

# Buildings for Sustainable Energy

## Buildings for Sustainable Energy

*Vítor Leal<sup>1</sup>*

<sup>1</sup>Faculdade de Engenharia da Universidade do Porto

Buildings represent about 40% of the demand of primary energy and about 60% of the consumption of electricity in developed countries. It was therefore realized long ago that they are a key-piece of Energy Systems, and difference types of programs or regulations to drive them towards energy efficiency have been implemented, with the equilibrium point being determined by both cost-effectiveness considerations and by cultural (mis)perception of the issue. Recent time however added complexity to the topic, as the miniaturization and cost reduction of local energy “production” allow a second way to mitigate the impact of buildings in the energy systems. Furthermore, the “demand efficiency” and the “local generation” paths can be combined in a multitude of ways, whose optimum is significantly context-dependent. The frontline of research in buildings has therefore moved from its physics to system analysis, first of the building as systems on their own, but also on how buildings interact with the “whole” energy system. Examples of this are the research on how much building energy load can be eliminated or be made flexible at cost-effective levels, as well as which doses of incentives, positive or negative, are effective to drive consumers to system-friendly options.

# Research related Heating, Cooling & time-agreggated energy balance

# Research related to Heating and Cooling

TIME

- Thermal characterization of materials
- Requirements for Human Comfort
- Manual calculation of Heating and Cooling Loads
- Accounting for Thermal Inertia
- Thermal characterization of building components
- Human requirements for Indoor Air Quality / Ventilation
- Analysis and design of Natural Ventilation
- Analysis and design of Daylighting
- Dynamic Simulation
- Efficiency of HVAC equipments
- Building-integrated Renewables
- ...

# Policy Action

TIME

- Requirements for thermal insulation
- Requirements for Ventilation
- Thermal Performance

- Energy Performance [EPBD]
- Certification and Labelling
- Regular inspections and energy audits

- Promotion / Enforcement of profitable EE measures [incl/ existing buildings]
- PassivHouse
- Net-zero Energy Buildings

# ● Recast EPBD (1): The 'Stick-Carrot-Tambourine' approach

## 1) The 'Stick': Performance Requirements

- a) All new build "nearly-zero energy buildings" as of 2020 (public sector: 2018). Remaining energy need mainly covered by renewables
- b) Minimum energy performance requirements for all existing buildings that undergo an energy relevant renovation
- c) Level of minimum energy performance requirements for new buildings (until 2020) and renovations: Benchmarking to achieve cost-optimal levels
- d) Requirement for min. energy performance levels for technical building systems when installed, replaced or upgraded

- Recast EPBD (2):  
The 'Stick-Carrot-Tambourine' approach

- 2) The 'Carrot': Financing

- a) Stimulating financing mechanisms for energy efficiency investments
- b) Assessment of appropriateness & best practices of fin. instruments

- 3) The 'Tambourine': Information

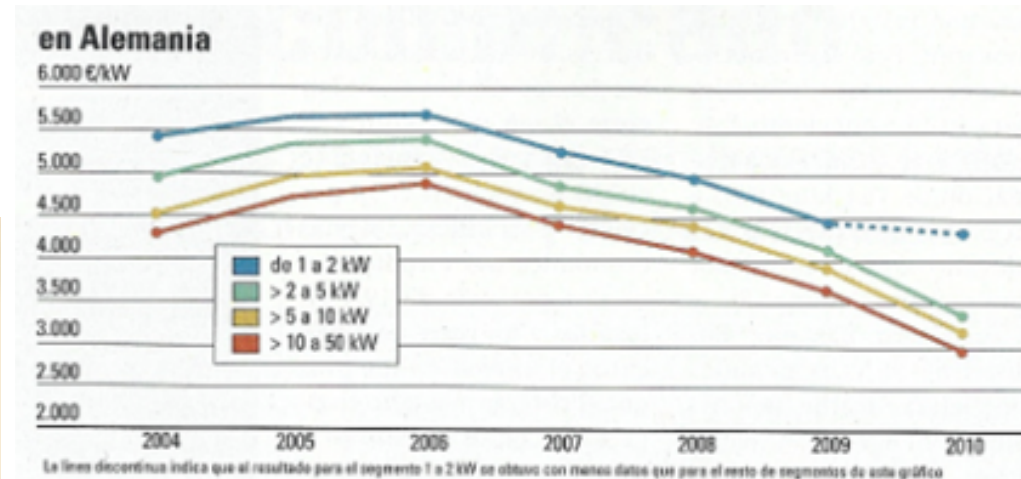

- a) Strengthening the role and the quality of energy performance certificates – i.a. by quality checks & use of performance indicator in all advertisements
- b) Strengthening the role and the quality of Heating and AC system inspections
- c) Display of EP Certificates in public buildings

# Net-Zero Energy Buildings

- A Net-Zero Energy Building (NZEB) is a building that includes microgeneration and is bidirectionally connected to the grid so that it produces as much energy as it uses when measured on site on an annual basis

- It is proven that they can be built !
- So what now ?
