Devices Included in this Data Sheet:
- PIC16F83
- PIC16F84
- PIC16CR83
- PIC16CR84
- Extended voltage range devices available (PIC16LF8X, PIC16LCR8X)

High Performance RISC CPU Features:
- Only 35 single word instructions to learn
- All instructions single cycle except for program branches which are two-cycle
- Operating speed: DC - 10 MHz clock input
  DC - 400 ns instruction cycle
- 14-bit wide instructions
- 8-bit wide data path
- 15 special function hardware registers
- Eight-level deep hardware stack
- Direct, indirect and relative addressing modes
- Four interrupt sources:
  - External RB0/INT pin
  - TMR0 timer overflow
  - PORTB<7:4> interrupt on change
  - Data EEPROM write complete
- 1000 erase/write cycles Flash program memory
- 10,000,000 erase/write cycles EEPROM data memory
- EEPROM Data Retention > 40 years

Peripheral Features:
- 13 I/O pins with individual direction control
- High current sink/source for direct LED drive
  - 25 mA sink max. per pin
  - 20 mA source max. per pin
- TMRO: 8-bit timer/counter with 8-bit programmable prescaler

Special Microcontroller Features:
- In-Circuit Serial Programming (ICSP™) - via two pins (ROM devices support only Data EEPROM programming)
- Power-on Reset (POR)
- Power-up Timer (PWRT)
- Oscillator Start-up Timer (OST)
- Watchdog Timer (WDT) with its own on-chip RC oscillator for reliable operation
- Code-protection
- Power saving SLEEP mode
- Selectable oscillator options

CMOS Flash/EEPROM Technology:
- Low-power, high-speed technology
- Fully static design
- Wide operating voltage range:
  - Commercial: 2.0V to 6.0V
  - Industrial: 2.0V to 6.0V
- Low power consumption:
  - < 2 mA typical @ 5V, 4 MHz
  - 15 μA typical @ 2V, 32 kHz
  - < 1 μA typical standby current @ 2V

To Our Valued Customers
We constantly strive to improve the quality of all our products and documentation. We have spent a great deal of
time to ensure that these documents are correct. However, we realize that we may have missed a few things. If you
find any information that is missing or appears in error, please use the reader response form in the back of this data
sheet to inform us. We appreciate your assistance in making this a better document.
1.0 GENERAL DESCRIPTION

The PIC16F8X is a group in the PIC16CXX family of low-cost, high-performance, CMOS, fully-static, 8-bit microcontrollers. This group contains the following devices:

- PIC16F83
- PIC16F84
- PIC16CR83
- PIC16CR84

All PICmicro™ microcontrollers employ an advanced RISC architecture. PIC16F8X devices have enhanced core features, eight-level deep stack, and multiple internal and external interrupt sources. The separate instruction and data busses of the Harvard architecture allow a 14-bit wide instruction word with a separate 8-bit wide data bus. The two stage instruction pipeline allows all instructions to execute in a single cycle, except for program branches (which require two cycles). A total of 35 instructions (reduced instruction set) are available. Additionally, a large register set is used to achieve a very high performance level.

PIC16F8X microcontrollers typically achieve a 2:1 code compression and up to a 4:1 speed improvement (at 20 MHz) over other 8-bit microcontrollers in their class.

The PIC16F8X has up to 68 bytes of RAM, 64 bytes of Data EEPROM memory, and 13 I/O pins. A timer/counter is also available.

The PIC16CXX family has special features to reduce external components, thus reducing cost, enhancing system reliability and reducing power consumption. There are four oscillator options, of which the single pin RC oscillator provides a low-cost solution, the LP oscillator minimizes power consumption, XT is a standard crystal, and the HS is for High Speed crystals.

The SLEEP (power-down) mode offers power saving. The user can wake the chip from sleep through several external and internal interrupts and resets.

A highly reliable Watchdog Timer with its own on-chip RC oscillator provides protection against software lockup.

The devices with Flash program memory allow the same device package to be used for prototyping and production. In-circuit reprogrammability allows the code to be updated without the device being removed from the end application. This is useful in the development of many applications where the device may not be easily accessible, but the prototypes may require code updates. This is also useful for remote applications where the code may need to be updated (such as rate information).

Table 1-1 lists the features of the PIC16F8X. A simplified block diagram of the PIC16F8X is shown in Figure 3-1.

The PIC16F8X fits perfectly in applications ranging from high speed automotive and appliance motor control to low-power remote sensors, electronic locks, security devices and smart cards. The Flash/EEPROM technology makes customization of application programs (transmitter codes, motor speeds, receiver frequencies, security codes, etc.) extremely fast and convenient. The small footprint packages make this microcontroller series perfect for all applications with space limitations. Low-cost, low-power, high performance, ease-of-use and I/O flexibility make the PIC16F8X very versatile even in areas where no microcontroller use has been considered before (e.g., timer functions; serial communication; capture, compare and PWM functions; and co-processor applications).

The serial in-system programming feature (via two pins) offers flexibility of customizing the product after complete assembly and testing. This feature can be used to serialize a product, store calibration data, or program the device with the current firmware before shipping.

1.1 Family and Upward Compatibility

Those users familiar with the PIC16C5X family of microcontrollers will realize that this is an enhanced version of the PIC16C5X architecture. Please refer to Appendix A for a detailed list of enhancements. Code written for PIC16C5X devices can be easily ported to PIC16F8X devices (Appendix B).

1.2 Development Support

The PIC16CXX family is supported by a full-featured macro assembler, a software simulator, an in-circuit emulator, a low-cost development programmer and a full-featured programmer. A “C” compiler and fuzzy logic support tools are also available.

All PICmicro™ Family devices have Power-on Reset, selectable Watchdog Timer, selectable code protect and high I/O current capability. All PIC16F8X Family devices use serial programming with clock pin RB6 and data pin RB7.
2.0 PIC16F8X DEVICE VARIETIES

A variety of frequency ranges and packaging options are available. Depending on application and production requirements the proper device option can be selected using the information in this section. When placing orders, please use the “PIC16F8X Product Identification System” at the back of this data sheet to specify the correct part number.

There are four device “types” as indicated in the device number.

1. **F**, as in PIC16F84. These devices have Flash program memory and operate over the standard voltage range.

2. **LF**, as in PIC16LF84. These devices have Flash program memory and operate over an extended voltage range.

3. **CR**, as in PIC16CR83. These devices have ROM program memory and operate over the standard voltage range.

4. **LCR**, as in PIC16LCR84. These devices have ROM program memory and operate over an extended voltage range.

When discussing memory maps and other architectural features, the use of **F** and **CR** also implies the **LF** and **LCR** versions.

2.1 Flash Devices

These devices are offered in the lower cost plastic package, even though the device can be erased and reprogrammed. This allows the same device to be used for prototype development and pilot programs as well as production.

A further advantage of the electrically-erasable Flash version is that it can be erased and reprogrammed in-circuit, or by device programmers, such as Microchip’s PICSTART® Plus or PRO MATE® II programmers.

2.2 Quick-Turnaround-Production (QTP) Devices

Microchip offers a QTP Programming Service for factory production orders. This service is made available for users who choose not to program a medium to high quantity of units and whose code patterns have stabilized. The devices have all Flash locations and configuration options already programmed by the factory. Certain code and prototype verification procedures do apply before production shipments are available.

For information on submitting a QTP code, please contact your Microchip Regional Sales Office.

2.3 Serialized Quick-Turnaround-Production (SQTP) Devices

Microchip offers the unique programming service where a few user-defined locations in each device are programmed with different serial numbers. The serial numbers may be random, pseudo-random or sequential.

Serial programming allows each device to have a unique number which can serve as an entry-code, password or ID number.

For information on submitting a SQTP code, please contact your Microchip Regional Sales Office.

2.4 ROM Devices

Some of Microchip’s devices have a corresponding device where the program memory is a ROM. These devices give a cost savings over Microchip’s traditional user programmed devices (EPROM, EEPROM). ROM devices (PIC16CR8X) do not allow serialization information in the program memory space. The user may program this information into the Data EEPROM.

For information on submitting a ROM code, please contact your Microchip Regional Sales Office.
3.0 ARCHITECTURAL OVERVIEW

The high performance of the PIC16CXX family can be attributed to a number of architectural features commonly found in RISC microprocessors. To begin with, the PIC16CXX uses a Harvard architecture. This architecture has the program and data accessed from separate memories. So the device has a program memory bus and a data memory bus. This improves bandwidth over traditional von Neumann architecture where program and data are fetched from the same memory (accesses over the same bus). Separating program and data memory further allows instructions to be sized differently than the 8-bit wide data word. PIC16CXX opcodes are 14-bits wide, enabling single word instructions. The full 14-bit wide program memory bus fetches a 14-bit instruction in a single cycle. A two-stage pipeline overlaps fetch and execution of instructions (Example 3-1). Consequently, all instructions execute in a single cycle except for program branches.

The PIC16F83 and PIC16CR83 address 512 x 14 of program memory, and the PIC16F84 and PIC16CR84 address 1K x 14 program memory. All program memory is internal.

The PIC16CXX can directly or indirectly address its register files or data memory. All special function registers including the program counter are mapped in the data memory. An orthogonal (symmetrical) instruction set makes it possible to carry out any operation on any register using any addressing mode. This symmetrical nature and lack of ‘special optimal situations’ make programming with the PIC16CXX simple yet efficient. In addition, the learning curve is reduced significantly.
PIC16CXX devices contain an 8-bit ALU and working register. The ALU is a general purpose arithmetic unit. It performs arithmetic and Boolean functions between data in the working register and any register file.

The ALU is 8-bits wide and capable of addition, subtraction, shift and logical operations. Unless otherwise mentioned, arithmetic operations are two’s complement in nature. In two-operand instructions, typically one operand is the working register (W register), and the other operand is a file register or an immediate constant. In single operand instructions, the operand is either the W register or a file register.

The W register is an 8-bit working register used for ALU operations. It is not an addressable register.

Depending on the instruction executed, the ALU may affect the values of the Carry (C), Digit Carry (DC), and Zero (Z) bits in the STATUS register. The C and DC bits operate as a borrow and digit borrow out bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.

A simplified block diagram for the PIC16F8X is shown in Figure 3-1, its corresponding pin description is shown in Table 3-1.

Legend:  
- I = input  
- O = output  
- I/O = Input/Output  
- P = power  
- — = Not used  
- TTL = TTL input  
- ST = Schmitt Trigger input  

Notes:  
1: This buffer is a Schmitt Trigger input when configured as the external interrupt.  
2: This buffer is a Schmitt Trigger input when used in serial programming mode.  
3: This buffer is a Schmitt Trigger input when configured in RC oscillator mode and a CMOS input otherwise.
3.1 Clocking Scheme/Instruction Cycle

The clock input (from OSC1) is internally divided by four to generate four non-overlapping quadrature clocks namely Q1, Q2, Q3 and Q4. Internally, the program counter (PC) is incremented every Q1, the instruction is fetched from the program memory and latched into the instruction register in Q4. The instruction is decoded and executed during the following Q1 through Q4. The clocks and instruction execution flow is shown in Figure 3-2.

3.2 Instruction Flow/Pipelining

An “Instruction Cycle” consists of four Q cycles (Q1, Q2, Q3 and Q4). The instruction fetch and execute are pipelined such that fetch takes one instruction cycle while decode and execute takes another instruction cycle. However, due to the pipelining, each instruction effectively executes in one cycle. If an instruction causes the program counter to change (e.g., GOTO) then two cycles are required to complete the instruction (Example 3-1).

