

Hey,

I know you don't know me, but I need your help! My name is Marty McFly, and I've accidentally trapped myself in the year 1885. I used a time machine built by my friend Dr. Emmett Brown to go back in time, but an optical processor on the machine got damaged when I got here. Now I'm stranded, and I can't figure out how to fix this thing.

Doc Brown's notes show that you guys came to his lab at a certain point in the future looking for some kind of orb that's inside the time machine's flux capacitor. I don't really understand how all of this works, but I'm willing to give it to you if you help me out.

I'm including with this letter all of the information I have about the broken optical processor, as well as models of the pieces that I have on my end. I need you to follow the instructions and figure out how to connect all the parts of the processor together correctly!

When you have it figured out, make a model of your solution so I can follow along and fix this thing. I'll give Western Union a device that will be able to send one short message back in time to me, so I'll be able to see your fix once you've figured it out. Then you'll get your orb and I'll be able to come back to the future. Easy!

I really hope you actually get this,
Marty McFly
