he developed the "case method" of teaching public administration, which grew into the Inter-University Case Program in Public Administration.

During his 18 mainly academic years (1928-1946) Herring published 6 books, 5 of which have remained in print long after their publication. *Group Representation Before Congress* (1929) took its place alongside Peter Odegard's *Pressure Politics* (1928) and E. E. Schattschneider's *Politics, Pressures and the Tariff* (1935) as the foundation of the study of pressure groups as a new field of political science. *Public Administration and the Public Interest* (1936b) was one of the first and most influential analyses of the interactions among government agencies and their organized and unorganized clienteles. *Federal Commissioners: A Study of Their Careers and Qualifications* (1936a) pioneered studies of the relationships between administrators' backgrounds and their behavior in office.

Herring's next two works were more general

in scope and impact. *Presidential Leadership* (1940b) was the first major study of the politics of presidential leadership written since Woodrow Wilson's *Constitutional Government in the United States* (1908). Perhaps his most important work, *The Politics of Democracy* (1940a) has remained a principal source of ideas and inspiration for political scientists who, like Jeane Jordan Kirkpatrick, Seymour Martin Lipset, Nelson Polsby, Aaron Wildavsky, and Austin Ranney, believe that America needs a politics of moderation and consensus more than one of sharp choice between irreconcilable alternatives, and that the decentralized, pragmatic parties of American tradition are more likely to meet that need than are the disciplined British-style parties so admired by advocates of "responsible party government." His last book, *The Impact of War* (1941), was an analysis of American war mobilization.

In 1953 Herring was elected president of the American Political Science Association. But, when he took office he was already well launched on his second career.

After serving from 1942 to 1947 in a variety of administrative positions in the national government and the United Nations, Herring in 1948 became president of the Social Science Research Council, which had been founded in 1923 to promote the organization and funding of social science research. Herring held the presidency from 1948 to 1968, and in those twenty years the council became the prime organization shaping the nature of research in most of the social sciences.

At the beginning of Herring's presidency the SSRC's annual budget was under \$500,000; when he left office it was nearly \$2 million. Under his leadership the council's growing resources were used to pursue two main goals. The first was to improve the quality of social science knowledge by encouraging researchers to acquire more and better data, analyze them by more rigorous quantitative methods, and develop more general and systematic theories with predictive power. The second goal was to focus and report research in ways that would make it more accessible and useful for the makers of public policy. The council worked mainly through its committees of scholars, chosen and encouraged by Herring and his staff. Among the more noteworthy may be mentioned the committees on mathematics in social science research, on economic stability, and on biological bases of social behavior. In Herring's own discipline the committee on polit-

ical behavior and its derivative committees on comparative politics and on governmental and legal processes played key roles in the "behavioral revolution" that transformed political science from the 1950s to the 1970s.

In the postwar era, Herring succeeded in attracting the country's leading social scientists to serve on the SSRC's committees, conferences, and board of directors. To mention only a small sample: in economics, R. A. Gordon, Lawrence R. Klein, Simon Kuznets, and James Tobin; in history, Philip Curtin, Louis Gottschalk, Roy F. Nichols, and Edwin Reischauer; in law, Willard Hurst, Edward H. Levi, and Leon Lipson; in political science, Gabriel A. Almond, Robert A. Dahl, V. O. Key, Jr., David B. Truman, and Robert Ward; in psychology, Angus Campbell, Lee J. Cronbach, Leon Festinger, Gardner Lindzey, Charles E. Osgood, and Herbert A. Simon; in sociology, James S. Coleman, Paul F. Lazarsfeld, and Robert K. Merton; and in statistics, Otis Dudley Duncan and Frederick Mosteller.

Herring retired from the SSRC in 1968 and became director of the Foreign Area Fellowship Program, which administered programs of training and research in foreign countries organized in close cooperation with scholars in the host countries. As president of the Woodrow Wilson Foundation after 1962, he played a major role in persuading Congress to establish the Woodrow Wilson International Center for Scholars in Washington.

Probably no one in his generation had as great and as varied an impact on social science as Herring. Postwar studies of political parties, pressure groups, and public administration took their departure from his prewar books. Postwar research in all the social sciences owes much of the broadening of its objectives, the refinement of its working methods, and the greater utility of its products to the work of the SSRC under his direction. Those who seek his monuments will find many in the other pages of this encyclopedia.

HERTZ, ROBERT

Robert Hertz (1881-1915) was one of the most brilliant and promising members of the younger generation of Émile Durkheim's *L'année sociologique* school—a group of scholars that was to be devastated by World War I (Mauss 1925).

Born at St. Cloud, France, Hertz was educated at the École Normale Supérieure, from which he graduated in first place as *agrégé de philosophie* in 1904. In the two succeeding years he did research in the library of the British Museum in London, and in 1906/1907 was philosophy master at the Lycée de Douai. In 1907 he was appointed to the École Pratique des Hautes Études in Paris, where he remained until the war, in which he was commissioned as a second lieutenant of infantry. He was killed by German machine guns, at the age of thirty-three, leading his men in an attack on Marchéville.

In his lifetime Hertz had published essays on death (1907), the preeminence of the right hand (1909), and the cult of St. Besse (1913), and a pamphlet on socialism (1910). At the front, he

had collected from his soldiers a number of country sayings, and these were later printed (1917). The introduction to a major work on sin and expiation was edited by Marcel Mauss (1922), and a long review on Russian ecstatic sects was included in a volume of his collected writings also brought out by Mauss (1928). Hertz also left a study, the product of two years' work, of the myth of Athena. This was complete (Mauss 1925, pp. 24-25), and Mauss announced his intention to publish it (in Hertz 1922, p. 4), but it did not appear and the manuscript has never been traced. In addition Hertz had embarked on another investigation, similarly inspired by the case of St. Besse, of legends and cults of rocks, mountains, and springs, but he had not the time to carry it out before the war took him (A. Hertz, in R. Hertz 1928, pp. xii-xiii).

In his published works Hertz exhibited a masterly command of the sources, an acute sense of problem, and a sure style of analysis; he wrote with clarity and remarkable authority. Nevertheless, and in spite of the courses of lectures based on his study of sin which Mauss delivered at the Collège de France between 1932 and 1937, as well as more sporadic attention by others (cf., Needham 1973, p. xiii), Hertz remained largely unknown until after World War II. His contributions were then brought to the notice of social anthropologists in lectures given at Oxford University by E. E. Evans-Pritchard, and at the latter's suggestion the essays on death and the right hand were brought out in an English edition (Hertz 1960). These led directly to a resurgence of interest in symbolic classification, especially that concerned with lateral values. In 1973 a substantial volume of studies of the symbolism of right and left was published (Needham 1973), inspired by Hertz's essay on the topic and dedicated to his memory.

During his university years Hertz long hesitated between committing himself to religious or economic sociology on the one hand, or else to ethics and politics on the other, but he made no decided choice (Mauss, in Hertz 1922, p. 2) and his publications eventually covered a range of apparently disparate subjects. His essay on the collective representation of death, an analysis of secondary burial with special reference to the Dayak peoples of southeastern Borneo, was a singularly accomplished piece of work for a man in his twenties. His argument was that in primitive societies death was not a unique event but an initiation; secondary burial, as a rite of

transition, was thus comparable with rites of birth and marriage. This was essentially the argument that Arnold van Gennep generalized, with acknowledgment to Hertz, in his global survey of rites of passage (1909). In the paper on the right hand, Hertz argued that the universal preeminence of the right over the left was a particular case and a consequence of the dualism inherent in primitive thought, a religious polarity that symbolically partitioned the universe and with it the human body. The study of the alpine cult of St. Besse, an enigmatic figure armed as a Roman legionary and associated with an isolated rock high in the mountains, was a profound combination of local inquiry, historical research, and sociological speculation. Finally, the projected work on sin and expiation was an attempt, by means of comparative ethnography, to define a form of religious experience. Starting from the domination of Christian Europe by the ideas of the sin of the first man and the redemptive passion of Christ, Hertz sought parallels in less advanced civilizations, especially among the Maori, and he intended to prove that the Polynesian ideas, while not strictly primitive, were in a sense antecedent to the Jewish, Greek, and Roman ideologies from which the modern European concepts emerged.

Hertz was more fundamentally concerned, however, to detect certain abstract features of collective representations and social conduct underlying these particular institutions: transition, opposition, the symbolic power of rocks, and the puzzle of how society could both castigate sin and absolve the sinner as if the offense could be effaced. In this focusing of analysis Hertz was a methodological successor to his teachers Durkheim and Mauss. To some extent also he shared their weaknesses—for example, an excessive reliance on the opposition of sacred and profane, and a metaphoric tendency to hypostasize society. In other respects, by contrast, he was in advance of his seniors, not least in abstaining from Durkheim's typical vices of *petitio principii* and the explaining away of contrary evidences by resort to conjectured changes, and from Mauss's inclination to derive complex social facts from a single causal factor; also, he got his references right.

Hertz's characteristic method was to explicate the interconnections among various aspects of an institution, to press his analysis in progressively more fundamental terms, and finally to relate the social facts to a specific ground or occasion. Thus the physical phenomena of death

do not determine the collective representations and emotions, but they contribute to the form of the latter and lend them material support; the superior agility of the right hand is not the cause of lateral values and religious polarity, but it provides the occasion and a paradigmatic case of opposition; the significance of the rock of St. Besse is not its anecdotal association with the cult, but its value as an emblem of the collective existence and continuity of the community of the faithful. An especially important feature of this style of interpretation is that Hertz makes no doctrinaire disjunction between social facts and inner states: thus the institution of secondary burial helps to overcome grief and to bring the survivors gradually to terms with the reality of the separation; the ideology of dualism, as an essential source and pattern of order, is protected by individual reactions of contempt for the left and aversion from what it symbolizes; and the social organization of a saint's cult derives from the adherents' wish to endure and from their imaginative response to the local emblem (the rock) of their persistence and unity; the regulation of mystical crime has to do with a distinct form of experience.

Connected with this approach, perhaps, was Hertz's attitude toward ethnographic research. Whereas neither Durkheim nor Mauss had made studies in the field, Hertz at least based his study of St. Besse on six weeks spent in the alpine hamlet of Cogne. He took part in a pilgrimage to the rock, and in September 1914 he was to have made a journey to the mountainous regions of Greece in order to learn directly, not merely through books, the background to the myth of Athena and to cults of rocks in general (A. Hertz, in R. Hertz 1928, p. xiii). He urged hagiographers not to neglect two "precious instruments of research": a pair of good boots and an iron-tipped walking stick (1928, p. 188). In many respects Hertz was a direct precursor, theoretically and practically, of much that is best in modern social anthropology. Mauss (in Hertz 1922, p. 1) found that time only confirmed and perpetuated Hertz's methods, the directive value of his analyses, and his style of exposition: "They enter the serene sphere of the classical."

HESCHEL, ABRAHAM J.

Abraham Joshua Heschel (1907-1972) was born and raised in Warsaw, acquired his academic training in Berlin, and wrote most of his mature works in the United States, to which he emigrated in 1940. From 1945 until his death he held the position of professor of ethics and mysticism at the Jewish Theological Seminary of America in New York. His work as a philosopher of religion and a theologian is best understood as an attempt to achieve a creative synthesis between the two different worlds in which he lived before he came to the United States. Born into an intensely traditional Hasidic milieu, he counted among his paternal ancestors Rabbi Dob Ber of Mezeritch, "the Great Maggid," successor to the Ba'al Shem Tov, founder of the Hasidic movement that swept across eastern European Jewry in the eighteenth century, and Rabbi Abraham Joshua Heschel, known as "the Apter rebbe." On his mother's side he was also descended from rabbis. Growing up in the world of piety and learning, he acquired a thorough training in the study of the Talmud as well as a

knowledge of the world of Jewish mysticism, the Kabbalah. Determined to receive a modern Western education, he spent time at a secular Yiddish Realgymnasium in Vilna, and in 1927, moved to Berlin, where he attended the Hochschule für die Wissenschaft des Judentums and the University of Berlin. In February 1933 the university awarded him a doctorate for his dissertation on prophetic consciousness (1936).

Arriving in Germany with an impressive accumulation of rabbinical learning, he was confronted at the University of Berlin with the critical methods of modern philology and source criticism, while his ancestral piety was challenged by the approaches of modern secular philosophy, science, and psychology. Heschel was especially impressed by the works of the neo-Kantian philosophers and by such phenomenologists as Eduard Husserl and Max Scheler. Against the neo-Kantians he defended the claims of Biblical and rabbinical Judaism that God is more than an idea, a postulate of reason, or a logical possibility. From the phenomenologists he learned to analyze the constitutive traits and structures of experienced reality in their essential purity, without reducing them to alien categories that distort their uniqueness. Thus, in his doctoral dissertation, he refused to force the phenomena of Biblical prophecy into the fixed categories of Aristotelian metaphysics, as the medieval scholastics had done, or to "explain" them in terms of modern psychological or sociological notions. As a result of his attempt to analyze the prophetic consciousness of the Bible he developed a novel conceptual framework that became the nucleus of his later philosophy of Judaism.

Heschel saw the task of the philosopher of religion neither in the construction of a "religion of reason," such as the neo-Kantian philosopher Hermann Cohen had done, nor in the analysis of "religious experience," such as Rudolf Otto had achieved in *The Idea of the Holy* (1917). The first substitutes philosophy for religion; the second tends to replace it with the psychology of religion. If religion is *sui generis*, it must be studied in its own terms, and the interpreter, while making full use of the tools of philosophy, must never forget that the main task is to understand and illumine the reality underlying religion, the living and dynamic relationship between God and man disclosed in the classical documents of Judaism and the lives and experiences of pious men.

Heschel therefore pursued two parallel, com-

plementary tasks: he did research in the sources of classical Judaism to gain valid and objective knowledge of that tradition, and he formulated his own philosophy of religion based on the results of his specialized studies. These, in addition to his work on prophecy (later expanded into his English book *The Prophets* [1962]), included a biography of Maimonides (1935), articles on medieval philosophy, Kabbalah, and Hasidism, as well as a major work on the doctrines of revelation in talmudic thought written in Hebrew (1962–1965). A two-volume work on the thought of Rabbi Menahem Mendel of Kotzk (1973a), written in Yiddish, and an English volume on the Kotzker and Kierkegaard (1973b) appeared posthumously.

Heschel used the results of these researches to construct his own philosophy of religion, which is developed in *Man Is Not Alone* (1951a) and its successor volume, *God in Search of Man* (1955). In these books, Heschel defined religion as an answer to man's ultimate questions. Since modern man is often alienated from the reality that informs genuine faith, Heschel thought it inadequate to present traditional answers to these questions. Instead, he tried to recover the significant existential questions to which Judaism offers answers. Delving beneath the surface phenomena of modern doubt and rootlessness, he confronted his readers with the living God of the Bible. This God is not "proved" as is the conclusion of a syllogism; to the religiously sensitive man God is an "ontological presupposition," the ultimate reality, which is then crystallized by discursive thinking into the concept of a power, a principle, or a structure.

Heschel described three ways in which man could reach an awareness of God. The first is by going through wonder beyond the mere givenness of the facts to an awareness of the grandeur and mystery of reality. Such wonder can take different forms: as curiosity it becomes the starting point of science, which looks beyond the given facts (data) to the laws they exemplify; as radical amazement it points to the ground and power that stand behind all facts and perceptions of facts. This evocative approach yields a *panentheistic* outlook: through created things man reaches an awareness of the God who is within, but is also beyond all finite existence.

In the second way, man reaches an awareness of God by delving into the recesses of his own being, thus realizing that the self is not a discrete, independent, and self-sufficient entity, but part of something greater and more encompass-

sing than one's individual ego. This second way tends to a *quasimystical* world view, but it stops short of the danger of mystical absorption and annihilation in the Godhead by articulating God as the subject of all reality and man as the object whose dignity and worth derive from his consciousness of being the goal of divine concern and expectation.

In the third way, man becomes aware of the *voice* of God. The "holy dimension" discovered by listening to the voice and acting responsively and responsibly characterizes the Biblical view of man as the recipient of divine revelation. In facing the transcendent God and his demands one becomes a moral agent. By observing the commandments the Jew enters this holy dimension of God's challenge and guidance, and by obediently responding to the divine imperative he experiences himself as the object of God's address and concern.

Heschel's emphasis that faith is not so much assent to a proposition as an attitude of the whole person, a response and an attachment to God's demands, is not only important for his understanding of the significance of *halakhah* (law). It is also crucial for his interpretation of God as personal outgoing ("transitive") concern and for his critique of the main trends of philosophical theology that have tried to assimilate the living God of the Bible to impersonal categories of Greek metaphysics or to some types of modern process philosophy. To raise the concept of God from the level of crude anthropomorphism, the medievals defined him as Being Itself, while the modern inclination is to describe the Deity as the power that makes for goodness, the underlying structure or the *nisus* of the universe or the moral dimension of reality. This however is not only detrimental to religious life, watering down the "religious availability" of God, but in direct conflict with the Biblical and rabbinic outlook. Therefore Heschel emphasized the divine concern of the personal God as essential to any adequate Biblical theology. He developed the concept of the "divine pathos," which he had first presented in his doctoral thesis, and made it the cornerstone of his later thought. In fact, the concept of *personal concern* can be considered the key to Heschel's whole system: The Ultimate is not Being but concern or *directed attention*. Few of Heschel's readers realize that he propounded a doctrine that ran counter to the whole venerable tradition of Jewish and Christian metaphysical theology from Philo Judaeus, Maimonides, and Thomas Aquinas to Hermann

Cohen, Étienne Gilson, and Paul Tillich. He declared that the Greek category of "being" and eternally frozen perfection is inadequate to Judaism and must be replaced by a new set of categories derived from Biblical thinking. Aristotle's Unmoved Mover must give way to the Bible's Most Moved Mover, the God of pathos and transitive concern who stands in a dynamic and reciprocal relationship to his creation. "Being through creation," through the divine act of freedom, expresses in symbolic form that reality is not a self-sufficient, fixed, mechanical order. It is a process in which responsible man freely reacts to the challenges of life and in which surprise, novelty, and unexpected creative possibilities always occur. Through sympathy, compassion, and sensitivity to the divine demands, man can overcome his egocentric predicament and fulfill his true potential.

Man as created in the image of God must find his goal in *imitatio Dei*. Heschel's teachings on the nature and worth of man are perhaps his most important contribution to the social sciences. Animate is distinguished from inanimate existence by reflexive concern: every living organism abhors its own destruction. God, who faces no threat to his being, is free of reflexive concern and is characterized by transitive or outgoing concern for others. Man, who as a living creature shares reflexive concern and anxiety for his own future with the animals, is distinguished by sharing transitive concern with God, a regard for others. "Man cannot even be in accord with his own self unless he serves something beyond himself." In ethics the idea of concern helps to explain the ideal of caring for the fellow creature. Animals are content when their needs are satisfied; man cannot find true happiness unless he is also able to satisfy, to *be a need*, not only to have needs.

In exploring basic human attitudes the idea of active concern enables us to overcome routine dullness and alienation by reminding us that man is a self-surpassing creature, the being who is always beyond himself, in *ek-stasis*, transcending his loneliness and isolation in knowledge, action, art, and worship. Space and time take on a new meaning in Heschel's Biblical thinking: things are merely frozen processes; life itself is a process gathering the past into itself, reaching out into the future. Reality is not like a stone sculpture, but like a symphony. The Sabbath, whose celebration is the weekly renewal of the divine-human covenant, is an edifice in time, a cathedral of the spirit.

For the student of the social sciences the most challenging and significant aspect of Heschel's thought may lie in his frankly theocentric viewpoint. Where naturalists have tried to understand religion in terms of human interests, categories, and needs, he maintained the traditional Jewish doctrine that man cannot understand his own nature, his needs and fulfillment, in isolation from God. He once remarked that the Bible is not man's theology but rather God's anthropology. His philosophy of religion expounding the thesis that God needs man and that man finds his deepest fulfillment in sharing in the divine concern, was an attempt to work out the implications of this Judaic world view for modern man.

HICKS, JOHN R.

John Hicks was born in Leamington Spa, England, in 1904. He was an undergraduate at Balliol College, Oxford, from 1922 to 1926, and studied mathematics for a year, then philosophy, politics, and economics. He was Jevons professor of political economy, Manchester (1938–1946), fellow of Nuffield College, Oxford (1946–1952), and Drummond professor of political economy, Oxford (1952–1965).

Hicks is one of the leading economic theorists of the twentieth century. He was created Knight Bachelor in 1964. In 1972 he was awarded the Nobel Prize in economics (jointly with Kenneth J. Arrow) for his work on "general equilibrium and welfare economics." His *Value and Capital* (1939b) is an economic classic. His major writings have become thoroughly absorbed into teaching at the university level, most notably those on indifference curve analysis, and on the IS-LM curve presentation of the Keynesian system.

In his early years as a junior lecturer at the London School of Economics (L.S.E.), Hicks had intended to specialize in labor economics, and his earliest publications were on institutional aspects of the labor market. However, by 1929 he had begun to explore economic theory and to read Gustav Cassel, Léon Walras, Vilfredo Pareto, Francis Y. Edgeworth, Knut Wicksell, and the Austrians. At the same time, he was lecturing on general equilibrium theory, in the tradition of Walras and Pareto, and on risk. The influence on Hicks of Friedrich A. von Hayek (who arrived at the L.S.E. in 1931) was strong and may be detected in varying degrees in all his major works. By 1934, Hicks was independently writing on money in a distinctly Keynesian vein. He subsequently became a noted expositor and developer of Keynesian ideas. Starting from Hicks's first book on wages, D. H. Robertson was an important private influence, something which is perhaps most obvious in Hicks's trade cycle volume.

Hicks's first book, *The Theory of Wages* (1932), is not typical of his total work, adopting, as it does, the assumption of "neutral" money. Even so, it has been influential in a number of respects, including its discussion of inventions, and its introduction of a new measure of the substitutability of factors, the "elasticity of substitution." Various generalizations of the elasticity of substitution have since been developed; by Hicks himself and by Paul A. Samuelson (Wolfe 1968).

It was Hicks's second book, *Value and Capital*, which established his reputation as a theorist of the first water. Its major contributions are the elaboration and development of Paretian value theory and Walrasian general equilibrium theory. The early chapters build on the work jointly developed with R. G. D. Allen in the article "A Reconsideration of the Theory of Value" (1934). This paper abandoned the concept of measurable utility, and showed that to derive many operational results of demand analysis, it was sufficient to assume simply that consumers were able to rank bundles of goods in order of preference. Although the apparent novelty of the Hicks-Allen theory was diminished by the discovery of an earlier mathematical version developed by Eugen Slutsky, the clear literary way in which it was developed in *Value and Capital*, and the skill with which it was used to illuminate such concepts as complementarity and substitutability, made it essentially a Hicksian theory. In *A Revision of Demand Theory* (1956), Hicks revised the first three chapters of *Value and Capital* in terms of the "revealed preference" theory of Samuelson.

In the 1950s, Hicks was one of a group of economists who were concerned with developing compensation criteria in welfare economics. The theoretical underpinnings of this work are contained in the previously mentioned two books. His approach was much criticized by theorists. It has been, at least partly, replaced by the more concrete policy approach of Jan Tinbergen; the social welfare function approach of Abram Bergson and Samuelson; and the approach by I. M. D. Little and others giving distribution effects paramount place. Nevertheless, the compensation approach may remain the best rationale for modern work in cost-benefit and cost-effectiveness analyses.

Another accomplishment of *Value and Capital* was to investigate the stability of Walrasian general equilibrium. Hicks went beyond the "equation counting" approach of Walras, to investigate how the system would react to changes in tastes and resources. However, the stability criteria he developed failed to provide a satisfactory theory of behavior out of equilibrium. This deficiency was noted by Samuelson who was able to demonstrate that Hicks's conditions were neither necessary nor sufficient for dynamic stability. There followed a period of intense research into the properties of general equilibrium models by economists such as Lloyd A. Metzler, J. L. Mosak, and P. K. Newman (a student of Hicks), culminating in the important

works of G. Debreu, Arrow, and F. H. Hahn. On the whole, this research has reconfirmed the value of the Hicksian contribution. For example, the work of D. McFadden (Wolfe 1968) has shown that certain processes which are stable, in the sense of Samuelson, are "close to" the sequential adjustments to temporary equilibria described by Hicks.

The work of Hicks on value and risk led him to develop an early version of portfolio selection theory in the paper "A Suggestion for Simplifying the Theory of Money" (1935). This theory has flourished in the hands of James Tobin, H. Markowitz, and others, though elements of it were already present in Keynes's writings. Perhaps as a result of this 1935 paper, Hicks was asked to review Keynes's *General Theory* (1936) for the *Economic Journal* in 1936. This review was very much a first impression, but it led on to what is essentially a second review, "Mr. Keynes and the 'Classics'" (1937), in which Hicks introduced the IS-LM curve diagram which has come to be regarded as the essence of the Keynesian theory. Useful though this model has been as an expository device, it had the undesirable effect, recognized by Hicks himself, of causing Keynesian analysis to relapse into statics. Don Patinkin maintained that the Keynesian model was best viewed in a framework of disequilibrium dynamics, and this is the view that has prevailed, largely through the intellectual leadership of Robert W. Clower, a former student of Hicks.

The first major attempt by Hicks at disequilibrium dynamics was his *Contribution to the Theory of the Trade Cycle* (1950), which built on the multiplier-accelerator framework established by Samuelson, and the growth model of Roy F. Harrod. In the Hicksian model, two effects mitigated the instability which the accelerator induces in a Harrod-type model of equilibrium growth. Firstly, the accelerator was assumed to work with a lag, and secondly, a part of investment was assumed to be autonomous. The path that the cycle took was constrained from below by a "floor" caused by autonomous investment and its consequential consumption, and was constrained from above by a full capacity "ceiling." R. M. Goodwin (1951) simultaneously published a theory of the cycle which may have been more satisfactory, from a technical point of view than that of Hicks, but since that time, relatively less interest has been shown in theoretical models of this kind, although cycles remain a major field of interest for the econometrician.

Hicks's next major investigation of dynamics was *Capital and Growth* (1965), a book which he himself described as "critical and expository, rather than constructive." Even so, the early chapters have become influential as a methodological study of the "microfoundations of macroeconomics." The book made a simple, but fruitful, distinction between "fixprice" and "flex-price" markets: a distinction which was used to great effect in Hicks's analysis of *The Crisis in Keynesian Economics* (1974). Paradoxically, the most important aspect of *Capital and Growth* was a flaw in the second part of the book which dealt with a steady-state growth model. It was pointed out by C. M. Kennedy (Wolfe 1968), that Hicks had assumed that capital goods which were being made in a given period were also used to produce output. This criticism led to the writing of *Capital and Time* (1973a) in which Hicks developed a model which was based on the Austrian tradition of Eugen von Böhm-Bawerk, Wicksell, and Hayek. Hicks regarded each production process as a time profile of inputs and outputs. The model was one of complete vertical integration in which, at no point, were intermediate products referred back to the market. This model was shown by E. Burmeister to be a particular case of a John von Neumann model in which input and output matrices have a special form. If this were the only point, the main advantage of the neo-Austrian approach would be pedagogic. However, the deeper purpose of *Capital and Time* was to provide a theory of the effects of innovation. Such a theory was implicit in Hicks's *A Theory of Economic History* (1969) and was discussed again in the guise of "impulse" (1973b) in Hicks's Nobel lecture in 1972.

For many years, Hicks contributed to policy discussion—not always with unanimous agreement. One must note, however, his important applied work on taxation, much of it in collaboration with his wife, Ursula Hicks. Since 1965, his work on policies toward wage inflation has commended itself widely, even in political circles. Much of this discussion has been particularly concerned with taxation policies toward excessive wage claims.

The range of activity of Hicks has been immense, and is not easily summarized. His own subtitle to *Value and Capital* provides perhaps the best description of his life's work: *An Inquiry Into Some Fundamental Principles of Economic Theory*.

HILGARD, ERNEST R.

Ernest Ropiequet Hilgard is best known among his scientific colleagues as an experimental psychologist who has worked deeply in two very different fields, human learning and hypnosis. In a much wider circle he is equally well known as an educator and a scientific statesman. Through his authoritative textbooks he has become the leading generalist—and possibly one of the last—in the gradually fragmenting psychology of the latter half of the twentieth century.

Hilgard was born in Belleville, Illinois, on July 25, 1904. His father was a physician and his earliest vocational thoughts were toward medicine; his father died in France in early 1918 while on army medical service, however, destroying the possibility of a normal family succession in practice. Medicine lost its appeal to him, but his scientific orientation was reflected some years later when he chose chemical engineering as his undergraduate major at the University of Illinois.

A second decision, soon after graduation, revealed an underlying conflict between science and humanitarianism that characterized Hilgard's career from then on. He chose to spend a year as a Young Men's Christian Association counselor rather than to go immediately to graduate school. The following year he enrolled in the Yale Divinity School, strongly attracted to the study of social ethics. So far as his education was concerned, the conflict was resolved a year later, when he transferred to psychology at Yale University, a compromise between hard science and liberal humanitarianism. The latter remained a clear part of his life, however, and in later years he participated in a succession of social betterment activities such as work with a consumers' cooperative, and support of labor schools and of the American Civil Liberties Union. Indeed, because of these interests he briefly became a victim of McCarthyism in the early 1950s.

Hilgard was attracted to both vocational and experimental psychology, but the latter field was Yale's strength. His dissertation on eyelid conditioning, performed under the direction of Raymond Dodge, was the first major study of the differences between reflexes, conditioned reflexes, and voluntary action. After receiving his PH.D. (1930), he remained at Yale as an instructor for three years, completing a number of studies on occipitally decorticated dogs with his colleague, Donald G. Marquis. This collaboration

led eventually to their classic volume on *Conditioning and Learning* (1940), an exhaustive and perceptive review that set the stage for the vigorous development of that field during the postwar decade.

In 1933, Hilgard was offered an assistant professorship at Stanford University. He hesitated to leave the eastern academic scene, but on being advised by his department chairman that only a man with private means should remain at Yale, he accepted the invitation. With the exception of a sabbatical year at the University of Chicago and a three-year stint in Washington during World War II, he remained at Stanford throughout his career. During the first few years he studied the problems of learning as these related to the conditioning process, examining the relation between principles of learning revealed by conditioning and by more conventional methods such as rote learning. In 1940 the Society of Experimental Psychologists awarded him its Warren medal for his research.

At the same time, Hilgard's interest in the relationship between learning and education was renewed. Since the beginning of his Stanford career he had been a courtesy member of the education faculty. In 1940, he was invited to the University of Chicago to participate in a one-year study of the application of knowledge about child development and learning to the education of young children. This year marked a significant change of direction and broadening of Hilgard's career. Several factors were responsible. His wife, Josephine Hilgard, a Gesell-trained PH.D. in developmental psychology, had secured a medical degree at Stanford in preparation for a career in child psychiatry. During the year at the University of Chicago she began her training at the Psychoanalytic Institute, thus bringing her husband into contact with a kind of psychology entirely new to him. Likewise, the work with Daniel Prescott's child development group opened another new scene to him. A third important influence soon followed; with the outbreak of World War II he went to Washington to participate in a program of civilian surveys, first working with Rensis Likert and successively in other agencies with many other leading social psychologists. These were the experiences—psychoanalysis, child development, and applied social psychology—that converted Hilgard, the conditioned reflexer, to Hilgard, the generalist, whose introductory textbook on psychology would become the leader in its field less than a decade later (Hilgard 1953).

During the war years, Lewis M. Terman had retired and Hilgard was appointed, in absentia, executive head of the psychology department. On his return to Stanford, he began enlarging the faculty in order to cope with the tremendous influx of returned war veterans in the graduate program. Not surprisingly, his expansion was in the direction of child and clinical psychology. There was one remaining job for him to do in the field of learning, however, and he largely put aside further experimentation to complete a critical treatise comparing the many divergent learning theories that had grown up during the previous two decades. *Theories of Learning* (Hilgard 1948) became the definitive statement on theories that *Conditioning and Learning* had been on empirics.

Hilgard was appointed dean of graduate studies in 1951, but found time to complete his introductory text (Hilgard 1953) while guiding the university's increasing participation in externally funded research and strengthening the faculty in the social sciences. The textbook was notable for a return to a more Jamesian style than had been customary in the texts of the 1930s and 1940s. Particularly in the areas of developmental, social, and motivational psychology it provided a broader and somewhat more applied—or real life—emphasis, avoiding the limitations that would have been imposed by a close reliance on purely experimental data.

It was during the war years that Hilgard began his role as a national statesman for science. He was a key member of the committee that reorganized the American Psychological Association (APA) to bring together the academic and applied psychologists. He was elected to the APA council soon thereafter, and to the presidency in 1949. In the meantime he served on Harvard University's review committee designed to make recommendations for the future of the psychology department. In the subsequent two decades he served on the National Advisory Mental Health Council, was an advisor to the Ford Foundation, and was an APA representative on both the Social Science and National Research Councils. From 1967 to 1969 he was chairman of the joint committee of the National Academy of Sciences and the Social Science Research Council that appraised (in nine volumes) the current status and future needs of the social and behavioral sciences. He was also elected to membership in the American Academy of Arts and Sciences, the National Academy of Education, and the American Philosophical Society.

In 1969, he was given the APA's distinguished scientific contribution award.

Fifteen years of national service, university administration, and book writing had left Hilgard with a strong desire to resume his research career. In 1955 he resigned the graduate deanship, and with initial funding from the Ford Foundation, established a laboratory for hypnosis research. During the first six years, he and his collaborators—graduate students and junior faculty—explored thoroughly the phenomena of hypnosis and constructed reliable scales for measuring a subject's susceptibility to hypnotic induction. A major finding was that hypnotizability is a highly stable personality quality, even over a ten year period. He published a full review of this work under the title *Hypnotic Susceptibility* (1965).

By this time Josephine Hilgard had joined him in the developmental study of hypnotizability, and her psychodynamic investigations paralleled and enriched his more experimental researches. Again Hilgard's abiding interest in application gave direction to his work; during the next decade the Hilgards examined intensively the use of hypnosis in alleviating both chronic and experimentally induced pain (Hilgard & Hilgard 1975). From this work has come a substantial theoretical contribution to the problem of pain itself, a sorting out of the independent contributions of anxiety and of direct sensory perception. The former source can be reduced by both hypnosis and placebos, but only hypnotic analgesia can reduce the latter, and then only in highly hypnotizable persons. These findings, coupled with many others from the laboratory's two productive decades, led Hilgard to construct a neodissociation theory of the divided conscious and unconscious processes represented by the classical phenomena of amnesia, analgesia, fugues, multiple personalities, and induced hallucinations. The theory rests on a distinction between monitoring and executive functions in mental operations, the tripartite fractionation of the former allowing for independent occurrence of mental processing (1977, chapter 11).

In his autobiography (1974), Hilgard referred to himself as an eclectic with respect to psychological theories. In support of this assertion is the fact that *Theories of Learning* contained no definitive chapter that could be called Hilgard's theory. Likewise, one of the significant qualities of the *Introduction* was its easy movement back and forth between the languages of consciousness and of behavior, a point of view

anticipated in his 1949 APA presidential address, in which he discussed the importance of the self-concept in psychology. This quality of eclecticism—a common sense empiricism that draws on whatever is needed to construct a useful psychology—has made his introductory text widely influential in its field. Curiously enough, it also provided the essential ingredient needed to permit Hilgard to develop a theory in his second research area, hypnosis. Neodissociation theory does succeed in integrating the many complex findings that stem from studies in three parallel realms: consciousness, overt behavior, and physiology.

HOCART, A. M.

Arthur Maurice Hocart (1883–1939), a British anthropologist of French descent, was born in Belgium and attended Exeter College, Oxford. After receiving his degree in classics and ancient history, he went to the Solomon Islands to carry out ethnographic research with W. H. R. Rivers

as a member of the Percy Sladen Trust Expedition (1908/1909). Alfred C. Haddon, professor of anthropology at Cambridge University, then recommended Hocart for the post of headmaster of a school in the Lau Islands, Fiji, where he remained for three years (1909–1912) and acquired a profound knowledge of Fijian civilization. There followed investigations on Rotuma, Wallis Island, Samoa, and Tonga before he returned in 1914 to Oxford, where in the succeeding year he lectured on psychology and anthropology. From 1915 to 1919 he served in the light infantry, fought in France, and rose to the rank of captain. After the war, in 1921, he was appointed archeological commissioner for Ceylon, a post he retained until 1929, when poor health forced him to retire. For the next four or five years he was honorary lecturer in ethnology at University College London, and librarian and a member of the Council of the Royal Anthropological Institute. In 1934, at the instance of E. E. Evans-Pritchard, he was elected professor of sociology at Fuad I University, Cairo, a post he held until he died in 1939 of an infection contracted during field work in upper Egypt.

Although for most of his life Hocart held no academic position, he engaged the professional respect of many prominent figures in anthropology, including Rivers, Haddon, Grafton Elliot Smith, William J. Perry, Evans-Pritchard, Lord Raglan, and also Marcel Mauss. He published five books and nearly two hundred lesser items (Needham 1967). In spite of Hocart's scholarship and numerous achievements, he made little contemporary impression on an academic anthropology dominated by Bronislaw Malinowski and A. R. Radcliffe-Brown, and in the subsequent development of the discipline he was accorded no prominent recognition. His main theoretical concern was with the history of culture, studied by the comparative and inferential methods of philology, and this was not fashionable in a period when academic efforts were most committed to the prosecution of intense functionalist studies of single societies. Religion and symbolism, his chief forms of evidence, were set at a discount against the sociological analysis of kinship, segmentary organization, and political systems. In later decades, however, his work and style of thought attracted greater attention. *The Life-giving Myth* (1952a) was reissued in 1970, and in the same year there appeared a critical edition of *Kings and Councillors* (1936), his major monograph. With the development of a less doctrinaire conception of anthro-

pology came a revival of interest in cultural origins and ritual, as well as in speculation about the foundations of culture, that gave Hocart's ideas a new relevance.