A fetch cycle begins with the Program Counter (PC) incrementing in Q1.

In the execution cycle, the fetched instruction is latched into the “Instruction Register” in cycle Q1. This instruction is then decoded and executed during the Q2, Q3, and Q4 cycles. Data memory is read during Q2 (operand read) and written during Q4 (destination write).

**FIGURE 3-2: CLOCK/INSTRUCTION CYCLE**

**EXAMPLE 3-1: INSTRUCTION PIPELINE FLOW**

1. **MOVLW 55h**
   - Fetch 1
   - Execute 1

2. **MOVWF PORTB**
   - Fetch 2
   - Execute 2

3. **CALL SUB_1**
   - Fetch 3
   - Execute 3
   - Fetch SUB_1
   - Execute SUB_1

4. **BSF PORTA, BIT3**
   - Fetch 4
   - Flush

All instructions are single cycle, except for any program branches. These take two cycles since the fetch instruction is “flushed” from the pipeline while the new instruction is being fetched and then executed.
4.0 MEMORY ORGANIZATION

There are two memory blocks in the PIC16F8X. These are the program memory and the data memory. Each block has its own bus, so that access to each block can occur during the same oscillator cycle.

The data memory can further be broken down into the general purpose RAM and the Special Function Registers (SFRs). The operation of the SFRs that control the “core” are described here. The SFRs used to control the peripheral modules are described in the section discussing each individual peripheral module.

The data memory area also contains the data EEPROM memory. This memory is not directly mapped into the data memory, but is indirectly mapped. That is, an indirect address pointer specifies the address of the data EEPROM memory to read/write. The 64 bytes of data EEPROM memory have the address range 0h-3Fh. More details on the EEPROM memory can be found in Section 7.0.

4.1 Program Memory Organization

The PIC16FXX has a 13-bit program counter capable of addressing an 8K x 14 program memory space. For the PIC16F83 and PIC16CR83, the first 512 x 14 (0000h-01FFh) are physically implemented (Figure 4-1). For the PIC16F84 and PIC16CR84, the first 1K x 14 (0000h-03FFh) are physically implemented (Figure 4-2). Accessing a location above the physically implemented address will cause a wrap-around. For example, for the PIC16F84 locations 20h, 420h, 820h, C20h, 1020h, 1420h, 1820h, and 1C20h will be the same instruction.

The reset vector is at 0000h and the interrupt vector is at 0004h.
4.2 Data Memory Organization

The data memory is partitioned into two areas. The first is the Special Function Registers (SFR) area, while the second is the General Purpose Registers (GPR) area. The SFRs control the operation of the device.

Portions of data memory are banked. This is for both the SFR area and the GPR area. The GPR area is banked to allow greater than 116 bytes of general purpose RAM. The banked areas of the SFR are for the registers that control the peripheral functions. Banking requires the use of control bits for bank selection. These control bits are located in the STATUS Register. Figure 4-1 and Figure 4-2 show the data memory map organization.

Instructions MOVWF and MOVF can move values from the W register to any location in the register file (“F”), and vice-versa.

The entire data memory can be accessed either directly using the absolute address of each register file or indirectly through the File Select Register (FSR) (Section 4.5). Indirect addressing uses the present value of the RP1:RP0 bits for access into the banked areas of data memory.

Data memory is partitioned into two banks which contain the general purpose registers and the special function registers. Bank 0 is selected by clearing the RP0 bit (STATUS<5>). Setting the RP0 bit selects Bank 1. Each Bank extends up to 7Fh (128 bytes). The first twelve locations of each Bank are reserved for the Special Function Registers. The remainder are General Purpose Registers implemented as static RAM.

4.2.1 GENERAL PURPOSE REGISTER FILE

All devices have some amount of General Purpose Register (GPR) area. Each GPR is 8 bits wide and is accessed either directly or indirectly through the FSR (Section 4.5).

The GPR addresses in bank 1 are mapped to addresses in bank 0. As an example, addressing location 0Ch or 8Ch will access the same GPR.

4.2.2 SPECIAL FUNCTION REGISTERS

The Special Function Registers (Figure 4-1, Figure 4-2 and Table 4-1) are used by the CPU and Peripheral functions to control the device operation. These registers are static RAM.

The special function registers can be classified into two sets, core and peripheral. Those associated with the core functions are described in this section. Those related to the operation of the peripheral features are described in the section for that specific feature.

### Legend: x = unknown, u = unchanged, - = unimplemented read as '0', q = value depends on condition.

### Note:
1. The upper byte of the program counter is not directly accessible. PCLATH is a slave register for PC<12:8>. The contents of PCLATH can be transferred to the upper byte of the program counter, but the contents of PC<12:8> is never transferred to PCLATH.
2. The T0 and PD status bits in the STATUS register are not affected by a MCLR reset.
3. Other (non power-up) resets include: external reset through MCLR and the Watchdog Timer Reset.
### 4.2.2.1 STATUS REGISTER

The STATUS register contains the arithmetic status of the ALU, the RESET status and the bank select bit for data memory.

As with any register, the STATUS register can be the destination for any instruction. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to device logic. Furthermore, the TO and PD bits are not writable. Therefore, the result of an instruction with the STATUS register as destination may be different than intended.

For example, `CLRF STATUS` will clear the upper-three bits and set the Z bit. This leaves the STATUS register as `000u uuu` (where `u = unchanged`).

Only the BCF, BSF, SWAPF and MOVWF instructions should be used to alter the STATUS register (Table 9-2) because these instructions do not affect any status bit.

**Note 1:** The IRP and RP1 bits (STATUS<7:6>) are not used by the PIC16F8X and should be programmed as cleared. Use of these bits as general purpose R/W bits is NOT recommended, since this may affect upward compatibility with future products.

**Note 2:** The C and DC bits operate as a borrow and digit borrow out bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.

**Note 3:** When the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. The specified bit(s) will be updated according to device logic.

---

- **R/W-0**
  - **IRP**: Register Bank Select bit (used for indirect addressing)
    - `0 = Bank 0, 1 (00h - FFh)`
    - `1 = Bank 2, 3 (100h - 1FFh)`
    - The IRP bit is not used by the PIC16F8X. IRP should be maintained clear.

- **R/W-0**
  - **RP1:RP0**: Register Bank Select bits (used for direct addressing)
    - `00 = Bank 0 (00h - 7Fh)`
    - `01 = Bank 1 (80h - FFh)`
    - `10 = Bank 2 (100h - 17Fh)`
    - `11 = Bank 3 (180h - 1FFh)`
    - Each bank is 128 bytes. Only bit RP0 is used by the PIC16F8X. RP1 should be maintained clear.

- **R-1**
  - **TO**: Time-out bit
    - `1 = After power-up, CLRWDT instruction, or SLEEP instruction`
    - `0 = A WDT time-out occurred`

- **R-1**
  - **PD**: Power-down bit
    - `1 = After power-up or by the CLRWDT instruction`
    - `0 = By execution of the SLEEP instruction`

- **R/W-x**
  - **Z**: Zero bit
    - `1 = The result of an arithmetic or logic operation is zero`
    - `0 = The result of an arithmetic or logic operation is not zero`

- **R/W-x**
  - **DC**: Digit carry/borrow bit (for ADDWF and ADDLW instructions) (For borrow, the polarity is reversed)
    - `1 = A carry-out from the 4th low order bit of the result occurred`
    - `0 = No carry-out from the 4th low order bit of the result`

- **R/W-x**
  - **C**: Carry/borrow bit (for ADDWF and ADDLW instructions)
    - `1 = A carry-out from the most significant bit of the result occurred`
    - `0 = No carry-out from the most significant bit of the result occurred`

**Note:** For borrow, the polarity is reversed. A subtraction is executed by adding the two's complement of the second operand. For rotate (RBF, RLF) instructions, this bit is loaded with either the high or low order bit of the source register.
4.2.2.2 OPTION_REG REGISTER

The OPTION_REG register is a readable and writable register which contains various control bits to configure the TMR0/WDT prescaler, the external INT interrupt, TMR0, and the weak pull-ups on PORTB.

**Note:** When the prescaler is assigned to the WDT (PSA = '1'), TMR0 has a 1:1 prescaler assignment.

- **bit7**: **GIE**: Global Interrupt Enable bit
  - 1 = Enables all un-masked interrupts
  - 0 = Disables all interrupts
  - **Note**: For the operation of the interrupt structure, please refer to Section 8.5.

- **bit6**: **EEIE**: EE Write Complete Interrupt Enable bit
  - 1 = Enables the EE write complete interrupt
  - 0 = Disables the EE write complete interrupt

- **bit5**: **T0IE**: TMR0 Overflow Interrupt Enable bit
  - 1 = Enables the TMR0 interrupt
  - 0 = Disables the TMR0 interrupt

- **bit4**: **INTE**: RB0/INT Interrupt Enable bit
  - 1 = Enables the RB0/INT interrupt
  - 0 = Disables the RB0/INT interrupt

- **bit3**: **RBIE**: RB Port Change Interrupt Enable bit
  - 1 = Enables the RB port change interrupt
  - 0 = Disables the RB port change interrupt

- **bit2**: **T0IF**: TMR0 overflow interrupt flag bit
  - 1 = TMR0 has overflowed (must be cleared in software)
  - 0 = TMR0 did not overflow

- **bit1**: **INTF**: RB0/INT Interrupt Flag bit
  - 1 = The RB0/INT interrupt occurred
  - 0 = The RB0/INT interrupt did not occur

- **bit0**: **RBIF**: RB Port Change Interrupt Flag bit
  - 1 = When at least one of the RB7:RB4 pins changed state (must be cleared in software)
  - 0 = None of the RB7:RB4 pins have changed state

**Note**: Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>).
4.3 Program Counter: PCL and PCLATH

The Program Counter (PC) is 13-bits wide. The low byte is the PCL register, which is a readable and writable register. The high byte of the PC (PC<12:8>) is not directly readable nor writable and comes from the PCLATH register. The PCLATH (PC latch high) register is a holding register for PC<12:8>. The contents of PCLATH are transferred to the upper byte of the program counter when the PC is loaded with a new value. This occurs during a CALL, GOTO or a write to PCL. The high bits of PC are loaded from PCLATH as shown in Figure 4-1.

FIGURE 4-1: LOADING OF PC IN DIFFERENT SITUATIONS

4.3.1 COMPUTED GOTO

A computed GOTO is accomplished by adding an offset to the program counter (ADDWF PCL). When doing a table read using a computed GOTO method, care should be exercised if the table location crosses a PCL memory boundary (each 256 word block). Refer to the application note “Implementing a Table Read” (AN556).

4.3.2 PROGRAM MEMORY PAGING

The PIC16F83 and PIC16CR83 have 512 words of program memory. The PIC16F84 and PIC16CR84 have 1K of program memory. The CALL and GOTO instructions have an 11-bit address range. This 11-bit address range allows a branch within a 2K program memory page size. For future PIC16F8X program memory expansion, there must be another two bits to specify the program memory page. These paging bits come from the PCLATH<4:3> bits (Figure 4-1). When doing a CALL or a GOTO instruction, the user must ensure that these page bits (PCLATH<4:3>) are programmed to the desired program memory page. If a CALL instruction (or interrupt) is executed, the entire 13-bit PC is “pushed” onto the stack (see next section). Therefore, manipulation of the PCLATH<4:3> is not required for the return instructions (which “pops” the PC from the stack).

Note: The PIC16F8X ignores the PCLATH<4:3> bits, which are used for program memory pages 1, 2 and 3 (0800h - 1FFFh). The use of PCLATH<4:3> as general purpose R/W bits is not recommended since this may affect upward compatibility with future products.

4.4 Stack

The PIC16FXX has an 8 deep x 13-bit wide hardware stack (Figure 4-1). The stack space is not part of either program or data space and the stack pointer is not readable or writable.

The entire 13-bit PC is “pushed” onto the stack when a CALL instruction is executed or an interrupt is acknowledged. The stack is “popped” in the event of a RETURN, RETLW or a RETFIE instruction execution. PCLATH is not affected by a push or a pop operation.

Note: There are no instruction mnemonics called push or pop. These are actions that occur from the execution of the CALL, RETURN, RETLW, and RETFIE instructions, or the vectoring to an interrupt address.

The stack operates as a circular buffer. That is, after the stack has been pushed eight times, the ninth push overwrites the value that was stored from the first push. The tenth push overwrites the second push (and so on).

If the stack is effectively popped nine times, the PC value is the same as the value from the first pop.

Note: There are no status bits to indicate stack overflow or stack underflow conditions.
4.5 Indirect Addressing: INDF and FSR Registers

The INDF register is not a physical register. Addressing INDF actually addresses the register whose address is contained in the FSR register (FSR is a pointer). This is indirect addressing.

EXAMPLE 4-1: INDIRECT ADDRESSING
- Register file 05 contains the value 10h
- Register file 06 contains the value 0Ah
- Load the value 05 into the FSR register
- A read of the INDF register will return the value of 10h
- Increment the value of the FSR register by one (FSR = 06)
- A read of the INDF register now will return the value of 0Ah.

Reading INDF itself indirectly (FSR = 0) will produce 00h. Writing to the INDF register indirectly results in a no-operation (although STATUS bits may be affected).

FIGURE 4-1: DIRECT/INDIRECT ADDRESSING

A simple program to clear RAM locations 20h-2Fh using indirect addressing is shown in Example 4-2.

EXAMPLE 4-2: HOW TO CLEAR RAM USING INDIRECT ADDRESSING

```
movlw 0x20 ;initialize pointer
movwf FSR ; to RAM

NEXT clrf INDF ;clear INDF register
incf FSR ;inc pointer
btfss FSR,4 ;all done?
goto NEXT ;NO, clear next

CONTINUE ;YES, continue
```

An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>), as shown in Figure 4-1. However, IRP is not used in the PIC16F8X.

Note 1: PIC16F83 and PIC16C83 devices.
Note 2: PIC16F84 and PIC16C84 devices
Note 3: For memory map detail see Figure 4-1.
5.0 I/O PORTS

The PIC16F8X has two ports, PORTA and PORTB. Some port pins are multiplexed with an alternate function for other features on the device.

5.1 PORTA and TRISA Registers

PORTA is a 5-bit wide latch. RA4 is a Schmitt Trigger input and an open drain output. All other RA port pins have TTL input levels and full CMOS output drivers. All pins have data direction bits (TRIS registers) which can configure these pins as output or input.

Setting a TRISA bit (=1) will make the corresponding PORTA pin an input, i.e., put the corresponding output driver in a hi-impedance mode. Clearing a TRISA bit (=0) will make the corresponding PORTA pin an output, i.e., put the contents of the output latch on the selected pin.

Reading the PORTA register reads the status of the pins whereas writing to it will write to the port latch. All write operations are read-modify-write operations. So a write to a port implies that the port pins are first read, then this value is modified and written to the port data latch.

The RA4 pin is multiplexed with the TMR0 clock input.

**EXAMPLE 5-1: INITIALIZING PORTA**

```asm
CLRF PORTA ; Initialize PORTA by setting output data latches
BSF STATUS, RP0 ; Select Bank 1
MOVLW 0x0F ; Value used to initialize data direction
MOVWF TRISA ; Set RA<3:0> as inputs, RA4 as outputs
 ; TRISA<7:5> are always read as '0'.
```

**FIGURE 5-2: BLOCK DIAGRAM OF PIN RA4**

Note: I/O pin has protection diodes to VSS only.

5.2 PORTB and TRISB Registers

PORTB is an 8-bit wide bi-directional port. The corresponding data direction register is TRISB. A ‘1’ on any bit in the TRISB register puts the corresponding output driver in a hi-impedance mode. A ‘0’ on any bit in the TRISB register puts the contents of the output latch on the selected pin(s).

Each of the PORTB pins have a weak internal pull-up. A single control bit can turn on all the pull-ups. This is done by clearing the RBPU (OPTION_REG<7>) bit. The weak pull-up is automatically turned off when the port pin is configured as an output. The pull-ups are disabled on a Power-on Reset.

Four of PORTB’s pins, RB7:RB4, have an interrupt on change feature. Only pins configured as inputs can cause this interrupt to occur (i.e., any RB7:RB4 pin configured as an output is excluded from the interrupt on change comparison). The pins value in input mode are compared with the old value latched on the last read of PORTB. The “mismatch” outputs of the pins are OR’ed together to generate the RB port change interrupt.

This interrupt can wake the device from SLEEP. The user, in the interrupt service routine, can clear the interrupt in the following manner:

a) Read (or write) PORTB. This will end the mismatch condition.

b) Clear flag bit RBIF.

A mismatch condition will continue to set the RBIF bit. Reading PORTB will end the mismatch condition, and allow the RBIF bit to be cleared.

This interrupt on mismatch feature, together with software configurable pull-ups on these four pins allow easy interface to a key pad and make it possible for wake-up on key-depression (see AN552 in the Embedded Control Handbook).

Note 1: For a change on the I/O pin to be recognized, the pulse width must be at least TCY (4/fosc) wide.

The interrupt on change feature is recommended for wake-up on key depression operation and operations where PORTB is only used for the interrupt on change feature. Polling of PORTB is not recommended while using the interrupt on change feature.

5.3 I/O Programming Considerations

5.3.1 BI-DIRECTIONAL I/O PORTS

Any instruction which writes, operates internally as a read followed by a write operation. The BCF and BSF instructions, for example, read the register into the CPU, execute the bit operation and write the result back to the register. Caution must be used when these instructions are applied to a port with both inputs and outputs defined. For example, a BSF operation on bit5 of PORTB will cause all eight bits of PORTB to be read into the CPU. Then the BSF operation takes place on bit5 and PORTB is written to the output latches. If another bit of PORTB is used as a bi-directional I/O pin (i.e., bit0) and it is defined as an input at this time, the input signal present on the pin itself would be read into the CPU and rewritten to the data latch of this particular pin, overwriting the previous content. As long as the pin stays in the input mode, no problem occurs. However, if bit0 is switched into output mode later on, the content of the data latch is unknown.

Reading the port register, reads the values of the port pins. Writing to the port registers writes the value to the port latch. When using read-modify-write instructions (i.e., BCF, BSF, etc.) on a port, the value of the port pins is read, the desired operation is done to this value, and this value is then written to the port latch.

A pin actively outputting a Low or High should not be driven from external devices at the same time in order to change the level on this pin ("wired-or", "wired-and"). The resulting high output current may damage the chip.

5.3.2 SUCCESSIVE OPERATIONS ON I/O PORTS

The actual write to an I/O port happens at the end of an instruction cycle, whereas for reading, the data must be valid at the beginning of the instruction cycle (Figure 5-5). Therefore, care must be exercised if a write followed by a read operation is carried out on the same I/O port. The sequence of instructions should be such that the pin voltage stabilizes (load dependent) before the next instruction which causes that file to be read into the CPU is executed. Otherwise, the previous state of that pin may be read into the CPU rather than the new state. When in doubt, it is better to separate these instructions with a NOP or another instruction not accessing this I/O port.

Example 5-1 shows the effect of two sequential read-modify-write instructions (e.g., BCF, BSF, etc.) on an I/O port.

**EXAMPLE 5-1: READ-MODIFY-WRITE INSTRUCTIONS ON AN I/O PORT**

</tr>
<tr>
<td>NOP</td>
<td></td>
</tr>
</tbody>
</table>

Note:
This example shows a write to PORTB followed by a read from PORTB.
Note that:
data setup time = \((0.25T_{CY} - T_{PD})\)
where \(T_{CY}\) = instruction cycle
\(T_{PD}\) = propagation delay
Therefore, at higher clock frequencies, a write followed by a read may be problematic.
6.0 TIMER0 MODULE AND TMR0 REGISTER

The Timer0 module timer/counter has the following features:

- 8-bit timer/counter
- Readable and writable
- 8-bit software programmable prescaler
- Internal or external clock select
- Interrupt on overflow from FFh to 00h
- Edge select for external clock

Timer mode is selected by clearing the T0CS bit (OPTION_REG<5>). In timer mode, the Timer0 module (Figure 6-1) will increment every instruction cycle (without prescaler). If the TMR0 register is written, the increment is inhibited for the following two cycles (Figure 6-2 and Figure 6-3). The user can work around this by writing an adjusted value to the TMR0 register.

Counter mode is selected by setting the T0CS bit (OPTION_REG<5>). In this mode TMR0 will increment either on every rising or falling edge of pin RA4/T0CKI. The incrementing edge is determined by the T0 source edge select bit, T0SE (OPTION_REG<4>). Clearing bit T0SE selects the rising edge. Restrictions on the external clock input are discussed in detail in Section 6.2.

The prescaler is shared between the Timer0 Module and the Watchdog Timer. The prescaler assignment is controlled, in software, by control bit PSA (OPTION_REG<3>). Clearing bit PSA will assign the prescaler to the Timer0 Module. The prescaler is not readable or writable. When the prescaler (Section 6.3) is assigned to the Timer0 Module, the prescale value (1:2, 1:4, ..., 1:256) is software selectable.

6.1 TMR0 Interrupt

The TMR0 interrupt is generated when the TMR0 register overflows from FFh to 00h. This overflow sets the T0IF bit (INTCON<2>). The interrupt can be masked by clearing enable bit T0IE (INTCON<5>). The T0IF bit must be cleared in software by the Timer0 Module interrupt service routine before re-enabling this interrupt. The TMR0 interrupt (Figure 6-4) cannot wake the processor from SLEEP since the timer is shut off during SLEEP.

---

**FIGURE 6-1: TMR0 BLOCK DIAGRAM**

![Diagram of TMR0 Block Diagram](image)

**Note 1:** Bits T0CS, T0SE, PS2, PS1, PS0 and PSA are located in the OPTION_REG register.

**Note 2:** The prescaler is shared with the Watchdog Timer (Figure 6-6)

**FIGURE 6-2: TMR0 TIMING: INTERNAL CLOCK/NO PRESCALER**

![Diagram of TMR0 Timing](image)
FIGURE 6-3: TMR0 TIMING: INTERNAL CLOCK/PRESCALE 1:2

FIGURE 6-4: TMR0 INTERRUPT TIMING

Note 1: T0IF interrupt flag is sampled here (every Q1).
2: Interrupt latency = 3.25Tcy, where Tcy = instruction cycle time.
3: CLKOUT is available only in RC oscillator mode.
4: The timer clock (after the synchronizer circuit) which increments the timer from FFh to 00h immediately sets the T0IF bit.
The TMR0 register will roll over 3 Tosc cycles later.
6.2 Using TMR0 with External Clock

When an external clock input is used for TMR0, it must meet certain requirements. The external clock requirement is due to internal phase clock (Tosc) synchronization. Also, there is a delay in the actual incrementing of the TMR0 register after synchronization.

6.2.1 EXTERNAL CLOCK SYNCHRONIZATION

When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of pin RA4/T0CKI with the internal phase clocks is accomplished by sampling the prescaler output on the Q2 and Q4 cycles of the internal phase clocks (Figure 6-5). Therefore, it is necessary for T0CKI to be high for at least 2Tosc (plus a small RC delay) and low for at least 2Tosc (plus a small RC delay). Refer to the electrical specification of the desired device.