Hocart's thought was quick and kaleidoscopic, his method of advancing an argument was disciplined but unpredictable (like a fencer in attack), and he did not often work out a theory by way of a lengthy sequence of validated grounds. The vehicle that best suited his purposes was a brief essay or even a letter to a journal, and his argumentation was often terse and unconventional to the point of seeming erratic. His subjects varied extraordinarily, ranging over monotheism and money; snobbery and saviors; baptism, covenants, and decadence; kinship, sacrifice, and taxation. In whatever matter he took up, he was guided by the habit of "taking all beliefs seriously" and also of "taking nothing for granted"; he methodically distrusted the generalizations of anthropology and the definitions concocted by academics; and he relied on the precept to assume "nothing which we do not know actually to occur." His questions could sound simple or even naive—"why should a custom . . . not stay as it is?" "once man has come to believe in gods, why should he ever cut their number down to one?" "how did men first conceive the idea of melting stone?"—but they were provocative and fundamental. His conclusions could sound blunt and implausible, but they seldom failed to challenge accepted ideas and to stimulate thought about topics of enduring interest. If his evidence was adduced sporadically, from India, Fiji, or anywhere at all in the world, it nevertheless was intended to establish principles: for example, "the first kings must have been dead kings," "a single family of rituals has spread to the remotest parts of the world," "myths and miracles are reliable history, not of events but of customs."

Hocart propounded no general theory, and it is hardly possible to systematize his disparate ventures, but he was constantly inspired by the intention to "reconstruct the history of thought" and the "development of human institutions." He had no dogmatic method for achieving these ends, but urged that anthropologists could not afford to neglect any possibly fruitful hypothesis: "We shall adopt the obvious hypothesis of a common origin and see where it will lead us." The form of thought that he tried to discern was a religion, the main features of which could be traced across a considerable part of the world. In his longest and most integrated argument,

Kings and Councillors, he contended that the common origin of government itself, and of its various specialized offices, resided in an ancient organization not of the utilitarian management of social affairs but of a symbolic quest of life. Although this book was not likely to supplant the theories of historians and political philosophers, it made a novel and arresting case that was admirable in itself, and it pointed to a metaphysical aspect of social life that surely had some part in the development of society and its proliferating apparatus of administration. It stands, moreover, as the foremost example of Hocart's ambition to formulate "a theory that will explain all the variations in the simplest possible way without invoking any processes that have not been observed" (1952a, p. 170).

In many regards Hocart's qualities are those of a maverick, and his writings make a special appeal to a particular type of intellectual temperament for which sound method and sober conclusions can be secondary to provocative changes of aspect and the adventures of ideas. Yet for some, Hocart was also the ideal type of scholar; as Evans-Pritchard described him (1939): "He did not acquire knowledge to advance himself, but because he had the true scientist's craving to understand the causes of things."

HOEBEL, E. ADAMSON

E. Adamson Hoebel, born in 1906, is a major figure in the anthropology of law, having pointed the rediscovery of law as a valid and significant topic for anthropological study after decades of almost total neglect. His theoretical and methodological contributions have moved that area of study far enough for it to drop the label "primitive law," and, saliently, to see itself as "the ethnography of law" or "the anthropology of law." In his work with the famed jurist, Karl N. Llewellyn, Hoebel established a model for collaboration between lawyers and anthropologists and the utilization of analytical and methodological concepts from both disciplines. Partly because of this collaborative, interdisciplinary approach, his work also has seized the attention of lawyers and led them to recognize the legal systems of nonliterate societies as law and as a source of insight into Western legal systems. Hoebel is also well known as an ethnographer, especially of the Cheyenne, although he has done field work in and published on four other cultures, especially Comanche, Shoshone, Keresan Pueblo, and Pakistan. As an anthropological educator he has had an impact primarily through his nonlegal books, his administrative roles, and his teaching.

Hoebel was born and raised in Madison, Wisconsin. His father was a traveling salesman for a harness manufacturing company founded by his grandfather and his mother was state civil service commissioner for Wisconsin. He received his Bachelor's degree from the University of Wisconsin in 1928 where he majored in sociology and was strongly influenced by E. A. Ross, who whetted his interest in law and social control. As a Wisconsin undergraduate he was a contemporary of anthropologists-to-be John Gillin, Lauriston Sharp, Sol Tax, and Clyde Kluckhohn. Like the latter, Hoebel's work mirrors a deep orientation to both the social science and humanistic dimensions of anthropology.

Hoebel's major writings reflect this in that, to a greater degree than those of most anthropologists, they are simultaneously analytic and poetic. His exposure to these two strains of the anthropological ethos continued in his graduate training at Columbia University where, after completing an M.A. in sociology, he turned to anthropology and was a student of Franz Boas and Ruth Benedict.

In 1933, when Hoebel expressed an interest in doing his doctoral research on a field study of a Plains Indian legal system, Boas professed disbelief that those cultures had legal institutions and Benedict indicated both disinterest and ignorance. But Boas arranged for Karl Llewellyn, who was then holder of the Betts professorship at the Columbia University Law School and well known as a leading figure in the jurisprudential school of "legal realism" and for the breadth of his outlook on law, to serve as Hoebel's thesis advisor. The dissertation on law of the Comanche was later published as *The Political Organization and Law-ways of the Comanche Indians* (1940). Hoebel received his PH.D. in 1934. Llewellyn also advised Hoebel in his early studies of the Shoshone and, later, he and Hoebel collaborated in the study of Cheyenne law that was published as *The Cheyenne Way* (1941), which became a germinal work in both anthropology and jurisprudence. Although Llewellyn was the senior author, the book was truly collaborative.

Many of E. Adamson Hoebel's major ideas were developed in the collaboration with Llewellyn. They must be viewed in the context of the position of the law in anthropology in 1933 when the two men first met. Not only Boas, but many other prominent anthropologists (e.g., Ralph Linton) gave short shrift to the notion that tribal peoples had anything that, in the formal sense, could be called "law." And in the forty years since the heyday of the evolutionary school there had been virtually no anthropological publications on tribal law and hardly more by nonanthropologists. An exception was Bronislaw Malinowski's *Crime and Custom in Savage Society* (1926), which Llewellyn thought was analytically careless, but which suggested to him that a collaboration between anthropology and law might be fruitful.

The most germinal concept of the Comanche law monograph, of *The Cheyenne Way*, and of all of Hoebel's other legal writing is the "trouble case method." The method, which has become the hallmark of all modern anthropological

studies of legal systems, focuses on actual disputes as the heart of the law and the key to the rules or normative aspects of any legal system and its procedures. Hoebel (1964) acknowledges the origins of the method in Llewellyn's legal realism, but it is also rooted in Hoebel's training in the meticulous ethnography of Boas. It has been discussed and refined by Epstein (1967), Gulliver (1969), Twining (1973a; 1973b), Abel (1969), and Gluckman (1973).

The second major idea that grew out of the collaboration with Llewellyn was the concept of the functions of the law, the "law jobs" as Llewellyn called them. These functions, Llewellyn and Hoebel argued, were shared by both "advanced" and "primitive" legal systems. They go beyond dispute settlement to include the "functional prerequisites of a society specifically shouldered by law." Although the major role in articulating the law functions was Llewellyn's, Hoebel's acceptance of the concept was rooted in his own knowledge of Malinowski's and Radcliffe-Brown's then current work.

Throughout the collaboration Llewellyn and Hoebel viewed law in its cultural matrix, an idea that Hoebel refined later in his postulational analysis. Viewing law in its cultural matrix often is attributed to Llewellyn's legal realism which, in turn, has intellectual roots in his exposure to William Graham Sumner and Edward S. Corwin, who emphasized the importance of folkways and mores and the cultural dependence of law. But to view law in its cultural matrix was, of course, completely in line with all of Hoebel's anthropological training, and he helped Llewellyn to see cultural roots of law that he would have overlooked.

As an anthropologist, Hoebel subjected the juristic generalizations of Western law to comparative testing on the Plains and Shoshone material, and Llewellyn was enough of a comparativist, a skeptic, and, of course, a realist, to concur. This dimension of the collaborators' work has had an especially important impact in juristic studies, by extending the scope of what is considered a relevant comparison in law.

The last phase of the Hoebel-Llewellyn collaboration involved a study of the law of the Keresan-speaking pueblos which began in 1944 and was unfinished at the time of Llewellyn's death in 1962. The bulk of that material remains unpublished, although Hoebel has published alone several papers on Keresan pueblo law (e.g., 1969).

Hoebel has made major contributions to the

anthropology of law in his own right that go significantly beyond those developed in collaboration with Llewellyn. He has laid the groundwork for a science of law by the comparative study of a range of non-Western legal systems in order to derive empirical generalizations about law and to refine analytical concepts. So, although *The Cheyenne Way* contains no definition of law, Hoebel's second major work, *The Law of Primitive Man* (1954), does. Focusing on norms, Hoebel's much quoted definition ties law clearly to its cultural and social context. It also focuses on process, both hallmarks of Hoebel's thinking. But it has been criticized for limiting sanctions to physical ones.

Hoebel (1954) demonstrates that cultural norms can be derived from "postulates, broadly generalized propositions held by the members of a society as to the nature of things and as to what is qualitatively desirable and undesirable." Law, then, functions to give expression to and uphold some of the postulates of a society. This postulational approach is one of Hoebel's major contributions to comparative law and he has used it in his ethnographic writings as well, most notably his short general monograph on the Cheyenne. This approach has intellectual roots in the work of Ruth Benedict and the concept is similar to one postulated by Morris Opler, "themes." The approach is documented in *The Law of Primitive Man* with brilliantly pithic profiles of the "primitive" legal systems of five non-literate societies. The methodology for inferring postulates is somewhat intuitive and difficult to replicate, so the concept has not been as widely adopted by legal anthropologists as that of the trouble case method.

The Law of Primitive Man offers an evolutionary analysis of what Hoebel calls the "trend of the law," empirical covariations of the subsistence mode of a society with the content of legally-sanctioned norms—or the rules of law—and legal procedures. This schema, which has been widely accepted, complements Hoebel's insightful survey of the universals—as opposed to the variations—in the content of law found in the same volume. *The Law of Primitive Man* refines the statement of the functions of law first developed in *The Cheyenne Way* but still concludes that the major functions of law are universal and that "primitive" law is primitive only in procedure. That impact of the monograph has been extended by its translation into German and Italian.

The young Hoebel had enough ego strength

and knowledge of his discipline to be comfortable in the collaboration with Llewellyn. That partnership became a prototype for later relationships and Hoebel has collaborated with a series of other scholars (Jesse D. Jennings, Michael G. Smith, A. A. Schiller, Ernest Wallace, Everette L. Frost, Shirley Holt, and Thomas Weaver), some of them peers; and others, younger scholars for whom he was the Llewellyn.

Hoebel's impact in the anthropology of law has been less through his students than through his influence on peers and younger colleagues. In spite of the very general acknowledgment of the role of his works, he is not intellectually imperialistic. Having been a student of the authoritarian Boas and, initially, a student of the forceful Llewellyn, he was, perhaps, wary of imposing his ideas on his students too strongly. They are not disciples. The inherent significance of his ideas more than his own advocacy of them has significantly influenced in acknowledged ways the work of a generation of legal anthropologists, including Max Gluckman, Philip Gulliver, Paul Bohannan, Laura Nader, Leopold Pospisil, William Twining, James Lowell Gibbs, Jr., and others.

As an ethnographer, Hoebel is a careful fieldworker, but he is particularly gifted in the other portion of the ethnographer's role—describing a culture in a written portrait. He writes about a culture with conceptual veracity but, at the same time, conveys a sense of the reality of culture. He has a gift for anecdote, for the apt example, and for a poetic turn of phrase, all of which characterize *The Cheyenne Way* and the later, more general monograph on that culture which he authored alone, *The Cheyennes: Indians of the Great Plains* (1960). This was an inaugural volume and an immediate best-seller in a series of short ethnographic monographs published in the 1960s. The flair for ethnographic writing marks Hoebel's more conceptual works also, e.g., *The Law of Primitive Man*.

E. Adamson Hoebel has had notable impact as an educator. Wide reading in ethnography and early fieldwork in three cultures equipped him to write *Man in the Primitive World* (1949), designed as a textbook for the undergraduate students who flocked to anthropology after World War II. As *The Cheyenne Way* stimulated a new generation of anthropologists to turn to the anthropology of law, so the textbook spawned a host of imitations and stimulated young anthropologists to think self-consciously about the role of anthropology as a vehicle for liberal

education in the general education model dominant in undergraduate education of the time and in the variations that have followed since. The volume has gone through four editions, the third and fourth as *Anthropology: The Study of Man*, and it has been translated into Spanish and Finnish. A fifth reworking with Thomas Weaver as coauthor was published in 1979 as *Anthropology and the Human Experience*.

Concern with education per se, both liberal education and graduate education, led Hoebel to accept administrative positions as head of the department of anthropology and dean of University College at the University of Utah, and as chairman of the department of anthropology at the University of Minnesota where in 1969 he was named to a distinguished professorship, regents professor in anthropology. He has been regents professor emeritus of anthropology since 1972 and adjunct professor of law since 1969.

HOFSTADTER, RICHARD

When Richard Hofstadter died in October 1970 at the age of 54, he was at the height of his powers but not of his influence. His rare combination of qualities—literary elegance, playful intelligence, and a civilized perception of politics—was less than welcome at the end of a decade overheated by the frustrations of the civil rights movement and of an unpopular war, when many intellectuals and professors, guardians of reason, called its values into question.

It was not a decade for subtle discrimination or inconvenient self-appraisal, let alone humor. But while the dominant passions and the mood of the 1960s have faded, Hofstadter's writings have retained their pertinence. Some of them, notably *The Age of Reform: From Bryan to F.D.R.* (1955), which won a Pulitzer Prize in 1956 and spawned a sizable controversy, bid fair to become classics of American historical writing.

Hofstadter's work was pervaded by two pairs of tensions: he was at once writer and scholar, engaged polemicist and detached professional. As critics have not failed to point out, he spent less time in the archives than other historians. This is why, though intensely receptive and impressively well read—few historians have studied Sigmund Freud and Karl Mannheim to greater advantage, or learned more from fellow intellectuals, like his colleagues Lionel Trilling and C. Wright Mills at Columbia University—he sometimes questioned his place in the ranks of historians, wondering whether he was not, rather, a publicist. He had undertaken *The American Political Tradition* (1948), which made his national reputation, preparing to enter a journalistic career.

These tensions expressed themselves in a certain ambivalence toward the issues of his day. Though not an activist, he had an impressive fund of civic courage: in spring 1968, when Columbia University was engulfed by student unrest and the traditional commencement ceremonies had to be moved, Hofstadter, defying the anxious warnings of his friends, delivered the commencement address, a sturdy defense of free inquiry in an academic setting. He wrote occasional pieces, like his article on Catholic presidential candidates during John F. Kennedy's campaign for the Democratic nomination (1960); and his celebrated dissections of the McCarthy phenomenon are thoughtful interventions in public matters that gravely concerned him (1953; Hofstadter & Metzger 1955). Practically the last thing he published was an anthology on *American Violence* (Hofstadter & Wallace 1970). Certainly several of his most important books, notably *The Age of Reform* and *Anti-intellectualism in American Life* (1963), which won him a second Pulitzer Prize, bear the visible imprint of the decade in which he wrote them. Yet they are far from being frantic for relevance; they are, rather, sober historical re-examinations of aspects of the American past which (like the Progressive era) had been much,

if superficially, studied, or (like the pervasive hostility to high culture and science) had not been studied at all. If Hofstadter drew the impulse for his writing from his turbulent present, he scrupulously tried to see the past as past.

Some of Hofstadter's critics in the 1960s accused him of "neo-Conservatism," of betraying the progressive forces in America; they objected to his discovery of what united Americans rather than that which divided them and called him a "consensus historian." They also criticized him for venturing psychological and sociological explanations for—and hence presumably denigrating the cause of—American radicals (see Williams 1956; Pollack 1960). These charges puzzled and irritated Hofstadter, who rightly thought himself a liberal historian-critic, "critical" of the Progressive tradition, as he had written, "but not hostile, for I am criticizing largely from within" (Hofstadter 1955, p. 12), and free of its easy optimism and facile generalizations of that tradition. In *The American Political Tradition*, he had deftly thrown darts at the complacency, the unwearied self-congratulation endemic in the official version of America, employing a wit that, though it owed something to H. L. Mencken, was his own. In turn, and with far more benevolent intent, he questioned some of the righteous and simplistic images that most previous historians had drawn of the American Populists' and Progressives' passion for reform. Part of the revisionist, rather sardonic, portrait that Hofstadter drew of the Populists' nativism and anti-Semitism may need to be revised in turn (Woodward 1959–1960), but as a corrective and as a deep reading of an important American epoch, *The Age of Reform* stands. Later, in *The Progressive Historians* (1968), an intensive study of Frederick Jackson Turner, Charles A. Beard, and Vernon L. Parrington, Hofstadter gently rejected the charge of being a "consensus historian" by noting that the Progressive historians, long dominant in the profession, had sharply overemphasized the element of conflict in American society, and that at the same time conflict was hardly absent from his own historical thinking. Hofstadter was above all the historian of complexity.

Richard Hofstadter was born in Buffalo in 1916, graduated from the University of Buffalo in 1937, and went to New York that year to do graduate work in history at Columbia University, where he received his PH.D. in 1942. Except for a four-year stint (1942–1946) at the University of Maryland, he lived in New York from then

on, and soon became part of the New York cultural scene; his origins in upstate New York generated another of the fertile tensions in which his life abounded. He was at home among New Yorkers yet distant from their parochial cosmopolitanism. His dissertation (and first book), *Social Darwinism in American Thought* (1944), was still a traditional exercise, but it showed something of the energy and control that would characterize all his later work. The book was, as Stanley Elkins and Eric McKittrick have noted, "a spirited account of the life, movement and interpenetration of ideas; it also showed an extraordinary adeptness at setting forth lucid and compact expositions of ponderous bodies of thought" (1974, p. 304). And it showed Hofstadter able at the beginning of his career to distill first-rate history from second-rate minds—a capacity he would demonstrate over and over again with minds like those of Senator Joseph McCarthy or popular preachers and charismatic demagogues.

His second book differed from *Social Darwinism* not merely in tone but in substance; it was far more mordant and far more political. For while his published thesis was rooted in the familiar soil of orthodox intellectual history, *The American Political Tradition* was highly unconventional political history: it gathered a collection of a dozen portraits, ranging across almost two centuries, of the men who had generated the political style in which Americans were still working late in the 1940s. From this book onward, his unique blending of two specialties would define the area in which Hofstadter was most at home. Reflecting on his work, he described his historical interests as "marginal to both political historians and to practitioners of the history of ideas" and situated himself "between the two fields, at the intersection of their perimeters."

This self-chosen marginality gave Hofstadter the intellectual scope he needed. All his mature work—and he matured early—gives evidence for his abiding interest in the nonrational side of social, especially of political, life; he was as sensitive to the cultural matrix as to the private dimensions of ideas. He had an unwavering respect for the life of the mind; when in 1953 he defined the intellectual, in Weberian terms, as a man who lives for, rather than off, ideas, he was defining himself. Intensely at home with ideas, he still could not treat them as abstractions, mere counters in a lofty debate among philosophers. His debt to Freud and Mannheim (already

noted) and to contemporary political sociologists was extensive, though lightly borne. When in 1963 he lectured on "The Paranoid Style in American Politics," he protected this technical word drawn from psychiatry with an elaborate disclaimer: he was not speaking, he wrote, "in a clinical sense, but borrowing a clinical term for other purposes" (1965, p. 3). Yet, while his most famous and most controversial thesis, "status politics," pays its respects to man's irrational drives by stressing the projection, into the political arena, of private anxieties generated by fears of social decline or worries about social ascent, Hofstadter never questioned the potency of rational self-interest in human decisions: "We have, at all times, two kinds of processes going on in inextricable connection with each other: *interest politics*, the clash of material aims and needs among various groups and blocs; and *status politics*, the clash of various projective rationalizations arising from status aspirations and other personal motives" (1963, p. 53). His concentration on psychological strategies and sociological mechanisms did not prevent him from alternating his analytical pages with explicit and powerful narrative passages, or from writing straightforward institutional history, such as his volumes on *The Development and Scope of Higher Education in the United States* (Hofstadter & Hardy 1952), and *The Development of Academic Freedom in the United States* (Hofstadter & Metzger 1955). Still, his first and controlling interest was the human comedy, principally as it played itself out in the United States, an interest to which he brought a measure of irony and sympathy unsurpassed in his generation. His intellectual style was too personal to permit a Hofstadter school to form, and so his work continues to exercise its influence largely by example and as a demonstration of how deeply a civilized mind, disciplined stylist, and skeptical observer can penetrate the human past.

HOIJER, HARRY

Harry Hoijer (1904-1976) was the son of John Oscar and Agnes Sophia (Peterson) Hoijer. Hoijer received his A.B. (1927), A.M. (1929), and Ph.D. (1931) from the University of Chicago. During his Chicago period, Hoijer benefited from the training and friendship of two distinguished pioneers in anthropological linguistics, Edward Sapir and Leonard Bloomfield,

as well as from collaboration with Morris E. Opler, an anthropologist central in Apachean studies.

After 1929 Sapir's research concentrated on Indian languages. In collaboration with Sapir, Hoijer, from 1930 on, studied Navajo as well as Chiricahua Apache and other Apache dialects, all closely related to Navajo. Although Hoijer's dissertation project was the rescue of Tonkawa (1933), an Indian language of Texas now extinct, the focus of his research during most of his career was the Athapaskan language family, part of Nadene, with Apachean languages at the center.

Hoijer taught anthropology at the University of Chicago from 1931 to 1940, when he left to enjoy thirty years (1940–1970) of productive scholarship at the University of California at Los Angeles. He was chairman of the anthropology department from 1948 to 1951. He served as memoirs editor of the American Anthropological Association (1948–1952), as well as vice president of that association (1949), president of its western states branch (1950), and its national president (1958); he then became president of the Linguistic Society of America (1959). Hoijer was book review editor of the *International Journal of American Linguistics* and associate editor of the *Journal* from 1964.

In private he had a mordant, hearty sense of humor; in public his stance was conservative and guarded. His name became an anthropological household word, partly through his coauthorship of a best-selling text, *An Introduction to Anthropology* (Beals & Hoijer 1953). In this text, he proved a descriptive and historical linguist and comparative grammarian. Less constrained and more intuitive was his enthusiasm for problems and solutions in the field of language and culture. If, like Bloomfield, Hoijer was cautious in interpreting linguistic data and inflexibly dedicated to productive drudgery, he was also, like Sapir, willing to speculate about the influence on perception and cognition of grammatical categories, especially those of the Navajo. He became the perfect referee on matters Athapaskan, as well as the prime target of Athapaskanists and others who failed to understand his principles of scholarship. In his lifetime he achieved the status of a scholar who cannot be ignored, whose work future perspectives on prehistoric Athapaskans, no matter how different, would have to consider.

Hoijer extended confidentiality to his infor-

nants, and did not document his many field trips. Asked in a questionnaire to name three publications that reflected his basic interests, he chose six: a sketch of anthropological linguistics, 1930–1960 (1961a), a study of Athapaskan kinship systems (1956a), an article on language in relation to culture (1953a), and three contributions to *Linguistic Structures of Native America* (1946c; 1946d; 1946e). The categories he selected as his special provinces in linguistics were theory and method, descriptive linguistics, historical and comparative linguistics and linguistic reconstruction, language and culture, language typology, lexicography and lexicons, linguistic change and language acculturation, phonetics, phonemics, morphophonemics, phonology, semantics, structural linguistics, and syntax. His special provinces in anthropology were kinship and marriage, oral literature, and change (acculturation). Hoijer left a manuscript bibliography of published works, published with additions and annotations and a technical review of his linguistic contributions. His collection of manuscripts went after his death to the library of the American Philosophical Society in Philadelphia (see Kendall & Landar 1977).

Empiricism and structuralism. Among Hoijer's contributions to anthropological linguistics are studious caution, organization, and clarity. He reminds us constantly that his conclusions are "tentative." At the same time he begs the adjective because his conclusions were reflections of enormous care in assembling, inspecting, and revising linguistic data.

Quality was to his taste. He mistrusted Athapaskan vocabularies of anthropologists or missionaries unexposed, or poorly exposed, to classroom instruction in linguistics. The Tainaina vocabularies of Cornelius Osgood (1937), for example, failed to please him. He preferred not to speculate about spellings, wearing philological glasses; excellent phonetic and phonemic transcriptions were his *métier*. He defended his standards and theoretical orientation in 66 reviews between 1941 and 1973. Typical are three reviews of contributions to Navajo linguistics. Hoijer (1945b) criticized Gladys Reichard for disorganization in her 1944 essay on the hail chant, evoking a scarcely cordial reply; he devastated her for the ineptness of her Navajo grammar (1951), leaving no room for a reply (1953b). He also found Berard Haile's Navajo dictionary poorly organized and difficult for students to use (1952).

Pragmatism in empirical research was institutionalized in anthropology as the discipline developed in America. Hoijer's theoretical orientation was nourished on this tradition, structured largely by Sapir, Bloomfield, Franz Boas, and Alfred L. Kroeber. All were dedicated to the collection of data and the assessment of patterns. Bloomfield, especially, tried to axiomatize procedures and to exploit structural principles developed by such European scholars as Ferdinand de Saussure and Nikolai S. Trubetzkoy.

Boas, one of the great teachers of American anthropologists, particularly during his professorship at Columbia University (1899–1937), taught the importance of a model of grammatical description involving base forms and processes that transformed them. Some students of Bloomfield, however—Zellig Harris, C. F. Hockett, and Floyd G. Lounsbury—for example, explored a model limited to items and arrangements, in which structure was defined by meaningful contrasts, of phonemes with phonemes on the phonological level of analysis, of morphemes with morphemes on the morphological level. Items were classified in terms of shared criterial properties on the one hand and noncontrastive distribution on the other. Transformational processes were not permitted in this model. Bloomfieldian structural analysis in the item-and-arrangement mold stimulated Clyde Kluckhohn, Claude Lévi-Strauss, and others to seek implications for anthropology in general. If linguists could group alternants, variations of a structurally distinctive sound into phonemic classes, variations of semantically similar utterance-fractions into morphemic classes, why could anthropologists not do likewise? In myth, ritual, and kinship, explorations were undertaken that were patterned on the principles of distribution and classification of some of Hoijer's linguistic contemporaries.

Against this background one can understand Hoijer's cordial disagreements with Harris (Hoijer 1945*d*) and Lounsbury (Hoijer 1954*a*). Hoijer followed Boas and Sapir and favored an item-and-process model. He refused to accept Harris' revision of his inventory of phonemes in *Navaho Phonology* (1945*d*), in which, for example, aspiration was transcribed as [h], pitches were reduced from four tones to two, high and low, and unitary phonemes were respelled as clusters (Hoijer's /c/ became /tsh/ and so on). Hoijer used various spellings for Athapaskan forms, but he insisted on the unitary nature of phonemes in his inventories; he held to the

position inherited from Sapir that Proto-Athapaskan could be reconstructed with morphophonemic pitch notation and ideal analogues of morphemes, instead of with lists of allomorphs of morphemes and the environments of those allomorphs (Hoijer 1943; Hoijer 1954*a*).

Hoijer's conservatism manifested itself also in historical and comparative grammar. Against the fashion of scholars like Sapir, Morris Swadesh, Paul Radin, and Joseph Greenberg in America, and Paul Rivet in France, Hoijer aimed at caution, refusing to accept rash assignments of language families into ever-larger assemblages. For the contrast between Sapir and Hoijer, see Sapir's list of American language families in the *Encyclopaedia Britannica* (1929), Hoijer's enumeration in *Linguistic Structures of Native America* (1946*c*), and Hoijer's revision of Sapir's *Britannica* presentation (1961*b*; 1961*c*; 1961*d*). Hoijer emphasized the tentative nature of Sapir's six groups for all languages north of Mexico: Eskimo–Aleut, Nadene, Aztec–Tanoan, Algonkin–Wakashan, Penutian, Hokan–Siouan. Hoijer accepted Eskimo–Aleut, Nadene, and Aztec–Tanoan, leaving it for future determination, after scientific comparative work, whether Sapir's reductions would survive.

Theories, models, and paradigms. Hoijer admired Bloomfield and Kroeber, who characterized data, described patterns, and worked from demonstrable bodies of detail. Hoijer's grammars came from records, not intuitions. In the 1950s Noam Chomsky and other pioneers in generative transformational grammar brought to the linguistic scene two claims, among others, observing that some models in social sciences played upon patterns behind observable data, patterns not directly demonstrable: (1) all—and only—the sentences of a language can and should be characterized by mathematical logic, by semigroup theory as distinguished from Carnapian use of metalanguages; and (2) phrase–structure grammarians (among whom Hoijer was exemplary) did not go far enough. They could parse a sentence, naming parts of speech, labeling phrases and clauses, and tallying types of constructions, but they failed in not recognizing transformations, additions, deletions, and permutations in sentence derivation and amalgamation. They failed in not positing “deep structures,” engrams whose composition by the mind resulted in the sentences that found their way into the anthropological linguist's corpus.

Many anthropologists of Hoijer's generation saw in Chomsky's approach a reversion to the mentalism decried by Bloomfield. Since it was impossible to correlate claims about "deep structures" with neurobiological mechanisms, some disagreements of generative grammarians exposed anti-empirical bias and true decadence in theory construction. Other anthropologists saw in the best of transformational research an important stimulus to developing models, relating old data to new perspectives in ways that made discoveries significant, and providing "paradigmatic" quality in the sense—or one of the senses—popularized by Thomas Kuhn (1962). Hoijer's response to this dramatic, controversial new paradigm lay primarily in continued dedication to the Bloomfieldian paradigm. Hoijer worked with his hands, not with computers.

Language and culture. Sapir said that one is "at the mercy" of his language. Each language represents its own social reality and defines experience. Benjamin L. Whorf claimed that when grammars differ radically, speakers who use those grammars systematically observe and evaluate experience differently. Hoijer tried to integrate both views under the rubric of the "Sapir-Whorf Hypothesis."

Hoijer's aim in ethnolinguistic research was, in part, to show correlations between grammatical categories and nonverbal cultural sensitivities—e.g., sensitivities of Navajos, for whom motionful activity is salient, in consonance with a grammatical system of verbs of motion (1951). He outlined his approach thus: (1) determine the structural patterns of a language; (2) determine the semantic patterns "that attach to structural patterns"; (3) isolate active structural categories with "definable semantic correlates"; (4) isolate "fashions of speaking," through comparison of "active structural-semantic patterns," to get a partial description of the "thought world" of a speaker; (5) identify indirect connections between the ethnolinguistically derived thought world and other cultural areas.

Hoijer illustrated his approach by analyzing Navajo verbs to show that "the Navaho speaks of 'actors' and 'goals' . . . not as performers of actions or as ones upon whom actions are performed, as in English, but as entities linked to actions already defined in part as pertaining especially to classes of beings" (1954*b*, p. 102). He tied this manner of speaking to the Navajo religious motif of compromising with nature, rather than trying to control it.

Hoijer qualified his view by calling for em-

pirical tests. Generalizations about "the" Navajo, however, oversimplify; there are difficulties in cross-cultural testing of claims about differential perception and cognition. Ironic contrast inheres in Hoijer's impressionistic efforts to follow Sapir and Whorf while refusing to accept "meaning as a primary guide to analysis," which is "analysis by fiat" when used in descriptive linguistics (1953*b*, pp. 80, 83).

Lasting impact. Hoijer's impact on anthropological linguistics was strongest where he was most dedicated to framing scientific statements founded on carefully prepared data of high quality. He recognized that any subgrouping of Athapaskan languages, considering present imperfections in our knowledge, could only be tentative. He experimented with lexicostatistic subgrouping and subgrouping by criterial sound laws. Also tentative was his work with Athapaskan kinship systems, stimulated by Kroeber (Hoijer 1960*b*, p. 32). Hoijer contributed to the reconstruction of 73 Proto-Athapaskan kin terms, using 14 subgroups. But he had misgivings about lexicostatistics in subgrouping or in dating separations of tribes (1956*a*; 1956*b*; 1956*c*; 1962*a*; 1962*b*; 1974*a*).

Hoijer's most durable contributions lie, perhaps, where his emulation of Bloomfield is most apparent. Like Bloomfield, he strove to show regularity of sound change for Apachean (1938); Pacific Coast Athapaskan (1960*a*); and all Athapaskan (1963; 1971*c*). Sound laws that he established permitted the reconstruction of hypothetical prehistoric forms—e.g., kinship systems (1956*a*) and morphological systems (1971*a*). Just as Bloomfield was a founder of Algonquian studies, so Hoijer was a founder of Athapaskan studies on a scientific basis, with texts (Hoijer & Opler 1938; Hoijer & Sapir 1942), grammatical sketches (1946*d*; 1966*a*; 1966*b*; 1973; Hoijer & Joel 1963), and signal contributions to Navajo grammar (1945*a*; 1945*c*; 1945*d*; 1946*a*; 1946*b*; 1948; 1949*b*; 1967; 1971*b*; Hoijer & Sapir 1967). He pioneered also in the study of Athapaskan classificatory verbs (Davidson et al. 1963). With Edward P. Dozier (like William Bittle, who worked on Kiowa Apache, one of Hoijer's distinguished students), he published on Santa Clara Tewa phonemes (1949). In Tonkawan studies Hoijer is unique, having rescued the language with a grammar (1933), a sketch (1946*e*), a dictionary (1949*a*), a study of suffixes and particles (1949*c*), and a collection of texts (1972). His most polished work, perhaps, a pattern and guide for all future

Athapaskan lexicography is *Navajo Lexicon* (1974b).

HOOK, SIDNEY

In the *Handbook* to his lectures on logic, Immanuel Kant distinguished between a philosophy in the scholastic sense (making, and sometimes endlessly multiplying, distinctions) and a philosophy in the universal sense (*in sensu cosmico*), which is "the knowledge of the ultimate aims of human reason," or the "knowledge of the highest maxims of the use of our reason." In this cosmopolitan sense, the field of philosophy, according to Kant, may be divided by four questions: What can I know? What ought I to do? What may I hope? What is man? Metaphysics deals with the first, ethics the second, religion the third, and philosophical anthropology the fourth. Kant added: "Fundamentally all this could be reckoned as anthropology, since the first three questions are related to the last."

Except for the phrases "the ultimate aims" and "highest maxims," Kant's program for philosophy can be said to describe Sidney Hook's intentions and concerns. "Philosophies," John Dewey declared, "are different ways of construing life. . . ." As Hook elaborated this statement, in *Pragmatism and the Tragic Sense of*

Life (1974), his 1960 presidential address to the eastern section of the American Philosophical Association:

Here lies the important task for the philosopher. To be wise he must immerse himself in the actual subject matters (not necessarily experiences) out of which life's problems arise. To be wise about economic affairs he must study economics, to be wise about the problems of law he must study law, to be wise about politics he must study history, sociology and other disciplines. . . . It is philosophy not as a quest for salvation but as a pursuit of understanding of great cultural issues and their possible upshot. It does not start with a complete stock of philosophical wisdom . . . but with an initial sense of concern to meet the challenges of the great unresolved problems of our time, offering analyses of these problems which will win the respect of the specialist and yet command the attention of everyman. . . . It is philosophy as *normative* social inquiry. (1974, pp. 7-8)

This willingness—more, eagerness—to enter into the fray of mundane affairs has distinguished Hook's career, for he believes that science is on a continuum with common sense, and that knowledge, as an instrumental activity, emerges from the confrontation of problems, rather than being derived from first principles. As Paul Kurtz, who edited a *Festschrift* for Hook's 65th birthday, remarked in his preface:

Hook speaks to the actual conditions of contemporary life; and he has persistently attempted to apply pragmatic intelligence to concrete issues of practical concern. The breadth of his critical analysis has been very wide, and includes education, politics, Marxism, morality, metaphysics, religion, civil disobedience, democracy, science, psychology, art, economics, law, nuclear weapons, racial segregation, the Supreme Court, the Bill of Rights, and international affairs. . . . Sidney Hook, virtually alone among contemporary American philosophers, has not abandoned ethical, political or social philosophy, in the original sense of these disciplines. (1968, pp. 11-12)

To a considerable extent this is true, though the hint of anti-intellectualism (in the guise of anti-scholasticism) in Kurtz's remarks minimizes the enduring contributions to the linguistic clarification of truth and empirical inquiry of more technical philosophers such as Alfred Tarski, Rudolf Carnap, and Hans Reichenbach, or of pragmatists such as C. I. Lewis, and the somewhat younger generation of W. V. Quine, Nelson Goodman, and Ernest Nagel. A useful distinction is made by one of Hook's students,

Raziel Abelson, who wrote: "Philosophy, for Hook, is primarily concerned with 'value facts' rather than linguistic facts, and it mainly clarifies and criticizes values, although on occasion it may clarify and criticize meanings" (Kurtz 1968, pp. 203–204).

Sidney Hook was born on December 20, 1902, of immigrant Jewish parents, and grew up in the working-class neighborhood of Williamsburg, in Brooklyn, graduating in 1919 from Boys' High School, which was then, along with Stuyvesant High School, one of the incubators of young New York intellectual Jews and radicals. World War I roused a sympathy for socialism in Hook, and the reading of W. E. H. Lecky, H. C. Lea, John W. Draper, and other rationalists who counterposed science to religion made him an agnostic; Hook has retained this double stance all his life.

As a student at the City College of New York, he encountered Morris Raphael Cohen, whom he admired, as he wrote in a memoir fifty years later, not only because of his tough-minded, relentless questioning, and sharp wit (a typical Cohen story: "Professor Cohen, prove to me I should study logic." "How will you know it is a good proof?") but also because Cohen was the first teacher to respect Hook's questioning of America's entry into the war "with anything other than the ferocious antipathy of my high school and City College teachers." (Hook's classmate was Ernest Nagel, with whom he formed a lifelong friendship.) Following graduation in 1923 (he won the Ward medal for logic), Hook began teaching in the public schools of the city while attending Columbia University, part-time, as a graduate student in philosophy. After obtaining his M.A. in 1926, he was awarded a university fellowship and finished his Ph.D. a year later.

At Columbia, Hook came under the influence of John Dewey and became his friend and foremost expositor. Yet Hook, who believes that there is an ascertainable connection between temperament and philosophy, has written, in a memoir of Dewey: "Temperamentally, I have found Russell and Cohen more congenial than Dewey. They are philosophers of the clean line, incisive, witty, rarely hesitant about sacrificing the dull or exact truth for the sake of a bon mot" (1974, p. 113). In 1927 he became an instructor in philosophy at New York University, where he remained for the rest of his academic life, retiring in 1972. There, he achieved the legendary qualities of his first teacher, a wit and sharp-

ness as quick as Cohen's tempered by compassion.

Hook's great passion has been radical politics, and his involvement first with Marxism and later as the intellectual leader of the anticommunist left has given him his largest public prominence. In the early 1930s, Hook was close to the Communist party, and was instrumental in gaining a large degree of intellectual support for the Communist presidential candidate in 1932. But his philosophical views on Marx, which were at variance with party orthodoxy, and his dismay at the communist theory of "social fascism," which in Germany labelled the Social Democrats, not the Nazis, as the prime enemy, and which brought the Communist party into practical alliance with the Nazis at key points in opposing the Weimar Republic, turned Hook against the communists, and toward an appreciation of the need for democracy as an integral aspect of socialist belief.

In the mid-1930s, Hook was close to the Trotskyites, and in 1934, together with James Burnham, a fellow instructor in philosophy at N.Y.U., he was instrumental in the formation of the short-lived American Worker's party, an effort at an indigenous American radicalism; but the party was captured by orthodox Trotskyites and soon dissolved. Hook, however, then took the initiative in setting up the John Dewey commission of inquiry, which, following the Moscow trials, in the course of which many of the original leaders of the Russian revolution were shot by Stalin, examined the charge that Trotsky was a Nazi agent, through a series of hearings held in Mexico, where Trotsky then lived. These hearings resulted in a two-volume report demonstrating the Moscow trials to be a frame-up. By 1940 Hook had broken with all variants of Bolshevism, though, out of respect for Trotsky, he dedicated his *Reason, Social Myths and Democracy* (1940) "to the memory of a Great Adversary."

Within the milieu of the New York Jewish intelligentsia, a remarkable group of men and women rising to prominence in American cultural life (for example, Ernest Nagel, Meyer Schapiro, Lionel Trilling, William Phillips, Herbert Solow, Elliot Cohen), Hook became a leading figure. He was for many years the political mentor of *Partisan Review*, which became the dominant cultural periodical in the United States. In 1939 Hook took the lead in organizing the Committee for Cultural Freedom, headed by John Dewey, to combat all varieties of totalitar-

ianism and to oppose a larger communist intellectual front, headed by Franz Boas, which expired on August 23, 1939, a week after many of its leading members signed a statement denouncing the charges that the Soviet Union was a totalitarian society. Ten years later, during the cold war, Hook again was instrumental in helping form the American Committee for Cultural Freedom. In 1950, with Arthur Koestler, Ignazio Silone, Raymond Aron, Michael Polanyi, and other European and American intellectuals, he helped found the world-wide Congress for Cultural Freedom (C.C.F.), to oppose totalitarianism and communist influences in intellectual life. In 1967 it was revealed that the C.C.F. had received funds from the CIA, though there was little question of its intellectual independence. Hook has made no apology for his activities in that period. In an article, "What the Cold War Was About" (1975), Hook, who called himself an "unreconstructed 'Cold Warrior,'" stated that when asked to justify his position, the shortest answer he gives is "Read Solzhenitsyn's *The Gulag Archipelago*."

Despite his intense activism, Hook has been remarkably prolific. A bibliography in the 1968 *Festschrift* listed 21 books by Hook, 13 edited or coedited by Hook, 62 books to which he has contributed (excluding encyclopedia articles), 516 articles in various periodicals, and 107 "selected" book reviews, in a period beginning with his first essay, "Philosophy of Non-resistance" (1922). Since that bibliography appeared, Hook has published, as of 1978, six more books. A large number of his articles have appeared in general intellectual periodicals, such as *The New Leader*, *Partisan Review*, *Commentary*, and *Encounter*, and Hook's relish for intellectual battle has often led to polemics in which an article is countered by a reply and a riposte by Hook, a counterreply and a counterriposte—all of which becomes a robust way of adding to a bibliography. Yet an extraordinary number of the essays, particularly in the books to which Hook has contributed, are serious philosophical articles on the value questions with which he has been concerned all his life.

What is most remarkable, however, is the consistency of his philosophical viewpoint. Hook has been described, variously, as a pragmatist, a naturalist, an experimentalist, an instrumentalist, even an "epistemological activist" (Arthur O. Lovejoy once said that there were 13 varieties of pragmatism). What unifies these positions is the persistent attack on metaphysical absolutes,

"ultimates of human reason," first principles or final causes, because they provide no guides to cognitive validity or practical conduct, and are incapable of being tested or disproved in experience, but are only given some counterlogical formulation. Hook has argued, for example, that it is possible and not unusual for individuals to agree on matters involving values while disagreeing on metaphysical doctrines, or to agree on metaphysics and disagree on values; so nothing immediately follows from metaphysics (Kurtz 1968, p. 183).

Central to his thinking is the attack on the idea of "Being," as such, or on a priori categories. This argument is the leitmotif of Hook's first book, his PH.D. thesis, *The Metaphysics of Pragmatism* (1927), which unites Charles Pierce's "fallibilism" with Dewey's "instrumentalism," and whose target is Kant. It is reiterated in the paper "The Quest for Being" (1953; written for the 11th International Congress of Philosophy, in Brussels, and reprinted in the book of that title, in 1961), whose target is Martin Heidegger. In his first book, in a chapter on "categorical analysis," Hook wrote:

Categories are bound up with distinctions we make in analysis. Analysis starts *from* something given and *with* something taken. . . . It follows, therefore, that Being is not a category and Experience is not a category. Neither is Space-Time nor subsistence nor any other denotative indication of the sum total of actual and possible existents. A fundamental term which has no intelligible opposite describes nothing because its apparent import is to describe everything. (1927, p. 116)

In renewing his attack on the revived interest in such metaphysics, Hook wrote:

In ordinary discourse every significant word has an intelligible opposite. Being, however, as an all-inclusive category does not seem to possess an intelligible opposite. Not-Being is not the opposite of Being, because when it is taken as equivalent in meaning to Nothing, and Nothing is interpreted as a substantival entity, then Nothing is a Something . . . and hence possesses Being too. . . .

Precisely for this reason the question originally asked by Schelling and repeated in our time by Heidegger: "Why is there something: why is there not nothing?" is devoid of sense except as a sign of emotional anxiety.

For Hook, as for Dewey, an idea is an instrument, a sign or a tool, a "mental blue-print which directs its exercise and interprets its effects" (1927, p. 18), ideas are "implicit guides to ac-

tivity and behavior, and knowledge is dependent on the experiment and reconstructive activity" (1974, p. 21), philosophy is an empirical discipline, its methods of inquiry continuous with those of the natural and social sciences (1961, p. 50).

The emphasis, then, is almost entirely on *method*—not Cartesian method, in which, from axioms of undoubted doubt, knowledge is derived by rationalist deduction, or the phenomenological method of Husserl, a logical technique for the "bracketing" of experience, but the *scientific method*, as the one reliable method. In fact, at one point Hook says, in an italicized statement, "All knowledge that men have is scientific knowledge" (1961, p. 214).

What is less clear, however, is the meaning of scientific method and scientific knowledge. Hook has distinguished between the "scientific method as the procedures pursued in the study of nature"—in particular, physics, with its search for quantitative and mathematical precision—from the "scientific method as a general pattern of inquiry whenever we seek knowledge." The latter does require "the recognition and formulation of a problem, the formulation of an hypothesis, the elaboration of its logical implications, the performance of an experimental act, and the observation of its consequences" ([1946] 1963, pp. 174–176).

But when Hook also states that the "experimental act" may be "just looking," and that the consequences of a hypothesis may include "logical consequences," and that "there is no opposition between common sense knowledge and scientific knowledge as knowledge, but only a difference in their objects and problems" (1961, p. 214), then the initial precision seems to have dissolved into a defense of any systematic empiricism that begins with some hypothesis and looks for some consequences. It is striking that Hook, for all his defense of the scientific method, has rarely engaged in the contemporary discussions of the philosophy of science (e.g., those initiated by Karl Popper), perhaps preferring to leave this to his friend and colleague Ernest Nagel (Nagel 1961; 1968).

Hook's forte has been the exposition of ideas, and nowhere is this more evident than in his works on Marx and Dewey, works that have rendered two ambiguous and opaque writers lucid and comprehensible. His first book on Marx, *Towards the Understanding of Karl Marx* (1933) is a *tour de force*. Having spent an academic year (1928/1929) in Berlin and Moscow working through the Marx–Engels archives,

Hook was among the first to read the newly "discovered" early philosophical writings of Marx, and he pointed out that the "young Marx" had an activity theory of knowledge that made intelligible the emphasis on praxis running like a thread through Marx's writings. At the time, Hook was accused of reading Dewey into Marx, for the received notion of that period was the epistemology proposed by Engels in *Anti-Dühring* (1878)—that sensations and knowledge are "mirror reflections" of a material world, a view which Lenin took over in his attack on Mach in the *Materialism and Empirio-criticism* (1909) and which had become the orthodox Soviet position. Yet the view first propounded by Hook is now widely accepted, though it remains an intellectual mystery why Marx, who had read and even contributed to a section of *Anti-Dühring*, allowed this idea to be proposed if it in fact contradicted the views he had come to hold. One answer may be that Marx had changed his mind somewhat, since *Das Kapital* (1867–1879), is written in a determinist mode, in which the "laws of motion" operate and tendencies are "inevitable."

Hook's second book, *From Hegel to Marx* (1936), is still unsurpassed in its meticulous tracing of the relation of Marx to Hegel, and to the group of young Hegelians with whom he jostled so bitterly. What is striking in the book is Hook's neglect of the idea of alienation, which after 1950 became so fashionable that for some writers "alienation" was the master key to all of Marx's thought. In an introduction written for the 1962 edition, Hook pointed out that the concept of alienation was foreign to Marx's thought because its origins were religious; that it implies an essence to man from which man would be alienated and that the term, when used, as it is in the *Economic and Philosophic Manuscripts* (1844), was completely Feuerbachian. In fact, Marx abandoned the term, and later mocked it, as in *The Communist Manifesto* (Marx & Engels 1848), because he had found in economics the material embodiment of philosophy, and "alienation" had been replaced by "exploitation." In two subsequent works, the long essay "What Is Living and Dead in Marxism" (printed in 1940, pp. 105–142) and *The Hero in History* (1943), Hook evaluates and refutes the thesis of social determinism, and provides, through the case study of the Russian revolution, a fruitful analysis of the interplay of structural constraints, contingency, and personality, as the way in which social events can be understood.

Hook's book *John Dewey: An Intellectual Por-*

trait (1939) is a comprehensive survey of Dewey's ideas. The heart of the book is the defense of the argument that values are open to scrutiny and empirical testing, like any other mode of empirical knowledge. What Hook seeks to show is that all values, even those claimed as "ultimate ones," can be judged (evaluated, not just described) on the basis of relevant consequences, for there is no Good in the large any more than there is Truth in the large; and that all statements of value exist in determinate contexts whose claims can be tested. The second theme central to Hook's discussion—and it becomes relevant time and again in his subsequent judgments on Bolshevism and all its variants—is the interconnectedness of ends and means. The notion that the end justifies the means often overlooks the fact that the means used become ends in themselves, or, in different situations, an emphasis on a single end overrides the "irreducibly plural ends" of human beings and distorts the quest that initiated the desire for change in the first place.

This theme is expanded with great sensitivity and poignance in the book that serves as Hook's credo, *Pragmatism and the Tragic Sense of Life* (1974). Rejecting the existential and mystical views that define a tragic sense of life as the ineluctable intrusion of evil into human affairs, or the role of death in defeating the aspirations of men, Hook defines the tragic sense as "a very simple thing which is rooted in the very nature of moral experience and the phenomenon of moral choice." Every such experience, Hook argues, takes place in a situation in which good conflicts with good, and any resolution involves some surrender of a moral position: "No matter how we choose, we must either betray the ideal of the greater good or the ideal of right or justice. In this lies the agony of the choice." The tragic sense of life is the realization of the guilt inherent in making a choice: "In its starkest form [this] is the theme of Sophoclean tragedy, but the primary locus of the tragic situation is not in a play but in life, in law and in history."

DANIEL BELL

WORKS BY HOOK

- 1927 *The Metaphysics of Pragmatism*. Chicago: Open Court. → This was Hook's Ph.D. thesis at Columbia University. Includes an introductory word by John Dewey.
- 1933 *Towards the Understanding of Karl Marx*. New York: John Day.
- 1936 *From Hegel to Marx: Studies in the Intellectual Development of Karl Marx*. New York: Reynal & Hitchcock. → A paperback edition, with a new

- introduction by Hook, was published in 1962 by the University of Michigan Press.
- 1939 *John Dewey: An Intellectual Portrait*. New York: John Day.
- (1940) 1950 *Reason, Social Myths and Democracy*. New York: Humanities Press.
- 1943 *The Hero in History: A Study in Limitation and Possibility*. New York: John Day.
- (1946) 1963 *Education for Modern Man: A New Perspective*. 2d ed. New York: Knopf.
- 1961 *The Quest for Being, and Other Studies in Naturalism and Humanism*. New York: St. Martins.
- 1974 *Pragmatism and the Tragic Sense of Life*. New York: Basic Books.
- 1975 *What the Cold War Was About*. *Encounter* (London) 44:62–67.
- 1976 *Morris Cohen—Fifty Years Later*. *American Scholar* 45:426–436.

HORKHEIMER, MAX

Insofar as the members of the Institute for Social Research constituted a coherent "Frankfurt School," their acknowledged "master" was the philosopher and social theorist Max Horkheimer. Although less widely known than sev-

eral of his junior institute colleagues, in particular Theodor W. Adorno and Herbert Marcuse, Horkheimer was the major organizer of the institute's intellectual life and the chief promulgator of its common theoretical perspective, known as "Critical Theory." Although by the time of his death in 1973 Horkheimer had repudiated many of "Critical Theory's" more radical dimensions, his reputation as one of the founding fathers of the tradition of Western Marxism has remained intact.

In common with many other contributors to that tradition, Horkheimer came from a non-proletarian background. He was born in Zuffenhausen near Stuttgart, Germany, in 1895, the son of a wealthy Jewish textile manufacturer, Moriz Horkheimer. His father insisted on his entering the family business, and after graduating from a Gymnasium in 1910, the young Horkheimer reluctantly agreed. But like another son of a successful businessman, Arthur Schopenhauer, to whose ideas Horkheimer was particularly drawn, he entertained hopes of pursuing a less mundane career. In a series of novellas and extended diary entries (1974), he expressed his adolescent yearnings and utopian hopes. His tone was similar to that of the expressionists, whose moral idealism he would come to scorn after drawing closer to Marxism.

His interest in Marxism matured slowly over the next decade. Emboldened by his friendship with Friedrich Pollock, another restless son of a bourgeois household, and made more independent by a year of army service during World War I, Horkheimer left his father's factory for academic life. From 1919 to 1925 he studied in Munich, Freiburg, and Frankfurt, earning his doctorate in 1922 and *Habilitation* in 1925 at the last of these universities. Written under the direction of Hans Cornelius, his dissertation dealt with Kant's *Critique of Judgment* and its implications for overcoming the contradictions of bourgeois life and thought (1925). Although never joining any of the Weimar Republic's radical parties, Horkheimer was drawn increasingly to the left during his student days. Among his friends were a group of similarly inclined intellectuals, including Theodor W. Adorno, Leo Lowenthal, and Felix Weil, who were all excited by the new stimulus to Marxist thinking in the work of Georg Lukács and Karl Korsch. In 1923, supported by Weil's wealthy father, Horkheimer, Pollock, and Weil founded the Institute for Social Research to provide an independent scholarly setting for the pursuit of their radical goals.

Lowenthal soon joined them, as did the economist Henryk Grossmann and the Sinologist Karl A. Wittfogel. Although loosely associated with the University of Frankfurt and maintaining informal ties with several of the leftist parties, the institute was able to achieve an autonomy that it maintained throughout its history.

Horkheimer was too young to become the institute's first director, a post that went to the Austrian Marxist Carl Grünberg, because the director also had to have a chair at the university. But in 1930, when Grünberg's health had deteriorated, Horkheimer had completed *Anfänge der bürgerlichen Geschichtsphilosophie* (1930) and was thus able to assume a professorship in social philosophy, and with it, the institute's leadership. From that date the history of the Frankfurt School may be properly traced. In his first three years as director, the institute started a new journal, the *Zeitschrift für Sozialforschung* ("Journal for Social Research"), opened branch offices in Geneva and London, and welcomed several new members, most notably the psychoanalyst Erich Fromm and the philosopher Herbert Marcuse. It began as well to gather materials for its first collective project, a study of the relations between authority and family in the modern world, which was designed in part to explain the proletariat's inability to assume the revolutionary role assigned it by orthodox Marxism.

By the time the *Studien über Autorität und Familie* (1936) appeared, the institute itself had been victimized by that inability. With the Nazi seizure of power in January 1933, Horkheimer and his colleagues, most of whom were Jewish as well as socialists, were forced to flee. After a year in Geneva they went to New York, where they established a loose affiliation with Columbia University. In that same year, a collection of Horkheimer's aphorisms appeared pseudonymously under the pointedly ambiguous title *Dämmerung* (1934), the German word for both dawn and twilight. Written when the fate of the Weimar Republic was still uncertain, they expressed a militancy that would wane in his later writings.

In New York the institute was able to resume a large part of its earlier work. The *Zeitschrift* continued to be published in Paris until 1939, and then for two more years in the United States under the title *Studies in Philosophy and Social Science*. New members joined the institute's ranks, most notably Franz L. Neumann, Otto Kirchheimer, and, still in his Paris exile, Walter

Benjamin. Although the late 1930s saw the departure of Fromm and the loosening of ties with Grossmann and Wittfogel, Adorno joined the institute officially in 1938. For Horkheimer, his collaboration was to be of particular importance; in later years, they would be more closely identified with the Frankfurt School than would any other institute members.

During the institute's first years in exile, Horkheimer spelled out the tenets of Critical Theory in a series of articles in the *Zeitschrift*, later collected in book form (1968). Drawing on the Hegelianized Marxism introduced by Lukács and Korsch, but hostile to its inherent identity theory, loyal to the classical German idealist notion of reason, but wary of its disdain for concrete human happiness, open to insights from psychoanalysis, but disturbed by its tendency to naturalize the contradictions of bourgeois society, "Critical Theory" opposed itself to what Horkheimer called "Traditional Theory." Most important, it claimed that the goal of theory was social emancipation, not abstract truth, and thus that the theorist could not be detached and "objective," as traditional theory contended he should. Although reluctant to endorse conventional metaphysics, Horkheimer was particularly scornful of positivism, which he accused of accepting the reified "facts" of the *status quo* as eternal and immutable. Instead, "Critical Theory" stressed their historical and therefore changeable nature.

By the 1940s, however, Horkheimer and his colleagues had grown more cautious about the possibilities of significant change. In two books written after he left New York for California in 1940, *Dialectic of Enlightenment*, coauthored by Adorno (1947), and *Eclipse of Reason* (1947), Horkheimer voiced his increasing pessimism about the current situation. Moving beyond a strictly class analysis, he stressed the importance of instrumental rationality and the domination of nature as central elements of Western culture from its beginning. Fascism could be explained in part as a revolt of dominated nature against its subjugation. Even traditional Marxism, Horkheimer suggested, had not entirely escaped the Enlightenment's ambiguous dialectic.

As his hope in the proletariat's ability to reverse this unprogressive progress of domination waned, Horkheimer increasingly stressed the importance of rescuing and nurturing critical, negative, and utopian impulses wherever they might be found. In an increasingly bleak anal-

ysis of what he called our "administered world," Horkheimer came to identify these impulses more with artistic and philosophical than with directly political phenomena. Most art, to be sure, was manufactured by what he and Adorno called the "culture industry," and most philosophy was a variant of positivism or idealism, but there were certain counterexamples that allowed some hope for the ultimate emancipation of mankind from the sinister dialectic of the Enlightenment. Ironically, they were most likely to be those cultural phenomena, such as modernist art and "Critical Theory" itself, that eschewed any direct and immediate political efficacy. For Horkheimer and the Frankfurt School in general, there was no viable political practice that could lead to qualitative change, at least for the foreseeable future.

In their empirical work, Horkheimer and his colleagues probed the reasons for this pessimistic prognosis. Using methods they had first employed in their studies of fascism in Europe, institute members joined with American researchers to explore the potential for a similar disaster in America. Under the auspices of the American Jewish Committee, whose director for scientific studies Horkheimer became in 1943, the institute helped write a five-volume series, *Studies in Prejudice* (1949–1950). The central volume was *The Authoritarian Personality*, co-authored with the Berkeley Public Opinion Study Group, which quickly became a controversial classic of social scientific research. Although the institute's more radical impulses seemed to be submerged in the predominantly psychological methodology of the work, the social origins of the phenomena under discussion were not slighted in the sections of the volume written by Adorno and inspired by "Critical Theory." Read in conjunction with the more theoretical writings of the late 1940s, *The Authoritarian Personality* did little to dispel the sense of mounting despair that ran through the Frankfurt School's work. Although the study did spell out the components of a nonauthoritarian personality syndrome, it never ventured an estimate of the relative prevalence of each. Even with the defeat of fascism, Horkheimer and his colleagues were not sanguine about the direction in which the world was moving. What Marcuse was later to make famous as "one-dimensional" society meant that even in the seemingly liberal democracies of the West, true emancipatory impulses were suppressed.

Although Horkheimer had felt grateful to his

American hosts, he recognized that "Critical Theory" had little chance of breaking through the prevailing philosophical and cultural discourse of this country after the war. He was thus willing to consider, and finally accept, the blandishments of the city of Frankfurt to return with his institute and begin where he had left off in 1933. Accompanied by Pollock and Adorno, he reestablished the institute in its original home in 1950. From 1951 to 1953 he served as rector of the university. Although returning to America sporadically for the next five years to act as guest professor at the University of Chicago, Horkheimer quickly established himself as a leading intellectual presence in the Federal Republic. In 1959 he became professor emeritus and moved in the following year to Montagnola, Switzerland, where he lived until his death in 1973.

The last decade of Horkheimer's life was perhaps his most controversial. While many of the institute's students were rediscovering his earlier and more radical works, he was becoming increasingly concerned with the totalitarian threat to individualism. His lifelong interest in Schopenhauer came to the surface and pessimistically colored his later writings, collected in *Gesellschaft im Übergang* (1972a), *Sozialphilosophische Studien* (1972b), and the posthumously published edition of *Dawn and Decline* ([1934] 1978). A new concern for religious issues, in particular for Jewish questions, also emerged in ways confusing to his more politically minded disciples in the German New Left. Although he was spared the direct harassment suffered by Adorno and their younger colleague Jürgen Habermas, Horkheimer was accused of betraying the link between theory and practice that "Critical Theory" had originally stressed. Ironically, conservative elements in German society soon afterwards berated the Frankfurt School for fomenting the student unrest that led to the terrorism of the 1970s.

In neither case was the subtlety of Horkheimer's position fully appreciated. For although he condemned the instrumentalization of theory in a way that seemed to preclude virtually any political activism, he never abandoned his hope for a future practice that might satisfy his yearnings for what he called "the entirely other" (*das ganze Andere*). He was thus never as resigned as his students claimed, nor as irresponsible as his establishment detractors charged. And yet both were correct in sensing the impasse at which his version of "Critical Theory"

had ultimately arrived. Schopenhauer and Marx were not, after all, very compatible bedfellows. It is, however, the special good fortune of masters of intellectual schools to have students who develop their ideas in new and creative ways. In the work of Jürgen Habermas and other still younger "Critical" theorists in Europe and America, Horkheimer's influence remains very much alive.

HOTELLING, HAROLD

Harold Hotelling (1895-1973), a pioneer in statistical theory and mathematical economics, began his career as a journalist. After completing high school in Seattle, he worked on small weekly newspapers in the state of Washington in 1915-1916, then took up journalism as an undergraduate at the University of Washington, where he earned a bachelor's degree in 1919. While completing that program he took several mathematics courses with Eric Temple Bell. Under Bell's influence, he undertook graduate study in mathematics, obtaining an M.A. degree at Washington in 1921. He went to Princeton

University from Seattle and completed a doctorate in mathematics in 1924.

From the beginning of his study of mathematics, Hotelling was interested in its applications. He once said that he had hoped to study both statistics and mathematical economics in his doctoral program and was surprised to find that extensive offerings in these subjects were not available in the United States in 1921. His own career both as a researcher and as a teacher did much to overcome those deficiencies.

After completing his doctorate at Princeton, Hotelling went to Stanford University's Food Research Institute, where he remained until 1927. It was here that he published the first of the many scholarly papers that brought him international recognition. His early interests in the application of mathematics included the fields of journalism and political science, population, and food supply; he then turned to mathematical economics while simultaneously producing fundamental research in the developing theory of statistics.

Hotelling was associate professor of mathematics at Stanford University from 1927 to 1931. During this period he spent six months with R. A. Fisher, then the dominant figure in mathematical statistics, at the Rothamsted Agricultural Experiment Station in England. This visit reinforced and further developed Hotelling's interest in mathematical statistics. In 1931 he moved to Columbia University as professor of economics, remaining for 15 extremely productive years during which he became an internationally recognized authority in both mathematical economics and statistics. In 1946 he moved to the University of North Carolina, founding the department of statistics on the Chapel Hill campus, where his uncanny ability to recognize talent in others led him to attract an outstanding faculty. He later became also professor of economics, Kenan professor of statistics, and was Kenan professor emeritus from his retirement in 1966 until his death in 1973.

Although Hotelling published a few papers in theoretical mathematics (1925c; 1926), the bulk of his teaching and research efforts was devoted to statistics and mathematical economics. Even in economics he published a relatively small number of papers, but they had a major impact. Hotelling's contributions to economics may be classified under five headings: optimization over time, imperfect competition and location theory, the incidence of taxation, demand theory, and welfare economics.

One of Hotelling's first papers (1925*b*) dealt with the problem of finding a logical basis for methods of depreciation. The problem was solved by relating depreciation methods to profit maximization. The paper also suggested that the calculus of variations could be applied to problems of temporal optimization in economics including the problem of depreciation, but this suggestion was not acted on in this paper. A later paper (1931*a*) dealt with the economics of exhaustible natural resources. In this paper the calculus of variations was used to obtain the socially optimal rate of exploitation of irreplaceable natural resources. After decades of neglect, this paper has received a good deal of attention since the petroleum crisis of 1973.

A single paper (1929*b*) made contributions to the theory of imperfect competition and to the theory of the location of economic activity. Some earlier economists had argued that oligopoly situations were inherently unstable—that is, that an equilibrium could not be reached and maintained. Hotelling developed an oligopoly case that attained a stable equilibrium, thus showing that oligopoly equilibrium was possible although it need not hold in every oligopoly situation. The case that was developed involved two competing firms connected by a linear thoroughfare (main street in a small town or a transcontinental railroad). Hotelling demonstrated that profit maximization would cause the two firms to locate near each other on the thoroughfare, rather than at the quartile points, which would minimize transportation costs for the customers. This aspect of the paper has made it interesting to scholars of the locations of economic activity. This tendency of competitors to draw near each other was generalized by Hotelling to explain similarity of competing products and of the platforms of political parties.

Hotelling then studied Edgeworth's (1897) argument that an excise tax on one of two related goods may result in a lowering of the prices of both goods. This thesis had produced a seemingly consistent and reasonable numerical example in which price reduction for both goods followed the levying of an excise on one of them. Edgeworth regarded this as a mere "curiosum." Hotelling investigated this phenomenon and found that it could occur if the two goods were substitutes in both consumption and production; he thus raised the phenomenon above the category of a curiosity (1932). In this paper he also developed a measure of the social loss due to the levying of an excise tax. The measure

was to be developed further in his work on welfare economics.

Hotelling also worked out the mathematical characteristics of demand functions under the assumption that the consumer maximizes satisfaction subject to a budget constraint (1935). This work was in the same general area as that of J. R. Hicks and R. G. D. Allen, and it came at about the same time as their work and the discovery of Eugen Slutsky's work. Since the 1950s this type of material has been taught to virtually all first-year graduate students in economics, but in 1935 it was considered advanced economics.

Perhaps Hotelling's most noteworthy contribution to economics was in welfare economics (1938). For some time economists had been aware that pricing at marginal cost was advantageous from the social viewpoint. Hotelling provided a mathematical demonstration of the validity of the principle of pricing at marginal cost. This principle, together with its variations and limitations developed by others, forms an important part of the theory of welfare economics. Hotelling also refined the concept, first developed in 1932, of the social loss due to levying an excise tax.

When Hotelling began his career, mathematical economics was regarded as a recondite specialty. He lived to see economic theory established on a firm mathematical basis. Through his teaching and research efforts he contributed a great deal to this reformation of economic theory.

His role in the dramatic development of mathematical statistics in the United States since 1930 was also a most significant one, involving important contributions in diverse areas. For example, his early work on differential equations subject to error (1927*b*) pioneered in a field of great subsequent, and indeed current, research interest. His work in the nonparametric area involving rank correlations (Hotelling & Pabst 1936) stimulated much later research, as did that on statistical prediction (1940*a*) and on experimental determination of the maximum of a function (1941).

The work for which Hotelling will be especially remembered, however, is in the field of multivariate analysis, an area in which he became the acknowledged leader. He was responsible for a number of fundamental developments in this specialty, which is concerned with the treatment of the simultaneous measurement of multiple characteristics (vector random varia-

bles). His first major contribution involved a "measure of deviation" now known as "Hotelling's T^2 ," by which two populations may be compared by the simultaneous comparison of a number of their characteristics. This generalized the "Student- t -statistic" introduced earlier to compare single characteristics of two populations.

In 1933 Hotelling developed the idea of "principal components analysis" (a concept introduced originally by Karl Pearson). Basically this method describes the dispersion of n points in a k -dimensional space by a convenient transformation giving new orthogonal axes and is now a widely used method of multivariate analysis.

Canonical correlation analysis developed by Hotelling (1936a) provides another method for describing associations between two sets of random variables. In this method, the two linear combinations of the variables of each set are found for which the correlation is maximum. Then the process is repeated among the linear combinations that are orthogonal to those already considered, and so on. In this way a set of "canonical variates" may be formed and natural measures of association obtained.

Hotelling's contributions to the teaching of statistics were also noteworthy. His generous manner extended to all situations, including the classroom, where his students became genuinely involved in the subject. His informal style, encouragement of class discussion, and his clear authority as a leader in the field instilled in students a keen desire to perform at their best.

Hotelling's influence on the teaching of statistics reached far beyond his personal classroom involvement. He gave deep consideration to the general issues surrounding the teaching of the subject, being especially concerned about the qualification of instructors, balance between theory and practice, and the organization of statistics instruction on a university campus. Many of his views on these subjects are contained in a famous paper (1940b) delivered first as an address at the 1940 annual meeting of the Institute of Mathematical Statistics. It is indicative of Hotelling's almost prophetic nature that many of the issues he raised are still discussed.

Hotelling was a member of the National Academy of Sciences and of the Accademia Nazionale dei Lincei, an honorary fellow of the Royal Statistical Society, a distinguished fellow of the American Economic Association, and a

fellow of the Econometric Society, the Institute of Mathematical Statistics, and the Royal Economic Society. He served as president of the Econometric Society in 1936/1937 and of the Institute of Mathematical Statistics in 1941. He received an honorary LL.D. degree from the University of Chicago in 1955, an honorary D.Sc. degree from the University of Rochester in 1963, and, in 1972, the North Carolina award for science.

HOWELLS, WILLIAM W.

Characteristically in America, the anthropological view of *Homo sapiens* is one incorporating prehistory and physical (biological) anthropology as well as cultural and social anthropology. William White Howells exemplifies that tradition from the perspective of physical anthropology. He was born in New York City in 1908, the son of John Mead and Abby Macdougall White Howells and the grandson of the novelist William Dean Howells. He married Muriel Gordon Seabury in his senior year at Harvard College. His concentration as an undergraduate was anthropology, and this focus continued on through his PH.D. at Harvard University in 1934. Earnest A. Hooton had made Harvard the United States center for academic training in physical anthropology after World War I, and Howells' entry into the field was attributable to Hooton's stimulating presentations of anthropology to

undergraduates and to the public. Some of Howells' professional interests in physical anthropology, for example quantitative methods in dealing with morphological variation in populations, derive from the approaches that Hooton pioneered at that time.

Apart from three years of wartime service in Washington in the U.S. Office of Naval Intelligence, Howells has held only three professional positions. The first was in the American Museum of Natural History in New York City, where he, along with Hooton's first doctoral student, Harry L. Shapiro, investigated racial variation in Pacific island populations. In 1939 he accepted a teaching position at the University of Wisconsin at Madison, where he remained until he returned to Harvard on the death of Hooton in 1954. He retired in 1974. At both Wisconsin and Harvard, Howells excelled in undergraduate instruction. At the former institution he was a leader in the development of the integrated liberal studies curriculum, and in the latter university he originated one of the most popular courses in the natural sciences division of the general education program. In doctoral training at Harvard, he has produced more than a score of physical anthropologists whose strong methodological training under him is displayed in the diverse subject matter in physical anthropology that they have pursued in their research (Giles & Friedlaender 1976).

An engaging lecture style has carried over to his popular books, which cover primitive religion in *The Heathens* (1948), world archeology in *Back of History* (1954), and physical anthropology, with an emphasis on fossil man, in *Mankind So Far* (1944), followed by a book along similar lines, *Mankind in the Making* (1959). These books, widely used as texts, have received extensive critical praise in the profession. Their translations, variously, into French, German, Spanish, Japanese, Dutch, and Arabic, have made Howells the most diverse and accessible American physical anthropologist explicating the discipline.

Howells was elected to the National Academy of Sciences and the American Academy of Arts and Sciences, and, in 1954 received the Viking Fund medal in physical anthropology. He was editor of the *American Journal of Physical Anthropology* from 1950 to 1954, and in 1951 was president of the American Anthropological Association, a position reflecting his esteem in the general anthropological community.

Howells' early research was spread among

topics common to physical anthropologists: technical reports on modern human skeletal populations recovered by archeologists, refinements of measurement techniques in osteology, and the use of anthropometry, blood groups, and other traits to determine racial groups and their history and interrelations. The main themes that characterize his research developed out of these interests. The studies perhaps most clearly associated with him in physical anthropology are innovative elaboration and application of multivariate statistical techniques to problems of morphology: understanding individuals in terms of physique, living populations in terms of anthropometric measurements, fossil specimens in terms of affinities, and world populations in terms of cranial variation.

Howells' involvement in primary description of fossil material has been minor but significant (e.g., the Kanapoi humerus fragment from east Africa); his syntheses and reviews in paleo-anthropology have been acclaimed as authoritative and even-handed. His research has been most extensive and influential in the examination of human cranial variation, culminating in "Cranial Variation in Man: A Study by Multivariate Analysis of Patterns of Difference Among Recent Human Populations" (1973a). For this analysis, Howells first collected data from 17 well-defined populations representing all regions of the world. This required him personally to take more than 100,000 measurements in various museum collections. His thorough multivariate discriminant analysis of these cranial dimensions convincingly demonstrated that such variation is not, as he once put it, merely a taffy-pull with the skeleton of the head. Howells' work provides at least as appropriate a base for assessing the relationships among the world's populations as any other means, and is a major contribution to studies of prehistory as well as to physical anthropology. Cranial variation has been the subject of attention, often inconclusive or at worst irresponsible, in physical anthropology for more than a century. No one has succeeded like Howells in bringing credibility and modern evolutionary thinking into such investigations.

From his earliest papers, Howells has evinced a particular interest in the populations and prehistory of Oceania. He has visited almost all of the major Oceanic groups and conducted research in the Solomon Islands and elsewhere as part of a medical-human biology research team organized by Albert Damon. Among the

modern populations of this region, Howells has emphasized the concept of biological distance, a measure of interpopulation affinity in a restricted area based upon multivariate analysis of similarities and differences in single-gene traits (e.g., blood groups) and polygenic ones (e.g., finger- and handprints). Such studies can be complementary to, or include, similar investigations of linguistic, geographic, and other measures of relationship in determining patterns of colonization and the dynamics of population interaction in more recent periods.

In *The Pacific Islanders* (1974), Howells has synthesized an immense amount of diverse and sometimes conflicting evidence from linguistics, social anthropology, prehistory, and physical anthropology to present a comprehensive picture of the indigenous people of the major regions of this area: Melanesia, Polynesia, Micronesia, and Australia. The evidence suggests to Howells two ancient population complexes: that of what he calls old Melanesia, extending into the Philippines as well as Australia, New Guinea, and other modern-day Melanesian islands, and the Proto-Mongoloids, diversifying later into all the island groups. Despite the great diversity of physical types in Oceania, Howells sees the ultimate derivation of these peoples from eastern Asia. In this volume as well as others, Howells is characteristically modest about his own substantial contributions of data and synthesis, preferring to emphasize the work of others and the problems that remain.

HUNT, J. McVICKER

Joseph McVicker Hunt, American psychologist, has contributed to education and public policy as well as to his own field. He has influenced psychology primarily through syntheses of a wide range of ideas and data suggesting new directions for theory and practice. His work has been characterized by broad scholarship, innovative integration of ideas, and a concern with the application of knowledge to practical social problems.

Hunt was born in 1906 on a farm in Scottsbluff, Nebraska, and attended local public schools. As an undergraduate at the University of Nebraska in Lincoln, he sampled many courses, including biology, sociology, and economics, but without a clear focus of interests or a career goal. Psychology was not then prominent at Nebraska, although the philosophy department since 1899 had had a laboratory of psychology. In 1928, when Hunt was a senior, J. P. Guilford returned to direct the laboratory and to teach the general psychology course. Hunt enrolled in it and his interest in psychology, sparked by the course, was solidified by Guilford's invitation to pursue graduate study in psychology as his assistant. Although Hunt's later work in psychology does not reflect Guilford's direct influence, a concern for measurement and empirical verification may derive from the two years of graduate work under him.