When a prescaler is used, the external clock input is divided by an asynchronous ripple counter type prescaler so that the prescaler output is symmetrical. For the external clock to meet the sampling requirement, the ripple counter must be taken into account. Therefore, it is necessary for T0CKI to have a period of at least 4Tosc (plus a small RC delay) divided by the prescaler value. The only requirement on T0CKI high and low time is that they do not violate the minimum pulse width requirement of 10 ns. Refer to parameters 40, 41 and 42 in the AC Electrical Specifications of the desired device.

6.2.2 TMR0 INCREMENT DELAY

Since the prescaler output is synchronized with the internal clocks, there is a small delay from the time the external clock edge occurs to the time the Timer0 Module is actually incremented. Figure 6-5 shows the delay from the external clock edge to the timer incrementing.

6.3 Prescaler

An 8-bit counter is available as a prescaler for the Timer0 Module, or as a postscaler for the Watchdog Timer (Figure 6-6). For simplicity, this counter is being referred to as “prescaler” throughout this data sheet. Note that there is only one prescaler available which is mutually exclusive between the Timer0 Module and the Watchdog Timer. Thus, a prescaler assignment for the Timer0 Module means that there is no prescaler for the Watchdog Timer, and vice-versa.

The PSA and PS2:PS0 bits (OPTION_REG<3:0>) determine the prescaler assignment and prescale ratio.

When assigned to the Timer0 Module, all instructions writing to the Timer0 Module (e.g., CLRF 1, MOVWF 1, BSF 1,x ... etc.) will clear the prescaler. When assigned to WDT, a CLRWDT instruction will clear the prescaler along with the Watchdog Timer. The prescaler is not readable or writable.
FIGURE 6-5: TIMER0 TIMING WITH EXTERNAL CLOCK

Note 1: Delay from clock input change to TMR0 increment is 3Tosc to 7Tosc. (Duration of Q = Tosc). Therefore, the error in measuring the interval between two edges on TMR0 input = ± 4Tosc max.
2: External clock if no prescaler selected, Prescaler output otherwise.
3: The arrows ↑ indicate where sampling occurs. A small clock pulse may be missed by sampling.

FIGURE 6-6: BLOCK DIAGRAM OF THE TMR0/WDT PRESCALER

Note: T0CS, T0SE, PSA, PS2:PS0 are bits in the OPTION_REG register.
6.3.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control (i.e., it can be changed “on the fly” during program execution).

Note: To avoid an unintended device RESET, the following instruction sequence (Example 6-1) must be executed when changing the prescaler assignment from Timer0 to the WDT. This sequence must be taken even if the WDT is disabled. To change prescaler from the WDT to the Timer0 module use the sequence shown in Example 6-2.

7.0 DATA EEPROM MEMORY

The EEPROM data memory is readable and writable during normal operation (full VDD range). This memory is not directly mapped in the register file space. Instead it is indirectly addressed through the Special Function Registers. There are four SFRs used to read and write this memory. These registers are:

- EECON1
- EECON2
- EEDATA
- EEADR

EEDATA holds the 8-bit data for read/write, and EEADR holds the address of the EEPROM location being accessed. PIC16F8X devices have 64 bytes of data EEPROM with an address range from 0h to 3Fh.

The EEPROM data memory allows byte read and write. A byte write automatically erases the location and writes the new data (erase before write). The EEPROM data memory is rated for high erase/write cycles. The write time is controlled by an on-chip timer. The write-time will vary with voltage and temperature as well as from chip to chip. Please refer to AC specifications for exact limits.

When the device is code protected, the CPU may continue to read and write the data EEPROM memory. The device programmer can no longer access this memory.

7.1 EEADR

The EEADR register can address up to a maximum of 256 bytes of data EEPROM. Only the first 64 bytes of data EEPROM are implemented.

The upper two bits are address decoded. This means that these two bits must always be '0' to ensure that the address is in the 64 byte memory space.

**FIGURE 7-1: EECON1 REGISTER (ADDRESS 88h)**

| bit 7:5 Unimplemented: Read as '0' |
| bit 4 EEIF: EEPROM Write Operation Interrupt Flag bit |
| 1 = The write operation completed (must be cleared in software) |
| 0 = The write operation is not complete or has not been started |
| bit 3 WRERR: EEPROM Error Flag bit |
| 1 = A write operation is prematurely terminated (any MCLR reset or any WDT reset during normal operation) |
| 0 = The write operation completed |
| bit 2 WREN: EEPROM Write Enable bit |
| 1 = Allows write cycles |
| 0 = Inhibits write to the data EEPROM |
| bit 1 WR: Write Control bit |
| 1 = initiates a write cycle. (The bit is cleared by hardware once write is complete. The WR bit can only be set (not cleared) in software. |
| 0 = Write cycle to the data EEPROM is complete |
| bit 0 RD: Read Control bit |
| 1 = Initiates an EEPROM read (read takes one cycle. RD is cleared in hardware. The RD bit can only be set (not cleared) in software. |
| 0 = Does not initiate an EEPROM read |
7.2 EECON1 and EECON2 Registers

EECON1 is the control register with five low order bits physically implemented. The upper-three bits are non-existent and read as '0's.

Control bits RD and WR initiate read and write, respectively. These bits cannot be cleared, only set, in software. They are cleared in hardware at completion of the read or write operation. The inability to clear the WR bit in software prevents the accidental, premature termination of a write operation.

The WREN bit, when set, will allow a write operation. On power-up, the WREN bit is clear. The WRERR bit is set when a write operation is interrupted by a MCLR reset or a WDT time-out reset during normal operation. In these situations, following reset, the user can check the WRERR bit and rewrite the location. The data and address will be unchanged in the EEDATA and EEADR registers.

Interrupt flag bit EEIF is set when write is complete. It must be cleared in software.

EECON2 is not a physical register. Reading EECON2 will read all '0's. The EECON2 register is used exclusively in the Data EEPROM write sequence.

7.3 Reading the EEPROM Data Memory

To read a data memory location, the user must write the address to the EEADR register and then set control bit RD (EECON1<0>). The data is available, in the very next cycle, in the EEDATA register; therefore it can be read in the next instruction. EEDATA will hold this value until another read or until it is written to by the user (during a write operation).

EXAMPLE 7-1: DATA EEPROM READ

```
BCF STATUS, RP0  ; Bank 0
MOVLW CONFIG_ADDR  ;
MOVF EEADR, W      ; Address to read
BSF STATUS, RP0  ; Bank 1
BSF EECON1, RD ; EE Read
BCF STATUS, RP0  ; Bank 0
MOVF EEDATA, W  ; W = EEDATA
```

7.4 Writing to the EEPROM Data Memory

To write an EEPROM data location, the user must first write the address to the EEADR register and the data to the EEDATA register. Then the user must follow a specific sequence to initiate the write for each byte.

EXAMPLE 7-1: DATA EEPROM WRITE

```
BSF STATUS, RP0  ; Bank 1
BCF INTCON, GIE  ; Disable INTs.
BSF EECON1, WREN  ; Enable Write
MOVLW 55h          ;
MOVF EECON2, W      ; Write 55h
MOVLW AAh           ;
MOVF EECON2, W      ; Write AAh
BSF EECON1,WR  ; Set WR bit
                     ; begin write
BSF INTCON, GIE  ; Enable INTs.
```

The write will not initiate if the above sequence is not exactly followed (write 55h to EECON2, write AAh to EECON2, then set WR bit) for each byte. We strongly recommend that interrupts be disabled during this code segment.

Additionally, the WREN bit in EECON1 must be set to enable write. This mechanism prevents accidental writes to data EEPROM due to errant (unexpected) code execution (i.e., lost programs). The user should keep the WREN bit clear at all times, except when updating EEPROM. The WREN bit is not cleared by hardware.

After a write sequence has been initiated, clearing the WREN bit will not affect this write cycle. The WR bit will be inhibited from being set unless the WREN bit is set.

At the completion of the write cycle, the WR bit is cleared in hardware and the EE Write Complete Interrupt Flag bit (EEIF) is set. The user can either enable this interrupt or poll this bit. EEIF must be cleared by software.
7.5 Write Verify

Depending on the application, good programming practice may dictate that the value written to the Data EEPROM should be verified (Example 7-1) to the desired value to be written. This should be used in applications where an EEPROM bit will be stressed near the specification limit. The Total Endurance disk will help determine your comfort level.

Generally the EEPROM write failure will be a bit which was written as a ‘1’, but reads back as a ‘0’ (due to leakage off the bit).

EXAMPLE 7-1: WRITE VERIFY

```
BCF STATUS, RP0 ; Bank 0
: ; Any code can go here
: ;
MOVF EEDATA, W ; Must be in Bank 0
BSF STATUS, RP0 ; Bank 1
READ
BSF EECON1, RD ; YES, Read the
; value written
BCF STATUS, RP0 ; Bank 0
;
; Is the value written (in W reg) and
; read (in EEDATA) the same?
;
SUBWF EEDATA, W ;
BTFSS STATUS, Z ; Is difference 0?
GOTO WRITE_ERR ; NO, Write error
: ; YES, Good write
: ; Continue program
```

7.6 Protection Against Spurious Writes

There are conditions when the device may not want to write to the data EEPROM memory. To protect against spurious EEPROM writes, various mechanisms have been built in. On power-up, WREN is cleared. Also, the Power-up Timer (72 ms duration) prevents EEPROM write.

The write initiate sequence and the WREN bit together help prevent an accidental write during brown-out, power glitch, or software malfunction.

7.7 Data EEPROM Operation during Code Protect

When the device is code protected, the CPU is able to read and write unscrambled data to the Data EEPROM.

For ROM devices, there are two code protection bits (Section 8.1). One for the ROM program memory and one for the Data EEPROM memory.

8.0 SPECIAL FEATURES OF THE CPU

What sets a microcontroller apart from other processors are special circuits to deal with the needs of real time applications. The PIC16F8X has a host of such features intended to maximize system reliability, minimize cost through elimination of external components, provide power saving operating modes and offer code protection. These features are:

- OSC Selection
- Reset
  - Power-on Reset (POR)
  - Power-up Timer (PWRT)
  - Oscillator Start-up Timer (OST)
- Interrupts
- Watchdog Timer (WDT)
- SLEEP
- Code protection
- ID locations
- In-circuit serial programming

The PIC16F8X has a Watchdog Timer which can be shut off only through configuration bits. It runs off its own RC oscillator for added reliability. There are two timers that offer necessary delays on power-up. One is the Oscillator Start-up Timer (OST), intended to keep the chip in reset until the crystal oscillator is stable. The other is the Power-up Timer (PWRT), which provides a fixed delay of 72 ms (nominal) on power-up only. This design keeps the device in reset while the power supply stabilizes. With these two timers on-chip, most applications need no external reset circuitry.

SLEEP mode offers a very low current power-down mode. The user can wake-up from SLEEP through external reset, Watchdog Timer time-out or through an interrupt. Several oscillator options are provided to allow the part to fit the application. The RC oscillator option saves system cost while the LP crystal option saves power. A set of configuration bits are used to select the various options.
8.1 Configuration Bits

The configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped in program memory location 2007h.

Address 2007h is beyond the user program memory space and it belongs to the special test/configuration memory space (2000h - 3FFFh). This space can only be accessed during programming.

To find out how to program the PIC16C84, refer to PIC16C84 EEPROM Memory Programming Specification (DS30189).