To complete his studies, Hunt went to Cornell University in 1931 to work with Madison Bentley and, two years later, received his PH.D. for research on characteristics of the process of observing. Bentley's theoretical orientation did not have a long-lasting influence on Hunt's thinking, but their encounter may have sustained Hunt's interest in the problem of the determinants of both adaptive and disorganized human behavior. A quest for factors affecting behavior, particularly in the long term, is reflected in most of Hunt's work. At Cornell he also enrolled in several courses in neuroanatomy and physiology. These courses gave him the background necessary to follow neurophysiological literature, which he continuously attempted to integrate

with theoretical formulations stemming from observation of behavior.

Hunt made his first major contribution to psychology while teaching at Brown University. He organized and edited a handbook in the field of personality psychology that was published as *Personality and the Behavior Disorders* (1944). This two-volume compendium brought together psychoanalytic understandings of human functioning with behavioristic formulations, research on experimentally-induced disorders in animals with interpretations derived from clinical work in psychiatric settings, and discussion of biological, organic determinants of personality with cultural and experiential determinants in an effort to forge a cross-disciplinary, scientific approach to the study of personality. The impact of this work resulted from the counterpositioning of topics and viewpoints within the covers of one book, not from any integrating section written by the editor. As a whole, the work embodied the view that human personality is amenable to systematic assessment, rigorous study, and deterministic understanding.

Hunt brought to this undertaking considerable experience beyond his graduate training. He had been a postdoctoral fellow at the New York Psychiatric Institute, where he had learned of different approaches to the study of personality, and at the Worcester State Hospital, where he had been exposed to a lively group of professionals who had recently emigrated from Europe. There he had expanded his knowledge of psychoanalytic theory, gestalt psychology, and the Rorschach technique. At St. Elizabeth Hospital in Washington, he had pursued his interest in various methods of psychiatric treatment and had continued his study of Sigmund Freud's writings. Most important, he had been influenced by the group at Yale University led by Clark L. Hull, and including John Dollard, Neal E. Miller, O. Hobart Mowrer, and Robert R. Sears, and had adopted their conviction that clinical insights into personality dynamics could be translated into propositions consonant with the drive-reduction theory of behavior and rigorously tested. *Personality and the Behavior Disorders* managed to convey this view.

The book was widely used in the growing field of clinical psychology and brought Hunt recognition within the profession. He was elected president of the Eastern Psychological Association for the 1947/1948 term and of the American Psychological Association (APA) in 1950. He served as the editor of the important *Journal*

of *Abnormal and Social Psychology* from 1949 to 1955, and later was accorded various posts and honors in professional organizations. He received the distinguished contribution award of the APA's division of clinical psychology in 1973 and the G. Stanley Hall award of its division of developmental psychology in 1976.

In 1946 Hunt left the academic world to become director of the Institute of Welfare Research in New York. Believing sound evidence to be the best guide for policy, he proceeded rapidly to develop methods for assessing conditions under which social casework is effective (Hunt, Blenkner, & Kogan 1950; Hunt & Kogan 1950). It was one of the first attempts to evaluate the effectiveness of social intervention. In the process he discovered and disapproved of the political nature of social policy decisions and he began to look again to academia, moving in 1951 to the University of Illinois as professor of psychology. In later years his interest in the psychology of personality was expressed in collaborative work with Norman S. Endler on the conceptualization and measurement of personality traits (1968), but his main effort was directed elsewhere.

While still at Brown University, Hunt had begun work in the second area to which he has made significant contributions. He saw the possibility of using laboratory animals to investigate the effects of experience on behavior. With the collaboration of Harold Schlosberg and others, he carried out a series of studies on the effects of feeding frustration in infant rats on their later hoarding and eating behavior (Hunt 1941). The studies were designed with the implications of psychoanalytic theory clearly in mind. Although this research was interrupted by World War II and Hunt went on to pursue this issue through other means, the method of controlling the life histories of animals in order to study the effects of rearing conditions on later functioning became the mainstay of a lively area of research.

Hunt pursued the question of the role of experience in ontogenesis through a critical examination of the existing literature and through field research. In 1961 he published *Intelligence and Experience*, in which he marshalled evidence against the twin assumptions that the level of adult intelligence as measured by the intelligence quotient is fixed at birth and that intelligence develops at a predetermined rate. In doing so, he brought together Donald O. Hebb's (1949) theorizing on the neurophysiological correlates

of information processing and problem solving with Jean Piaget's (1947) views on the course of cognitive development. From the evidence, Hunt argued for accepting the significance of continuous interaction between environmental demands and the problem-solving capacities of the organism, with optimal growth attributable to some degree of discrepancy between them. He suggested that intelligence might be usefully conceived as a hierarchically organized system of central processes involved in problem solving, processes that were constructed in the course of interaction with the environment. Since the optimal range and sequence of interactions for the development of intelligence has not been determined, he claimed that the potential level of average adult intelligence also remains unknown.

The viewpoint expressed in *Intelligence and Experience* differed considerably from the Hullian position on the attainment of competencies, but it did not merge with genetic structuralism either. Hunt seemed to be groping for a position giving greater importance to specific interactions with the environment than was acknowledged by structuralists, and one giving more initiative to the organism than was granted by learning theorists.

While reviewing the literature on the effects of experience, Hunt concluded that the prevalent conception of motivation needed revision as well. He came to recognize the limitations of the drive-reduction position, even though it meant a basic change in his own theoretical orientation. He tried to unite cognition and motivation through the concept of intrinsic motivation—that is, motivation inherent in information processing and action, independent of external reward. This conception was first sketched in 1960 and was elaborated in a Nebraska Symposium paper (1965) and in chapters of books published later. Hunt's concept of an active comparison process between input and internal standards resembles the notions of dissonance, discrepancy, and incongruity that became current around the same time. However, his developmental perspective encouraged him to consider the epigenesis of intrinsic motivation and permitted him to find a way to reconcile a feedback mechanism with hierarchically ordered change.

The study of the literature on the effects of experience led Hunt to make a major commitment to the field of developmental psychology. From his base at the University of Illinois, he began with students and collaborators a program

of research into cognitive and motivational development during infancy and early childhood. The search for opportunities to introduce development-fostering experiences experimentally led him to undertake a research project at an orphanage in Iran, where sequential groups of infants could be provided with progressively modified living régimes. The progress made by children growing up under different conditions was assessed not by psychometric tests, but by a set of ordinal scales constructed to permit evaluation of development in different domains of functioning (Užgiris & Hunt 1975). The results obtained in these studies convinced Hunt of the plasticity of early development, not only in terms of over-all rate but also in terms of a selective effect on specific aspects of competence (Hunt et al. 1976). He explicitly rejected Arnold Gesell's (1946) stress on maturational control of behavioral development and implicitly questioned Piaget's notion of holistic stages in early functioning.

On the basis of the evidence for behavioral plasticity, Hunt suggested that the concept of a "norm of reaction" used in genetics was of much greater potential value to psychologists than the concept of heritability. Not only did he reject Arthur R. Jensen's (1969) conclusion that individual differences in intellectual functioning are largely genetically determined, but he also argued that psychology lacks knowledge about the range of achievements open to particular human genotypes. In 1967, as a result of his increasing concern with the educational aspects of child rearing, he changed his position at the University of Illinois to become professor of psychology and early education.

Intelligence and Experience was perhaps Hunt's most influential work. It acted as a catalyst on research concerning intellectual development, in shifting the orientation from psychometric to Piagetian. Moreover, it indicated the need for an educational psychology of infancy and early childhood, apparently the period of the most rapid intellectual development. Its implications matched the national inclination in the 1960s to do more for the poor and the underprivileged. When Project Head Start was launched, Hunt was drawn into the national advisory network for early education. In 1966 he was invited to chair President Lyndon B. Johnson's Task Force on Early Childhood, which in its report "A Bill of Rights for Children" recommended such subsequently implemented programs as neighborhood parent and child centers

and Follow Through classrooms (White House Task Force 1967). In 1967/1968, he served as director of the National Laboratory for Early Childhood Education Coordination Center. He continued to write and lecture on the relation of experience to development and educational achievement in school. A selection of these papers was published as *The Challenge of Incompetence and Poverty* (1969).

Throughout Hunt's career, theory and practice were intimately related. He used incidental observations to confront theoretical beliefs, and he was mindful of the practical implications of theoretical ideas. When he was working on the psychology of personality, he was also involved in devising ways to assess the outcome of the interventions that constituted psychotherapy and social casework. When concerned with the study of intellectual development, he was also involved in the evaluation of educational programs for infants and young children. His influence comes largely from breadth of perspective, a willingness to modify his beliefs on the basis of evidence, an ability to integrate and reformulate existing information to suggest new paths for the field, and, not the least, from enthusiasm about the value of psychological knowledge.

J

JAKOBSON, ROMAN

Roman Jakobson was born in Moscow on October 11, 1896. In 1914, he enrolled in the philological faculty of Moscow University, where he joined a number of fellow students in founding the Moscow Linguistic Circle, of which he was president from 1915 to 1920. The circle included among its members persons from a variety of backgrounds: linguists, philosophers, students of literature, and several poets. Its purpose was "the elucidation of linguistic problems of both practical and poetic language as well as questions of folklore and ethnology" (*Selected Writings*, vol. 2, p. 531; hereafter cited as *Writings*). In the 1920s, the circle's interests became more literary, and together with the Society for the Study of Poetic Language in Leningrad, it was instrumental in the development of the important school of literary criticism known as Russian Formalism (Erlich 1955, pp. 44 ff.).

With regard to linguistics, the circle represented a reaction to the then dominant neogrammarian school, which had come into being in the late 1870s in the wake of a number of spectacular breakthroughs that clarified many obscure points in the phonological evolution of the Indo-European family of languages. These advances so deeply impressed workers in the field that for close to half a century the majority of linguists devoted most of their energies to the search for sound correspondences among cognate languages and to the reconstruction of forms in temporally ever more remote protolanguages. With the passage of time, attention naturally began to shift to those many other aspects of

language that had been slighted during the preceding period. Jakobson and his colleagues in the Moscow Linguistic Circle were among the scholars to whom the questions left unanswered by their teachers and their predecessors appeared more interesting than what was already known. Looking back in 1962 to this early period, Jakobson wrote: "Though the linguistic textbooks of our college years used to define language as an instrument of communication, chief attention in these manuals was paid to the pedigree [historical origins] of its *disjecta membra*. No answer appeared to the crucial questions: how do the diverse components of this tool operate? What is the multiform relationship and interplay between the two sides of any verbal sign—its sensuous, perceptible aspect . . . *signans* . . . and the intelligible or, properly, translatable aspect . . . *signatum* . . . ?" (*Writings*, vol. 1, p. 631). Since the linguistic literature was silent on these questions, the young researchers were forced to look elsewhere, and it was the experimental procedures of the avant-garde artists of the 1900s that provided Jakobson with a clue to the answers to these questions. He was particularly impressed "by the pictorial theory and practice of cubism, where everything is based on relationship and interaction between parts and wholes, between color and shape, between the representation and the represented" (*ibid.*, vol. 1, p. 632). And it was in the study of the productions of the Russian poets, especially those of Velemir Khlebnikov and Vladimir Mayakovsky, whose bold linguistic experiments were the counterparts of the cubists' experiments with visual forms, that the new

methods were first developed and tested. According to Jakobson, "poetic language, disregarded by neogrammarian doctrine but presenting the most patently deliberate, goal-directed, and integrated linguistic species, was a field that called for a new type of analysis and particularly required us to study the interplay between sound and meaning" (*ibid.*, vol. 1, p. 633).

What attracted Jakobson's immediate attention in the linguistic experiments of the poets was that not all phonetic components were treated on a par, but that a special status appeared to be assigned to those sounds and sound qualities which by themselves were capable of signaling that two utterances represented different words. (Ferdinand de Saussure had made similar observations in his lectures in the early 1900s. Jakobson became acquainted with Saussure's ideas in 1917 through the reports of the linguist Sergei Karcevsky, who had studied in Geneva.) This distinction among phonetic entities provided Jakobson with the means to overcome the apparently endless accumulation of facts without rime or reason that characterized the study of the sounds of speech (phonetics) during much of this period. It directly led to the recognition that each language had its own system of distinctive sounds, its own *system of phonemes*. It was these insights that led Jakobson, in his essays on Khlebnikov, to suggest that "phonetic texture does not deal with sounds but with phonemes" and "to examine the basic prosodic elements (of Czech and Russian verse) from a phonological angle" (*ibid.*, vol. 1, p. 633).

In 1920 Jakobson moved to Czechoslovakia, where he remained until 1939. These years saw the full development of his scientific genius. The 134 items in Jakobson's bibliography that were published between 1920 and 1939 include studies on all of the major topics that have occupied Jakobson during his entire career. They include studies on the theory of linguistics, especially phonology and linguistic geography, contributions to the historical phonology of various Slavic languages, synchronic descriptions of phonological phenomena in different languages, including also their prosody, inquiries into morphology, investigations of medieval Slavic culture and literatures, especially Old Church Slavonic and medieval Czech, studies in folklore, sociolinguistics, poetics (especially metrics), literary criticism, and essays on the film, painting, and the theater. In addition, Jakobson was instrumental in the founding of the Prague Linguistic Circle in 1926, of which he was vice

president for the first 13 years. Many of the most important theoretical papers of the period are to be found in the eight volumes of *Travaux*, published by the circle. Among them, a considerable number were by Jakobson. During this period, he was in close contact with Nikolaj S. Trubetzkoy, professor of Slavic philology in Vienna, who also participated actively in the activities of the Prague Circle. As the correspondence between Trubetzkoy and Jakobson shows, the two scholars exercised a profound influence on each other, especially in the area where both were to make their most significant contributions: the development of the modern study of the sounds of speech, phonology (Jakobson 1975).

Having tested the usefulness of the phoneme concept for the description of various poetic devices (rime, alliteration, meter), the natural next step was "to attack . . . that aspect of language, which had been traditionally monopolized by the neogrammarians," the phonological evolution of a language. The monograph *Remarques sur l'évolution phonologique du russe comparée à celles des autres langues slaves* (1929, in *Writings*, vol. 1, pp. 7-116) represents such an attempt. Rather than follow the procedure that since the neogrammarian days has been used in almost all studies of historical phonology and enumerate the reflexes of each sound of the protolanguage in its (more) modern descendants, Jakobson presents the phonological system of proto-Slavic and discusses each of the steps (and intermediate systems) through which the protosystem has evolved into that found in modern Russian, for what is most important in Jakobson's view is not the sounds themselves but the structure of their interrelation.

The idea that the sounds of a language are not just an arbitrary aggregate of entities, but constitute a system with its own imminent structure appears to have first been suggested by the American linguist, Edward Sapir, in his 1925 essay, "Sound Patterns in Language" (*Selected Writings* . . . 1949, pp. 33-45). Jakobson and Trubetzkoy read this paper in 1928 and were much impressed with it (Jakobson 1975, p. 144). Like Sapir, they insisted on the importance of the patterns that were constituted by the phonemes of different languages. In a 1930 monograph, Jakobson wrote that phonemes constitute a system, and that even though a phoneme of one language may be physically identical with the phoneme of another language, the place that the two phonemes occupy in their

respective systems may be different (*Writings*, vol. 1, p. 151). While in Sapir the nature of the properties that made up the different patterns remained somewhat obscure, Jakobson and Trubetzkoy saw that the relationships between phonemes in different languages reflected well-known phonetic properties. For example, the consonant [č] as in *chew* differs from [j] as in *Jew* by the property of voicing, whereas [č] differs from [š] as in *shoe* by the property of affrication. They correctly pointed out that the same distinctive properties were to be found among other pairs of phonemes: e.g., [č] : [j] = [š] : [ž] = [s] : [z] = [f] : (v). It was noted that languages differed from one another with regard to the extent to which they illustrated particular contrasts. Thus, Russian differs from English in that it lacks the phoneme [j] and thus provides no illustration of the contrast [č] : [j]. Hence the position of [č] in the Russian consonant system is quite different from that of [č] in the English system. It was said in the 1920s and 1930s that the structure of the phonemic system of every language was determined by the oppositions (the distinctive contrasts) that its phonemes entered into. It was believed then that the oppositions themselves exhibited marked structural differences. Some, like voicing and affrication (the two contrasts illustrated above), were binary in that they admitted only two values: voiced : voiceless and affricate : fricative. Others like the so-called point of articulation, the place where the vocal tract is maximally narrowed in the production of the sound in question, could assume a multiplicity of values. The former (binary) oppositions were termed by Jakobson and other Prague school phonologists, correlative, whereas the latter (multivalued) oppositions were called disjoint.

While this relational model of the phonological system represented substantial progress over the traditional phonetic doctrines embodied, for example, in the international phonetic alphabet, it had a number of flaws. In particular, the oppositions utilized in the characterization of vowels were separate and distinct from those utilized in the characterization of consonants. There appears to be little motivation for this since both classes of speech sounds are produced and perceived by the same organs. Moreover, the distinction between disjoint and correlative oppositions, which has been introduced into phonology by Jakobson and Trubetzkoy, was more of a formalization of traditional practice than a move justified on its own grounds. In addition, Jakob-

son's studies of the utilization of phonetic features by the poets (meter, assonance, rime) had strongly suggested to him that binary features (i.e., correlative oppositions) occupied a special, privileged status. He, therefore, attempted to reduce all oppositions to a single binary type.

These efforts resulted in Jakobson's communication to the 1938 International Congress of Phonetic Sciences (*ibid.*, vol. 1, pp. 272-279), which breaks with an important tenet of almost all previous phonetic research that speech sounds are further undecomposable entities which can be characterized with the help of phonetic properties, much as chemical elements were once characterized with the help of such properties as valence, atomic weight, etc. Instead, Jakobson proposed that phonemes are nothing but complexes of features, much as chemical atoms are now seen as specific configurations of protons, electrons, etc. And just as the behavior of chemical atoms is directly determined by their subatomic structure, Jakobson shows that it is the feature composition of the different phonemes that determines their behavior in individual languages. Moreover, he uses the latter to make inferences about feature composition and about the nature of the features themselves where direct phonetic evidence is not unequivocal. Jakobson also shows that the multivalued dimension of points of articulations—the points of maximal constriction in the vocal tract—by means of which consonants have been traditionally classified can and must be replaced by a number of binary features and that this replacement results in a notable gain of exploratory power. Finally, he describes the hierarchical interrelations among features and directs attention to the need for a search for the invariant properties of the signal.

Although Jakobson's ideas, writings, and activities in connection with the Prague Linguistic Circle won him considerable international recognition, they also aroused noticeable opposition from older professional colleagues and administrators both inside and outside of Czechoslovakia. Because of this opposition it was only in 1937 that Jakobson received a tenure appointment in the Masaryk University in Brno (Jakobson 1975, p. 293, note 1). Jakobson was not fated to remain long in this position; the Nazi take-over of Czechoslovakia in the spring of 1939 forced him to flee to Scandinavia. He worked some months in Denmark, then proceeded to Norway, where he was warmly received by the local linguists and remained until the Nazi in-

vasion in April 1940, from which he escaped by walking across the border into Sweden.

It was in Sweden that Jakobson published *Kindersprache, Aphasie und allgemeine Lautgesetze* (1940, in *Writings*, vol. 1, pp. 328–401), his most popular and influential study. In this book, he attempts to justify further his conception of phonemes as complexes of binary distinctive features. In addition to the evidence previously adduced, Jakobson puts forth facts from the acquisition of language by children and its loss in aphasia. Jakobson argues that the facts of aphasia and language learning are governed by certain broad principles that imply that phonemes are complexes of binary distinctive features and that the same principles also account for the distribution of phonemes among the languages of the world. *Kindersprache* was not only an important step in the development of the theory of distinctive features, it was also one of the earliest linguistic studies of language pathology and in many of its insights anticipated the development of what now is known as neurolinguistics. Moreover, it continues to exercise a profound influence on studies of language acquisition by children, being widely quoted and discussed to this day (Luria 1977).

In June 1941, Jakobson came to the United States. Although structural linguistics had gained a firm position in the United States as a result of the work of Sapir and Leonard Bloomfield, the narrowly empiricist approach that became predominant in American linguistics in the 1940s contrasted sharply with Jakobson's flexible and far-ranging perspective, which excluded nothing from its purview on a priori grounds. These differences account in part for the rather inhospitable reception that was accorded Jakobson by some American linguists. An equally significant role was played by their concern—as one of them was to describe it years later—lest “positions (for which they had been trained and were eminently qualified) be snatched from under their noses and given to European refugees” (Hall 1969, p. 194, note 3). These “chauvinistic protectionists who launched quasi-ideological arguments in order to repress competition” (Jakobson 1973a, p. 17) contributed materially to the difficulties that Jakobson experienced all through the war years in obtaining a regular university appointment in linguistics.

Like several other European academicians who had taken refuge in the United States, Jakobson became a faculty member of the “uni-

versity in exile,” *École libre des hautes études*. Here, together with the Belgian Byzantinist, Henri Grégoire, Jakobson conducted a working seminar on the Russian medieval epic, the *Igor Tale*. This poem, which recounts a military disaster of a minor Russian prince of the end of the twelfth century, has come down to us in two late eighteenth-century copies of a single sixteenth-century manuscript which was burned in the Moscow fire of 1812. Certain contradictions and obscure statements in the account of the discovery of the burned manuscript prompted the French Slavist, André Mazon, to question the authenticity of the poem. Mazon suggested that like the Ossian poems published by James MacPherson and the archaic Bohemian poems published by Vaclav Hanka, the *Igor Tale* was a modern forgery. These doubts seemed unjustified to Grégoire and Jakobson, and their seminars at the *École libre* were devoted to a detailed examination of the questions raised by Mazon. These seminars showed that in the grammar and vocabulary of the poem, in its historical and geographical references, in its poetic conventions, in the customs and traditional beliefs reflected in it, and in its utilization of contemporary literary sources, there was nothing that was implausible or that conflicted with information available to us from documents of unimpeachable authenticity. Since much of this information was totally unknown in 1800, and since, moreover, there were serious flaws in Mazon's own argumentation, the seminar confirmed the authenticity of this masterpiece (*Writings*, vol. 4, p. 294; Grégoire, Jakobson, & Szeftel 1948).

The rapid expansion of Slavic studies in the United States that took place immediately after the end of World War II enabled Jakobson to obtain a regular professorship at an American university. In the fall of 1946 he became T. G. Masaryk professor of Czechoslovak studies at Columbia University. The cold war period of the late 1940s did not fail to affect him. He was denounced as an individual of doubtful loyalty by supporters of right-wing causes in America, whereas in the Soviet Union, where culture and education were suffering through the Zhdanov period, his activities were described in the following terms: “One of the founders of the structuralist direction in linguistics, R. Jakobson was in the beginning of the 1920s closely connected with the ‘Moscow Circle,’ which . . . was a fortress of formalism, that most reactionary

bourgeois movement which during the NEP years was attempting to poison the consciousness of the Soviet intelligentsia. It is significant that at present Jakobson has migrated to the USA, the stronghold of bourgeois reaction, the chief source of imperialist aggression" (Desnickaja 1949, p. 342).

In 1949, Jakobson left Columbia for Harvard University, where he taught until his retirement in 1967. From 1957 on, he held a concurrent appointment at the Massachusetts Institute of Technology. An immediate result of this move, which included most of Jakobson's graduate students at Columbia, was to give Harvard the leading Slavic department in the country. A large percentage of American Slavic scholars of the last quarter century were trained by Jakobson at Harvard, as well as a fair number of important linguists. What attracted students to him was not only his extraordinary knowledge, scientific imagination, and his dramatic lecture style; much more important were the close personal relationship into which he involved almost every one of his many students, the genuine interest he took in their scholarly efforts, no matter how elementary, and the assistance and encouragement he gave to all who came.

During the Cambridge period, he again took up work on several topics that had attracted his attention earlier. He extended his inquiries into Slavic mythology and folklore, and uncovered in this domain previously unnoticed relationships between the Slavs and other Indo-European peoples (*Writings*, vol. 4; Jakobson 1969).

Of even greater interest, though perhaps somewhat overlooked by the wider public, are Jakobson's contributions to sociolinguistics. These concern primarily the activities of the ninth-century Byzantine apostles to the Slavs, Cyril and Methodius. Jakobson showed that the apostles developed Old Church Slavonic as a separate liturgical language and fought successfully to have it recognized as the equal, for ritual purposes, of the three traditional languages of the Church, Hebrew, Greek, and Latin. This struggle, which anticipated by many centuries the linguistic battles of the Reformation, had enormous historical consequences, and furthered the religious, cultural, and political self-determination of Slavic peoples (Jakobson 1965).

Since the beginning of the 1960s, Jakobson has been publishing a series of analyses of poetic texts composed in a great many languages in different countries and time periods. The pur-

pose of these is to illustrate the crucial role that is played by the grammatic structure of the texts. These original analyses have elicited lively reactions from many quarters, from linguists and literary scholars as well as from writers and journalists. They have been especially influential in France, where a collection of these articles, plus a number of his earlier pieces on poetry, were published in translation in 1973 (Jakobson 1973*b*; *Writings*, vol. 5).

In the early years at Cambridge a very major part of Jakobson's research efforts were directed towards further development of the distinctive feature model that had formed the core of *Kindersprache*. What absorbed his particular interest in those days was the acoustic facet of the different features and the relationship between the acoustic signal and the motor events in the human vocal tract which produced the signal. Much of this information was being developed by Gunnar Fant, who at that time was working at the Massachusetts Institute of Technology. Fant worked out in great detail the systematic interrelationships between the articulatory gestures involved in the production of different speech sounds and the acoustical signal that these gestures elicit. In a special monograph Jakobson, Fant, and Halle (1952) catalogued for the first time these systematic interrelationships for all known phonetic features. The monograph also showed that the number of features that were required to characterize the sounds of all languages was quite small and that this same set of features was also fully adequate for characterizing the various rules in which speech sounds are involved. The last insight was of great importance for the subsequent development of generative phonology by Noam Chomsky, Halle, and others. Generative phonology was directly influenced by Jakobson in yet another respect. His 1948 account of the Russian conjugation (*Writings*, vol. 2, pp. 119-129), with its explicit recognition of the distinction between surface and underlying forms of words that are related to each other by means of a set of synchronic sound laws, provided an essential model for much subsequent work (Halle 1959; Chomsky & Halle 1968).

In the early 1950s there was great interest in the Boston scientific community in the ideas developed by the mathematician Norbert Wiener in his book *Cybernetics*, and in the formalization by Claude E. Shannon and Warren Weaver of the concept of information. Jakobson found in

these ideas much that was congenial. "I am convinced," he wrote in 1960, "that methods newly developed in structural linguistics and in communication theory, when applied to verse analysis, and to many other provinces of language, are capable of opening up wide perspectives for further coordinated efforts of both disciplines" (*Writings*, vol. 2, p. 579). Jakobson employed concepts of information theory in a description of the phonological pattern of modern Russian (*ibid.*, vol. 1, pp. 449–463), and he adapted the terms "code" and "message," and utilized them in discussion of linguistic phenomena (*ibid.*, vol. 2, pp. 130–148).

Communication is for Jakobson the nexus of all social phenomena, and with Claude Lévi-Strauss, he takes this insight quite literally: "One cannot but follow Lévi-Strauss's triadic conception that in society communication operates on three different levels: exchange of messages, exchange of commodities (namely goods and services), and exchange of women (or, perhaps, a more generalizing formulation, exchange of mates). Therefore linguistics (jointly with other semiotic disciplines), economics, and finally kinship and marriage studies 'approach the same kinds of problems on different strategic levels and really pertain to the same field'" (*ibid.*, vol. 2, p. 663). In Jakobson's scheme, linguistics occupies the central core because it deals with language, the human communicative medium par excellence. The science of semiotics deals with the communication of messages of all kinds, not only verbal messages, and thus includes linguistics as a special case; while the general theory of communication, the basis of all social science, studies exchanges of all kinds, not only that of messages, and includes, therefore, also anthropology and economics. Moreover, Jakobson sees important parallels between the genetic code and human language: "among all the information-carrying systems, the genetic code and the verbal code are the only ones based upon the use of discrete components which, by themselves, are devoid of inherent meaning but serve to constitute the minimal senseful units; i.e., the entities endowed with their own intrinsic meaning in the given code" (Jakobson 1973a, p. 50). He draws attention to a series of other similarities between the genetic code and the entities of phonology that lead him to the even more basic question: "whether the isomorphism exhibited by these two different codes, genetic and verbal, results from a mere convergence induced by similar needs, or whether, perhaps, the founda-

tions of the overt linguistic patterns superimposed upon molecular communication have been modelled directly upon its structural principles" (*ibid.*, p. 53).

JASPERS, KARL

Karl Jaspers (1883–1969), a German philosopher, was, for most of his career, professor of philosophy at the University of Heidelberg. After the end of World War II and the collapse of the Nazi régime, he accepted a professorship at the University of Basel in Switzerland, where he completed his career. He was a special target of the Nazis, largely because his wife was Jewish. They were, however, allowed to live in seclusion in Heidelberg throughout the period of the Nazi rule.

It is interesting that Jaspers came to philosophy from medicine and psychiatry. Before medicine, he had studied law at the universities of Heidelberg and Munich in 1901 and 1902. For the next six years, he studied medicine at the universities of Berlin, Göttingen, and Heidelberg. In 1908, he passed the state exam to practice medicine and in February 1909, he was registered as a doctor.

Jaspers could very well have made his career in psychiatry. As it was he wrote a general book, *Allgemeine Psychopathologie* (1913), which went through several editions and was importantly influential. This background is surely significant for the nature of his first major philosophical work, namely the *Psychologie der Weltanschauungen* (1919), which, however, was not a clinical study of personalities, although he did this for such figures as Strindberg, Van Gogh, and Nietzsche, but was rather a typological study of possible kinds of world view. One unsolved problem for the researcher is to define Jaspers' relation to Freud. In his writings, Jaspers makes relatively sparse references to Freud's work, and most of them are on the derogatory side. It seems likely that Jaspers never made a careful study of Freud and was not attracted to his ideas. Perhaps Freud struck him as too biologically oriented.

In the 1920s, Jaspers was one of the few most prominent personalities in the University of Heidelberg community. He particularly interested sociologists because he was a special ad-

mirer and had been a close personal friend of Max Weber.

Jaspers' place in philosophy is linked to the concept of existentialism. Perhaps his best-known book is *Reason and Existenz* (1935). It is notable that the translator and publisher retained the German form of the word *Existenz*, which Jaspers treated as definitely a technical term. The usual German translation of "existence" would be *Dasein*, which for Jaspers was quite different.

In terms of most classifications of "schools" of philosophy, Jaspers belongs in the German "idealist" tradition, but this statement needs careful interpretation. Basically he was a Kantian, and in that role he attempted further to develop some of Kant's most important philosophical approaches and leads. In any case he was clearly not a Hegelian idealist; indeed he speaks of Hegel as having "built a tower of Babel where everything was absorbed into a reason which now had a sense far beyond that of Kant. This reason is 'mysticism for the understanding'; . . . its philosophizing wanted to be the absolute knowledge of an evolving rationality of all Being, the unity of the rational and the irrational" ([1935] 1955, p. 154). He also repudiates the other two "classical" idealists, J. G. Fichte and F. W. J. von Schelling.

Central to Jaspers' position was his treatment of the subject-object relation and his attempt to maintain a very careful balance between them. Indeed his conception of mysticism, whose possible authenticity he does not dispute, is of a state, if it can be attained, in which the distinction disappears. Indeed he insisted that such states could not be objectively proven beyond the assertions of those who claimed to have experienced them—surely a Kantian position.

In connection with this problem, Jaspers presented an illuminating discussion of the relationship between positivism and idealism. He speaks of both as closed systems of thought which squeeze out the element of freedom that was so essential to Kant. He treats positivism as the attempt to "absolutize" the objective, and idealism as the attempt to absolutize the subjective, sphere. Jaspers explicitly repudiates both attempts at "closure" and assumes a definitely pluralistic position, leaving open many possibilities, but at the same time being careful *not* to undermine the centrality of the subject-object relation.

Jaspers' underlying position here seems es-

entially correct and exceedingly important. To a social theorist, however, his treatment of these issues is in some respects disappointing, as in his identification of positivism with "materialism" and mechanism. Surely the object world in the context of the sciences includes a much wider range of object types than the "mechanistic." Surely such scientific objects as organic systems, including human organisms, are not now properly called "mechanistic," and certainly what we call *action* systems are also capable of objectification.

Then there is a particular difficulty in the status of what are often called "cultural" objects, such as documents with meanings or works of art. Cultural objects are *always* the products of human action, but they may exist both as objects external to individual selves—that is, they are "externalized"—and can be "internalized," becoming parts of the personalities of human individuals. Thus Jaspers' writings are cultural objects that can be found and observed in books, but as studied and understood, they become part of the student's personality and hence "subjective" to him. Of course this problem area, which includes "motives" as well as cultural objects, involves the problem of subjective *Verstehen*, which was so important to Weber, and which is also discussed in a variety of ways by Jaspers.

When from the purely "mechanistic" level through that of organic systems we reach the level of action, which is in principle *Verstehbar*, there is a double involvement of the category "subjective." This is to say that what are, epistemologically speaking, members of a class of objects must, to be understood in the cognitive sense, be treated as having "meanings" to concrete human actors, meanings that can be grasped only through processes of *Verstehen*. It is this complication that makes it so essential, in the analysis of action phenomena, to distinguish clearly between the "point of view of the actor" and that of an "observer." This of course should not be interpreted to preclude self-observation and self-understanding by any given actor. Jaspers treats the latter problem area quite extensively. It would be illuminating to compare his treatment of this complex with that of George Herbert Mead on the one hand and Freud on the other.

In order to avoid the misunderstandings that may arise in this field, it is necessary to supplement the underlying conception of subject and object and their relationships with a classifica-

tion of *levels* of empirically existent reality or being, which can, through human cognitive processes, in Kantian terms, come to be treated as objects. Such a classification would have a hierarchical structure, starting with the world of physical objects and going on to the organic world. Then, with the level of action, "consciousness" emerges, and with it a "subjective" point of view. Furthermore, as Kant so clearly worked out, this classification implies a dual structure of the components, not only of empirical knowledge, but of "orientation" more generally—in the cognitive case the combination of sense data and what Kant called the "transcendental" component, here the categories of the understanding.

Although even Weber did not work out a satisfactory hierarchical scheme of the organization of the object world in this sense, both he and Jaspers, leaning on Kant, did think in closely related terms that can be readily linked with such a scheme (most fully presented in Parsons 1978, chapter 15). In Jaspers' version it involves three components that in turn are related to "levels" in the above sense. The two limiting categories are directly related to the distinction between positivism and idealism mentioned above. They are "empirical existence" (*Dasein*) and "spirit" (*Geist*). The intermediate, and in an important sense mediating, category is "consciousness as such" (*Bewusstsein überhaupt*), which was a famous category of Kant's.

In this three-fold schema, consciousness as such comes to focus in the category of cognitive function. It is the point at which "motivational" factors, which are in a special sense "psychological," meet with cultural factors, which are clearly transpsychological. Since Jaspers wrote, much has come to be understood about these relationships, especially through improved knowledge of language. In particular, there is one German word that is translated as "reason" or, sometimes, "understanding"—namely *Verstand*. This is the reference of Kant's categories and also of Weber's very central concept of *Verstehen*. In most German literature, *Verstand* is explicitly contrasted with the term translated as "reason" in Jaspers' title, namely *Vernunft*. There is an important sense in which this concept is the key to Jaspers' extension of his consideration beyond the object world, in the sense in which we have used that term.

This extension Jaspers works out through the use of the striking concept that he calls "the

Encompassing" (*das Umgreifende*). The central concept is that any formed or "structured" experience of Being (*Sein*), whether of objects external to the self or of subjective experience, implies that there are limits bounding the range of that "structuring," and the concept of a limit implies that what is beyond the limit is not simply "nonbeing," to use the current philosophical term. Jaspers' exploration of the implications of the limit and what can conceivably lie beyond it constitutes his most distinctive contribution.

In developing these themes Jaspers used a basically Kantian strategy, "relativizing" without losing anchorage in firm philosophical commitments. In this connection Jaspers' statement (some would say "outburst,") against Hegel, quoted above, is a major key to understanding him. He objected above all to *Absolutizing*. But his extended discussion of skepticism and nihilism makes it quite clear that his relativizing did not go over to a totally "relativistic" position. On both the subjective and the objective sides he held firmly to the view that structured—indeed we may say "institutionalized"—orientations could in principle be regarded as fully "authentic"; they should not—for example, in the case of scientific theory—be treated as "fictional," as these were treated by Alfred Schutz.

Indeed, there is a notable section in *Philosophie* (Jaspers 1932*b*, vol. 1, chapter 7) in which he discusses the relationships of philosophy to religion, the intellectual disciplines (*Wissenschaften*), and art. Here he carefully distinguishes philosophy from theology. The latter is part of a religious system, whereas philosophy should be regarded as independent. Similarly, philosophy is not the summary integration of our intellectual knowledge of the objective world, but is distinguished by a distinctive approach or "orientation." A philosophy, finally, is not a "work of art," though some philosophers have attempted to achieve that status for the discipline.

Jaspers' central formula for the distinctiveness of philosophy is its concern with *reflection* about the meaning of human experience, both of objects of the various meaningful categories, and of the subject—the philosopher himself as a human person. It is in this context that the concept *Existenz* fits. Thus reason as *Vernunft* is the boundary concept for reflection about the object side of the subject-object distinction, whereas *Existenz* is the boundary concept on

the subjective side. It is most definitely not confined to treatment of the self as object but transcends that. Indeed, Jaspers introduces the concept of transcendence to denote the "final" boundary in what can be called the "telic" direction, which synthesizes the objective and the subjective. It is as the summit of whatever is conceived to be transcendent in this sense that Jaspers treats the concept of God.

Jaspers considered the need for reflection in the above sense to be the most distinctive feature of philosophy in his time. He devoted the first chapter of *Reason and Existenz* to Søren Kierkegaard and Nietzsche, stressing that they had in common the relentless pursuit of reflective exploration of the human condition. He endorsed, however, not the final positions at which either one arrived, but, rather, approved the example they both set in their reflections on the meaning of experience.

Jaspers seems to have been consistent in maintaining that the problem of analyzing the "encompassing" arose at *all* of the limiting boundaries of human experience. Thus physical science faces the boundary problems of "cosmology," touching the origins, scope, and nature of the physical "universe," which are actively discussed in astronomical and philosophical circles. In biology similar problems have arisen and been actively discussed about the origins and nature of organic life, ranging from the most primitive microorganisms to the status of man as organic species and to the possibilities of organic evolution beyond the human level.

Then man, as conscious being with knowledge not only of the outside world but also of self, becomes the focus of the reflective endeavor. After all, his *awareness* both of himself and of the world external to him, which includes other human individuals, can be meaningful only from the "perspective" of the human condition, and indeed, "in the last analysis," of particular individual human beings. Relative to the positivistic components of our cultural background this is perhaps the predominant note, brought in with German idealism but greatly sophisticated in Jaspers' work. The "world" is not simply "given" to the human observer and experiencer but must be "processed" and interpreted in complex ways if it is to "make sense." Indeed many, like the nihilists whom Jaspers discusses, have come to the conclusion that the world is "absurd" and have abandoned the attempt to make sense of it.

This is by no means Jaspers' position. It is not fortuitous that in his important title "Reason" is placed first, before *Existenz*. Again in something like the Kantian sense, Jaspers was a "rationalist." However, he qualified his position in this respect very carefully. He definitely did not share in a variety of movements of this century that might be called "anti-intellectual"—for example some branches of phenomenology (reference has been made to Schutz on the fictional character of scientific theory.) Indeed, for him it was only through reason, as integrated with *Existenz*, that another phenomenon, which he called *Kommunikation*, was conceivable. This integration of course occurred in the individual, who in one sense and at one level was conceived to be unique and "alone," being at the same time in a position to relate to others—potentially not only other humans but other "sentient" beings. This potential for relating involved *both* levels of the English concept "reason," which are differentiated in German terminology, namely *Verstand* and *Vernunft*, and some kind of synthesis between them.

In other words, to Jaspers, the other, with whom one communicates, must be *object* as well as subject, and he who communicates must also be an object to others and to himself. Their common and mutual "objectness" is, precisely in the Kantian sense, an essential ground or condition on which they can communicate with each other. But the possibility implies an integration, not only through the categories of understanding, that is *Verstand*, but also as related to "transcendental" considerations, as *Vernunft*, and mutual awareness of each other at the level of *Existenz*.

Jaspers also holds that the boundaries between areas known and experienced and the encompassing which lies beyond them should not be regarded as fixed. They may shift with a wide variety of changes in human society or culture, including the "advancement of knowledge," and with new forms of subjective experience that would not ordinarily be called knowledge, such as philosophical reflection of the sort that Jaspers practiced. Such reflection, however, can also help men adjust to the many changes in significant aspects of culture and of the human condition that are continually occurring in complex societies.

Thus Jaspers maintained a careful and judicious balance in at least two related fields. The first was the very central relation between subject and object. The second was that be-

tween rationality and those aspects of the humanly significant world that must be classed as non- or irrational. This balance of course includes that between reason and *Existenz*.

Still another was the balance between openness and flexibility on the one hand and rigidity of crystallization on the other. The latter is in particular a danger of rationalistic theories, as in philosophy, and also of institutions. It is notable that Jaspers, in discussing such rationalisms on both the positivistic and the idealistic sides, refers to them as producing *Gehäuse*. This is the same word used by Weber at the end of his study of the Protestant ethic, which Parsons translated as "cage" and which has come into the English-language discussion in the term the "iron cage." Jaspers' warning about the dangers of rationalistic *Gehäuse*, however, should not be interpreted to mean that he advocated a Heraclitean doctrine that "all is flux" and that such concepts as structure should be abolished.

Finally, another balance Jaspers was careful to maintain in subtle and delicate ways was that between individuality and the collective aspects of the human condition, which in turn involves a balance between the "historically" unique, bound to particular times and places, and the universal or general, independent of such particularities. Only particular individuals can practice the art of philosophical thinking, though philosophical tradition has become a major component of human culture more generally.

A particularly striking expression of this theme of both individuality and historical temporality was Jaspers' statement that, from one perspective, thinking philosophically could be considered "a way of learning how to die."

In the years following World War II, Jaspers wrote a number of relatively public statements on the moral and existential aspects of that grandiose historic episode and the involvement of Germany in it. His writings in this vein attracted widespread attention, including in the English-language world through translations. His voice was a voice of sanity which was unhesitating in its condemnation of this episode not only in German but in world history. At the same time his was one of the most serious attempts to understand what had gone wrong and why.

In his career as a philosopher, rather than a psychiatrist, Jaspers was the author of two major works. The first, *Psychologie der Weltanschauungen*, may be regarded as marking the

transition between the two phases of Jaspers' career. The use of the term "psychology" in the title is not particularly felicitous. In any usual sense it is not a psychological study, but rather one at the "general action" level of possible types of "orientation" in the human situation to what, following Weber, Jaspers called problems of the "meaning" of being human.

The second major work was his three-volume *Philosophie*, the first volume of which was published in 1932, just on the eve of the Nazi takeover. As the most systematic statement of his mature work, it may be noted that the main aspects were incorporated in the subtitles of the three volumes: *Philosophical Orientation to the World*, *The Clarification of Existenz*, and *Metaphysics*; the latter deals mainly with his concept of transcendence. For purposes of general interpretation, Jaspers' one short book, translated as *Reason and Existenz*, is particularly useful.

It is appropriate, perhaps, to conclude with the remark that Jaspers has a special place as a social scientist's philosopher. He was very careful not to merge the philosophical and the scientific enterprises, yet at the same time to treat them as intimately interdependent. A good scientist, then, especially at the level of general theory, must be aware of, and acutely sensitive to, the philosophical order or problems that lie on the boundaries of his field and intertwine with it.

A further word is in order concerning the description of Jaspers as a "social scientist's philosopher." Jaspers' grounding of his position in the Kantian tradition has become the focus of a major "metatheoretical" controversy in the social sciences. The controversy centers on the challenge from phenomenology to what may be regarded as the "main line" of sociological theorizing associated with the heritage of Émile Durkheim and Weber. This challenge concerns above all the status of the "subjective point of view" in relation to what Weber called the *Verstehen* ("understanding") of the intentions of human actors. This was a central problem area in the German intellectual world of Weber's day and had a substantial influence on Jaspers' thinking. For example, Jaspers gave special attention to the subject-object relationship. Concern for the philosophical side of the "subjective" aspect underlay Jaspers' emphasis on the concept *Existenz* and its complicated context. This can be regarded as an attempt to provide a further philosophical grounding for Weber's position on *Verstehen* and its

many ramifications. Specifically, in relation to the phenomenological challenge, theoretically minded social scientists would do well to give careful consideration to Jaspers' writings.

JESSUP, PHILIP C.

Philip Caryl Jessup, born in 1897, has been one of the most esteemed and influential international lawyers of this century. As a professor of international law, a prolific writer, and a judge on the International Court of Justice in the Hague, he has produced studies and opinions on virtually all of the major issues in the international legal field. He has combined scholarship with active participation in public affairs, serving as a United States delegate to

the United Nations, as an ambassador-at-large, and as a prominent advocate of stronger international institutions based on law.

Jessup has not been a proponent of any grand theory; rather, in the common law tradition, he has addressed himself mainly to specific problems of current concern. In his writing and lectures, he characteristically relies on particular cases and on concrete facts to illuminate principles and procedures. He discusses cases with a relish for the odd fact and personal idiosyncrasies, conveying amid the abstractions and sonorities of legal doctrine, a sense of the strange ways of individuals. As a judge he went deeply into the facts of the case before him and into the origins and social function of the legal rules at issue. His presentation of concrete facts has often been accompanied by an emphasis on historical trends in law and society. He tends to perceive specific legal events in terms of evolutionary developments responsive to changing social needs and moral ideals. In this respect, a distinct teleological element is evident in his thought. The trends of international law are seen largely as a progressive development toward a more comprehensive and effective world legal order. The significant features of that world order include: recognition of the interest of the international community, protection of the basic rights of individuals, greater recourse to judicial procedures for resolving conflicts, the strict prohibition of the use of force except in self-defense, and the extension of international regulation in areas of interdependence. These social ends are virtually axiomatic for Jessup; he assumes their desirability and he is, on the whole, optimistic about their eventual adoption (Jessup 1948; 1959a).

Jessup's evolutionary optimism may be linked to the early influences in his career and to his personal involvement in the dramatic expansion of international institutions and international law in the period following World War II. Jessup's choice of a career in international law was suggested to him in 1918 by Elihu Root, America's most eminent international lawyer, a former secretary of state and a fervent advocate of international judicial settlement. Jessup was then a college senior, having returned to Hamilton College in upper New York state after service in the infantry in World War I. His war experience left him with a strong desire to take part in efforts to end wars. Root, then in residence on the Hamilton College campus, stimulated his interest in international law and put

him in touch with James Brown Scott, then editor in chief of the *American Journal of International Law* and an active proponent of international legal institutions. Jessup also consulted John Bassett Moore, the professor of international law at Columbia University Law School. Thus, even before entering Columbia Law School, Jessup received guidance and inspiration from the three acknowledged leaders of the field. These leaders shared a belief in the evolution of international society to a stage in which international law, and judicial and arbitral institutions in particular, would have the principal role in preventing war and settling disputes. At Columbia Jessup studied international law with Moore and Edwin M. Borchard, who was both scholar and practitioner, specializing in international claims. Jessup produced his first written piece, a note for the *Columbia Law Review* on maritime jurisdiction in regard to rum smuggling. That note led him later to select the subject of the law of territorial waters for a doctoral dissertation and his first book (1927). Thus begun, his interest in the law of the sea and related questions of resource exploitation remained with him throughout his career. After receiving a law degree in 1924 from Yale Law School (to which he had transferred for his third year), Jessup served as an assistant solicitor in the State Department under Charles Cheney Hyde. When Hyde returned to Columbia Law School in 1925, Jessup accompanied him and began teaching international law and doing graduate work toward a Ph.D. In 1927 he became a member of a New York law firm, an association that continued until 1943, although his activity in practice was sporadic. In 1929 he served as an aide to Root at the conference of jurists in Geneva on the revision of the Statute of the Permanent Court of International Justice. That same year he delivered lectures at the Hague Academy of International Law—an unusual distinction then for one 32 years old—on the exploitation of ocean resources (1929a). While on the Columbia faculty, he took leave in 1930 to serve as legal adviser to the United States ambassador in Cuba and later, during World War II, to work in the State Department and the United Nations Relief and Rehabilitation Administration (UNRRA) on postwar relief (Jessup 1944a; 1944b). Even earlier, Joseph Chamberlain of the Columbia faculty had stimulated his interest in international organizations. Jessup was an assistant to the United States delegation at the 1945 San

Francisco Conference on the UN charter. In 1946 he was named the Hamilton Fish professor of international law and diplomacy at Columbia University, a chair he held until 1960 when he became an "associate" of the Rockefeller Foundation. In 1947 he was appointed United States representative on the UN Committee on the Progressive Development of International Law and Its Codification, which drafted the plan for the International Law Commission. From 1948 to 1953, he also served as a United States representative at several sessions of the UN Security Council and General Assembly and as an ambassador-at-large (Acheson 1972). In 1960 he was elected by the UN to serve as a judge on the International Court for the period 1961-1970. After retirement from the International Court in 1970, he devoted himself to lectures, research, and writings; from time to time he gave legal advice to governments and private clients. He continued to play an active role in professional and scholarly societies, particularly in the American Society of International Law, of which he had been president (1954/1955), the curatorium of the Hague Academy of International Law, and the Institut de droit international, of which he was a vice president. Numerous honorary awards were bestowed on Jessup, and he delivered several series of lectures under distinguished auspices. These honors confirmed his long-standing preeminence in the community of American international lawyers (Kennedy 1962).

No account of Jessup's career would be adequate without mention of his extraordinary personal qualities. Endowed with a commanding presence, a resonant voice, a gift for direct and lucid expression, a lively mind, and human warmth, Jessup was a natural leader in conferences and organizations: "His wit, gay and ready, and his irrepressible humor would survive the longest and dullest meetings" (Acheson 1972, p. 6). He was much admired for speaking out on behalf of his ideals irrespective of governmental or popular attitudes. Within his wide circle of friends, professional colleagues, and students, he was known for generosity and innumerable kindnesses; he was always ready to devote time and effort to those who sought his help and counsel, and one must regard this as a significant part of his contribution to international law.

Jessup's intellectual contributions to international law fall into three categories. One category includes his ideas about the role of

international law, its aims, values, and historical trends. A second category contains his opinions on the content and interpretation of existing legal principles, rules, and concepts. In the third category are his ideas on measures and policies that should be taken to enhance the effectiveness of international law.

Within the first category, the most prominent ideas are those relating to the reality and social ends of international law, the application of the international "community interest," and the concept of transnational law. Jessup's concern with the reality of international law had a strong practical dimension. He felt that those who denied the reality of international law lacked practical knowledge of the workings of foreign offices and international bodies in numerous areas of interstate relations. Quoting Moore, Jessup observed that international law was as well observed as national law (Jessup 1948, p. 7), but he recognized that the absence of compulsory judicial settlement and the deep attachment to national sovereignty limited the use of law in international disputes. Although hopes for an early achievement of world rule of law were unrealistic, this did not mean that one should minimize the role of treaties and international custom in the conduct of the world's business in orderly and predictable fashion (Jessup 1959a).

Jessup's treatment of values in international law exhibits a sophisticated blend of positivism, idealism, and pragmatism. He is careful to distinguish positive law—the *lex lata*—from recommended or future law. In many of his writings, notably in *A Modern Law of Nations* (1948), Jessup was concerned primarily with indicating desirable future legal developments, making it clear that he was writing *de lege ferenda*. But it is noteworthy that he generally linked future law to concepts and ideals that had been accepted in existing law. Thus in advocating new rules and procedures, he related them to the principles and purposes of the UN Charter, especially those principles recognizing the equal rights of states and peoples, respect for the dignity of the individual, and the obligations of peaceful settlement and collective security. There was, therefore, no sharp break between existing and proposed law. Existing law was itself an authoritative source of the ideals that had been validated by international consensus and that therefore served as a basis for new law. Jessup also turned to those ideals for guidance in interpreting existing law, thus

transcending strict positivism. He did so with lawyerlike caution, aware that broad principles of social ends cannot be pressed too far without losing the consensus on which their authority rests. He was also conscious that in many cases conflicting principles had to be satisfied. These essentially pragmatic concerns led him, especially in his judicial opinions, to devote considerable attention to the particular facts of the case at issue and to the social function of rules in that and similar cases. Instructive examples of Jessup's treatment of the facts and of his functional approach can be found in his individual opinions in the International Court cases on the North Sea continental shelf (International Court of Justice 1969, pp. 67–84) and on Barcelona Traction (International Court of Justice 1970, pp. 162–221).

Illustrative of Jessup's careful value-oriented approach is his advocacy and use of the notion of the international community interest. In presenting the concept he observes that the basic idea was expressed in 1915 by Root, who called for a change in the legal theory that an international wrong could be redressed only at the instance of the nation injured. Root had argued that the maintenance of the international order was a community interest and that law violations that threaten peace and order should be treated as injuries to all on the analogy of domestic criminal law. Jessup suggested that Root's projected idea of community interest was adopted in some degree in the UN Charter, which allows all states to take up threats to peace and security (Jessup 1948, p. 11). He noted, however, that the application and limits of the international community interest remain uncertain, dependent on future decisions by states and international tribunals. Later, as a judge in the International Court of Justice, Jessup traced the notion of community interest to Article 11 of the League of Nations Covenant and on that basis supported the right of members of the League to invoke the jurisdiction of the Court even though their own interests or their nationals were not affected (International Court of Justice 1962, pp. 387–436). In the subsequent phase of the same case on southwest Africa, Jessup concluded (in a dissenting opinion) that the condemnation of apartheid by the General Assembly was decisive proof of contemporary international community standards which the Court had to take into account in deciding whether South Africa met its obligation under the mandate to promote the well-being of

the inhabitants of southwest Africa (International Court of Justice 1966, p. 441). Jessup was careful to avoid the thesis that the General Assembly may create new law by majority resolutions; his view was that the repeated resolutions of the General Assembly (adopted by near unanimity) expressed the international community's attitudes, and that such contemporary community attitudes were relevant in applying a legal standard, such as well-being, laid down in an earlier treaty. Jessup thus sought to give legal effect to the strong views against apartheid held by nearly all states without endowing the General Assembly resolutions with general legislative character.

The importance attached by Jessup to the idea of the interest of the international community did not mean that he regarded all international communities as universal. Particularly in his later writings, he took note of nonuniversal "selective" communities, joined by common interest, geography, or shared values. These diverse communities have been and are increasingly the basis of new legal arrangements; notable examples are the European Economic Community and the functional groupings concerned with maritime and economic arrangements (Jessup 1964; 1973a). Though Jessup recognizes the expanding role of nonuniversal communities, he has continued to stress the universal character of the basic principles of the Charter and of general international law. Thus he argues for the universal application of the rule against the use of force (except in self-defense) and against the idea that armed force may be used in wars of liberation or by third parties in civil wars (Jessup 1973a, pp. 423–429). He also considers that the law of state responsibility for injuries to aliens has—and should have—universal application in its essential aspects, noting that abuses by powerful states typified by "gunboat diplomacy" have now been eliminated (International Court of Justice 1969, p. 164; Jessup 1973a, pp. 420–421). In regard to the law of the sea, he asserts the need for general rules to safeguard navigation, fishing, and environmental protection, but he accepts the necessity of nonuniversal arrangements to manage resources in particular regions. His general approach is strongly value-oriented, underlining what he considers to be universally accepted ideas of order, responsibility, and justice, yet recognizing that diversity and special conditions create many different kinds of international communi-

ties that must have their own interests and legal arrangements.

Jessup is also commonly credited with the concept of "transnational law," a term he did not invent but developed and popularized in his Storrs lectures at Yale in 1956 (Jessup 1956*b*; 1973*b*). Through that conception, Jessup sought to show that the international legal realm could no longer be compartmentalized into its two classic divisions of public international law, applicable only to relations among states, and private international law, governing choice of law and enforcement of national judgments in cases involving nationals of two or more states. The legal rules and processes applicable to situations that cut across national lines must now be sought in both public and private international law and to a significant degree, in new bodies of law that do not fit into either traditional division. As examples of the latter, Jessup cited the growing areas of European community law, maritime law, international administrative law, international law on war crimes, the law of economic development, and the emerging law applicable to multinational enterprises. Jessup's aim was not merely to chart the new fields of law but to underline the extent to which these new fields involve law directly applicable to the individual. Outmoded conceptions of international law as law applicable to states alone had to be modified, and the "mysteries" of the distinction between public and private law could not be allowed to determine the rights of parties (Jessup 1973*b*, p. 343). One significant consequence of increased recognition of "transnational law" has been the growth of law school courses and research concerned with international transactions, human rights, international economic law, and other subjects that are much broader in scope than the traditional law of state-to-state relations.

Jessup's interest in the widening scope of international law included particular emphasis on recognition of the rights of individuals. True to his evolutionary perspective, he saw the gradual progression of such rights as proceeding from relatively isolated cases of humanitarian intervention, through the adoptions of special treaties (as those on minorities) to the Charter obligation to respect and promote human rights, and eventually the more detailed covenants with provision for complaints by individuals. He maintained that the Charter articles 55 and 56 imposed obligations in regard to human rights and removed human rights from the exclusive

sphere of domestic jurisdiction (Jessup 1948, pp. 87-89). But he also foresaw difficulties in universalizing national practices, and he cautioned against efforts to extend American concepts to the rest of the world: "The human rights to be defined and protected must be considered not in a vacuum of theory but in terms of the constitutions and laws and practices" of all the states of the world (Jessup 1948, p. 92).

Throughout his active career, Jessup was an outspoken advocate of a wider use of judicial settlement by governments. No single subject occupied him more than the International Court of Justice. In addresses, editorials, and books, he explained why the Court should be used and he cited the many instances in which third-party settlement through the Court or other tribunals had been successful. He strongly criticized the United States for adhering to the self-judging reservation of the Connolly amendment (Jessup 1945). While there was at times almost an evangelical flavor to his advocacy of judicial settlement, he recognized that many disputes are best left to negotiation or mediation. His practical and specific approach led him to propose several measures to enhance the use of the International Court to a modest degree. He advocated the use of small special chambers by the Court to speed decisions and to accommodate regional or functional interests, for example, a chamber for African disputes or one for environmental issues (Jessup 1971, pp. 61-70). Knowing that governments are reluctant to submit to binding judgments, he proposed to increase the nonbinding advisory opinions of the Court by extending the right to request such opinions to the UN Secretary-General, the International Law Commission, and a small committee of the General Assembly. He supported a proposal under which the highest national courts would be able to seek advisory opinions from the International Court on questions of international law before such national courts (Jessup 1970, pp. 5-20). Although these proposals won favor in academic and professional circles, they have received little support from the major governments. They remain on the international agenda to await a more propitious climate for international judicial settlement.

Jessup's advocacy of international cooperation has also extended to proposals for international regulation and, in some degree, administration of areas outside of national jurisdiction. He sees the vast area of outer space as a *res*

communis requiring international administration to avoid national conflict and has advanced a similar conception for Antarctica (Jessup & Taubenfeld 1959). These proposals represent for Jessup an evolutionary advance from a decentralized system based on reciprocity to more centralized regulation on matters "which escape the old territorial realm of national sovereignty" (Jessup 1959a, pp. 140–153). Science and technology are seen as the moving forces in expanding the area of community interests and requiring international administration to serve the needs of all. Jessup does not attempt to demonstrate why or how the recognition of the common interest will prevail over conflicts of ideology or national interest. He rests his case on an assumption of rationality rather than a theory of historical causation. Whether or not his hopes are realized, his eloquent espousal of the "practical necessity" for international administration in the common interest may itself be a factor in influencing future decisions.

JOHNSON, HARRY G.

Harry Gordon Johnson was born in Toronto, Canada, on May 26, 1923, and died in Geneva, Switzerland, on May 9, 1977. During this relatively short life, he wrote prodigiously: 526 professional articles, 35 books and pamphlets, and more than 150 book reviews straddling a number of corners of intellectual concern in the theory and policy of economics. In addition, he edited 27 books and wrote for popular and in-

tellectual magazines. He had an immense impact on the economics profession, for this vast outpouring of publications was characterized not merely by creative insights, but also by the unique capacity to synthesize apparently untidy and unyielding masses of unrelated and abstruse contributions. Then again, his impact was enhanced by his ceaseless travels to conferences around the world, picking up and adding to the development of new knowledge and disseminating it in improved form, and by his willingness to lecture at the smallest campus or institute, for he perceived this as a professional obligation, no matter what the personal cost in time and health.

Johnson was a cosmopolitan economist, reflecting the richness of his own education and teaching career. He graduated from the University of Toronto in 1943, then spent a year at St. Francis Xavier University in Nova Scotia as acting professor of economics (at the age of twenty), to proceed, after military service in the Canadian infantry, to Cambridge, England, to take his B.A. in 1946. He taught the ensuing year at the University of Toronto, where he also earned his M.A., specializing in economic history, and then spent 1947/1948 at Harvard University. This was followed by a year at Jesus College, Cambridge, after which he was elected to a Berry-Ramsey fellowship at King's College, Cambridge, in 1949. He remained a fellow of King's, teaching also at the London School of Economics (L.S.E.), until he left for the University of Manchester as professor of economic theory in 1956. In 1959, he joined the University of Chicago as professor of economics; he later became the Charles F. Grey distinguished service professor of economics, remaining at Chicago until his death. However, he was soon to combine this with a chair at the L.S.E. (1966-1974) and then with teaching at the Graduate Institute for International Studies in Geneva (1976/1977).

These shifts in location and the associated changes in intellectual environment inevitably proved important in shaping Johnson's education as an economist. In particular, the years in Cambridge and Chicago were the most significant. For both campuses had, in addition to Johnson himself, remarkable figures in economics: Dennis H. Robertson, R. F. Kahn, Nicholas Kaldor, and Joan Robinson at Cambridge; Milton Friedman, George J. Stigler, and Theodore W. Schultz at Chicago. The strong pro-

fessional and political views and interests of these major economists undoubtedly deepened Johnson's interest in developing theory as a tool of policymaking as well as his disdain for logically imposing but irrelevant theoretical constructs. At the same time, they certainly influenced the evolution of his own views and attitudes toward the various approaches to economics, resulting in his eventual antipathy to Marxist viewpoints and to the economics of the New Left.

How does one present in a few pages a set of writings whose major characteristic is the extraordinarily broad scope of its topics? Topics that range from the history of economic doctrines to the economics of the price of gold; from the theory of international commodity agreements to the theory of preferences and consumption; from an analysis of Keynesian economics to the theory of income distribution. They cover, too, the economics of reparations, public goods, common markets, monetary reform, basic and applied research, the brain drain, poverty and opulence, bank mergers, the North-South relationship, student protest, the multinational corporation, universities, libraries, the international monetary union, dumping, smuggling, speculation, bluffing, patents, licenses, innovations, and reversed welfare and revised transfers; the theories of growing productivity and balance of payments, tariffs, excise taxes, inflation, index numbers, nationalism, advertising, the demand for money, distortions, money and economic growth, effective protection, and human capital; analyses of the efficiency of monetary management, minimum wages, the infant-industry argument for protection, the role of uncertainty, income policy, mercantilism, equal pay for men and women, monetarism, buffer stocks, and legal and illegal migration; economic policies for Canada, Britain, the United States, and developing countries; the state of international liquidity; the relationship between planning and free enterprise; the choice between fixed and floating exchange rates; and the monetary approach to the balance of payments and the exchange rate.

Four areas of interest and impact, clearly the most important, deserve to be highlighted: the pure theory of international trade, macroeconomics, international monetary theory, and writings on economic policies and issues of political economy.

Johnson's work on the pure theory of international trade constitutes perhaps his most im-

portant scientific contribution. That trade theory clearly established him as a leading theorist is evident from his papers in *International Trade and Economic Growth* (1958). Characteristically, his work in this area revealed an uncanny and quick perception of the importance of a new idea, and a remarkable ability to shape it into a major contribution of his own that would catch everyone's imagination. Thus, for example, he saw early on the significance of the idea of effective protection (1965*b*). In the theory of optimal policy intervention, he discerned the apparent discrepancy between the use of a production tax-cum-subsidy and the use of a tariff. He showed perceptively (1965*a*) that the former was suited to a production-augmenting objective and the latter to a trade-restraining objective. Again, when the theoretical literature on incorporating illegal transactions into general equilibrium theory began in the early 1970s, Johnson immediately developed interesting extensions of the current analysis into such questions as the effect of smuggling on the optimal- and maximal-revenue tariffs. Moreover, his important and highly original papers on the theory of trade and growth (1953*a*; 1954), written at the time of the dollar shortage after the war, addressed the issues from the viewpoint of differential growth of productivity among trading countries, and put the entire theoretical discussion into a form that dominated the work of trade theorists for years.

His writings on the general equilibrium analysis of international trade include two influential companion articles on income distribution (1959*b*; 1960*b*). Among his best writings on the theory of trade, however, are those that belong to what James E. Meade called the theory of trade and welfare. Here, mention must be made of at least four analytically basic contributions which, at the same time, have had considerable impact on policy discussions. These are his papers on optimum tariffs and retaliation (1953*b*); the cost of protection and the scientific tariff (1960*a*), building on his earlier work measuring the gains from trade; optimal trade interventions in the presence of domestic distortions (1965*a*); and the possibility of income losses from economic growth of a small, tariff-distorted economy (1967*c*).

Written in the first flush of his youth, the paper on optimum tariffs and retaliation is a splendid piece of theorizing: subtle, elegant, economical, and addressed to an important policy problem. Basically, Johnson analyzed whether a

large country could "get away with" exercising its monopoly power. If a foreign country retaliated, would any gain be left for the large country from its departure from free trade? If the country was worse off as a result of the retaliation than under free trade, the case for first-best departures from free trade would collapse completely: John Stuart Mill's celebrated exception to the case for free trade for a large country would no longer be tenable. What was at stake, therefore, was a truly significant cornerstone of the theory of trade policy. Tibor Scitovsky had argued, following on earlier writers, that retaliation would indeed leave everyone worse off than they were under free trade. Johnson used a Cournot-type of retaliation mechanism, in which each country imposed an optimal tariff in turn to show that a country could benefit more from imposing an optimal tariff than from free trade. From the perspective of Johnson's evolution as an economist, two things are notable: (1) This early vintage Johnson was clearly intrigued by analytical complexities that he found less interesting later: thus, he discussed at great length how the retaliation process could lead to a tariff cycle. (2) More interestingly, the policy implication of this early analysis is to resurrect the classic case for the exercise of monopoly power by a large country; Johnson's later writings leaned in the opposite direction, highlighting the great potential cost of departing from free trade.

This shift in Johnson's emphasis to the advantages of free trade is seen most directly in his work on the theory of optimal policy intervention in the presence of distortions and his work on the theory of immiserizing growth. In both instances, Johnson opposed the use of tariffs, utilizing the insights of the theory of second-best as applied to the problems of trade and welfare. His 1965 paper on distortions was built squarely on two propositions: (1) The only *first-best* case for tariffs was the Mill argument for exercise of monopoly power by a large country; and (2) The *second-best* use of a tariff to offset the distortion caused domestically need not be welfare-improving. This paper became a classic reference in support of free trade, reducing the argument for tariffs to a second-best case in the presence of all distortions other than that implied by the presence of monopoly power.

The later article on immiserizing growth (1967c) presented yet another influential and novel argument against protection. Johnson showed that if a small country grew subject to a distortionary tariff, it could experience real in-

come losses. He linked it to the case for an infant industry tariff, which often rested on protection-induced gains in technical efficiency in the industry, and concluded that the case was weak. If technical change in the protected industry was in fact the source of growth, the likelihood of immiserizing growth was enlarged. Equally important have been the subsequent applications of this contribution to (1) the question of measuring growth at world, rather than domestic, prices in trade-distorted economies and (2) the question whether tariff-induced capital flows would be welfare-improving.

Finally, Johnson wrote a paper on the scientific tariff (1960a), whose impact was in two areas: (1) the measurement of protection and (2) analytical propositions regarding optimal tariff structures. Johnson's influence on empirical work, on measuring the cost of protection, and on measuring the gains or losses to Britain from joining the European Economic Community was important, and he took pains to make his theoretical work in this area directly usable by econometricians. Thus, the Johnson who was interested in alternative measures of the gains from trade corresponding to the different Hicckian concepts of compensating and equivalent variation and their relationship to the historic Marshallian measure, was also successful in translating this into practical guides for measurement of the cost of protection and indeed carried out some of these empirical applications himself. Many of Johnson's contributions to the theory of tariffs and commercial policy are reprinted in his *Aspects of the Theory of Tariffs* (1971a).

Johnson's early contributions to macroeconomics were made during his tenure at Cambridge. In "Some Cambridge Controversies in Monetary Theory" (1951a), he clarified the essence of the controversy between the Keynesian and the Robertsonian approaches to such key issues as loanable funds versus liquidity preference, the saving-investment identity, and the Gibson paradox, and distilled and integrated complex issues into a coherent framework. His major contributions during that period, however, were his study of the implications of secular changes in United Kingdom banks' assets and liabilities as a result of the replacement of private by public debt (1951b), and his active participation in the discussion surrounding Britain's revival of monetary policy. Johnson was critical of the quality of British monetary statistics and argued that improved monetary

statistics were essential for a well-managed monetary policy. In "British Monetary Statistics" (1959a) he published his own laboriously constructed monetary aggregates for the period 1930–1957, which stimulated further research.

Johnson's move to the University of Chicago (to which he was invited as a "Keynesian" economist) marked an increased research interest in monetary theory. In the early 1960s, he wrote "The 'General Theory' After Twenty-five Years" (1961), the survey article "Monetary Theory and Policy" (1962b), and "Recent Developments in Monetary Theory" (1963b). These three articles, classics in the field of monetary economics, established Johnson's reputation as a mature scholar with broad scientific and historical perspectives. Johnson's survey suggested a list of issues that would benefit from further research and, in retrospect, this list served indeed as the agenda for research in the following fifteen years. One of the notable issues on the list was his early skepticism about the stability of the Phillips curve in the face of macroeconomic policies. His evaluations of the major developments in monetary economics (as of the early 1960s) have been influential and perceptive. These developments include the application of capital theory to monetary theory and the shift from a static to a dynamic analysis (1962c; 1967b). Following the pioneering analysis by James Tobin, Johnson's analysis of money and economic growth extended Robert Solow's neo-classical barter growth model to a monetary economy by considering the effect of changes in the rate of monetary expansion on the steady-state stock of capital and consumption per head when money is viewed as a consumer's and producer's good.

The dynamic context for the monetary analysis led Johnson to analyze the optimal rate of growth of the money supply (1969b; 1970). He noted that the typical analysis rests on the assumption that money does not bear interest and that the issue of the optimal money supply can be analyzed in terms of the efficiency of the monetary and banking organization.

As a result of his interest in the Keynesian revolution and his deep historical perspective, Johnson wrote his controversial article "The Keynesian Revolution and the Monetarist Counter-revolution" (1971b), which was first presented as the prestigious Richard E. Ely lecture in 1970 and was reprinted in *Further Essays in Monetary Economics* (1972a). This article is an exercise in the history of economic

thought and scientific evolution. Following Axel Leijonhufvud, he drew a sharp distinction between Keynes and the Keynesians, sharply criticizing the latter but not sparing the former. His continuing interest in the various aspects of Keynes and his economic thought resulted in a series of provocative articles, some of which appeared posthumously in his joint book with Elizabeth Johnson, *The Shadow of Keynes* (Johnson & Johnson 1978).

Johnson's major criticism of the Keynesian model was its failure to deal with the problem of inflation at the level of both economic theory and economic policy. He was extremely critical of the "sociological" noneconomic theories of inflation, as well as of price controls and income policy as the proposed remedies to inflation. His analysis of inflation was approached from the perspective of an international economist who views inflation (under a fixed exchange rate régime) as a global phenomenon, a proper analysis of which requires a shift of focus from the concept of monetary developments in individual countries to the concept of the aggregate world money supply (1972b).

Throughout his professional life, Johnson continued his research on international monetary economics. Three articles in 1950 set the stage for what later became the typical characteristics of his style of research: courage to take positions not always popular with others, the application of relatively simple economic techniques to a new range of problems with resultant important insights, and an unabashed love for geometry as a tool of analysis. He took an early stand against raising the price of gold in terms of all other currencies (1950a), analyzed the destabilizing effect of international commodity agreements on the prices of primary products (1950b), and produced an early diagrammatic analysis of income variations and the balance of payments (1950c)—an analysis that was conducted within the then typical Keynesian framework.

In his writings on the theory of the transfer problem, originally developed in the context of the postwar reparations, Johnson synthesized the earlier work of Paul A. Samuelson, Lloyd A. Metzler, Fritz Machlup, and James E. Meade, and demonstrated his philosophy that individual research effort is most productive when it utilizes the work of previous theorists as a foundation for new construction. Johnson's theme was that of "continuity and multiplicity of effort." In "The Transfer Problem and Exchange

Stability" (1956*b*), he proved that the problems of transfers and exchange stability are formally the same, and that all possible methods of correcting balance-of-payments disequilibrium can be analyzed effectively with the apparatus of the transfer problem. Almost two decades later (1974), he returned to the analysis of reversed transfers with greater emphasis on the monetary aspects of the problem.

Johnson's most important contribution to the understanding of international monetary economics is "Towards a General Theory of the Balance of Payments" (printed in 1958). His key insight here was his emphasis on the monetary nature of balance-of-payments surplus or deficit: "[A] balance-of-payments deficit implies *either* dishoarding by residents, *or* credit creation by the monetary authorities"; the former is inherently transitory and the latter has the obvious policy implication. As for policy, Johnson distinguished between "expenditure reducing" policies and "expenditure switching" policies. The originality of this article is all the more remarkable considering the intellectual environment in the mid-1950s, when to a large extent, the balance of payments was viewed as a "real" (in contrast with "monetary") phenomenon. This article may be considered the intellectual precursor of what 15 years later would be termed "the monetary approach to the balance of payments."

Over the years, Johnson focused increasingly on issues, with special reference to Canada (1962*a*; 1963*a*; 1965*c*). Johnson was a supporter of flexible exchange rates as revealed in "The Case for Flexible Exchange Rates, 1969" (1969*a*), which builds on Friedman's classic contribution but incorporates the important lessons from the literature on optimum currency areas. Thus, while he supported the move to a flexible exchange rate régime, he recognized circumstances under which a small country (like Panama) might be better off maintaining fixed parities.

His analysis of the international monetary system revealed his strength as a realistic political scientist. Monetary reform is not carried out in a vacuum; it is implemented or frustrated by representatives of independent nation-states, to whom international commitments are likely to be secondary to national commitments. This realization is reflected in his numerous commentaries on current international monetary crises, his doubts about the prospects of a stable European monetary union, his appraisal of the Bretton Woods system, and his article "Political Economy Aspects of International Monetary Re-

form" (1972*d*). He took a hard line on schemes designed to solve the international monetary problems by methods that would channel resources to less developed countries. Although he was aware of the unpopularity of such a stance, integrity and courage always dominated his position: "My reason for refusing to endorse such schemes is not that I am opposed to the less developed countries receiving more development assistance but that I think that no useful purpose is served by misapplying economic analysis for political ends" (1967*b*, p. 8).