8.2 Oscillator Configurations

8.2.1 Oscillator Types

The PIC16F8X can be operated in four different oscillator modes. The user can program two configuration bits (FOSC1 and FOSC0) to select one of these four modes:

- **LP** Low Power Crystal
- **XT** Crystal/Resonator
- **HS** High Speed Crystal/Resonator
- **RC** Resistor/Capacitor

8.2.2 Crystal/Ceramic Resonators

In XT, LP or HS modes a crystal or ceramic resonator is connected to the OSC1/CLKIN and OSC2/CLKOUT pins to establish oscillation (Figure 8-3).

- **C1:** (1) Crystal/Ceramic resonator
- **C2:** (1) Crystal/Ceramic resonator
- **RF:** (3) Series resistor (RS) may be required for AT strip cut crystals.
- **SLEEP:**

**Note:**
1. See Table 8-1 for recommended values of C1 and C2.
2. A series resistor (RS) may be required for AT strip cut crystals.
3. RF varies with the crystal chosen.

The PIC16F8X oscillator design requires the use of a parallel cut crystal. Use of a series cut crystal may give a frequency out of the crystal manufacturers specifications. When in XT, LP or HS modes, the device can have an external clock source to drive the OSC1/CLKIN pin (Figure 8-4).
8.2.3 EXTERNAL CRYSTAL OSCILLATOR CIRCUIT

Either a prepackaged oscillator can be used or a simple oscillator circuit with TTL gates can be built. Prepackaged oscillators provide a wide operating range and better stability. A well-designed crystal oscillator will provide good performance with TTL gates. Two types of crystal oscillator circuits are available; one with series resonance, and one with parallel resonance.

Figure 8-5 shows a parallel resonant oscillator circuit. The circuit is designed to use the fundamental frequency of the crystal. The 74AS04 inverter performs the 180-degree phase shift that a parallel oscillator requires. The 4.7 kΩ resistor provides negative feedback for stability. The 10 kΩ potentiometer biases the 74AS04 in the linear region. This could be used for external oscillator designs.

Note: Higher capacitance increases the stability of oscillator but also increases the start-up time. These values are for design guidance only. Rs may be required in HS mode as well as XT mode to avoid overdriving crystals with low drive level specification. Since each crystal has its own characteristics, the user should consult the crystal manufacturer for appropriate values of external components.

For VDD > 4.5V, C1 = C2 = 30 pF is recommended.

Figure 8-6 shows a series resonant oscillator circuit. This circuit is also designed to use the fundamental frequency of the crystal. The inverter performs a 180-degree phase shift. The 330 kΩ resistors provide the negative feedback to bias the inverters in their linear region.
8.2.4 RC OSCILLATOR

For timing insensitive applications the RC device option offers additional cost savings. The RC oscillator frequency is a function of the supply voltage, the resistor (Rext) values, capacitor (Cext) values, and the operating temperature. In addition to this, the oscillator frequency will vary from unit to unit due to normal process parameter variation. Furthermore, the difference in lead frame capacitance between package types also affects the oscillation frequency, especially for low Cext values. The user needs to take into account variation due to tolerance of the external R and C components. Figure 8-7 shows how an R/C combination is connected to the PIC16F8X. For Rext values below 4 k\(\Omega\), the oscillator operation may become unstable, or stop completely. For very high Rext values (e.g., 1 M\(\Omega\)), the oscillator becomes sensitive to noise, humidity and leakage. Thus, we recommend keeping Rext between 5 k\(\Omega\) and 100 k\(\Omega\).

Although the oscillator will operate with no external capacitor (Cext = 0 pF), we recommend using values above 20 pF for noise and stability reasons. With little or no external capacitance, the oscillation frequency can vary dramatically due to changes in external capacitances, such as PCB trace capacitance or package lead frame capacitance.

See the electrical specification section for RC frequency variation from part to part due to normal process variation. The variation is larger for larger R (since leakage current variation will affect RC frequency more for large R) and for smaller C (since variation of input capacitance has a greater affect on RC frequency).

See the electrical specification section for variation of oscillator frequency due to VDD for given Rext/Cext values as well as frequency variation due to operating temperature.

The oscillator frequency, divided by 4, is available on the OSC2/CLKOUT pin, and can be used for test purposes or to synchronize other logic (see Figure 3-2 for waveform).

Note: When the device oscillator is in RC mode, do not drive the OSC1 pin with an external clock or you may damage the device.

8.3 Reset

The PIC16F8X differentiates between various kinds of reset:

- Power-on Reset (POR)
- WDT Reset during normal operation
- WDT Reset during SLEEP
- WDT Wake-up (during SLEEP)

Figure 8-8 shows a simplified block diagram of the on-chip reset circuit. The MCLR reset path has a noise filter to ignore small pulses. The electrical specifications state the pulse width requirements for the MCLR pin.

Some registers are not affected in any reset condition; their status is unknown on a POR reset and unchanged in any other reset. Most other registers are reset to a “reset state” on POR, MCLR or WDT reset during normal operation and on MCLR reset during SLEEP. They are not affected by a WDT reset during SLEEP, since this reset is viewed as the resumption of normal operation.

Table 8-3 gives a description of reset conditions for the program counter (PC) and the STATUS register. Table 8-4 gives a full description of reset states for all registers.

The TO and PD bits are set or cleared differently in different reset situations (Section 8.7). These bits are used in software to determine the nature of the reset.
FIGURE 8-8: SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT

Note 1: This is a separate oscillator from the RC oscillator of the CLkin pin.

Note 1: One or more bits in INTCON will be affected (to cause wake-up).

Note 2: When the wake-up is due to an interrupt and the GIE bit is set, the PC is loaded with the interrupt vector (0004h).

Note 3: Table 8-3 lists the reset value for each specific condition.
8.4 Power-on Reset (POR)

A Power-on Reset pulse is generated on-chip when VDD rise is detected (in the range of 1.2V - 1.7V). To take advantage of the POR, just tie the MCLR pin directly (or through a resistor) to VDD. This will eliminate external RC components usually needed to create Power-on Reset. A minimum rise time for VDD must be met for this to operate properly. See Electrical Specifications for details.

When the device starts normal operation (exits the reset condition), device operating parameters (voltage, frequency, temperature, ...) must be met to ensure operation. If these conditions are not met, the device must be held in reset until the operating conditions are met.

For additional information, refer to Application Note AN607, “Power-up Trouble Shooting.”

The POR circuit does not produce an internal reset when VDD declines.

8.5 Power-up Timer (PWRT)

The Power-up Timer (PWRT) provides a fixed 72 ms nominal time-out (TPWRT) from POR (Figure 8-10, Figure 8-11, Figure 8-12 and Figure 8-13). The Power-up Timer operates on an internal RC oscillator. The chip is kept in reset as long as the PWRT is active. The PWRT delay allows the VDD to rise to an acceptable level (Possible exception shown in Figure 8-13).

A configuration bit, PWRTEN, can enable/disable the PWRT. See either Figure 8-1 or Figure 8-2 for the operation of the PWRTEN bit for a particular device.

The power-up time delay TPWRT will vary from chip to chip due to VDD, temperature, and process variation. See DC parameters for details.

8.6 Oscillator Start-up Timer (OST)

The Oscillator Start-up Timer (OST) provides a 1024 oscillator cycle delay (from OSC1 input) after the PWRT delay ends (Figure 8-10, Figure 8-11, Figure 8-12 and Figure 8-13). This ensures the crystal oscillator or resonator has started and stabilized.

The OST time-out (TOST) is invoked only for XT, LP and HS modes and only on Power-on Reset or wake-up from SLEEP.

When VDD rises very slowly, it is possible that the TPWRT time-out and TOST time-out will expire before VDD has reached its final value. In this case (Figure 8-13), an external power-on reset circuit may be necessary (Figure 8-9).
FIGURE 8-10: TIME-OUT SEQUENCE ON POWER-UP (MCLR NOT TIED TO VDD): CASE 1

FIGURE 8-11: TIME-OUT SEQUENCE ON POWER-UP (MCLR NOT TIED TO VDD): CASE 2
When VDD rises very slowly, it is possible that the TPWR\nrt time-out and TOST time-out will expire before VDD
has reached its final value. In this example, the chip will reset properly if, and only if, V1 ≥ VDD min.
8.7 Time-out Sequence and Power-down Status Bits (TO/PD)

On power-up (Figure 8-10, Figure 8-11, Figure 8-12 and Figure 8-13) the time-out sequence is as follows: First PWRT time-out is invoked after a POR has expired. Then the OST is activated. The total time-out will vary based on oscillator configuration and PWRT configuration bit status. For example, in RC mode with the PWRT disabled, there will be no time-out at all.

**TABLE 8-5 TIME-OUT IN VARIOUS SITUATIONS**

<table>
<thead>

<tr>
<td>RC</td>
<td>72 ms</td>
<td>—</td>
<td>—</td>
</tr>
</tbody>
</table>

Since the time-outs occur from the POR reset pulse, if MCLR is kept low long enough, the time-outs will expire. Then bringing MCLR high, execution will begin immediately (Figure 8-10). This is useful for testing purposes or to synchronize more than one PIC16F8X device when operating in parallel.

Table 8-6 shows the significance of the TO and PD bits. Table 8-3 lists the reset conditions for some special registers, while Table 8-4 lists the reset conditions for all the registers.

8.8 Reset on Brown-Out

A brown-out is a condition where device power (VDD) dips below its minimum value, but not to zero, and then recovers. The device should be reset in the event of a brown-out.

To reset a PIC16F8X device when a brown-out occurs, external brown-out protection circuits may be built, as shown in Figure 8-14 and Figure 8-15.

**FIGURE 8-14: BROWN-OUT PROTECTION CIRCUIT 1**

This circuit will activate reset when VDD goes below (Vz + 0.7V) where Vz = Zener voltage.

**FIGURE 8-15: BROWN-OUT PROTECTION CIRCUIT 2**

This brown-out circuit is less expensive, although less accurate. Transistor Q1 turns off when VDD is below a certain level such that:

$$\frac{VDD \cdot R1}{R1 + R2} = 0.7V$$
8.9 Interrupts

The PIC16F8X has 4 sources of interrupt:
- External interrupt RB0/INT pin
- TMR0 overflow interrupt
- PORTB change interrupts (pins RB7:RB4)
- Data EEPROM write complete interrupt

The interrupt control register (INTCON) records individual interrupt requests in flag bits. It also contains the individual and global interrupt enable bits.

The global interrupt enable bit, GIE (INTCON<7>) enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. Individual interrupts can be disabled through their corresponding enable bits in INTCON register. Bit GIE is cleared on reset.

The “return from interrupt” instruction, RETFIE, exits interrupt routine as well as sets the GIE bit, which re-enable interrupts.

The RB0/INT pin interrupt, the RB port change interrupt and the TMR0 overflow interrupt flags are contained in the INTCON register.

When an interrupt is responded to; the GIE bit is cleared to disable any further interrupt, the return address is pushed onto the stack and the PC is loaded with 0004h. For external interrupt events, such as the RB0/INT pin or PORTB change interrupt, the interrupt latency will be three to four instruction cycles. The exact latency depends when the interrupt event occurs (Figure 8-17). The latency is the same for both one and two cycle instructions. Once in the interrupt service routine the source(s) of the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid infinite interrupt requests.