As world inflation accelerated in the 1960s, Johnson recognized that in a world integrated through international trade in goods and assets, national rates of inflation cannot be fully analyzed without a global perspective: "I have become increasingly impressed in recent years with the conviction that the traditional division between closed-economy and open-economy monetary theory is a barrier to clear thought, and that domestic monetary phenomena for most of the countries with which most economists are concerned can only be understood in an international monetary context" (1972*a*, p. 11). This perception of world inflation, along with the analytical insights from his earlier work "Towards a General Theory of the Balance of Payments" (printed in 1958), paved the way for his work on the monetary approach to the balance of payments, which he viewed as the crowning achievement of his career. The intellectual roots of the monetary approach run back to the classic writers (David Hume and David Ricardo), and its early developments can be found in the work of economists associated with the International Monetary Fund (e.g., Jacques Polak). Johnson, however, along with Robert A. Mundell and other members of the International Trade Workshop at the University of Chicago, introduced new and significant dimensions to the approach. He was the most prolific writer and the most devoted contributor to the new approach, having been quick to understand the fundamental policy implications of the simple key proposition that the balance of payments is essentially a monetary phenomenon. Among these is the implication that balance-of-payments policies will not produce an inflow of international reserves unless they increase the quantity of money demanded or unless domestic credit policy forces the resident population to acquire the extra money wanted through the balance of payments *via* an excess of receipts over payments. He saw himself as a missionary, and he

took the lead in developing and disseminating this approach by encouraging and guiding theoretical and empirical research in this field in Chicago, London, and Geneva (Frenkel & Johnson 1976).

The evolution of the international monetary system into a régime of flexible exchange rates led to further extensions of the monetary approach and resulted in a new direction of theoretical and empirical research on the economics of exchange rates. Johnson stimulated much of the early research in the area and coedited *The Economics of Exchange Rates* (Frenkel & Johnson 1978), which contains some of the resulting work.

While the foregoing review of Johnson's major theoretical contributions amply shows the strong policy relevance of his best work, he also wrote directly on policy. He reacted quickly to major policy issues, as well as to theoretical developments. Thus, when the question of responding to the needs of the less developed countries became important during the 1960s, he published *Economic Policies Toward Less Developed Countries* (1967a), a comprehensive and masterly study for the Brookings Institution of foreign economic policy issues facing the United States in regard to the less developed countries. He analyzed such proposals as commodity schemes and preferential entry for manufactured exports of the less developed countries. The originality and independence of his thinking were further evident in many of his policy analyses, where he often departed from the conventional view. This is best illustrated by his work on the brain drain, where he was most influential, through his own writings (1964; 1967c) and those of his associates, in propounding the view that the brain drain might be welfare improving for the countries from which it occurred. This is one example of how, in his later years, his analyses increasingly questioned interventionist policies. Thus, the brain drain was beneficial rather than harmful; the multinational corporations were part of a non-zero-sum game, and so on. The United Nations Conference on Trade and Development, which addresses the less developed countries' problems and demands, and which he viewed benignly in the early 1960s, came under his withering criticism as he came to feel that professional economists, influenced by their sympathies for the poor countries, had been led into empathetic and nonscientific research on trade and development.

Three additional aspects of Johnson's work deserve mention. He was a humane social scientist, interested not merely in understanding social phenomena, but also in contributing to the improvement of well-being (1975a; 1975b). Moreover, he was a gifted teacher with a deep sense of mission and responsibility. He devoted great effort to the preparation of his lectures and always accepted a heavy teaching load. Some of his lucid and insightful lectures are published in *Macroeconomics and Monetary Theory* (1972c) and *The Theory of Income Distribution* (1973). Then again, he was widely respected as an editor, who demonstrated considerable judgment and a talent for recognizing and encouraging the development of original lines of thought. In addition, he was devoted to his sustained role as an editor of the *Journal of Political Economy*. He also served on the editorial boards of *Economica*, the *Journal of International Economics*, the *Review of Economic Studies*, and the *Manchester School*.

Many honors came Johnson's way. His combination of sociological insights with professional economic expertise, and the elegance of his style, made him a popular lecturer, and he was invited to deliver many of the prestigious public lectures in economics: the Ely lecture, the Wicksell lectures, the de Vries lecture, the Ramaswami lecture, the Johansen lectures, and the Horowitz lectures. He was president of the Canadian Political Science Association (1965/1966) and the Eastern Economic Association (1976/1977), chairman of the (British) Association of University Teachers in Economics (1968–1971), and vice president of the American Economic Association (1976). He was also a fellow of the Econometric Society, the British Academy, the Royal Society of Canada, a distinguished fellow of the American Economic Association and of the American Academy of Arts and Sciences. He was the holder of honorary degrees from St. Francis Xavier University, University of Windsor, Queen's University, Carleton University, University of Western Ontario, Sheffield University, and the University of Manchester, and was awarded the Innis-Gérin medal of the Royal Society of Canada, the prix mondial Messim Habib by the University of Geneva, and the Bernhard Harms prize by the University of Kiel (Germany) just prior to his untimely death. The Canadian government named him an officer of the Order of Canada in December 1976, a fitting tribute from his native country

for a fully internationalist economist who had brought great distinction to his discipline.

JOUVENEL, BERTRAND DE

For assessing Bertrand de Jouvenel's life and works, and the intimate relationship between them, the best tools are provided by the French writer himself. His major works of the 1960s and 1970s have the double merit of being future oriented and opening new avenues on the one hand, yet, on the other hand, referring explicitly to questions raised twenty, thirty, and sometimes fifty years before. Three books constitute a particularly useful introduction to his thinking, since they are collections of essays written from the 1950s to the 1970s, grouped according to themes: *Arcadie: Essais sur le mieux-vivre* (1968) deals with the quality of life, environment, and the nonquantifiable dimensions of economic life; *Du principat* (1972) deals, in a more classical vein, with problems of political philosophy, particularly the growth of governmental power in modern societies; *La civilisation de puissance* (1976a) deals essentially with the growth of technological power and man's mastery over nature.

Each of these three books contains a preface which, almost apologetically, acknowledges their lack of systematic character, but maintains their unity of inspiration. In the preface to *La civilisation de puissance*, Jouvenel wrote:

In the course of a long life, I was never capable of devoting myself to a particular "intellectual dis-

cipline": I was always fascinated by the phenomena of my time and the most diverse ones. Out of this dispersion of my attention, a certain idea of the civilization within which my life was unfolding tended to take shape in my mind. To present a synthetic view of it, would be an ambition beyond my reach. Besides, a mind which would be powerful enough to provide such a vision would risk imprisoning other minds within it: this is the drawback of large syntheses. This is why I do not regret my limits.

What I am inclined to do is simply to shed light on certain features of our civilization, features which became printed in my mind through successive encounters. (1976a, p. ii)

And in the preface to *Arcadie*, he wrote:

I speak here not as someone who aspires to the position of guide to the human caravan, but as a traveler among others, who signals pot-holes here and attractive panoramas there to his companions as they spring to his eyes, and without forgetting that his view is partial and selective. Perhaps a certain indiscipline qualified me for this role of explorer. This does not mean that my mind is repelled by rigorous modes of thought; to the contrary, I like these beautiful nets cast upon reality, but we all know that part of reality escapes every net, that there is no formulated knowledge which is not incomplete by definition. It follows, it seems to me, that the vision obtained through a system of definitions and measures must always be completed by views taken from outside the system. (1968, pp. 7-8)

The metaphor of the traveler exploring uncharted roads, announcing opportunities and dangers ahead, and looking back to assess whether directions chosen were the good ones, is indeed appropriate for characterizing Jouvenel's approach and experience. His life coincides almost exactly with that of the century; his social background, his literary style, and his personal experience all help make his intellectual approach and his published work highly unconventional by academic standards, yet all the more able to reflect the contradictions of an epoch.

Jouvenel was born in 1903, the son of Henry de Jouvenel des Ursins, a well-known French public figure who was an ambassador, a senator, an editor of a major Parisian daily, and, above all, a constant fighter for liberal causes, from the Dreyfus affair to the League of Nations, where he inspired the Protocol for the Peaceful Settlement of Disputes, which was ultimately to be rejected. Jouvenel's mother, Claire Boas, was the daughter of a Jewish industrialist. The

entire Jouvenel family was aristocratic, political, and literary. Jouvenel's uncle, Robert de Jouvenel, was the author of a well-known political pamphlet, "La République des Camarades," and his stepmother was the great novelist Collette. The idea of a Czechoslovak republic is presumed to have been spread in French circles through his mother's "salon," at which Thomáš G. Masaryk, who was to become president of Czechoslovakia, was a frequent visitor.

Jouvenel's early studies showed the eclecticism that would characterize his interests. He graduated in law and mathematics from the Sorbonne, but his interest soon turned to social and economic matters, particularly in the United States. His first important book, *L'économie dirigée* (1928), coined the term adopted in French usage for economic planning. The work starts with an insistence on the importance of the technological revolution for changing the nature of social life and ends with a discussion of the inevitable and desirable increase in the economic role of the state and its power to assess economic trends. Perhaps his most formative experience in social and economic matters was the great depression in the United States, which shaped Jouvenel's permanent horror of the human costs of unemployment and his preference for growth-oriented economic policies, and which produced, as well, *La crise du capitalisme américain* (1933), one of the major books interpreting the depression.

Much of Jouvenel's political thinking and activities in the 1930s revolved around the search for some kind of a French and European New Deal, capable of overcoming both the economic, political, and ultimately, the spiritual crisis, by calling the state to fundamental reform, and, above all, by uniting and mobilizing popular energies, particularly those of the young. This quest involved him in such efforts as the founding of a short-lived weekly, significantly entitled *La Lutte des Jeunes* in 1934, the support of Gaston Bergery, a precursor of Mendès-France, and even of Jacques Doriot, the former communist and future collaborationist leader. Although these activities seemed to fluctuate in direction, all had in common an attempt to overcome the rigidities of classic right and left thinking and to learn from new experiences, including those of the fascist states. This last aspect is particularly apparent in *Le réveil de l'Europe* (1938), as it was to be in *Après la défaite* (1941).

Jouvenel's main activity during that period,

however, was as a journalist specializing in international affairs; he was both one of the most influential diplomatic commentators and one of the most famous special envoys of the time. His interview with Hitler in 1935 was a world scoop. His books of the time—for example, *D'une guerre à l'autre* (1940–1941)—are based essentially on his newspaper chronicles.

The outbreak of World War II brought about a fundamental change. Dropping his journalistic activities, Jouvenel enlisted as a volunteer. He published still another political tract, *Après la défaite*, which was widely—and rather erroneously—interpreted as a call to France to learn the lesson of its victors, but then withdrew into scholarship. He published two studies of economic history, *Napoléon et l'économie dirigée* (1942) and *L'or au temps de Charles-Quint* (1943). At the same time, he engaged in resistance activities that soon forced him to quickly go into hiding in France and then to take refuge in Switzerland, where he remained for the first years after the war ended. This period seems to have marked the turning point of his career. He did resume writing political columns, this time in the Swiss press, dealing particularly with the fate of Europe in the postwar world, calling for moderation and hard work and warning against the excesses of left-wing ideologies that were prevalent in France at the time and that he felt could lead to the repetition of the evils of fascism (1947c). He also continued to write books evaluating current political, social, and economic experiences. Examples are his analysis of the Labour experience in England in *Problèmes de l'Angleterre socialiste* (1947b) and of the Marshall Plan in *L'Amérique en Europe* (1948). However, his major work shifted from journalism and concrete economic history to political philosophy.

Jouvenel's most voluminous and best-known work, *Du pouvoir: Histoire naturelle de sa croissance* (1945), was followed by *De la souveraineté: A la recherche du bien politique* (1955) and by *The Pure Theory of Politics* (1963). Despite their great separation in time, the three volumes follow each other logically. The second and least-known work, *De la souveraineté*, holds the key to the passage from the historical approach of the first to the analytical perspective of the third. The collection of articles entitled *Du principat* offers a further key to Jouvenel's thought on the nature and evolution of politics, as does his work on Rousseau (1947d, 1965).

Besides those of the youthful socioeconomic observer, glamorous international correspondent, and meditative political philosopher, two other roles established Jouvenel's position and influence in French and international cultural life. The first was that of social and economic expert and adviser. As a founder and chairman of the SEDEIS (Société d'Études et de Documentation Économiques Industrielles et Sociales) he may have helped more than any other man, through innumerable meetings, round tables, and publications, to acquaint French elites both with modern, particularly Anglo-American, economic discussion and with the broader social implications of economic policies. For years the SEDEIS bulletin combined extremely close coverage of economic events and trends with longer-range or theoretical speculations. Later these two orientations gave rise to two different publications: the *Chroniques SEDEIS*, continuing the running coverage of trends and events, and *Analyse et Prévision*. The latter is the fruit of still another pioneering initiative of Bertrand de Jouvenel: the encouragement and, to a great extent, the launching in France and in the West, of future studies as an organized intellectual enterprise. Jouvenel coined the term "futuribles" which provided the title, first of a series of studies published by the *Bulletin SEDEIS*, next of an international association, and then of a series of books, of which the most rigorous methodologically is probably Jouvenel's own *L'art de la conjecture* (1963–1965). His twin preoccupations—with broadening the scope of economics to the quality of life, and with positive utopias and visions of the future—led to *Arcadie*, based on essays written as early as 1957.

Jouvenel's last role has been that of the academic. During the early postwar period he was a frequent visiting professor, largely to British and American universities. In the 1960s, he was appointed an associate professor at the Faculty of Law and Economic Sciences of the University of Paris, where he was given the chair of social forecasting. He also taught the history of political thought, however, and from this teaching has emerged *Les débuts de l'état moderne: Une histoire des idées politiques au XIX^e siècle* (1976b), which, in a way, returns to the themes studied thirty years earlier in *Du pouvoir*.

This alone would show that Jouvenel's intellectual travels, if they have often carried him

away from well-charted roads, have been far from rambling. What, then, is their logic and what is his basic contribution?

First, as has been said of Charles de Gaulle, Bertrand de Jouvenel is a man "d'avant-hier et d'après-demain," of the day before yesterday and the day after tomorrow. Although he follows and analyzes the present, his peculiar mark is to see it in the light of the past and of the future. Jouvenel's background, style of writing, and, to some degree, themes point toward the past, when the power of the state was more limited and man's contact with nature more satisfying; yet his best-known contribution, along with *Du pouvoir*, may be the impulsion he gave to future studies and his constant preoccupation with the consequences of our present activities for the future of our planet.

Second, his contradictions, while reflecting different facets of his personality and different phases of his life (emphasis on dynamism and mobilization in his youth and on prudence and procedure more recently) express above all the contradictory or complementary features of reality itself. One of Jouvenel's greatest contributions is his warning about the necessity for countervailing measures to trends he considers inevitable or to policies he favors. As an economist, he is for increasing salaries rather than reducing prices, yet he warns against the dangers of the inflationary society. He has warned, successively, against insufficient and excessive quantification. He thinks that growth and the satisfaction of the consumer are the imperatives upon which our society is built, but that they risk destroying both nature and individual responsibility. He warns that politics cannot be reduced to institutions, that power lies above all in the initiative of men moving other men; but this reality, in his eyes, justifies all the more the advocacy of new institutions better able to contain abuses of personal power from above or the rise of personal power from below.

To Jouvenel, the theme of the development of power is a guiding theme in his thinking. He cites the development of the state as the theme of *Du pouvoir* and the increase in the forces used by human societies as the theme of *La civilisation de puissance*.

For his political thought, the important point is to recognize both the generality of the phenomenon and the crucial theoretical and practical importance of distinguishing between its various levels or dimensions. *Du pouvoir* is a

generalization of Alexis de Tocqueville's idea that the French Revolution, rather than breaking the absolutism of the state, further concentrated power in the hands of the state—a work that the French kings had undertaken and that would be pushed even further by Napoleon. In this monumental book, Jouvenel considers power as a living being, whose growth he examines through the ages, along with the justifications, revolutionary or other, which have accompanied its concentration. He shows how modernity does away with the moral, legal, and social restraints that traditional régimes put in the way of the concentration of power. However, Jouvenel does make a distinction—which he makes even clearer in further works—between the growth in the functions of the state, the growth in its power over men, and the concentration of this power in the hands of one man. This is why twenty years later, in *Du principat*, one of his most impressive essays, he insists that the broader the scope of power, the more it must be controlled, and the more inevitable the growth of the executive at the expense of the legislative and the judiciary, the more one must find, within the executive itself, new checks and balances that can come only from the bureaucracy. This would be embodied in what Jouvenel calls “a new constitutionalism,” a policy needed to check the growth of personal power, given the decline of traditional forms of representation.

The reason why this new constitutionalism has not been forthcoming is the change in the legitimation of power. Instead of being justified by the way it is used, power, Jouvenel claims in *Du pouvoir* and in *De la souveraineté*, has been justified in terms of its origins: popular sovereignty or ideological orthodoxy are assumed to legitimate any use of power. An even more telling aspect of the decline in the notion of the rule of law is what Jouvenel calls the change from *nomocracy* (rule of law) to *telocracy* (rule of goals). Modern governments are justified by the expectations they fulfill or the goods they deliver. This is what gives the state, which has the initiative of planning for growth and welfare, the edge over parliament and the judiciary, which enunciate universal laws or are the guardians of a permanent constitution.

Much of this change in the functions and power of government is due to the change in the nature of society. In this aspect of his analysis, the unity of Jouvenel's thought, despite its apparent dispersion, becomes apparent. Much of

it consists in drawing the consequences from three characteristics of our societies: they are complex, open, and moving. These tenets are what renders unfeasible a Platonic republic; socialism; a fascist or anarchist society based on the model of the small community; and any conception of the common good based on a blueprint pretending to regulate the whole of society. Moreover, any attempt to achieve perfect justice through the redistribution of resources or perfect community through common enthusiasm is conducive to tyranny. Only through the just behavior of individuals, through the reconciliation of initiative and procedure, of action and negotiation, can progress toward freedom and justice be hoped for.

An analogous duality between power and moderation characterizes Jouvenel's thought on economic and social matters. Here too, the basic question is that of the human consequences and the metaphysical implications of the technological revolution. In *La civilisation de puissance*, Jouvenel suggests calling our time “the era of Watt,” for of the three great events of the mid-1770s—the invention of the steam engine by James Watt in 1774, the publication of Adam Smith's *Wealth of Nations* in 1776, and the American Declaration of Independence—the most important is the first one. It signaled the passage from biological to physical force as the latter was harnessed to extend man's power over nature and society. This increased enormously man's ability to achieve goals he had always desired, but it also led him to become a prisoner of his own power rather than to use technology and economic efficiency to achieve consciously chosen aims for the improvement of the quality of life.

This theme may not be Jouvenel's most original. His peculiar contribution, beyond a general critique of man's enslavement by his own machines, is fourfold. First is his great attention to the role of the organization of labor, of research and development, and, more generally, of the conditions of efficiency in modern industrial economies. Second is his insistence on the sometimes voluntary, sometimes unconscious, narrowing of the horizon implied by the very methods that produce this efficiency. In particular, Jouvenel may have been the first to point out the misleading aspects of the notion of gross national product, which includes only quantifiable data and ignores whether they are productive or destructive; to criticize the monetary bias

of economic science and its ignorance of physical data; and to point out the necessity of including political economy in a broadly conceived political ecology.

Third, the latter preoccupation, which Jouvenel expressed as far back as 1957, leads substantively to a concern with the deterioration of man's environment, and to a call to people to become "gardeners of the earth." Finally, it also leads to a call for conscious utopias and to the importance of alternative models of the future, or "futuribles."

Jouvenel's two most abstract and general books are *Futuribles: L'art de la conjecture* and *The Pure Theory of Politics*. The unifying concept of the two works is probably that of decisions. What worries Jouvenel in both the growth of the state and the growth of technology is the progressive constriction of the area of choice for the individual. The only area in which modern man exercises his choice is as a consumer. But he cannot fulfill himself unless he participates in social and political life as well. And he cannot do that unless he coordinates his preferences and expectations with those of other men.

This is why a preoccupation with the future is so important. Society is a system of decisions; the problem is to make these decisions compatible with each other and thus to reconcile freedom, which means individuality, and predictability, which implies coordination. It is at this point that Jouvenel's practical preoccupation with making social, economic, and political decisions as transparent as possible, and his theoretical one, with showing the preinstitutional bases of politics, coincide.

Jouvenel identifies the basic political phenomenon, power, as "man moving man." But there are two distinct sources of power of men over men: what he calls "potestas," or power based on institutional authority, and "potentia," or power based on interpersonal influence. And there are two different styles and tasks of power: that of moving or mobilizing, that of the "dux," of the charismatic leader or that of the team, and that of regulating or reconciling, that of the "rex," the wise and benevolent judge, or the committee.

Ever since his youth, Jouvenel has been sensitive to the appeals and dangers of the former, and his *Pure Theory of Politics* reads like a prophetic message to established elites that more dynamic and less controllable forces are

again afoot. Increasingly, however, his preferences go to those who define their task as maintaining the fragile consensus on which liberal institutions are based, as well as man's fragile coexistence with his planet. But for both tasks, a reawakening of personal responsibility and a restoring of the affectionate respect of individuals for each other, their institutions, and their natural environment are the ultimate preconditions of legitimacy.

K

KAHLER, ERICH

Erich Kahler (1885–1970) can be described as a historian, a philosopher, a sociologist, and a literary scholar. His work embraced all these fields, and whether he wrote a historical analysis of the Prussian state or a literary analysis on the changing form of the novel in the twentieth century, he was always studying the role of the phenomena at hand in the evolution of humanity and of human consciousness. As a philosopher of history, he deplored the compartmentalization and specialization of scholarship in the twentieth century, and insisted that the intellectual's role was to synthesize the relationships between all facets of human experience.

Kahler's holistic and humanistic perspectives are best reflected in *Man the Measure* (1943), one of his major studies in the philosophy of history. In it, he surveys the development of the Western world, a development he sees as "representative of human evolution as a whole" ([1943] 1967, pp. 24–25). In the course of this survey, he attempted to define what is specifically human about human beings, to uncover the roots of the crisis he saw facing the world in 1943, and to use the knowledge so derived for creating the future of man.

Kahler defined man's exclusively human quality as the "*faculty of going beyond himself*, of transcending the limits of his own physical being" (*ibid.*, p. 11). The transcending process involves two major acts:

the establishment of these limits by detaching and discerning a non-self from a self, and the establish-

ment of a new and conscious relationship with the clearly conceived non-self by transcending self toward the non-self.

History as the evolution of the human quality, then, is the *successive development of these two acts or faculties of man*. In its early periods, human history is mainly the formation of the faculty of detaching and discerning. The later part of human history is the genesis and perfection of the quality of transcending. (*ibid.*, pp. 18–19)

In this perspective, human history breaks down into three major phases. In the first period, which reaches from man's primitive state to the end of antiquity, man completes the separation of the inner and outer worlds. In so doing, he leaves behind both his unity with the physical universe and his membership in what Kahler called the "pre-individual" community of tribe and species. As a fully formed human individual, man enters the second evolutionary phase, extending from the end of antiquity to the Renaissance, in which the intellect is completely liberated and the human individual completely freed from superhuman rule. The third phase, the modern era, is characterized by man's struggle toward a collective order, a "post-individual community," and toward "reintegration in a clearly conceived universe" (*ibid.*, p. 21).

Under the impact of capitalism and capitalistic means of production, the development of modern man has been toward ever greater collectivization and loss of individuality. Paradoxically, the human being no sooner reached the height of his individuality at the end of the Renaissance than he was forced to collectivize, economically and politically, to protect that in-

dividuality. The result—and a major cause for the crises of the twentieth century—was the formation of “private collectives,” which pit interest groups against each other and are governed by things for the welfare of things. Kahler called instead for “public collectives” governed by man for the welfare of man.

The intellectual's job is a revolutionary one. He must determine what the future demands and help to bring it about. “We cannot go back, we can only go forward; historical processes are irreversible. We cannot preserve, we can only conquer, and, in the face of change, reconquer what is worth preserving, thereby making it new” (1969, p. 13). The idea of revitalizing what is worth preserving is crucial, for in Kahler's view of history nothing is ever left behind. History is neither linear nor cyclical; it proceeds like a spiral, expanding and advancing yet also circling back on itself. Kahler's allegiance to the guiding ideas of the classical and Judeo-Christian traditions was deep and abiding, but his conception of the ideas of universal peace, justice, democracy, and brotherhood of man was not static or absolute. These ideas always had to be “made new.” In *The True, the Good, and the Beautiful* (1960), he wrote that “there is a certain constancy of basic values which, at a certain point of maturity, emerged into human consciousness, and subsequently, in the process of history, blended with changing forms according to changing circumstances” (1960, p. 11).

Given Kahler's background and education, it is not surprising that these ideas were part of his very nature and that his work represents a lifelong effort to realize them in thought and action. The son of a Prague industrialist, Kahler grew up in intellectual and artistic circles. He studied in Vienna, Berlin, Munich, and Heidelberg, receiving his doctorate from the University of Vienna in 1910. During his residence in Germany from 1912 to 1933 he was in touch with the Max Weber circle and was a close friend of Friedrich Gundolf. Later, in his emigrant years in Switzerland and the United States, he formed close friendships with Thomas Mann, and especially, with Hermann Broch. Broch and Kahler shared both a strong moral impulse and a “striving toward unity” that has been attributed to the Judaic tradition.

Humanity's need for unity in its thinking and institutions pervaded Kahler's life and work. Man has to understand himself, his past, and his present as a whole if he is to shape his future in a humane way. The “public” and “post-

individual” collective that Kahler projected for this future would have to be a product of all the intellectual disciplines working together and would have to be based on the idea of man as a constantly evolving, historically created entity.

KALDOR, NICHOLAS

Nicholas Kaldor is probably one of the most original and provocative theoretical economists of the twentieth century, as well as one of the most radical advisers on taxation policies to

many governments. His contributions to economic theory range over a wide field: from the theory of the firm to welfare economics, from capital theory, international trade, and tariff policy to trade cycle and economic growth theory and monetary and taxation policy. But he probably will be most remembered for his theory of income distribution and his advocacy of an "expenditure tax."

Nicholas Kaldor was born in Budapest, the son of a barrister, on May 12, 1908. His parents, Dr. Julius and Joan Kaldor, very much welcomed this son, as two elder sons had died in infancy. They brought him up in a relatively well-to-do Jewish family in one of the major capitals of central European culture during the splendid last stage of the Austro-Hungarian empire. This privileged childhood affected Kaldor's attitudes throughout his life and may help explain his exuberant, egocentric, and undisciplined character. In 1934, Kaldor married Clarissa Goldschmidt, who graduated in history from Sommerville College, Oxford. They had four daughters.

Kaldor's education was elitist in nature. He attended the famous "Model Gymnasium" in Budapest (from 1918 to 1924). Then, in 1925/1926, he attended lectures at the University of Berlin, but soon moved to London. In 1927-1930, he was at the London School of Economics (L.S.E.), where he graduated with a brilliant record in 1930. In those years the chair of economics was occupied by Allyn Young, an American from Harvard University, who had a great influence on Kaldor. Young died in the winter of 1928/1929 and his place was taken by the active, flamboyant Lionel Robbins, well known for his efforts to build up contacts with continental Europe, especially with the Viennese circle of Ludwig von Mises.

In the very early 1930s, the L.S.E. teaching staff was joined by the Austrian Friedrich A. von Hayek. These surroundings could not help but to enhance Kaldor's career. He returned, for short periods, to Budapest, where he met and became a friend of John von Neumann. In 1932, he was appointed to an assistant lectureship at the L.S.E. Among his colleagues were J. R. Hicks and Tibor Scitovsky. He remained at L.S.E., as a lecturer, and then as a reader of economics, until 1947.

The early L.S.E. years were for Kaldor a period of strict orthodoxy in the marginal economics tradition. His 1930s writings are on the problems that were under discussion at the time—mainly the theories of imperfect and monop-

olistic competition and the theory of capital. They immediately revealed distinct originality. It was Kaldor (1933) who gave the name "cobweb theorem" to the theorem, by now well known, concerning the conditions of market stability in terms of relative elasticities of demand and supply. Later, he proposed (1939) a "compensation of the loser's test," in the hypothetical event of personal income redistribution; it has since become known as "Kaldor's compensation test" in the literature on welfare economics.

The crucial turning point came with the publication of Keynes's *General Theory* (1936). Kaldor's reaction was slow, but it went very deep. It materialized at first in a change of interest, mainly from micro- to macroeconomic problems, then as a complete and radical change in thinking on all of economic theory. He first wrote a series of articles on macroeconomic problems, the most remarkable of which is "A Model of the Trade Cycle" (1940), that relies on nonlinear investment and savings functions to produce "limit cycles." The idea turned out to be very fruitful and was further developed by Hicks (1950) and Goodwin (1951). Later, the break with tradition became wider, and a parting with the L.S.E.—the major center of opposition to Cambridge University—was finally inevitable. Kaldor had definitely moved "into the opposite (Cambridge) camp."

Kaldor's contacts with Cambridge had begun in 1940, when the L.S.E. had moved there physically because of the war. But the favorable opportunity arose only after World War II. Kaldor spent two years in Geneva as a director of research at the Economic Commission for Europe, and had to leave the L.S.E. On his return to academic life in 1949, he joined the economics faculty of Cambridge University, where he was appointed a fellow of King's College (Keynes's own college). He then became a reader of economics and, in 1966, a professor of economics, a position he held until his retirement in 1975. During this period he also became economic and taxation adviser to an extremely large number of governments (India, Ceylon, Mexico, Ghana, British Guyana, Turkey, Iran, Venezuela), to some central banks, and to the Economic Commission for Latin America. But, most important was his position as special adviser to the chancellor of the exchequer of the British Labour governments during the eventful years 1964-1968 and 1974-1976. He was elevated to the House of Lords as a life peer in 1974, when he took the name Baron Kaldor of Newnham in the City of Cambridge.

At Cambridge, Kaldor did most of his mature work. He was one of the major authors—along with Richard Kahn, Joan Robinson, and Piero Sraffa—of what has become known as the post-Keynesian school of economic theory (see Eichner & Kregel 1975). Kaldor's original contributions, which are numerous, can be found in a series of polemical papers and in his three versions of a model of economic growth (1957; 1961; Kaldor & Mirrlees 1962). His major original contribution, however, is in a 1956 article, in which he proposes a "Keynesian" theory of income distribution. The theory is in fact distinctly Kaldor's, and has correctly been so-called since.

Kaldor's theory of income distribution is based on the idea that profit receivers have a much higher propensity to save than wage earners. Therefore, in an economic system in which entrepreneurs carry out investments that correspond to full employment, there exists a distribution of income between profits and wages that—owing to the differentiated propensities to save—will generate precisely that share of profits into national income that is necessary to sustain the predetermined investments. This macroeconomic theoretical conception of income distribution is reminiscent of David Ricardo's. But Kaldor reverses Ricardo's chain of causation. For Ricardo, wages were the exogenous magnitude (determined by the sheer necessity of workers' subsistence), and profits were a residual, or rather a "surplus." For Kaldor, profits take up the character of an exogenous magnitude (determined by the necessity of capital accumulation), while wages become a residual. The consequences are far reaching, both on a theoretical level—for a critique of the marginal theory of income distribution—and also on a practical level, because of its implications for taxation policy. It can be no surprise that Kaldor's theory was immediately the target of bitter attacks. There is by now an enormous literature on the subject, which developed further after the publication of a related article by Pasinetti (1962), concerning a long-run theory of the rate of profit.

Along lines parallel to those on income distribution, Kaldor developed his idea of an "expenditure tax," proposed in a book (1955), which has become a classic and has served as the basis for other major works on the subject (for example, Meade et al. 1978). Kaldor points out that the present tax system, based on personal *income*, is inequitable in many respects. People

who inherit private fortunes have enormous spending power without contributing to the state's needs. On the other hand, thrifty people are taxed twice—once on the income they save and a second time on the income they derive from accumulated savings. Kaldor proposes a radical change in the system so that people would be taxed not on their incomes but on their actual expenditures.

In the latter part of his life, Kaldor was increasingly involved in British politics. His position as special adviser to the chancellor of the exchequer brought him into contact with practically the entire economic policy of the Labour government. He was surprisingly successful in this capacity, especially on matters concerning taxation. He devised ways to reform in detail British tax policies—to detect loopholes and eliminate them. He also invented new taxes, such as the selective employment tax.

Not surprisingly, this activity made Kaldor unpopular with the British establishment, but he did not mind. He was firmly convinced of the inequitable and unjust distribution of income prevailing in capitalist societies, and he wanted to have the rich pay more and the poor less. Being in the fortunate position of belonging to a family with considerable private means, he was often hit, sometimes rather badly, by the very taxes that he had helped to devise.

Kaldor took a keen interest in the economic problems of less developed countries. He wrote at length on economic development, as well as on the reform of the international monetary system.

His involvement with practical economic policy led him, in the late 1960s, to look more and more at empirically observed correlations among economic phenomena, trying to discover theoretical hypotheses that might explain them. His inaugural lecture (1966) is an example of this effort. But he also attempted a new theoretical construction based on the idea that the "Keynesian" features of an economy apply only to its industrial sector, which enjoys increasing returns to scale, while alongside that sector, another sector, the primary sector, which provides food and raw materials, operates with "non-Keynesian" features and decreasing returns. These ideas are clearly reminiscent of Allyn Young's, whose lifelong influence is explicitly brought out, especially in Kaldor's 1975 article.

As will appear, even from this brief survey, Kaldor's original ideas are numerous. They are

scattered in a remarkably large number of articles, papers, notes, memoranda, and reports. Fortunately, at the end of his career, Kaldor was persuaded to collect his writings into a series of eight volumes (1960–1979). To read these books is extremely rewarding for any economist. Unexpected clever insights, unorthodox remarks, original ideas are disseminated everywhere, even in the most “applied” writings; they will remain a rich source of ideas for years to come.

Kaldor's attitude was much like that of such great economists as Ricardo and Keynes. He was an innovator in economic theory, with his mind always intent on concrete situations and actual applications. Like Ricardo and Keynes, he was not a revolutionary. But he was a great believer in reforms. He believed in the possibility of even single persons to modify situations and influence events. And he actually did influence events, or acted always as if he had a deep conviction that he did and could.

KALECKI, MICHAŁ

Michał Kalecki (1899–1970) earned an important place in the history of economic analysis by his anticipation of the Keynesian revolution and by his original contributions to the theory of economic dynamics. His ideas (even if sometimes not directly identified with him) have had a lasting imprint on diverse branches of modern economics. His theory of dynamics and fluctuations of national income and its partition between profits and wages is more general than the Keynesian system and more relevant to the contemporary scene.

John Maynard Keynes's epoch making *General Theory* was published in 1936. But, in 1933, Kalecki had already discovered the basic components of Keynes's analytical system. He avoided the distinction between macro- and microeconomic theories. He constructed his macroeconomic model on the basis of a more realistic theory of the firm that incorporated imperfect competition and income distribution as integral parts of his analysis. He elucidated the dynamic properties of the economic process and dealt with an open economy. His model provides a starting point for understanding the contemporary problem of simultaneous occurrence of inflation and recession.

Kalecki studied engineering at Warsaw Poly-

technic and at Gdansk Polytechnic, but never received his degree. In economics, he was self-taught. He worked independently and outside the mainstream of economic theory. His pre-1936 writings were mainly in Polish and those in English and French were highly technical. Soon after the publication of the *General Theory*, Kalecki visited Cambridge University and met Keynes and his group. Although Kalecki had informed Keynes's younger colleagues of his own prior publication, he never mentioned it to Keynes. In fact, Kalecki's precedence was publicly acknowledged only after Keynes's death.

Kalecki's contributions are of particular importance because of modern assaults on the Keynesian revolution. They include:

(1) The model of perfect competition used by Keynes was foreign to Kalecki, who dealt with imperfect competition and oligopoly. Kalecki's macro model in this respect has a more useful microeconomic account. To build a realistic theory, Kalecki explained how industrial prices are formed by markups on costs and distinguished between "cost-determined" and "demand-determined" prices. The markups depend on the relative strength of market imperfection and oligopoly, which he termed the "degree of monopoly." The intensity of the "degree of monopoly," together with other distributional factors, is a key for the determination of macro-distribution. The distributional factors are essentially pertinent to effective demand and to fluctuations in aggregate output and utilization of resources.

(2) Kalecki's theory of profits was based on the principle that wage earners do not save, but spend what they get, and that entrepreneurs get what they spend. Thus entrepreneurs' profits are governed by their propensity to invest and consume and not the other way round. Kalecki's treatment of the consumption function is attractive because his analysis is based on behavior patterns of classes rather than on a "fundamental psychological law."

(3) Kalecki's model not only described a wide range of economic phenomena, but it presented the economic process in motion—i.e., how one sequence develops from the preceding ones. The model encompassed long-run dynamics and the capacity effects of investments and some other supply considerations.

(4) Kalecki did not approach the theory of effective demand through the multiplier, but through the theory of the business cycle, which

established two basic relations: (a) the impact of effective demand generated by investment on profits and national income and (b) the investment decision function, where the rate of investment decisions at a given time is roughly determined by the level and the rate of change in economic activity at some earlier time. Kalecki's model is distinguished by his clear separation between investment decision and actual implementation. He used the investment realization lag to explain the cumulative character of expansionary and contractionary processes.

According to Kalecki, if the current rate of investment surpasses that of the preceding period, the level of current profit will rise, profit expectations will improve, investment demand will increase, and more orders will be placed. This will be followed by an increased rate of investment activity and enlarged income. The income generating capacity of investment is the source of prosperity and encourages a further rise in investment. But investment has also a capacity creating effect; every completed investment adds to productive capacity, competes with the stock of equipment of older vintage, and discourages further investment. Sooner or later investment stops rising and so does the level of current profit. The rate of profit falls. The rise in investment is transitory and the boom cannot endure. A process of cumulative contraction takes place. Thus the growth of national wealth contains the seeds of retardation.

Kalecki modified, reformulated, and improved his business cycle model many times, seeking to bring it closer to reality. While his earlier writings were clearly influenced by the severity of the depression of the 1930s, his subsequent development of the argument made allowances for the relatively weak impact of the capital destruction effect. He introduced a certain "corrective"—a trend factor that shifts investment upward as the cycle continues. In a growing economy investment fluctuates along the long-run trend line. Innovations raise the prospects for profit, thus stimulating investment and engendering an ascending trend. Innovation becomes another weighty factor in the determination of the investment function, together with the change in the rate of profit, the rate of change in the stock of capital, and the "internal" gross savings (depreciation and undistributed profits) of firms.

In recasting the argument Kalecki continued his search for a more satisfactory formulation of the investment function, allowing for reper-

cussions of technical progress on the dynamic process as a whole. He sought to develop a theory integrating growth and cyclical processes. While he never reached a fully satisfactory solution, the investment function he initially propounded, and his analysis of the capital stock adjustment mechanism, provided the basis for modern business cycle theory and closely foreshadowed many contemporary developments in econometrics.

(5) To Kalecki the key prerequisite for becoming an entrepreneur was the ownership of capital which determined the amount of outside finance that could be secured. Moreover, entrepreneurs tend to be unwilling to use their full borrowing potential because the risk increases with the amount invested. In the case of a bad investment, the higher the ratio of borrowing to the entrepreneur's own capital, the greater is the decrease of the entrepreneur's income or the risk of wiping out his equity. These considerations cannot be ignored in the theory of investment decisions and in the analysis of factors circumscribing the size of the firm. Such decisions are related to the firm's "internal" accumulation of gross savings. These savings allow the firm to make new investments without facing the problems of the limited capital market, or "increasing risk."

(6) Kalecki dealt with an open system. He treated the rate of export surplus as a promoter of prosperity and the balance-of-payments difficulties that tend to accompany an upswing as a factor limiting expansion.

(7) Whatever the rationale of the *economics* of full employment, the *political* problems are formidable. Kalecki realized that full-employment policies could be used to reform the capitalist system toward beneficial welfare-oriented growth, whose fruits would be directed to the advancement of living standards of the lower income groups. He saw the opportunity, but was mindful of the grave political problems and, in 1943, predicted the emergence of the political business cycle. He argued that opposition by the "leaders of industry" to full employment stimulated by government spending may be expected because of the inherent fear of government interference (especially opposition to deficit spending), opposition to the objects of government spending (particularly to public investments and the subsidizing of consumption), fear of inflationary pressures, opposition to sustained full employment (as against mere prevention of deep depressions), and the dislike of the social

and economic changes resulting from the maintenance of full employment (including laxity of workers' discipline). He felt that business cycles in milder form would continue and result in a sort of stop-go economy. The government would stimulate business activity, then in the upswing it would withdraw under the clamor of an "unsound" financial situation (and even undertake deflationary policies near the peak) only to re-emerge as a stimulating agent when unemployment again rose above an "acceptable level."

Because of his silence about his priority of publication and, in general, his distaste for "promoting" or "advertising" his ideas, Kalecki has always been regarded as a very modest man. But he was totally free of false modesty. He was a stern moralist whose sense of rectitude, forthrightness, and integrity permeated his personal and intellectual life. While in personal dealings he was careful not to offend, in economics he was stubborn and merciless when discussing his economic theories. His ready wit could be destructive, thereby antagonizing many who were offended by his polemics. He courted controversy and was well known for courageously voicing unpopular views.

On the surface Kalecki's economic writings were dispassionate exercises in economic analyses of a highly technical nature. All of his major contributions, however, have their social and ethical underpinnings. The main concerns of his life's work were full employment, its composition and distributional equity. He was not impressed with huge sacrifices made by the present generation for future ones. He was outraged at high employment contrived by means of armaments buildup. He was disturbed by the blunders of socialist planners at the cost of the worker-consumer.

Kalecki spent the war years at the Oxford Institute of Statistics, where he developed the subtle device of general (expenditure) rationing to expand the range of economic choice under the trying conditions of a war economy. His proposal was designed to allow the consumer the widest possible choice under restrictive conditions; it would divert real resources from consumption to the war effort while keeping down inflationary pressures and reducing inequalities of distribution. In addition to his work on the war economy, he produced during this period a number of papers including a major essay on ways to full employment, modified the Gibrat distribution, and pursued his theoretical work on economic dynamics.

Until his return to Poland in 1955 he was an international civil servant mainly at the UN. During the remaining years of his life he served as economic adviser, preparing what is probably the most exemplary perspective plan (1961–1975) ever devised for a socialist economy. This plan, like the other constructive alternative plans suggested by Kalecki in later years, was rejected by the Polish leadership. At the same time he pursued an active career as teacher and researcher. He laid the foundations for a theory of growth under central planning, contributed to advances in planning methodology and investment and foreign trade efficiency calculations, wrote about the Third World, and advanced his theory of modern capitalism. He also resumed his interest in pure mathematics and made a significant contribution to the theory of numbers.

Despite many disappointments, until 1968 Kalecki led a relatively happy life, sustained by the general esteem of colleagues and students. He died on April 17, 1970, a deeply saddened man whose pessimistic views of humanity and its frailties were reinforced by the 1968 wave of repression in Poland and the cowardly behavior of many of his colleagues. It is unfortunate that the life of so productive a man should have been plagued by so many crises and bitter disappointments. He simply would not compromise his principles, and looking back over his troubled years, Kalecki observed that his life could be compressed into a series of resignations in protest—against tyranny, prejudice, and oppression.

KATZ, DANIEL

The career of Daniel Katz spans the development of social psychology as an empirical discipline, and his work has been of major importance in that development. He was among the earliest users of survey methods to study social psychological problems, and he improved the methods with which he worked. His early studies of racial stereotypes illuminated the nature of prejudice as his later research clarified the different forms of nationalism. His theoret-

ical work on attitude formation and change has provided a framework for relating methods of change to the different motivational bases of attitudes. His work on formal organizations has brought to social psychology a level of phenomena typically neglected by psychologists. One of the unifying characteristics of his varied work is a concern for the interplay of social structure and social process, the explanation of human behavior in terms of the structure of events in which it occurs. This emphasis reflects the theoretical views of Katz's influential teacher, Floyd H. Allport, and is explicit in Katz's own development of open-system theory.

Daniel Katz was born in Trenton, New Jersey, on July 19, 1903. The family later moved to Buffalo, New York, and Katz graduated from the University of Buffalo in 1925. His first published research dates from this undergraduate period; it is a study of the acculturation of Polish immigrants and their children (Katz & Carpenter 1927). Katz conducted this research jointly with Niles Carpenter, chairman of the sociology department, who had studied at Harvard University and was committed to empirical research in a field still predominantly social-philosophical.

The findings of this intergenerational study show a complex familial pattern: the Polish-born parents retained their stereotypic values and attitudes about parental authority, but their American-born children were more expert about the new society. The children acted on their expertise, and the parents adjusted to their doing so, accepting in pragmatic terms what they could not acknowledge ideologically. Apart from being an undergraduate publication, the work is of interest in forecasting several of Katz's enduring research concerns: the quantitative measurement of values and attitudes, the explanation of group differences in terms of differing external influences, and the conduct of social research in real-life settings.

In 1925 Katz went from Buffalo to Syracuse University to start his doctoral work on a fellowship that the chancellor of the University of Buffalo had helped to arrange. Syracuse was in many ways a fortunate choice. Floyd H. Allport had moved there a year earlier to take a chair in the university's new social science enterprise, the Maxwell Graduate School of Citizenship and Public Affairs. Allport's pioneering *Social Psychology* had been published that year, and he was already launched on a lifelong effort in the theoretical integration of individual and social phenomena. Katz committed himself to social

psychology and became Allport's first doctoral student at Syracuse. His dissertation, published jointly with Allport under the title *Students' Attitudes: A Report of the Syracuse University Reaction Study* (1931), was a quantitative description of the student culture of that university and its several component subcultures.

On completion of his doctorate in 1928, Katz moved to Princeton University, where he remained for 15 years. His publications during those years range widely in psychology and social psychology—experiments on eye movement and the Phi phenomenon, reviews of psychology for annual volumes of the *Britannica*, and articles on aesthetics and epistemology in the social sciences. His work on attitudes and on attitude measurement, especially by means of survey methods, continued during these years, and he became recognized as a survey methodologist.

The best known work of his Princeton years may well be the experiments on racial prejudices and racial stereotypes he conducted with Kenneth W. Braly (1935). The authors showed that students agreed among themselves in their preferential ranking of ethnic groups, that their attribution of characteristics to these groups was consistent with these rankings, and that this pattern (stereotypy) could not be plausibly explained in terms of the students' actual contact with or direct knowledge of the groups in question. During this period Katz published *Social Psychology* (1938), coauthored with another of Allport's early students, Richard L. Schanck. The book was characterized by a strong emphasis on research data and by an attempt to deal with different levels of social phenomena without such familiar reifications as "group mind" or "collective conscience."

In the early 1940s many social scientists were leaving their universities to take on work more directly related to the war effort. Several groups of quantitatively oriented sociologists and psychologists were forming in government agencies. Katz joined one such group that had been founded at the U.S. Department of Agriculture by Rensis Likert, and he maintained close ties with it after moving to the Office of War Information. Katz's research in organizational settings dates from this period and is well exemplified by a study of worker morale in wartime, conducted jointly with Herbert H. Hyman (1947). This research was ahead of its time in using a multiorganizational design (five shipyards), a representative sample of workers

within organizations, and a combination of self-reported and independent measures of the major variables. The findings emphasized the objective organizational determinants of worker satisfaction and morale (earnings, supervisory behavior, promotional opportunities, and the like), and the complex reciprocal relations between worker attitudes and productivity.

At the end of World War II, Katz went to Brooklyn College as the first chairman of its department of psychology, an appointment that he had accepted in 1943 while still in government service. That service had ended with an overseas assignment as senior analyst on the U.S. Strategic Bombing Survey, a set of studies of the effects of bombing on civilian attitudes and morale. The time at Brooklyn was successful in creating a strong department and training students who went on to prominence as social psychologists. It was, however, a brief period; in 1947 Katz went to the University of Michigan, where he has remained.

The move to Michigan was something of a reunion. The group of social psychologists led by Rensis Likert at the U.S. Department of Agriculture had just established the Survey Research Center at the University of Michigan; the department of psychology at Michigan had begun an extended development; and an interdisciplinary doctoral program in social psychology had been created under the direction of Theodore M. Newcomb.

Katz entered into all these activities, concentrating initially on the development within the Survey Research Center of a research program on social-psychological aspects of large-scale organizations. He was the first director of this program of research, which has continued and grown, and along with Likert he set its initial theoretical and methodological orientations. After he left the formal direction of the program in order to give more time to teaching and departmental activities, his commitment to organizational research continued. He was instrumental also in establishing organizational psychology as a field of doctoral study that stressed the interaction of organizational structure and individual behavior rather than the more conventional problems of selection, testing, and the like.

Katz's career spans more than fifty years. His writings are unusual in range, responsiveness to large social issues, and choice of problems at the boundary of psychology and other fields of social science; nevertheless, certain themes

and commitments persist. Especially since 1947, three substantive concerns are dominant:

(1) organizational life and its ramifications, including the nature of leadership, the determinants of organizational effectiveness, and the nature of satisfactions and deprivations at work;

(2) political structure and process, especially the phenomenon of nationalism, the resolution of conflict, and the nature of identification with political parties;

(3) attitude formation and change, including specific studies of prejudice and the development of a general theory of attitude change.

These areas of research are linked by two other persistent emphases:

(4) a concern for the improvement of research methods; and

(5) the use and development of open-system theory as a framework within which more specific substantive interests could be expressed. For example, in each of his substantive areas of work—organizational life, political behavior, and attitude change—we also find methodological articles. The book on research methods in the behavioral sciences, edited jointly with Leon Festinger (1953), set research standards for a generation of graduate students and research workers.

Katz's development of open-system theory is stated in *The Social Psychology of Organizations* (Katz & Kahn 1966). It owes much to other field theories and most, perhaps, to Allport's general theory of event-systems (never fully published). Katz's use of the open-system framework, however, is specific to the social psychological level. In his view, social psychologists had taken too little account of social structure and had been especially neglectful of organizational influences on human behavior. He proposed the open-system approach as a means of overcoming these limitations and created a social psychology concerned with social structure. The second edition of *The Social Psychology of Organizations*, published in Katz's seventy-fifth year, expresses this theoretical position most fully.

Katz's main efforts have been original rather than critical, but he has been influential as editor and critic. As editor of the *Journal of Abnormal and Social Psychology* from 1962 to 1964, and of the *Journal of Personality and Social Psychology* from 1964 to 1967, he played a leading editorial role during a transitional period in which the main journal for social psychologists was separated from the field of abnormal psychology and established in

its own right. He wrote several essays on the state of social psychology as a discipline, two of them undertaken as reviews of editions of the *Handbook of Social Psychology* (Lindzey 1954). His earlier articles on survey methods had appeared when standards were first sought in that rapidly expanding field.

Academic biographies are notoriously impersonal, but accurate description of Katz's place in social science requires some mention of his personal qualities. Colleagues know and students quickly recognize his absolute integrity, commitment to the intellectual life, and unflinching consideration for others. The example of high character may not be a requirement for scientific contribution, but it enriches those who encounter it.

KENNAN, GEORGE F.

As diplomat, historian, foreign affairs analyst, and publicist, George Frost Kennan enjoyed a varied and controversial career. Whether as practitioner or intellectual, bureaucrat or critic, he has demonstrated enviable traits: brilliant analysis, elegant language, introspective ability to adjust his ideas to the changing times, courage to speak out, and a studied, mannered style bespeaking reflection and authority. These qualities often propelled him after World War II to the center of national debates on the goals and methods of American foreign policy and prompted America's political leaders to entertain, if not always heed, his counsel. He has been widely recognized as the father of the "containment doctrine" formulated in the 1940s, the foiled advocate of "disengagement" in the 1950s, an eloquent spokesman for *détente* and "neoisolationism" and against global interventionism in the 1960s-1970s, the steady critic of the inner decay and mediocrity of American society—and its consequent flawed diplomacy—and the Cassandra who warned against the "cloud of danger" hovering over a world burdened with a nuclear arms buildup, the spoilation of the environment, and short-sighted leadership.

Career. Born in 1904 to a middle-income family in Milwaukee, Wisconsin, Kennan grad-

uated from Princeton University and entered the Foreign Service in 1926. He became an area specialist, concentrating on Soviet Russia, and mastered the German, French, and Russian languages. He served a short stint in Riga, Latvia, where he interviewed anti-Soviet *émigrés* from Russia, and went on to the University of Berlin to study Russian history, literature, and language. Always impatient with routine bureaucratic chores and the insufficient attention he thought superior officers paid to his work, Kennan spent the depression decade at posts in Riga, Moscow, Washington, and Prague, and World War II in Portugal, Germany, and England. In 1944 U.S. Ambassador W. Averell Harriman selected him to be a key adviser in the Moscow embassy. Until 1946 Kennan made no appreciable impact upon American foreign policy, although he himself developed a profound pessimism about Soviet-American relations and plucked the sleeves of all who would listen. But with a February 22, 1946 "long telegram" to Washington on the wellsprings of Soviet behavior, Kennan emerged from relative obscurity to join the American diplomatic hierarchy. "My reputation was made," Kennan recalled. "My voice now carried" (1967, p. 295). He was soon assigned to the National War College in Washington, D.C.

In 1947 Kennan was ordered to create and direct the policy planning staff, an in-house "think tank" designed to provide the secretary of state with the long-range perspective and policy recommendations. An essay Kennan had written earlier for Secretary of the Navy (later Defense) James V. Forrestal appeared in the July 1947 issue of *Foreign Affairs* magazine anonymously under the name "X." This highly influential article on "The Sources of Soviet Conduct," urging a policy of containment of communism for the United States, created a public sensation, and Kennan was soon revealed as its author, establishing him as the most prominent American expert on contemporary Soviet affairs. Until 1950 he and his staff turned out numerous secret reports on cold war crises and helped launch the Marshall Plan. But Kennan fell out with Secretary of State Dean Acheson, who, to Kennan's seldom concealed chagrin, increasingly implemented containment through military means and seemed to abandon diplomacy itself. Kennan moved from Washington to the scholarly quietude of the Princeton-based Institute for Advanced Study. He soon lectured Americans that they

were too emotional and simple-minded in their responses to the complexities of world politics and published these views in *American Diplomacy, 1900-1950* (1951), a book whose sales numbered more than a million copies by the early 1970s when its message was still being read by countless college students. In 1952 he served briefly as ambassador to the Soviet Union. That tour of duty was cut short when the Kremlin declared him *persona non grata* for his uncharacteristically undiplomatic remark to newsmen that living conditions for foreigners in Moscow were not unlike those for diplomats trapped in central Europe by the Nazis at the start of World War II.

Kennan again retreated to the institute, turned enthusiastically to historical research, and wrote two well-respected volumes on *Soviet-American Relations, 1917-1920* (1956-1958). In November-December 1957, Kennan brought himself once again to the center of public discussion on two continents with his Reith lectures broadcast over British Broadcasting Corporation radio and published as *Russia, the Atom and the West* (1958b). Therein Kennan advised American and European officials to seek a mutual disengagement of Soviet and American forces from the heart of Europe and to defuse the cold war. Senator John F. Kennedy was impressed by Kennan's reasoning and upon becoming president in 1961 appointed him ambassador to Yugoslavia. Kennan resigned in quiet protest two years later because the United States, still gripped by the cold war mentality which did not distinguish among different types of communist governments, attempted to punish Tito's Yugoslavia by cancelling the "most favored nation" provision in trade relations. During the troubled 1960s, when the nation was mired in tortuous war in Indochina, Kennan once again became headline news when he declared that the containment doctrine, meant for a European context, did not fit Asia. "I find myself," he said, "in many respects sort of a neo-isolationist" (quoted in Paterson 1973, p. 160). His prolific writing and lecturing thereafter expressed that sentiment. His summing up, *The Cloud of Danger* (1977), was a plea for restraint in foreign policy, for minding one's own business in a world of complex problems for which the United States had few answers.

The containment doctrine. By the mid-1940s George F. Kennan had come to intensely held ideas about the Soviet Union and American policy toward it. "Never," Kennan has written,

“did I consider the Soviet Union a fit ally or associate, actual or potential, for this country” (1967, p. 57). He judged Joseph Stalin a ruthless realist and Marxism a “pseudo-science, replete with artificial heroes and villains.” “I felt,” Kennan explained, “that it [communism] must some day be punished as all ignorant presumption and egotism must be punished” (quoted in Paterson 1974, pp. 252, 256). Having witnessed the ghastly purges and repression of the Soviet system in the 1930s, he considered it morally repugnant. As for Soviet diplomats, they were blunt and rude, violating Kennan’s sense of the gentlemanly profession he himself practiced with such devotion and pride. The Soviet Union could not be trusted; it seemed bent on global preeminence; it posed a supreme threat to the United States.

Kennan summarized his thoughts in an 8,000-word telegram he dispatched from Moscow on February 22, 1946. Marxist–Leninist ideology, Kennan advised, was a driving force behind Soviet foreign policy. The Soviets foresaw inexorable capitalist–socialist conflict. Yet at the bottom of the Kremlin’s “neurotic view of world affairs is [the] traditional and instinctive Russian sense of insecurity.” Communist dogma, Kennan wrote, was the new vehicle for perpetuating this very Russian tradition necessitating geographical expansion. “In summary, we have here a political force committed fanatically to the belief that with [the] U.S. there can be no permanent *modus vivendi*, that it is desirable and necessary that the internal harmony of our society be disrupted . . . if Soviet power is to be secure” (1967, pp. 549, 557). Kennan’s alarmist language was tempered by his conclusion, which received far less attention, that Russia would not unleash war because it was too weak. In Washington, high-level officials relished Kennan’s message, for it captured their moods and fears after Soviet–American diplomatic clashes over eastern Europe and Iran. It was embraced, too, because Kennan seemed to absolve Americans of any responsibility for the cascading cold war. The “long telegram,” Kennan admitted later, read “exactly like one of those primers put out by alarmed Congressional committees or by the Daughters of the American Revolution, designed to arouse the citizenry to the dangers of the Communist conspiracy” (1967, p. 294). Indeed, at the time, in 1946, it contributed to the “get tough” posture of the Truman administration.

Kennan’s widely read and reprinted “X” ar-

ticle in *Foreign Affairs* the following year repeated many of the themes of the earlier cable, highlighting implacable communist hostility, Stalinist totalitarianism, and the duplicity and suspiciousness of Soviet conduct. And the essay recommended, in language that would henceforth become an American cold war liturgy, that “the main element of any United States policy toward the Soviet Union must be that of a long-term, patient but firm and vigilant containment of Russian expansive tendencies.” Indeed, American “counter-force” had to be applied to “constantly shifting geographical and political points” to curb Russia and to create strains in the Soviet system which might weaken or break it up (1947, pp. 575, 576).

Kennan’s analysis of Soviet behavior and his prescription of containment met with wide approval at the time. One of the few critics was Walter Lippmann, who, in *The Cold War* (1947), found Kennan’s containment doctrine a “strategic monstrosity,” because it did not, at least as spelled out in the “X” article, discriminate between areas vital and peripheral to American national security. Containment, the venerable journalist and political commentator predicted, would test American resources and patience without end or limit. Lippmann also observed that the policy would probably have to be implemented distastefully through American coddling of “satellites, clients, dependents and puppets” (Lippmann 1947, pp. 18, 21). In 1952, during the presidential campaign, the Republicans, led by John Foster Dulles’ attack, scored the containment doctrine for being too defensive, too negative, leaving the initiative to the Soviets. Dulles said he would substitute “liberation” for Kennan’s vague formula.

In the years after, some scholars found Kennan’s explanations of Soviet behavior too speculative, placing too much stress on communist ideology and thereby positing a mechanistic view of Soviet foreign policy: it flowed not from interaction with other nations but from internal imperatives. Doubted was his conclusion in the “X” article that Soviet power “moves inexorably along the prescribed path, like a persistent toy automobile wound up and headed in a given direction, stopping only when it meets with some unanswerable force” (1947, p. 574). Rarely did Kennan suggest that the actions of noncommunist, or anticommunist, countries, such as the allied military intervention in the Russian civil war beginning in 1918, influenced Soviet decisions. He glaringly ignored American

power and expansionism as contributing factors to Soviet-American tension. Most important for the long-term application of containment, Kennan used words like "force" without precise meaning, thus inviting a host of methods for implementing his recommendation of "counterforce." Again and again after the 1940s, and especially in Kennan's memoirs, he claimed that he never meant that the United States should emphasize military over economic or political means or that crusading globalism and knee-jerk anticommunism should distinguish American diplomacy. Contemporary documents suggest that Kennan entertained a variety of methods, including military, but that, applying a pragmatic yardstick, he largely excluded Asia from the purview of containment. Yet Kennan's ideas and policy prescriptions, cast as they were in imprecise language and based on the assumption that because the threat was global, the effort to curb it had logically to be likewise universal, lent themselves to American decisions that the diplomat himself opposed, such as military aid to the French in their war at midcentury to shore up their crumbling colonial empire in Indochina. The father of containment would spend much of his life defining the purposes of his own offspring. As he wrote in his memoirs, he felt "like one who has inadvertently loosened a large boulder from the top of the cliff and now helplessly witnesses its path of destruction in the valley below, shuddering and wincing at each successive glimpse of disaster" (1967, p. 356).

Disengagement. After Stalin's death in 1953 and an apparent thaw in the cold war suggested by the peace settlement over Austria, the Soviet appeal for "peaceful coexistence," and Nikita Khrushchev's "de-Stalinization" program, a number of European leaders called for a reduction of armaments and troops on the continent. Other events at the same time, however, heated up the cold war: West Germany's entry into the North Atlantic Treaty Organization, the Soviet crushing of the Hungarian rebellion, the Suez crisis, and the firing of the missile *Sputnik*. Fearful that the United States might undertake feverish military missile development and an enlargement of NATO, and believing that the United States should undertake negotiations leading to the withdrawal of American troops from West Germany and a Soviet military withdrawal from eastern Europe, George F. Kennan spoke out in late 1957 in six Reith lectures. The architect of containment, read the headlines,

seemed to be abandoning his creation in favor of "disengagement." Kennan urged upon his listeners and readers a unified, nonaligned Germany, withdrawal of foreign troops from eastern Europe and Germany, and restrictions on the deployment of atomic weapons there. He was critical of strengthening NATO and pled that diplomacy replace an apparent American military fixation. The Stalinist Russia he had sketched in the "X" article was not the Russia of Khrushchev. The time was pregnant for tempering the cold war, Kennan argued.

A flurry of speeches, serial articles in such opinion magazines as *The New Republic* and *Foreign Affairs*, and stinging comments from Harry S. Truman and Dean Acheson jolted Kennan. The counterattack was formidable: Russia was still a military threat; American troops should remain in Germany as a deterrent; Russia could not be trusted in any agreement; Soviet political control of eastern Europe would not end with the removal of military control; if the eastern Europeans tried to throw off the Soviet yoke, Moscow's soldiers would fight back; a united Germany might become a new and threatening empire that would arouse fear in the Soviets or might even, as in 1939, join Russia in a menacing anti-American pact. Kennan fought back, finding his detractors too attached to a hardened cold war mentality. "Nothing, for example, in Mr. Acheson's attack on the lectures would suggest that he sees the faintest difference between the Soviet government as it is today and the same government as it was eight years ago" (January 18, 1958, Kennan Papers, Princeton University Library). One of Kennan's allies now was a former critic, Walter Lippman. They agreed that military disengagement was a necessity and that the time was ripe for diplomacy. Anyway, said Kennan, the West could not know Russian intentions and could not know whether his suggestions would work unless officials sat down at the negotiating table to find out. In those days of intense cold war passions, however, the weight of opinion went against Kennan.

The conduct of American foreign policy and neoisolationism. In 1951, in a set of lectures published as *American Diplomacy, 1900-1950*, Kennan expressed views to which he would return time and time again: Americans were too emotional, too afflicted with a "legalistic-moralistic approach" (1951, p. 95), too susceptible to stampedes of opinion, too tolerant of narrow special-interest lobbyists, too easily swayed by

simple answers. During the era of McCarthyism Kennan vigorously inveighed against mindless anticommunism. Later he deplored the "congenital subjectivity of the American perception of the outside world" (1976, p. 678). The congress and the president, people of mediocre talent, played politics with foreign policy, creating a misleading bogeyman image of the Soviet Union as a military monster. Russia, Kennan always insisted, did not pose a military threat to United States security. In 1951 and after, he appealed for a professional foreign service, an elite corps of bright, imaginative people undisturbed by the buffeting winds of public opinion and democratic politics. In 1976 he set the reformist tasks for American statesmanship:

It will have to overcome that subjectivity that caused Americans to be strongly pro-Soviet at the height of the Stalin era and equally anti-Soviet in the days of Khrushchev, and to acquire a greater steadiness and realism of vision before the phenomenon of Soviet power. It will have to make greater progress than it has made to date in controlling the compulsions of the military-industrial complex and in addressing itself seriously to the diminution, whether by agreement or by unilateral restraint or both, of the scope and intensity of the weapons race.

American politicians will have to learn to resist the urge to exploit, as a target for rhetorical demonstrations of belligerent vigilance, the image of a formidable external rival in world affairs. And American diplomacy will have to overcome, in greater measure than it has done to date, those problems of privacy of decision and long-term consistency of behavior which, as Tocqueville once pointed out, were bound to burden American democracy when the country rose to the stature of a great power. In all of this, American statesmanship will need the support of a press and communications media more serious, and less inclined to oversimplify and dramatize in their coverage of American foreign policy, than what we have known in the recent past. (1976, p. 689)

Kennan was also a persistent critic of American life, finding it by the 1970s ill suited as a model for other nations to imitate. "Foreign policy, like a great many other things," he wrote in *The Cloud of Danger*, "begins at home" (1977, p. 26). Only if America reformed itself, attended to its myriad internal problems of environmental pollution, commercialism, waste of natural resources, rampant pornography, urban disintegration, and political disunity and mediocrity, could it influence other peoples. During the 1960s and 1970s, a very pessimistic Kennan

spoke and wrote against American interventions in the Third World (especially in Indochina), foreign aid programs, the continued militarization of the cold war, and the sad neglect of diplomacy as a means to reduce crises. He complained that the United States had assumed the role of world policeman, thrusting itself into regions and problems where it inevitably stumbled because it lacked the necessary power, intelligence, inner strength, and cultural affinity to provide solutions.

The label "isolationist," a term often used pejoratively after the 1930s, attracted Kennan. He took it to mean, in a constructive sense, a reduction of the military establishment, more serious attention to domestic ills, and a frank recognition that Washington had neither the duty nor the capability to serve as mankind's guardian and savior. As for the global economic crisis—energy and food shortages, overpopulation, monetary disorder, and trade wars—Kennan argued against interdependence. He advised that the United States deal with other states individually, eschewing the multilateral arrangements that limited America's freedom of action. The United States had few vital interests abroad; only western Europe and Japan warranted a protective American shield. "The first requirement for getting on with most foreign peoples," Kennan concluded, "is to demonstrate that you are quite capable of getting on without them" (1977, p. 70). The emergence of Soviet-American *détente* in the early 1970s met with Kennan's approval, yet he thought the Nixon administration had oversold it, causing Americans to expect too much and then to suffer disappointment, if not anger, over the slow movement toward diplomatic accommodation. And in the later years of the decade he criticized President Jimmy Carter for attempting the impossible: reform of the Soviet system through a vocal "human rights" policy.

Kennan, as always, had his critics in the 1970s. Many commentators found him too gloomy, futilely trying to recover a simpler, rural life of the past. They thought him too elitist, too out of touch with the ways of a democratic society. Some analysts argued that the United States, whether it wished it or not, was profoundly intertwined in the world's problems, ensnared in interdependence, incapable of significant retrenchment. Others believed, unlike Kennan, that the United States had a humane responsibility as a wealthy nation to meet the needs of less fortunate peoples, especially for

food. Russia was still a threat, other analysts intoned, and they quoted Kennan's 1947 "X" article back at him. Kennan, the realist of the 1940s, had become, it seemed to his detractors, the dreamer of the 1970s. Still, Kennan's cry for restraint and humility in foreign policy, for neoisolationism, met a sympathetic reception in an America sobered by its bloody and costly failure in Indochina and beleaguered by a rash of domestic troubles long ignored. Yet Kennan, indulging his habit of self-anguish, was sure he had aroused no followers. He was wrong, of course, but from his Olympian perch, so far removed from the many people who admired his wisdom and his eloquence, he underestimated his influence upon a generation of Americans.

Otto Klineberg, born in 1899, is, understandably, best known as an American social psychologist because of the many contributions he made to that field during his 37 years of residence in the United States, first as a member of the Columbia University department of psychology, and toward the end, as the first chairman of a separate department of social psychology. Equally well, he could be labelled a Canadian psychologist, having been born in the city of Quebec and having done his undergraduate studies in philosophy and psychology at McGill University (B.A., 1919). Equally, he deserves the title physician, having completed the M.D. at McGill in 1925, two years before receiving his Ph.D. from Columbia. He also deserves the label anthropologist, having been a student and then, from 1929 to 1931, a research associate of Franz Boas in the Columbia department of anthropology. He did his first field work with Yakima Indian children at a reservation in the northwestern United States and with students from 36 Indian tribes enrolled at the Haskell Institute in Kansas (1926–1927). At the urging of Ruth Benedict, his later field work was in Mexico among the Huichol Indians (1974, p. 172).

In 1973, he referred to himself as "an international psychologist of Canadian origin," and this surely describes the global course of his career: from 1927 to 1929 research in Italy, France, and Germany under a National Research Council fellowship; from 1935 to 1936 research in China under a Guggenheim fellowship; from 1945 to 1947 in Brazil at the University of São Paulo as the first professor of psychology; from 1948 to 1949 and again from 1953 to 1955 in Paris as director of various international research projects and activities of the United Nations Educational, Scientific and Cultural Organization (UNESCO). Upon retiring from Columbia University in 1962, he became visiting professor in social psychology at the University of Paris, the Sorbonne, where, as of 1979, he still held a chair in ethnic psychology as well as the directorship of the International Center for the Study of Intergroup Relations. From Paris, he commuted monthly for many years to Rome as the visiting lecturer in intergroup relations at the Università Internazionale degli Studi Pro Deo.

His multidisciplinary training and multicultural experiences influenced the style and

themes of his work. This, however, is not to suggest a doctrine of crude geographical determinism, that Klineberg happened to be blessed by birth and growth in two cultures and the gift of a ticket around the world, complete with admission to lectures by Boas, Edward Sapir, Floyd Allport, and Robert S. Woodworth, and simply reaped the benefits of his good fortune. Others sat in these same lecture halls and have never been heard from since; others got a ticket to travel the world and never came back to science.

Although Klineberg does see chance as having played an important part in his career, he always made the most of his opportunities. By graduating from McGill University with first class honors and the Prince of Wales gold medal, he was able to obtain a scholarship to Harvard University, where he received his M.A. in 1920. Although he planned to study for the Ph.D. and then pursue a career in Canada in academic psychology, his former professors discouraged him because of the lack of job opportunities and urged him to obtain a professional degree. He thus decided to study psychiatry at the Medical School at McGill. By the time he became a physician, he knew that in spite of the scarcity of jobs he really wanted to teach psychology. So, he immediately enrolled in the Columbia University department of psychology as a doctoral candidate. In the process, however, he discovered anthropology courses by Sapir and Boas, and became as deeply involved in that discipline as in psychology.

Studies of race differences. In 1926, Klineberg began his work in the field of race, which continued throughout his life, and deservedly, brought him great recognition. His own studies plus his comprehensive reviews of the evidence led him to conclude "that psychological research gives no justification for the belief in a racial hierarchy of abilities" (1974, p. 167). Actually, his studies of race began accidentally when he was invited to ride with a graduate student in anthropology to the West coast, where Klineberg hoped to do research among the Indians. When Klineberg requested research funds for this purpose, Woodworth agreed to secure him a small sum if he used the research as the basis of his doctoral dissertation. Klineberg accepted this condition and thus shifted the emphasis of his work from abnormal psychology to race (*ibid.*, pp. 166-167).

The money and the free ride to the Yakima reservation in the state of Washington was the

source of his work. Klineberg began to administer performance tests of intelligence to Indian children selected at random, and to white children, also chosen at random, who lived in the town of Toppenish in the heart of the reservation. All of the children attended the same school. An unanticipated finding—that Indian children performed tasks much more slowly than did white children, but made fewer mistakes (1928, pp. 27-31)—led Klineberg to focus "on the factor of speed in group comparisons." Other observers, less acute and less sensitive to the role of culture, might have neglected the finding. As he later noted in *Race Differences* (1935*b*), many intelligence tests depend to some extent on speed and the scores are affected by the speed at which the questions are answered (p. 159). This leads to the unwarranted inference of racial or innate inferiority in intelligence among groups whose cultures have not taught speed and who therefore are unfairly penalized by such tests.

The test performances of the white and Indian children were indeed congruent with the respective patterns of their cultures: the hustle and bustle of American life and the slow tempo of Yakima life, the proverbial American value that the race is to the swift and the Indian precept to think carefully before one acts. But Klineberg did not rest his case solely on the ground of congruence. He carefully examined the possibility that the differences in tempo might in fact be racial, rather than cultural, in origin. As a trained physician, he could analyze competently the literature on group differences in basal metabolism and other physiological processes, and concluded that environmental factors also had considerable influence on the very tempo of the body. His direct approach to the cause of the differences was a research design in which groups of the same race, but living in contrasting environments, were tested and compared. He found that Indian children at the Haskell Institute, where white teachers encouraged them to work as quickly as possible, performed much more quickly on his tests than did the Yakima children.

Thus, the study of race differences, begun as a chance encounter, became a lifelong passion for Klineberg. But the style he displayed then, as in his later works, involved the careful presentation of alternative hypotheses, however uncongenial. He invented ingenious quasi-experimental designs, rendered judgment only after scrutiny of substantial and varied evidence, and

kept a sharp watch for artifacts that might result in misleading findings. One particular design proved to be the archetype of his later studies. Just as he compared the scores of Indian children contrasted in length of time at Haskell, he also tested a group of black children in Harlem and related their scores to their length of residence in New York City. By this design he tried to establish the claims of a theory of cultural determination as opposed to a theory of selective migration.

In 1927, after completing his dissertation, Klineberg was offered an instructorship at the City College of New York. Although jobs were still difficult to find, he decided instead to accept a National Research Council fellowship to study in Europe.

His research in Europe was a test of the theory or myth of Nordic superiority (1931). Later, in *Race Differences*, Klineberg specifically reviewed the long history of that myth and similar racial theories. It is perhaps a bitter lesson for scientists to recall that Klineberg's refutation of the theory during 1928 and 1929 occurred so shortly before Hitler resurrected the myth. More generally, he tested whether differences in the intelligence of racial groups were innate in origin or caused by the environments and cultures in which they were reared, and the design he employed was a more elaborate version of the basic design of the first study.

Earlier, he had compared members of the same racial group, the American Indian, living under contrasting conditions. Now, the size and heterogeneity of France, Germany, and Italy permitted him to locate and compare children from the same racial group—Nordic, Alpine, or Mediterranean—who were living in the contrasting environments of those three nations, and also to compare the test scores of the different racial groups when they were living in the same national environment. All the children in this quasi-experimental design, however, had in common the characteristics that they were boys aged 10 to 12, living in small communities in rural areas, and attending school. Most were from peasant or farm families. Since these factors were held constant, and since the tests were performance tests, always administered individually in the native language by Klineberg, methodological variables could not invalidate the comparisons or unfairly handicap any group.

A fair test of the theory also required that the

groups not be selected in an arbitrary or inaccurate fashion, and that the children be as representative as possible of "pure" racial types. Klineberg's medical and anthropological training again aided him. Boas had created a revolution in physical anthropology by rejecting subjective classification of races and by his further objection to the use of a single, arbitrarily chosen physical characteristic as the basis for the classification. Klineberg, correspondingly, chose his sites by reference to anthropological maps of the distribution of the various racial types, and then, within the most typical rural areas, chose his subjects by the combination of hair and eye color, cephalic index computed by head measurements, and by the inclusion of only those children who had been born there and whose parents had been born there.