Note 1: Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

FIGURE 8-16: INTERRUPT LOGIC

![Interrupt Logic Diagram]
8.9.1 INT INTERRUPT

External interrupt on RB0/INT pin is edge triggered: either rising if INTEDG bit (OPTION_REG<6>) is set, or falling, if INTEDG bit is clear. When a valid edge appears on the RB0/INT pin, the INTF bit (INTCON<1>) is set. This interrupt can be disabled by clearing control bit INTE (INTCON<4>). Flag bit INTF must be cleared in software via the interrupt service routine before re-enabling this interrupt. The INT interrupt can wake the processor from SLEEP (Section 8.12) only if the INTE bit was set prior to going into SLEEP. The status of the GIE bit decides whether the processor branches to the interrupt vector following wake-up.

8.9.2 TMR0 INTERRUPT

An overflow (FFh → 00h) in TMR0 will set flag bit T0IF (INTCON<2>). The interrupt can be enabled/disabled by setting/clearing enable bit T0IE (INTCON<5>) (Section 6.0).

8.9.3 PORT RB INTERRUPT

An input change on PORTB<7:4> sets flag bit RBIF (INTCON<0>). The interrupt can be enabled/disabled by setting/clearing enable bit RBIE (INTCON<3>) (Section 5.2).

Note 1: For a change on the I/O pin to be recognized, the pulse width must be at least Tcy wide.
8.10 Context Saving During Interrupts

During an interrupt, only the return PC value is saved on the stack. Typically, users wish to save key register values during an interrupt (e.g., W register and STATUS register). This is implemented in software.

Example 8-1 stores and restores the STATUS and W register’s values. The User defined registers, W_TEMP and STATUS_TEMP are the temporary storage locations for the W and STATUS registers values.

Example 8-1 does the following:

a) Stores the W register.
b) Stores the STATUS register in STATUS_TEMP.
c) Executes the Interrupt Service Routine code.
d) Restores the STATUS (and bank select bit) register.
e) Restores the W register.

**EXAMPLE 8-1: SAVING STATUS AND W REGISTERS IN RAM**

```
PUSH    MOVWF    W_TEMP          ; Copy W to TEMP register,
SWAPF   STATUS, W       ; Swap status to be saved into W
MOVWF   STATUS_TEMP     ; Save status to STATUS_TEMP register
ISR    :                       :
:                       ; Interrupt Service Routine
:                       ; should configure Bank as required
:                       ;
POP    SWAPF   STATUS_TEMP, W  ; Swap nibbles in STATUS_TEMP register
; and place result into W
MOVWF   STATUS          ; Move W into STATUS register
; (sets bank to original state)
SWAPF   W_TEMP, F       ; Swap nibbles in W_TEMP and place result in W_TEMP
SWAPF   W_TEMP, W       ; Swap nibbles in W_TEMP and place result into W
```
8.11 Watchdog Timer (WDT)

The Watchdog Timer is a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the OSC1/CLKIN pin. That means that the WDT will run even if the clock on the OSC1/CLKIN and OSC2/CLKOUT pins of the device has been stopped, for example, by execution of a SLEEP instruction. During normal operation a WDT time-out generates a device RESET. If the device is in SLEEP mode, a WDT Wake-up causes the device to wake-up and continue with normal operation. The WDT can be permanently disabled by programming configuration bit WDTE as a '0' (Section 8.1).

8.11.1 WDT PERIOD

The WDT has a nominal time-out period of 18 ms (with no prescaler). The time-out periods vary with temperature, VDD and process variations from part to part (see DC specs). If longer time-out periods are desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT under software control by writing to the OPTION_REG register. Thus, time-out periods up to 2.3 seconds can be realized.

The CLRWDT and SLEEP instructions clear the WDT and the postscaler (if assigned to the WDT) and prevent it from timing out and generating a device RESET condition.

The TO bit in the STATUS register will be cleared upon a WDT time-out.

8.11.2 WDT PROGRAMMING CONSIDERATIONS

It should also be taken into account that under worst case conditions (VDD = Min., Temperature = Max., max. WDT prescaler) it may take several seconds before a WDT time-out occurs.

FIGURE 8-18: WATCHDOG TIMER BLOCK DIAGRAM

8.12 Power-down Mode (SLEEP)

A device may be powered down (SLEEP) and later powered up (Wake-up from SLEEP).

8.12.1 SLEEP

The Power-down mode is entered by executing the SLEEP instruction.

If enabled, the Watchdog Timer is cleared (but keeps running), the PD bit (STATUS<3>) is cleared, the TO bit (STATUS<4>) is set, and the oscillator driver is turned off. The I/O ports maintain the status they had before the SLEEP instruction was executed (driving high, low, or hi-impedance).

For the lowest current consumption in SLEEP mode, place all I/O pins at either at VDD or VSS, with no external circuitry drawing current from the I/O pins, and disable external clocks. I/O pins that are hi-impedance inputs should be pulled high or low externally to avoid switching currents caused by floating inputs. The T0CKI input should also be at VDD or VSS. The contribution from on-chip pull-ups on PORTB should be considered.

The MCLR pin must be at a logic high level (VIHMC).

It should be noted that a RESET generated by a WDT time-out does not drive the MCLR pin low.

8.12.2 WAKE-UP FROM SLEEP

The device can wake-up from SLEEP through one of the following events:

1. External reset input on MCLR pin.
2. WDT Wake-up (if WDT was enabled).
3. Interrupt from RB0/INT pin, RB port change, or data EEPROM write complete.

Peripherals cannot generate interrupts during SLEEP, since no on-chip clocks are present.

The first event (MCLR reset) will cause a device reset. The two latter events are considered a continuation of program execution. The TO and PD bits can be used to determine the cause of a device reset. The PD bit, which is set on power-up, is cleared when SLEEP is invoked. The TO bit is cleared if a WDT time-out occurred (and caused wake-up).

While the SLEEP instruction is being executed, the next instruction (PC + 1) is pre-fetched. For the device to wake-up through an interrupt event, the corresponding interrupt enable bit must be set (enabled). Wake-up occurs regardless of the state of the GIE bit. If the GIE bit is clear (disabled), the device continues execution at the instruction after the SLEEP instruction. If the GIE bit is set (enabled), the device executes the instruction after the SLEEP instruction and then branches to the interrupt address (0004h). In cases where the execution of the instruction following SLEEP is not desirable, the user should have a NOP after the SLEEP instruction.

FIGURE 8-19: WAKE-UP FROM SLEEP THROUGH INTERRUPT

Note 1: XT, HS or LP oscillator mode assumed.
2: TOST = 1024Tosc (drawing not to scale) This delay will not be there for RC osc mode.
3: GIE = '1' assumed. In this case after wake-up, the processor jumps to the interrupt routine. If GIE = '0', execution will continue in-line.
4: CLKOUT is not available in these osc modes, but shown here for timing reference.
8.12.3 WAKE-UP USING INTERRUPTS

When global interrupts are disabled (GIE cleared) and any interrupt source has both its interrupt enable bit and interrupt flag bit set, one of the following will occur:

- If the interrupt occurs before the execution of a SLEEP instruction, the SLEEP instruction will complete as a NOP. Therefore, the WDT and WDT postscaler will not be cleared, the TO bit will not be set and PD bits will not be cleared.
- If the interrupt occurs during or after the execution of a SLEEP instruction, the device will immediately wake up from sleep. The SLEEP instruction will be completely executed before the wake-up. Therefore, the WDT and WDT postscaler will be cleared, the TO bit will be set and the PD bit will be cleared.

Even if the flag bits were checked before executing a SLEEP instruction, it may be possible for flag bits to become set before the SLEEP instruction completes. To determine whether a SLEEP instruction executed, test the PD bit. If the PD bit is set, the SLEEP instruction was executed as a NOP.

To ensure that the WDT is cleared, a CLRWDT instruction should be executed before a SLEEP instruction.

8.13 Program Verification/Code Protection

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

**Note:** Microchip does not recommend code protecting widowed devices.

8.14 ID Locations

Four memory locations (2000h - 2003h) are designated as ID locations to store checksum or other code identification numbers. These locations are not accessible during normal execution but are readable and writable only during program/verify. Only the 4 least significant bits of ID location are usable.

For ROM devices, these values are submitted along with the ROM code.

8.15 In-Circuit Serial Programming

PIC16F8X microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground, and the programming voltage. Customers can manufacture boards with unprogrammed devices, and then program the microcontroller just before shipping the product, allowing the most recent firmware or custom firmware to be programmed.

The device is placed into a program/verify mode by holding the RB6 and RB7 pins low, while raising the MCLR pin from VIL to VIH (see programming specification). RB6 becomes the programming clock and RB7 becomes the programming data. Both RB6 and RB7 are Schmitt Trigger inputs in this mode.

After reset, to place the device into programming/verify mode, the program counter (PC) points to location 00h. A 6-bit command is then supplied to the device, 14-bits of program data is then supplied to or from the device, using load or read-type instructions. For complete details of serial programming, please refer to the PIC16CXX Programming Specifications (Literature #DS30189).

**FIGURE 8-20: TYPICAL IN-SYSTEM SERIAL PROGRAMMING CONNECTION**

For ROM devices, both the program memory and Data EEPROM memory may be read, but only the Data EEPROM memory may be programmed.
9.0 INSTRUCTION SET SUMMARY

Each PIC16CXX instruction is a 14-bit word divided into an OPCODE which specifies the instruction type and one or more operands which further specify the operation of the instruction. The PIC16CXX instruction set summary in Table 9-2 lists byte-oriented, bit-oriented, and literal and control operations. Table 9-1 shows the opcode field descriptions.

For byte-oriented instructions, ‘f’ represents a file register designator and ‘d’ represents a destination designator. The file register designator specifies which file register is to be used by the instruction. The destination designator specifies where the result of the operation is to be placed. If ‘d’ is zero, the result is placed in the W register. If ‘d’ is one, the result is placed in the file register specified in the instruction.

For bit-oriented instructions, ‘b’ represents a bit field designator which selects the number of the bit affected by the operation, while ‘f’ represents the number of the file in which the bit is located.

For literal and control operations, ‘k’ represents an eight or eleven bit constant or literal value.

TABLE 9-1 OPCODE FIELD DESCRIPTIONS

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

</tr>
</tbody>
</table>

The instruction set is highly orthogonal and is grouped into three basic categories:

- **Byte-oriented** operations
- **Bit-oriented** operations
- **Literal and control** operations

All instructions are executed within one single instruction cycle, unless a conditional test is true or the program counter is changed as a result of an instruction. In this case, the execution takes two instruction cycles with the second cycle executed as a NOP. One instruction cycle consists of four oscillator periods. Thus, for an oscillator frequency of 4 MHz, the normal instruction execution time is 1 μs. If a conditional test is true or the program counter is changed as a result of an instruction, the instruction execution time is 2 μs.

Table 9-2 lists the instructions recognized by the MPASM assembler.

Figure 9-1 shows the general formats that the instructions can have.

**Note:** To maintain upward compatibility with future PIC16CXX products, do not use the OPTION and TRIS instructions.

All examples use the following format to represent a hexadecimal number:

```
0xhh
```

where h signifies a hexadecimal digit.