Klineberg concluded that "the concept of 'race' is quite incapable of explaining the results, since one and the same racial group will show up very differently depending on which national sample is taken as representative" (1931, p. 29). When he compared the different racial groups within the same nation, the Nordics were in no instance superior. In one nation, the differences were not statistically significant; in one, the Alpines scored the highest; in another, the Mediterranean group scored the best. "As far as these results go, they offer no substantiation of a definite racial hierarchy" (*ibid.*, p. 35).

In 1935, Klineberg published *Negro Intelligence and Selective Migration*, which was a large-scale, crucial test of his theory. In his first study, the fact that the Indian pupils at the Haskell Institute were quicker than those on the reservation led Klineberg to conclude that the environment accounted for the pattern of behavior. In his European study, his analysis of the intelligence of the various racial groups led him again to the same conclusion. The many earlier studies of the comparative intelligence of blacks and whites, which found that Northern blacks scored higher than Southern blacks and higher than whites from some Southern states, also suggested to Klineberg that environment and not innate endowment accounts for the relative intelligence of racial groups.

Since none of these studies, however, are true experiments in which groups are assigned at random to live in various environments, the alternative explanation has been advanced that the smart families migrate selectively to the better environments of the city or the North or

the favored region of a country, and their children correspondingly inherit that innate superiority. So, too, the critic might assert that the smart Indian senses the advantage of sending his child to the Haskell Institute. Although Klineberg notes that it is equally plausible that those who are not intelligent enough to succeed in harsh environments are the ones who selectively migrate, it is clear that "nothing of any scientific value can be obtained from this type of subjective" speculation (1935a, p. 5).

Anticipating the susceptibility of his basic design to this alternative argument of selective migration, Klineberg had devised in his first study the more refined design of comparing subgroups varying in the length of exposure to the better environment. If the scores show an improvement with increments of exposure, the alternative explanation becomes dubious, because their innate endowment should have made all the migrant children smart to start with, no matter how long they had been there. Klineberg therefore decided to use this refined design on a grand scale in a study of the intelligence of black children. The monograph, based on 9 comparable master's theses, presents findings on more than 3,000 black boys and girls in New York City between the ages of 10 and 12, whose intelligence (as measured by various verbal and performance tests) and school grades were examined in relation to their length of residence in the North. In general, the findings were that the "rise in intelligence is roughly proportional to length of residence in the more favorable environment" (*ibid.*, p. 59).

Klineberg realized, however, that his conclusions could still be attacked on the ground that selective migration, in a more subtle form, was the explanation. The smarter the family, the sooner they might sense the wisdom of moving. Correspondingly, the children of the earliest migrants could have been the smartest right from the start, and not because they had been in the better environment longer. Klineberg therefore used three supplementary designs to buttress his conclusions. The reasons for migration to the North were examined historically by an analysis of old newspapers and by data from interviews with migrant families. The analysis suggested that the move was mainly the result of coercive or accidental factors rather than a rational decision made on the basis of intelligence.

In a more direct approach to the problem, Klineberg examined school records in three

Southern cities of approximately six hundred black children, all of whom had migrated to the North, to see if they differed in ability from their classmates who had remained in the South. After the raw scores were transformed to provide a proper index of class standing, the average score of the migrants was almost exactly the same as that of the nonmigrants. The evidence, refined to see whether the earliest movers were the smartest, indicated that there had been a gradual improvement in the intellectual level (relative class standing in the South) of the migrants during the 15-year period examined. Klineberg's earlier conclusion about the gradual influence of environment was thus more compelling.

The third approach involved a variation on the basic design. Two of the master's theses which studied the relation of intelligence to years of residence in New York, were replications of each other, except that one was conducted in 1931 and the other a year later. Thus, in the second study, a child with any given length of residence was always a later migrant than the child with the same length of residence in the first study. The differences observed were nonsignificant, but the fact that the earlier migrant children tended to be inferior to their later counterparts made the environmental explanation even more compelling.

In 1935, Klineberg also published a comprehensive review of the literature in medicine, physical and cultural anthropology, and psychology, which dealt with the general problem of racial differences. Two chapters deal with the question he had already examined in his earlier researches of "the inherent intellectual superiority of certain races over others" (1935b, p. 152). As he lists the many factors that affect such test scores and that remain uncontrolled in comparisons between racial groups, it becomes obviously hasty to attribute such observed group differences to innate endowment. Klineberg also reviews the questions of race differences in personality, mental abnormality, crime, patterns of growth, bodily functioning, and physical endowment. He analyzes the many factors other than race that have been found to affect such observed differences, shows that invidious conclusions drawn from such studies are often arbitrary, and introduces proper cautions on hasty inferences from the physical to the psychological.

In the first two sections of the work, Klineberg uses mainly what one might call a "method

of negation," undermining the claims for racially determined psychological differences by a critical analysis of the evidence that had previously been used in support of such a theory. But the fact that races do differ in their behavior cries for an explanation. If it is not physical type or innate endowment, then what causes the differences? The final section of the book is, in effect, a brief, systematic text—trailblazing for its time—in social psychology and reveals the dramatic cultural patterning of the most basic psychological entities: motivation, emotion, cognition, mental organization, and personality. Understandably, the book leads to the conclusions "that there is no adequate proof of fundamental race differences in mentality, and that those differences which are found are in all probability due to culture and the social environment" (*ibid.*, vii). Klineberg, the physician-psychologist-anthropologist, had just the right combination of technical skills for the task, and he used his firsthand knowledge of many cultures tellingly in the book.

At least three more times in the course of his later life Klineberg reviewed the accumulated literature on race. Probably no one has examined the literature as often and as carefully as he has. Under the auspices of the Carnegie Corporation, he edited a volume, *Characteristics of the American Negro* (1944a), containing chapters by various authorities on mental disorders among blacks, stereotypes and attitudes about race, and his own chapters on black intelligence and personality. This book was prepared as essential background and documentation for Gunnar Myrdal's *An American Dilemma* (1944). Then, as director of the project on "Tensions Affecting International Understanding" for UNESCO, Klineberg proposed a series of publications by biologists and social scientists on race and science, and later wrote the book in the series on *Race and Psychology* (1951). Later, at the suggestion of the Society for the Psychological Study of Social Issues (SPSSI) of the American Psychological Association, he again reviewed the literature and wrote an article, "Negro-White Differences in Intelligence Test Performance" (1963). When he had finished this review of the long and confusing literature, he concluded that there was still "no scientifically acceptable evidence for the view that ethnic groups differ in innate abilities" (1963, p. 202).

Klineberg's contributions in the field of race have not been limited to research and scholar-

ship. Although the nature of his writings did have some ultimate influence on race relations, his impact may be seen more directly in the part he played in the events that led to the United States Supreme Court's 1954 decision on desegregation. In one of the five major cases in which the National Association for the Advancement of Colored People made a frontal attack on state laws requiring racially segregated schools, and which were later argued before the Supreme Court, Klineberg acted as an expert witness. In the Delaware case, his testimony went unchallenged and served to establish that "racial classification for the purposes of educational segregation was arbitrary and irrelevant since the available scientific evidence indicates that there are no innate racial differences in intelligence or other psychological characteristics" (Clark 1953a). Then in connection with the reargument before the Supreme Court, Klineberg and Robert K. Merton, in consultation with Kenneth B. Clark, planned the early work preparatory to the statements presented to the Court by social scientists in answer to the questions it had posed. In recognition of this and his other contributions to race relations, Howard University gave Klineberg an honorary degree.

Studies in the relations of groups and nations. In his textbook, *Social Psychology* (1940), Klineberg completed the formulation he had begun in the final section of *Race Differences*. He established the ways in which the fundamental psychological features of the individual are influenced by others as well as by his group and culture, using mainly a comparative method and drawing upon a wealth of anthropological evidence on cultural patterning of behavior. His first contact with anthropology had affected him "somewhat like a religious conversion" and had made him muse philosophically: "How could psychologists speak of *human* attributes and *human* behavior when they knew only one kind of human being?" (1974, p. 166). Now he had answered that question on the basis of knowing many kinds of human beings, and had provided what was perhaps the most powerful of justifications for social psychology by showing the force of culture upon even such apparently individualistic, rudimentary processes as the perception of size or color or time.

A different and more obvious agenda for social psychologists is the study of what is manifestly social, the specific ways in which individuals orient themselves and act toward others. Klineberg treats these topics in a long section

on "Social Interaction," using as specific vehicles the examples of racial stereotypes and prejudiced attitudes, and their modification. In this sense, the book is the bridge between his earlier and his later work: The interest in "alleged genetic psychological differences between ethnic groups led directly to a concern with intergroup relations . . . and from this it was an easy step to the study of relations between nations" (1973, p. 43). In some respects, the book is also a bridge between the old and new eras in social psychology. When one notes that some of the most fashionable topics of the 1970s—sex differences, psycho- and sociolinguistics, social behavior among animals—are the topics of chapters Klineberg wrote almost forty years ago, and that emotional expression—indeed a form of body language or communication—is also treated extensively in the text and was the problem he examined in his field work in China more than forty years ago, one can advise the young to cross that bridge and re-read this now ancient text.

During World War II, despite his duties in various United States government posts, Klineberg began his studies in the relations of groups and nations. In "A Science of National Character" (1944b), his address as the retiring president of the SPSSI, he focused on the character of contemporary nations. No matter that the origins are complex and cultural, and not racial, the character of nations as well as the false stereotypes about national character influence the course of their relations. These phenomena require scientific description, and Klineberg tried to build a framework for further studies.

In the quarter of a century since 1950, Klineberg has made many more contributions to the study of group and international relations. Only a few can be mentioned and briefly summarized. *Tensions Affecting International Understanding* (1950), a monograph prepared under the auspices of the Social Science Research Council, deals at length with approaches to the measurement of national character, with racial and national stereotypes and their origin and modification, and with factors making for aggression. This latter theme has been a recurrent concern of Klineberg's through the years (1970; 1972). In "The Role of the Psychologist in International Affairs" (1956), his address when the SPSSI gave him the Kurt Lewin memorial award, he reviewed ways that the action-oriented social psychologist could contribute to the improvement of international relations, and some of the barriers impeding performance of

that role. *The Human Dimension in International Relations* (1964) is a brief, semipopular textbook covering the various sources of tension reviewed in the earlier monograph, and also the contributions psychology can make to the effective operation of technical assistance programs and their evaluation. Two monographs deal specifically with cultural exchange programs. *International Exchanges in Education, Science and Culture: Suggestions for Research* (1966) is a critical survey of the literature, containing an interesting section on the discrimination nonwhites may experience in host countries with a tradition of race prejudice. *Étudiants du tiers-monde en Europe* (Klineberg & Brika 1972) reports research among students exclusively from developing countries attending European universities.

In *Religione e Pregiudizio* (1968), Klineberg and three Italian colleagues report the results of a content analysis of Catholic texts used in Italian and Spanish schools. References to Jews and Protestants in the period brought under study were predominantly negative, a finding having obvious implications for tensions between ethnic groups. In a brief paper, written in 1971, "Black and White in International Perspective," Klineberg returns to his earlier concerns with race relations, but looks at such patterns within other countries as well as within the United States, and treats their implications for international relations. In "The Multi-national Society: Some Research Problems" (1967), Klineberg examines societies that are heterogeneous in other respects than race to explore such sources of conflict and their reduction.

Two research monographs that may be seen as contributions to the improvement of relations between nations also have a special importance for methodologists concerned with cross-national surveys and for theorists concerned with problems of identity, reference group processes, and the developmental processes underlying national stereotypes. In *Nationalism and Tribalism Among African Students* (1969), Klineberg and Marisa Zavalloni explore the relative importance of tribal, national, and pan-African reference groups among students at African universities from six nations: Ethiopia, Ghana, Nigeria, Senegal, Uganda, and Zaire. By comparing the responses of such students resident in France, factors affecting the relative saliency of reference groups are established. In *Children's Views of Foreign Peoples* (1967), Klineberg and Wallace E. Lambert report findings

from a cross-national survey of an urban sample of more than 3,000 children at 3 developmental stages, ages 6, 10, and 14, in 11 nations. Self-conceptions, reference groups, feelings of similarity and difference from people of other countries, and stereotypes and attitudes toward people of other nationalities are examined within the comparative developmental framework of the design. Apart from the substantive importance of the findings both for theory and application, the problems of organizing and operating such a world-wide enterprise, the methodological problems involved in standardizing the open-ended interviewing technique, and the coding of data in so many languages are carefully reviewed and ingeniously handled.

In action as well as in scholarship, Klineberg has sought to foster international cooperation. He helped organize the World Federation for Mental Health, and later served as its president. He served for a long period as an officer of the International Union of Psychological Science. As a researcher and teacher in so many countries, he has personally transmitted a message of good will around the world and sown the seeds of social psychology over thousands of miles. The vocation he had chosen in his early days, to teach psychology, which he has pursued for almost fifty years, is perhaps what he cherishes most. The social psychologists whom he taught or whose researches he guided, including Solomon E. Asch, Robert Chin, Kenneth B. Clark, E. L. Hartley, Herbert H. Hyman, H. N. Schoenfeld, Muzaffer Sherif, and many others, have carried those seeds of a scientific and relevant social psychology to other places.

Klineberg has received many honors: The Butler medal of Columbia University, honorary degrees from Drew University and the University of Brazil, as well as from Howard University and his alma mater, McGill University. Gardner Murphy, in conferring the Kurt Lewin memorial award on Klineberg, described him as having "seen the intricacies, the triumphs, and the tragedies of human relationships as a challenge not only to the possibilities of a greater human brotherhood, but to the possibilities of a rigorous scientific method," and as being honored by "a permanent and illustrious place in the development of social psychology."

KOHN, HANS

From the publication of *The Idea of Nationalism* (1944) until his death, Hans Kohn (1891-1971) was the most prolific and influential student of this subject in the United States. The fifty books he authored or edited since 1913, and published in German, French, and Hebrew as well as English, measure his energy and erudition. Kohn's 45 reviews in the *American Historical Review* from 1944 to 1965, his 150 reviews in the *New York Times Review of Books* during the same period, and his dozens of articles in the *Britannica*, including the articles on "Communism," "Fascism," and "Democracy" in the *Britannica* yearbooks from 1942 to 1948, indicate his significance as an opinion molder and publicist (see Wolf 1976, p. 651).

Kohn's later works, especially those in which he discusses Germany, are notable for the dichotomy that he made between a liberal, rational, enlightened "Western" variety of nationalism and an illiberal, nonrational or romantic "Eastern" European variety. His historical thesis (see 1942; 1946; 1949; 1953; 1956; 1960; 1962; Snyder 1954, pp. 117-122) views the nationalist movements in England, France, Switzerland, and the United States as "forward-looking" and progressive because they maintained certain characteristic beliefs of the eighteenth-century European Enlightenment, which based human progress on individual liberty and held that the power of the state ought to be limited to protect this freedom. Thinkers and statesmen in "Eastern" nations, primarily in Germany and Russia during the nineteenth century, reacted against the Enlightenment, glorified state power and the collective unit as the agency of progress. Nationalists such as Heinrich von Treitschke in Germany and the Pan-Slav Fyodor Dostoevsky in Russia were both "statist" and "romantic": they favored a strong state government that could base its claim to greatness on appeals to a supposedly "heroic" past. That reactionary variety of nationalism grew up in countries with a weak middle class; it was narrow and egocentric and unlike its liberal counterpart, offered no "universal message" to mankind.

For all its imprecision, Kohn's dichotomy was popular because it helped explain how men as ideologically diverse as Johann G. von Herder, Otto von Bismarck, and Adolf Hitler could all be accounted German nationalists. It was simply a matter of noting how nationalism had, progressively and detrimentally, separated itself from liberalism. Indeed, Kohn's famous book *The Mind of Germany* (1960) is an excellent analysis of why and how German thinkers moved chronologically and ideologically from Johann Wolfgang von Goethe to Josef Goebbels. The divisiveness that Kohn saw among German intellectuals reflected his own preoccupation with "unity in diversity" throughout his intellectual life. Kohn's interpretation of nationalism cannot be understood without a prior appreciation of the tension between "the one and the many" in Kohn's thought.

Paradoxical as it may seem, nationalism was always associated in Kohn's works with the movement toward world unity. During his early years, Kohn, like Herder, understood nationalism to be primarily a cultural and only secondarily a political force. The title essay in *Nationalismus* (1922) argued that nationalism could be depoliticized in the wake of the World War just as religion had been depoliticized at the end of the Thirty Years War. As his early studies on nationalism in the Middle East make clear, Kohn soon accepted the inevitability of political nationalism. He remained convinced throughout his life, however, that nation-states should *not* be based upon what divided men from each other, such as language, religion, common traditions, or other so-called "objective" criteria of nationality. Rather, nations should be united around moral and political principles that not only make it possible for people to cooperate with each other but leave room also for cooperation with others outside the national unit. The nation-state was only the means to the end of international cooperation and harmony. Kohn was an avid supporter of world federalism in the 1940s, and in the 1960s he spoke of the age of "pan-nationalism" that was "merging into the age of pan-humanism" (1962, p. 166). As men, organized into nation-states, came to understand how much they had in common with each other, they could move into the next stage of "global history," an era of international cooperation in which men might yet "outgrow" nationalism ([1949] 1966, p. 235).

Of course, for nations to become—even potentially—a unifying world historical force, they

would have to be established on the basis of liberal principles. Such principles Kohn saw growing directly out of the "three great revolutions" of 1688, 1776, and 1789—the English, American, and French—each, to one degree or another, influenced by the social, intellectual, and political ideals of the Western European Enlightenment. The liberal beliefs in tolerance, the civil and political rights of individuals, and some form of representative government were founded upon the eighteenth-century assumption that man was fundamentally rational. Only this "faith in reason" could serve as an adequate basis for nationalist movements that would allow people to find meaning for themselves as members of a group without denying members of other, different groups that same right. Only a liberal could allow many different national flowers to bloom.

Kohn's often-used phrase, "unity in diversity," described for him the ideal political and cultural situation *among* nations as well as the best condition *within* a given national state. His concern for unity *with* freedom developed out of the experiences of Kohn's early years; he spent the first 25 in the multinational Austrian Empire. Following five years of grammar school education, Kohn entered the Altstädter Gymnasium in Prague in 1902, graduating in 1910 at the head of his class. Although he spent the years from 1910 to 1914 as a law student at Charles University in Prague, during these years his "chief interests were philosophy, literature and theology." Kohn's study for the bar examination was interrupted by World War I but his education as a "world citizen" was furthered by service in the Austro-Hungarian army, several years spent as a prisoner of war in Russia, and a period of time (after the 1917 revolution) serving with the Czech Legion. It was 1923 before Kohn finally returned to Prague to acquire his J.D. degree.

In 1908, while still a Gymnasium student, Kohn had joined the Zionist movement, and later traveled to Jerusalem. He remained an active member until 1929, when he left Jerusalem to begin a trek westward that ended with his appointment as a history professor at Smith College in 1934. In the decade before he settled permanently in the United States, Kohn traveled extensively in the Middle East, Russia, and Western Europe (Kohn 1964).

The most lasting influence upon his thought, however, was provided by a number of men whom Kohn later loosely described as "cultural" or "ethical" Zionists. One of Kohn's major works during this early period was an intellectual bi-

ography (1930) of Martin Buber, the most eminent of this group and a man whose version of Zionist nationalism and vision of human community strongly influenced Kohn (Wolf 1976, pp. 652ff.). The cultural Zionists, who also included Ahad Ha'am, Asher Ginzberg, Gustav Landauer, and A. D. Gordon, differed from Theodor Herzl and the political Zionists in emphasizing cultural and spiritual renewal within Judaism as a precondition for the establishment of a "national home" in Palestine. Though each approached the question slightly differently, all agreed that cooperation with the Palestinian Arabs was important for ethical as well as economic and political reasons. The Jews had the responsibility to show the world how to live by establishing a "true community" and a binational state in Palestine.

The cultural Zionists served as a "prophetic" force within the larger Zionist movement during the first two decades of the twentieth century. They not only challenged their more "practical" or "priestly" contemporaries, but Buber, at least, tried to synthesize in his writings and addresses during this period a concern for individual spiritual development with the growth of community; he also tried to link ethics and politics, mysticism and rationalism. In a similar fashion, Kohn, whose early essays were never specifically religious, tried to show that the "prophetic ethics" of the Old Testament were really very similar to the moral ideals of the eighteenth-century Enlightenment: he spoke of the "fusion of Jew and European" and compared the "universalism" or "universal messianism" of Isaiah with that of the eighteenth-century French *philosophes* (see 1924; 1931a). The Old Testament prophets from Amos to Jeremiah preached ideals of justice, equality, and community, making it clear that these were universal, not merely national, ideals. By linking this prophetic tradition to the secularized (but also universalist) rational ideals of justice and liberty "preached" by the eighteenth-century reformers, Kohn could synthesize nationalism and liberalism. More importantly, he could maintain his cultural Zionist conviction that nationalism could be a force promoting liberty and world unity.

By the late 1930s, Kohn's transition from a Zionist to a defender of the Western Enlightenment was complete. The dichotomy between "good" and "bad" nationalism that he began to develop by this period first appeared clearly in an essay on "Democracy: The Way of Man" in *World Order in Historical Perspective* (1942).

Kohn here saw American liberalism and fascism as contrasting prototypes. The American political system and values were an outgrowth of the eighteenth-century revolutions, while Nazism was, significantly, "the most audacious counter-revolution ever undertaken, not only against the last three revolutionary centuries, but against the whole development from Socrates and the Hebrew prophets to the present" (1942, p. 57). By drawing upon both English and French ideas, the Americans had devised a political system that rationally combined concern for the individual with necessary attention to the need for security for all members of the community. This was a national community at its best, a form of nationalism that could be copied by others to the benefit of all (see 1957, chapter 1). Nazism, by contrast, was an outgrowth of an anti-intellectual tradition that specifically despised Enlightenment nationalism and universalism. Fascism, Kohn wrote, generally "rejects all absolute standards of ethics and law and . . . the oneness of the human spirit. . . . Fascism believes in the immutable status of man . . . it denies the perfectibility of man" (1942, p. 37).

Hans Kohn remained committed to "liberal nationalism" and the dichotomy (of good and bad nationalism) in all his post-World War II works, despite charges from critics that he oversimplified a complicated subject. By the end of World War II, no other major student of nationalism was as willing to defend the indiscriminate combining of these two terms. The approach of the other major American historian of the subject, Carlton Hayes, for example, was quite different (Hayes 1931).

Kohn could not and would not admit that "liberal nationalism" was an oxymoron because, throughout most of his life and certainly for his last 35 years, it was not primarily nationalism that he was defending, but liberalism. This was clear at least as early as his first major American work; in the concluding pages of *The Idea of Nationalism*, he wrote: "In the word 'liberty' vibrates the message which pervades all human history and makes it human: the promise of the dignity of man, of his rights as an individual, of his duties to his fellow man. . . . Compared with it, nationalism is only a passing form of integration, beneficial and vitalizing yet by its own exaggeration and dynamism easily destructive of human liberty" (1944, pp. 575–576).

It was this "integration," call it world unity or "pan-humanism" or world community, that re-

mained the goal of Kohn's life and this goal gave unity to his many diverse works. "The individual liberty of man has to be organized today on a supra-national basis. Democracy and industrialism, the two forces which rose simultaneously with nationalism and spread with it over the world, have both today outgrown the national connection," he argued in the introduction to *The Idea of Nationalism* (1944, pp. 22–23). Thus, in both the opening and closing pages of Kohn's *magnum opus*, the work that, more than any other, made his reputation as a scholar, he proclaimed that a dispassionate study of nationalism was not his only aim. He made no secret of the fact that he wished to see (and would do what he could to encourage) a world where both individual freedom and human community were protected, a world that promoted both the freedom of the one and the security of the many, a world that manifested "unity in diversity," a world that could accommodate, by that name or by some other, "liberal nationalism."

While Hans Kohn's work was less a detailed study of nationalism than it was a protest against the way the term "nationalist" was used by many students of the subject, especially Americans, his appeal to many Americans in the post-World War II generation may reveal that he was saying what his cold war audience wished to hear, about themselves and about the Eastern "others" who were so unlike them. Kohn, like many of the other cultural Zionists of the early years of this century, was a utopian reformer. He found his audience, not among the Jews or Europeans, but, finally, among the Americans, who for him had come to typify the "liberal West."

KRECH, DAVID

David Krech was born Isadore Krechevsky in 1909. In 1913 his family moved from Russia to New England where he received his early education: an education that led to the development of a set of strong moral, social, and political values that influenced much of his later personal and professional life. He enrolled at New York University, where he became interested in psychology, partly through the influence of T. C. Schneirla. Near the end of his undergraduate studies he read Karl S. Lashley's just published *Brain Mechanisms and Intelligence* (1929), and this influenced him to conduct a series of experiments that demonstrated the existence of "hypotheses" in rats. Following the completion of his M.A. (1931) at New York University, he entered the University of California at Berkeley in 1931 and studied with Edward C. Tolman, who was just completing the final draft of his *Purposive Behavior in Animals and Men* (1932). At this same time Robert Tryon was performing his classic experiments on rats selectively bred to run mazes. Tolman's insistence that behavior could be understood best as dynamic and purposive (even when applied to the laboratory rat), and Tryon's concern for the importance of individual differences, influenced Krech's subsequent career.

Following the completion of his Ph.D. in 1933, Krech spent four years with Lashley at the University of Chicago, in the company of such people as Robert Leeper, Donald O. Hebb, and Frank A. Beach. As a result of his growing political awareness, he was one of the organizers of the Society for the Psychological Study of Social Issues. He then taught briefly at Swarthmore College, where he came under the influence of Wolfgang Kohler.

In 1942 he was drafted into the U.S. Army and assigned to the Office of Strategic Services' assessment station under the command of Henry A. Murray. During this period he married Hilda Sidney Gruenberg and changed his name to David Krech. He returned to Swarthmore after the war as a social psychologist and, with Richard Crutchfield, wrote *Theory and Problems of Social Psychology* (1948). In 1947 he joined the faculty at Berkeley, where he remained through his early retirement in 1972 and until his death in 1977. In 1970 he received one of the highest honors awarded by the American Psychological Association, the distinguished scientific contribution award.

Krech's professional contributions were multifaceted. He began with a search for the principles of learning in rats. This search gave way to an intensive period during which he was concerned with social psychology, political activity, and the application of gestalt psychological principles to the understanding of behavior. Finally, he focused on biological questions and developed a research program based on the relationships between brain chemistry and behavior. This latter pursuit was coupled with a concern for the ethical and moral implications of "mind control" through chemical intervention.

Four major threads run through all three phases of Krech's development. First, he had a strong concern for individual differences. Rather than characterize behavior on the basis of group trends he analyzed in detail the performance of each animal as it negotiated the "hypothesis box"—an unsolvable maze. In this way he was able to detect and characterize the strategies used by each animal in its attempts to solve the maze. He moved from this level to the formulation of an over-all schema that related behavior styles to genetic factors and to alterations in the nervous system. In his later work on brain chemistry, he again adopted this approach in order to relate brain chemistry to rat hypotheses.

Second, he insisted on the primacy of broad-ranging theoretical concerns. He realized that data are only as good as the schema by which they can be organized. He scorned those scientists who engaged primarily in amassing experimental facts—"pebble-pickers" as he called them. In all of his writing, research, and teaching, he emphasized the bearing of particular data on larger conceptions of behavioral significance.

Third, Krech strongly believed that molar behavioral concerns could be understood by molecular reduction. He thought that the smaller the unit of analysis, the greater the generality of the findings. This conviction led to his early studies of the behavior of selectively bred rat strains, of the effects of brain lesions on the nature of hypotheses, and of the effects of experience on the structural and chemical constitution of different parts of the brain.

Finally, he maintained an overriding commitment to the essential views of gestalt psychology. He accepted the gestalt emphasis on the organized unity of behavior and resisted attempts to fractionate this unity into static, molecular pieces. Even his physiological studies of the brain and behavior had a molar emphasis

that respected the inherent complexity of behavior.

Krech's contributions to psychology can be divided into four areas. The first is his concern for general behavior theory. He rejected the traditional behavioristic notions of John B. Watson, E. L. Thorndike, and Clark L. Hull that an organism approached a problem with a formless, random array of responses that were forged into a successful set of habits by reward and punishment on the anvil of trial and error. Krech demonstrated that rats attempted systematic solutions to problems, rejecting one after another until the correct response was selected. The organism's past experience and biological heritage affected the nature of the attempted solutions. This view of learning as a noncontinuous process provoked a great deal of controversy (especially with Kenneth W. Spence of the University of Iowa) and stimulated valuable research.

Krech also made major contributions to the field of social psychology, including the textbook he coauthored with Crutchfield (1948) and his political activities. Stressing phenomenology and cognitive organization, the theoretical orientation of the text helped to unify the subject matter and theory of what was then a fragmented field. In addition to providing a scientific framework for social psychology, the authors argued that a theoretically sound social psychology is also practically valid and immediately useful. Toward this end they presented intensive treatments of measurement techniques, public opinion survey methods, sampling problems, and action programs designed to minimize industrial conflict, racial prejudice, and international tensions.

His political involvement ranged from early membership in socialist organizations to a leadership role in the organization of the Society for the Psychological Study of Social Issues; now a formal division of the American Psychological Association. He also testified against the separate but equal doctrine in a 1951 suit brought by the National Association for the Advancement of Colored People on behalf of parents of black children in Clarendon County, South Carolina. This was the first time a federal court allowed social psychologists to testify as expert witnesses.

The third topical area, to which Krech devoted much of the last two decades of his life, was the relation of brain chemistry to behavior. This work began with the encouragement of the

biochemist Melvin Calvin. A research team consisting of Krech, the biochemist E. L. Bennett, and the physiological psychologist M. R. Rosenzweig began to study the effects of experience on the anatomy and chemistry of the rat brain. Later, they were joined by the neuroanatomist Marian Diamond and produced an extensive series of empirical and theoretical papers—some of which were greeted by a critical storm. The research indicated that the environmental conditions under which rats are housed produce differences in brain cholinesterases, weight of brain sections, and thickness of cerebral cortex. They demonstrated that the brain grows with use and that brain nerve cells can increase or decrease in size depending on whether or not the environment is stimulating. The provocative nature of these findings and their potential value in promoting an understanding of the substrates of behavior resulted in a flurry of research activity throughout the world. Within a few years of the inception of the project a large number of laboratories were actively inquiring into the relations between brain chemistry and behavior.

Above all, however, Krech was an educator. He had an extraordinary ability to teach. He was a brilliant, exciting, and exacting leader of a graduate seminar, a challenging teacher of advanced psychology classes, and an inspired lecturer in introductory psychology. His commitment to education is attested to by three major textbooks: the previously mentioned *Theory and Problems of Social Psychology*; an introductory psychology text, *Elements of Psychology* (Krech & Crutchfield 1958); and an introductory statistics package, *Statlab* (Hodges, Krech, & Crutchfield 1975). He was concerned with the quality of education and the quality of academic life at the university and took an active role to help the university steer a reasoned course through the social turmoil that embroiled the Berkeley campus in the 1960s.

KUZNETS, SIMON

An economist, statistician, and economic historian, Simon Kuznets' foremost contribution, for which he won the 1971 Nobel prize in economic science is the comparative study of the economic growth of nations. Kuznets' work was the fruit of a carefully designed and imaginatively conceived research program involving scholars throughout the world and extending over the three decades since World War II. The program centered on the quantitative measurement of the rate of economic growth and of associated shifts in internal conditions and external relations for as many nations as possible. It encompassed also exploratory studies of underlying causes. The culmination of these efforts appear in volumes written by Kuznets in the 1960s and 1970s. Here one may find most of what is known today about rates of economic growth; how they vary among nations and how they differ from premodern growth rates; the systematic changes in internal economic, social, and political structure that have accompanied modern economic growth; and the international economic and political ramifications of the spread of modern economic growth (for a brief summary, see Easterlin 1968).

This work is a logical outcome of a long record of distinguished scholarship. Kuznets'

first contributions in the late 1920s and early 1930s were in the analysis of economic time series movements—seasonal fluctuations, cyclical changes, and secular movements. From this he moved on to the measurement of the national income and product of the United States. This research is a landmark in the evolution of economic science. Today, figures of gross national product (GNP) are taken for granted, but before World War I there was almost total ignorance of such elementary data on the economy's size and structure. Kuznets was not the first to seek to close this gap, but his work on national income and product was so distinctive that it became the benchmark in the field. It encompassed estimates of total output and income by final product, industry of origin, and type of income; of capital formation and savings; and of the distribution of income between rich and poor. This work, coinciding with the new demands for economic information generated first by the depression of the 1930s, and then, by the mobilization requirements of World War II, laid the foundation for the establishment of official estimates of total GNP and its components by the federal government, a task in which Kuznets played a leading role. It provided, too, the basis for Kuznets' subsequent program of research on economic growth, which was built upon historical series of national income and product for as many countries as possible.

Kuznets' work on national income played a crucial role in the transition of economics from a deductive to a quantitative science. This transition required a union of theory, economic measurement, and statistical methodology. In the 1930s the new macroeconomic theories of John Maynard Keynes had aroused much interest because of their relevance to the worldwide economic crisis. Kuznets' concurrent and independent effort to develop measures of the consumption, savings, and investment components of national income provided the empirical counterparts of the Keynesian concepts. This advance in economic measurement and its concordance with new theoretical formulations was a key step in the development of econometrics, the systematic quantitative modeling of the economic system pioneered by Ragnar Frisch and Jan Tinbergen.

In his early work on secular movements, Kuznets identified fluctuations of 15 to 25 years' duration in a number of economic time series in the United States. Subsequently he returned

to this subject several times, widening the range of observation to other developed countries and incorporating demographic as well as economic time series. These movements, although still somewhat controversial, are today commonly referred to as "Kuznets cycles" in recognition of his pioneering contribution.

Kuznets was born in Kharkov, Russia, in 1901 and emigrated to the United States in 1922, where he took up studies at Columbia University, receiving his B.A. in 1923, his M.A. in 1924, and his Ph.D. in economics in 1926. In 1927 he became a member of the research staff of the National Bureau of Economic Research (NBER) where his work on national income was conducted. Although he remained an active member of the NBER staff until 1960, the primary base for his research effort from the 1950s was the committee on economic growth of the Social Science Research Council (SSRC). Kuznets rose to the position of professor of economics and statistics at the University of Pennsylvania during his tenure there from 1930 to 1954, and subsequently held professorial appointments at The Johns Hopkins University from 1954 to 1960, and Harvard University from 1960 until his retirement in 1971. His primary teaching areas followed the development of his interests: economic statistics (especially time series analysis), business cycles, economic development, and economic-demographic interrelations. His influence as a teacher extended beyond formal course work and the many dissertations that he supervised. Kuznets was teaching by example in the research projects that he directed as well as through the many professional conferences in which he participated throughout his career, particularly the NBER Conference on Research in Income and Wealth and its offshoot, the International Association for Research in Income and Wealth, both of which he helped found; and the many conferences organized under the auspices of the SSRC committee on economic growth.

Kuznets served two periods in government. Before his emigration to the United States, he was the youthful head of a statistical office in the Ukraine during the early chaotic post-Czarist years. During World War II he was associate director from 1942 to 1944 of the Bureau of Planning and Statistics of the War Production Board. Kuznets served as president of the American Economic Association (1954) and the American Statistical Association (1949). Since

retiring in 1971, his research efforts and publications have shifted increasingly to the field of population.

Kuznets' convictions about the importance of economic and quantitative measurement as the basis for understanding social problems antedated his emigration to the United States, but they received strong reinforcement from his mentor at Columbia, Wesley C. Mitchell. Mitchell's skepticism about the reliance of economics on deductive economic theory and his belief in the need for quantitative facts had been instrumental in the establishment in 1920 of the NBER, which was a nonprofit research organization devoted to the study of basic economic science and the first of its kind in America. Mitchell brought Kuznets into the NBER, where before long he came to head the bureau's program of national income studies. This project, along with the study on business cycles, headed by Mitchell and Arthur F. Burns, were the central pillars of the bureau's work, and the basis for the national and international reputation that the bureau established in the 1930s and 1940s. A crucial opportunity for maintaining the NBER's leadership was lost after World War II when the bureau rejected Kuznets' proposal to undertake the comparative study of economic growth of nations. As a result, Kuznets' primary research commitment was eventually shifted to the SSRC committee on economic growth.

In the development of American economics, the NBER is an offshoot of institutional economics. The leading features of Kuznets' approach to economic research are best appreciated in terms of this intellectual heritage. Two themes of the NBER's work—expressed in titles of the bureau's annual reports, "A Respect for Facts" (1960) and "The Cumulation of Economic Knowledge" (1948)—form key ingredients in Kuznets' research style. In Kuznets' work, as more generally in that of the NBER, economic science starts with measurement based on careful definition and classification. The underlying philosophy, in Kuznets' words, is that "statistical data are susceptible of cumulation to the highest degree. As statisticians so well know, a series that is twice as long possesses more than twice the analytical value—provided continuity and comparability are preserved. It is this advantage of statistical measurement and research that assures its fruitfulness . . ." (1947, p. 34).

The quintessential criticism of the NBER ap-

proach was captured in the title of T. C. Koopman's famed "Measurement Without Theory" review (1947) of the Burns–Mitchell treatise on business cycles. In Kuznets' view, however, measurement can never be divorced from economic theory and is necessarily guided by theory: "A major task is involved in the attempt to pass from the scattered incomplete, primary data, affected by all the peculiarities of both the country's economy and its data gathering institutions, to measures that reflect as clearly as possible the rigorously defined concepts of economic analysis" (1957, p. 553). Indeed, in the late 1940s Kuznets broke with the official estimators of GNP because he held that their increasing emphasis on "social accounting" was an abandonment of the fundamental Marshallian and Pigovian theoretical concept of national income as a measure of economic welfare. Throughout his career, Kuznets' monographs, although structured around tables of data, have been infused with "tentative" interpretations and explanations based on economic analysis.