</tr>
</tbody>
</table>

**Note 1:** When an I/O register is modified as a function of itself (e.g., MOVF PORTB, 1), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

**Note 2:** If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.

**Note 3:** If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a NOP.
## 9.1 Instruction Descriptions

### ADDLW Add Literal and W

| Syntax: | [label] ADDLW k |
| Operands: | $0 \leq k \leq 255$ |
| Operation: | $\text{(W) + k \rightarrow (W)}$ |
| Status Affected: | C, DC, Z |
| Encoding: | \[
\begin{array}{cccc}
11 & 1111 & kkkk & kkkk \\
\end{array}
\] |
| Description: | The contents of the W register are added to the eight bit literal 'k' and the result is placed in the W register. |
| Words: | 1 |
| Cycles: | 1 |
| Q Cycle Activity: | Q1 Q2 Q3 Q4 | Decode | Read literal 'k' | Process data | Write to W |
| Example: | ADDLW 0x15 |
| Before Instruction | W = 0x10 |
| After Instruction | W = 0x25 |

### ANDLW AND Literal with W

| Syntax: | [label] ANDLW k |
| Operands: | $0 \leq k \leq 255$ |
| Operation: | $\text{(W) .AND. (k) \rightarrow (W)}$ |
| Status Affected: | Z |
| Encoding: | \[
\begin{array}{cccc}
11 & 1001 & kkkk & kkkk \\
\end{array}
\] |
| Description: | The contents of W register are AND'ed with the eight bit literal 'k'. The result is placed in the W register. |
| Words: | 1 |
| Cycles: | 1 |
| Q Cycle Activity: | Q1 Q2 Q3 Q4 | Decode | Read literal 'k' | Process data | Write to W |
| Example: | ANDLW 0x5F |
| Before Instruction | W = 0xA3 |
| After Instruction | W = 0x03 |

### ADDWF Add W and f

| Syntax: | [label] ADDWF f,d |
| Operands: | $0 \leq f \leq 127$ |
| $d \in [0,1]$ |
| Operation: | $\text{(W) + (f) \rightarrow (destination)}$ |
| Status Affected: | C, DC, Z |
| Encoding: | \[
\begin{array}{cccc}
00 & 0111 & dfff & ffff \\
\end{array}
\] |
| Description: | Add the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'. |
| Words: | 1 |
| Cycles: | 1 |
| Q Cycle Activity: | Q1 Q2 Q3 Q4 | Decode | Read register 'f' | Process data | Write to destination |
| Example: | ADDWF FSR, 0 |
| Before Instruction | W = 0x17 |
| FSR = 0xC2 |
| After Instruction | W = 0xD9 |
| FSR = 0xC2 |

### ANDWF AND W with f

| Syntax: | [label] ANDWF f,d |
| Operands: | $0 \leq f \leq 127$ |
| $d \in [0,1]$ |
| Operation: | $\text{(W) .AND. (f) \rightarrow (destination)}$ |
| Status Affected: | Z |
| Encoding: | \[
\begin{array}{cccc}
00 & 0101 & dfff & ffff \\
\end{array}
\] |
| Description: | AND the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'. |
| Words: | 1 |
| Cycles: | 1 |
| Q Cycle Activity: | Q1 Q2 Q3 Q4 | Decode | Read register 'f' | Process data | Write to destination |
| Example: | ANDWF FSR, 1 |
| Before Instruction | W = 0x17 |
| FSR = 0xC2 |
| After Instruction | W = 0x02 |
### BCF (Bit Clear f)

**Syntax:**
\[
\text{[label] BCF } f,b
\]

**Operands:**
- \(0 \leq f \leq 127\)
- \(0 \leq b \leq 7\)

**Operation:**
\(0 \rightarrow (f<b>)\)

**Status Affected:** None

**Encoding:**
\[
01 \ 00bb \ bfff \ ffff
\]

**Description:**
Bit 'b' in register 'f' is cleared.

**Words:** 1

**Cycles:** 1

**Q Cycle Activity:**

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read register 'f'</td>
<td>Process data</td>
<td>Write register 'f'</td>
</tr>
</tbody>
</table>

**Example**

Before Instruction
FLAG_REG = 0xC7

After Instruction
FLAG_REG = 0x47

### BSF (Bit Set f)

**Syntax:**
\[
\text{[label] BSF } f,b
\]

**Operands:**
- \(0 \leq f \leq 127\)
- \(0 \leq b \leq 7\)

**Operation:**
\(1 \rightarrow (f<b>)\)

**Status Affected:** None

**Encoding:**
\[
01 \ 01bb \ bfff \ ffff
\]

**Description:**
Bit 'b' in register 'f' is set.

**Words:** 1

**Cycles:** 1

**Q Cycle Activity:**

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read register 'f'</td>
<td>Process data</td>
<td>Write register 'f'</td>
</tr>
</tbody>
</table>

**Example**

Before Instruction
FLAG_REG = 0x0A

After Instruction
FLAG_REG = 0x8A

### BTFSC (Bit Test, Skip if Clear)

**Syntax:**
\[
\text{[label] BTFSC } f,b
\]

**Operands:**
- \(0 \leq f \leq 127\)
- \(0 \leq b \leq 7\)

**Operation:**
skip if \((f<b>) = 0\)

**Status Affected:** None

**Encoding:**
\[
01 \ 10bb \ bfff \ ffff
\]

**Description:**
If bit 'b' in register 'f' is '1' then the next instruction is executed.
If bit 'b', in register 'f', is '0' then the next instruction is discarded, and a NOP is executed instead, making this a 2Tcy instruction.

**Words:** 1

**Cycles:** 1(2)

**Q Cycle Activity:**

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read register 'f'</td>
<td>Process data</td>
<td>No-Operation</td>
</tr>
</tbody>
</table>

If Skip: (2nd Cycle)

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>No-Operation</td>
<td>No-Operation</td>
<td>No-Operation</td>
<td>No-Operation</td>
</tr>
</tbody>
</table>

**Example**

Before Instruction
PC = address HERE

After Instruction
if FLAG<1> = 0,
PC = address TRUE
if FLAG<1> = 1,
PC = address FALSE
**BTFSS** Bit Test f, Skip if Set

- **Syntax:** `[label] BTFSS ` f,b
- **Operands:** `0 ≤ f ≤ 127  
  0 ≤ b < 7`
- **Operation:** skip if `(f<b) = 1`
- **Status Affected:** None
- **Encoding:**
  ```
  01 11bb bfff ffff
  ```
- **Description:** If bit 'b' in register 'f' is '0' then the next instruction is executed. If bit 'b' is '1', then the next instruction is discarded and a NOP is executed instead, making this a 2Tcy instruction.
- **Words:** 1
- **Cycles:** 1(2)
- **Q Cycle Activity:**
  - If Skip: (2nd Cycle)
    ```
    Q1  Q2  Q3  Q4
    No-Op  No-Op  No-Op  No-Op
    ```
- **Example**
  ```
  HERE  BTFSC  FLAG,1  
  FALSE  GOTO  PROCESS_CODE  
  TRUE  
  ```

**CALL** Call Subroutine

- **Syntax:** `[label] CALL  k`
- **Operands:** `0 ≤ k ≤ 2047`
- **Operation:** `(PC)+ 1 → TOS, 
  k → PC<10:0>, 
  (PCLATH<4:3>) → PC<12:11>`
- **Status Affected:** None
- **Encoding:**
  ```
  10 0kkk kkkk kkkk
  ```
- **Description:** Call Subroutine. First, return address `(PC+1)` is pushed onto the stack. The eleven bit immediate address is loaded into PC bits <10:0>. The upper bits of the PC are loaded from PCLATH. CALL is a two cycle instruction.
- **Words:** 1
- **Cycles:** 2
- **Q Cycle Activity:**
  ```
  Q1  Q2  Q3  Q4  
  1st Cycle  Decode  Read  Process  Write
  literal 'k', Push PC to Stack  data  to PC
  2nd Cycle  No-Op  No-Op  No-Op  No-Op
  ```
- **Example**
  ```
  HERE  CALL  THERE  
  ```

**Before Instruction**

| PC = | Address HERE |

**After Instruction**

| PC = | Address THERE |
| TOS = | Address HERE+1 |
### CLRF  Clear f

**Syntax:**  
[\( \text{label} \)]  CLRF f

**Operands:**  
\( 0 \leq f \leq 127 \)

**Operation:**  
\( 00h \rightarrow (f) \)
\( 1 \rightarrow Z \)

**Status Affected:**  
Z

**Encoding:**  

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>fff</th>
<th>ffff</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0001</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Description:** The contents of register \( f \) are cleared and the Z bit is set.

**Words:**  
1

**Cycles:**  
1

**Q Cycle Activity:**  

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read register f</td>
<td>Process data</td>
<td>Write register f</td>
</tr>
</tbody>
</table>

**Example**

Before Instruction

\[
\text{FLAG\_REG} = 0x5A
\]

After Instruction

\[
\begin{align*}
\text{FLAG\_REG} & = 0x00 \\
Z & = 1
\end{align*}
\]

### CLRW  Clear W

**Syntax:**  
[\( \text{label} \)]  CLRW

**Operands:**  
None

**Operation:**  
\( 00h \rightarrow (W) \)
\( 1 \rightarrow Z \)

**Status Affected:**  
Z

**Encoding:**  

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>xxx</th>
<th>xxxx</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0001</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** W register is cleared. Zero bit (Z) is set.

**Words:**  
1

**Cycles:**  
1

**Q Cycle Activity:**  

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>No-Operation</td>
<td>Process data</td>
<td>Write to W</td>
</tr>
</tbody>
</table>

**Example**

Before Instruction

\[
W = 0x5A
\]

After Instruction

\[
\begin{align*}
W & = 0x00 \\
Z & = 1
\end{align*}
\]

### CLRWDT  Clear Watchdog Timer

**Syntax:**  
[\( \text{label} \)]  CLRWDT

**Operands:**  
None

**Operation:**  
\( 00h \rightarrow \text{WDT} \)
\( 0 \rightarrow \text{WDT prescaler,} \)
\( 1 \rightarrow \text{TO} \)
\( 1 \rightarrow \text{PD} \)

**Status Affected:**  
TO, PD

**Encoding:**  

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>0110</th>
<th>0100</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0000</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**Description:** CLRWDT instruction resets the Watchdog Timer. It also resets the prescaler of the WDT. Status bits TO and PD are set.

**Words:**  
1

**Cycles:**  
1

**Q Cycle Activity:**  

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>No-Operation</td>
<td>Process data</td>
<td>Clear WDT Counter</td>
</tr>
</tbody>
</table>

**Example**

Before Instruction

\[
\begin{align*}
\text{WDT counter} & = ?
\end{align*}
\]

After Instruction

\[
\begin{align*}
\text{WDT counter} & = 0x00 \\
\text{WDT prescaler} & = 0 \\
\text{TO} & = 1 \\
\text{PD} & = 1
\end{align*}
\]
**COMF** Complement f

Syntax: `[ label ]   COMF    f,d 

Operands:  

- \(0 \leq f \leq 127\)  
- \(d \in [0,1]\)

Operation: \((f) \rightarrow (\text{destination})\)

Status Affected: \(Z\)

Encoding:  

<table>
<thead>
<tr>
<th>f</th>
<th>d</th>
<th>f</th>
<th>f</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>1001</td>
<td>dfff</td>
<td>ffff</td>
</tr>
</tbody>
</table>

Description: The contents of register 'f' are complemented. If 'd' is 0 the result is stored in W. If 'd' is 1 the result is stored back in register 'f'.

Words: 1  
Cycles: 1

Q Cycle Activity:  

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read register f</td>
<td>Process data</td>
<td>Write to destination</td>
</tr>
</tbody>
</table>

Example  

**Before Instruction**  

\[ \text{REG1} = 0x13 \]

**After Instruction**  

\[ \text{REG1} = 0x13 \]
\[ \text{W} = 0xEC \]

**DECF** Decrement f

Syntax: `[ label ]   DECF    f,d 

Operands:  

- \(0 \leq f \leq 127\)  
- \(d \in [0,1]\)

Operation: \((f) - 1 \rightarrow (\text{destination})\)

Status Affected: \(Z\)

Encoding:  

<table>
<thead>
<tr>
<th>f</th>
<th>d</th>
<th>f</th>
<th>f</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0011</td>
<td>dfff</td>
<td>ffff</td>
</tr>
</tbody>
</table>

Description: Decrement register 'f'. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'.

If Skip:  

(2nd Cycle)  

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>No-Operation</td>
<td>No-Operation</td>
<td>No-Operation</td>
<td>No-Operation</td>
</tr>
</tbody>
</table>

Example  

**HERE** \[ \text{DECFSZ} \]  
\[ \text{CNT, 1} \]

**CONTINUE**  
\[ \text{GOTO LOOP} \]

Before Instruction  

\[ \text{PC} = \text{address HERE} \]

After Instruction  

\[ \text{CNT} = \text{CNT - 1} \]
\[ \text{if CNT = 0,} \]
\[ \text{PC} = \text{address CONTINUE} \]
\[ \text{if CNT \neq 0,} \]
\[ \text{PC} = \text{address HERE + 1} \]

**DECFSZ** Decrement f, Skip if 0

Syntax: `[ label ]   DECFSZ    f,d 

Operands:  

- \(0 \leq f \leq 127\)  
- \(d \in [0,1]\)

Operation: \((f) - 1 \rightarrow (\text{destination}); \ skip \text{if result} = 0\)

Status Affected: None

Encoding:  

<table>
<thead>
<tr>
<th>f</th>
<th>d</th>
<th>f</th>
<th>f</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>1011</td>
<td>dfff</td>
<td>ffff</td>
</tr>
</tbody>
</table>

Description: The contents of register 'f' are decremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 1, the next instruction is executed. If the result is 0, then a NOP is executed instead making it a 2TCY instruction.

Words: 1  
Cycles: 1(2)

Q Cycle Activity:

</table>

Example  

**HERE** \[ \text{DECFSZ} \]  
\[ \text{CNT, 1} \]

**CONTINUE**  
\[ \text{GOTO LOOP} \]

Before Instruction  

\[ \text{PC} = \text{address HERE} \]

After Instruction  

\[ \text{CNT} = \text{CNT - 1} \]
\[ \text{if CNT = 0,} \]
\[ \text{PC} = \text{address CONTINUE} \]
\[ \text{if CNT \neq 0,} \]
\[ \text{PC} = \text{address HERE + 1} \]
### GOTO Unconditional Branch

**Syntax:**  
\[
[\text{label}] \quad \text{GOTO} \quad k
\]

**Operands:**  
\[0 \leq k \leq 2047\]

**Operation:**  
\[k \rightarrow \text{PC}<10:0>\]  
\[
PCLATH<4:3> \rightarrow \text{PC}<12:11>\]

**Status Affected:** None

**Encoding:**  
\[
01 1kkk kkkk kkkk
\]

**Description:**  
GOTO is an unconditional branch. The eleven bit immediate value is loaded into PC bits <10:0>. The upper bits of PC are loaded from PCLATH<4:3>. GOTO is a two cycle instruction.

**Words:** 1

**Cycles:** 2

**Q Cycle Activity:**  
1st Cycle:  
- Decode
- Read literal ‘k’
- Process data
- Write to PC

2nd Cycle:  
- No-operation
- No-operation
- No-operation
- No-operation

**Example**

**Before Instruction**

\[
\text{GOTO THERE}
\]

\[
\text{PC} = \text{Address THERE}
\]

### INCF Increment f

**Syntax:**  
\[
[\text{label}] \quad \text{INCF} \quad f,d
\]

**Operands:**  
\[0 \leq f \leq 127\]
\[d \in [0,1]\]

**Operation:**  
\[(f) + 1 \rightarrow \text{(destination)}\]

**Status Affected:** Z

**Encoding:**  
\[
00 1010 dfff ffff
\]

**Description:**  
The contents of register ‘f’ are incremented. If ‘d’ is 0 the result is placed in the W register. If ‘d’ is 1 the result is placed back in register ‘f’.

**Words:** 1

**Cycles:** 1

**Q Cycle Activity:**  
Q1 Q2 Q3 Q4

1st Cycle:  
- Decode
- Read register ‘f’
- Process data
- Write to destination

2nd Cycle:  
- No-operation
- No-operation
- No-operation
- No-operation

**Example**

**Before Instruction**

\[
\text{INCF CNT, 1}
\]

\[
\text{CNT} = 0xFF\]
\[
Z = 0
\]

**After Instruction**

\[
\text{CNT} = 0x00\]
\[
Z = 1
\]
INCFSZ Increment f, Skip if 0

Syntax:  [ label ]    INCFSZ   f,d
Operands:  0 ≤ f ≤ 127
d ∈ [0,1]
Operation:  (f) + 1 → (destination),
skip if result = 0
Status Affected:  None
Encoding:  
00 1111 dfff ffff
Description:  The contents of register 'f' are increased. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 0, a NOP is executed instead making it a 2Tcy instruction.

Words:  1
Cycles:  1(2)
Q Cycle Activity:  

If Skip:  (2nd Cycle)

IORLW Inclusive OR Literal with W

Syntax:  [ label ]    IORLW   k
Operands:  0 ≤ k ≤ 255
Operation:  (W) .OR. k → (W)
Status Affected:  Z
Encoding:  
11 1000 kkkk kkkk
Description:  The contents of the W register is OR'ed with the eight bit literal 'k'. The result is placed in the W register.

Words:  1
Cycles:  1
Q Cycle Activity:  

Example

Here    INCFSZ   CNT, 1
GOTO LOOP
CONTINUE •
•

Before Instruction
PC    =   address HERE

After Instruction
CNT    =   CNT + 1
if CNT= 0,
PC    =   address CONTINUE
if CNT= 0,
PC    =   address HERE +1
**IORWF**  
Inclusive OR W with f

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>[ label ] IORWF f,d</th>
</tr>
</thead>
</table>
| Operands: | $0 \leq f \leq 127$  
$\text{d} \in [0,1]$ |
| Operation: | $(W) \lor (f) \to \text{(destination)}$ |
| Status Affected: | Z |
| Encoding: | |00| 0100| dfff| ffff|
| Description: | Inclusive OR the W register with register $f$. If $d = 0$ the result is placed in the W register. If $d = 1$ the result is placed back in register $f$. |
| Words: | 1 |
| Cycles: | 1 |
| Q Cycle Activity: | Q1 Q2 Q3 Q4 |

**Example**  
IORWF RESULT, 0  
Before Instruction  
RESULT = 0x13  
W = 0x91  
After Instruction  
RESULT = 0x13  
W = 0x93  
Z = 1

**MOV**  
Move f

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>[ label ] MOV f,d</th>
</tr>
</thead>
</table>
| Operands: | $0 \leq f \leq 127$  
$\text{d} \in [0,1]$ |
| Operation: | $(f) \to \text{(destination)}$ |
| Status Affected: | Z |
| Encoding: | |00| 1000| dfff| ffff|
| Description: | The contents of register f is moved to a destination dependant upon the status of d. If d = 0, destination is W register. If d = 1, the destination is file register f itself. d = 1 is useful to test a file register since status flag Z is affected. |
| Words: | 1 |
| Cycles: | 1 |
| Q Cycle Activity: | Q1 Q2 Q3 Q4 |

**Example**  
MOV FSR, 0  
After Instruction  
W = value in FSR register  
Z = 1

**RETLW**

**Return with Literal in W**

**Syntax:**

\[ \text{[ label]} \] RETLW \( k \)

**Operands:**

\( 0 \leq k \leq 255 \)

**Operation:**

\( k \rightarrow (W); \)

\( \text{TOS} \rightarrow \text{PC} \)

**Status Affected:** None

**Encoding:**

\[
\begin{array}{|c|c|c|c|}
\hline
0 & 11 & 01xx & kkkk \\
\hline
\end{array}
\]

**Description:**

The \( W \) register is loaded with the eight bit literal \( k \). The program counter is loaded from the top of the stack (the return address). This is a two cycle instruction.

**Words:** 1

**Cycles:** 2

**Q Cycle Activity:**

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read literal ( k )</td>
<td>No-Operation</td>
<td>Write to ( W ), Pop from the Stack</td>
</tr>
</tbody>

- C = ?
- Z = ?

**After Instruction**

- REG1 = 1
- W = 2
- C = 1; result is positive
- Z = 0

**Example 2:**

**Before Instruction**

- REG1 = 2
- W = 2
- C = ?
- Z = ?

**After Instruction**

- REG1 = 0
- W = 2
- C = 1; result is zero
- Z = 1

**Example 3:**

**Before Instruction**

- REG1 = 1
- W = 2
- C = ?
- Z = ?

**After Instruction**

- REG1 = 0xFF
- W = 2
- C = 0; result is negative
- Z = 0

### SWAPF
**Swap Nibbles in f**

**Syntax:** \[ label \] SWAPF \ f, d

**Operands:**
- \(0 \leq f \leq 127\)
- \(d \in [0,1]\)

**Operation:**

- \((f<3:0>) \rightarrow (\text{destination}<7:4>)\)
- \((f<7:4>) \rightarrow (\text{destination}<3:0>)\)

**Status Affected:**
None

**Encoding:**

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>1110</td>
<td>dfff</td>
<td>ffff</td>
</tr>
</tbody>
</table>

**Description:** The upper and lower nibbles of register 'f' are exchanged. If 'd' is 0 the result is placed in W register. If 'd' is 1 the result is placed in register 'f'.

**Words:**
1

**Cycles:**
1

**Q Cycle Activity:**

<table>
<thead>
<tr>
<th>Q</th>
<th>Q</th>
<th>Q</th>
<th>Q</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode</td>
<td>Read</td>
<td>Process</td>
<td>Write to destination</td>
</tr>
</tbody>
</table>

**Example**

**Before Instruction**

- REG1 = 0xA5

**After Instruction**

- REG1 = 0xA5
- W = 0x5A

### TRIS
**Load TRIS Register**

**Syntax:** \[ label \] TRIS \ f

**Operands:**
- \(5 \leq f \leq 7\)

**Operation:**

- \((W) \rightarrow \text{TRIS register } f;\)

**Status Affected:**
None

**Encoding:**

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0000</td>
<td>0110</td>
<td>0fff</td>
</tr>
</tbody>
</table>

**Description:** The instruction is supported for code compatibility with the PIC16C5X products. Since TRIS registers are readable and writable, the user can directly address them.

**Words:**
1

**Cycles:**
1

**Example**

To maintain upward compatibility with future PIC16CXX products, do not use this instruction.
XORLW Exclusive OR Literal with W

Syntax: 
[label] XORLW k

Operands: 
0 ≤ k ≤ 255

Operation: 
(W).XOR. k → (W)

Status Affected: 
Z

Encoding: 
11 1010 kkkk kkkk

Description: 
The contents of the W register are XOR'ed with the eight bit literal ‘k’. The result is placed in the W register.

Words: 1
Cycles: 1

Q Cycle Activity: 

<table>
<thead>
<tr>
<th>Q1</th>
<th>Q2</th>
<th>Q3</th>
<th>Q4</th>

REG = 0xAF

W = 0xB5

After Instruction

REG = 0x1A

W = 0xB5
10.0 DEVELOPMENT SUPPORT

10.1 Development Tools

The PICmicro™ microcontrollers are supported with a full range of hardware and software development tools:

- PICMASTER®/PICMASTER CE Real-Time In-Circuit Emulator
- ICEPIC™ Low-Cost PIC16C5X and PIC16CXXX In-Circuit Emulator
- PRO MATE® II Universal Programmer
- PICSTART® Plus Entry-Level Prototype Programmer
- PICDEM-1 Low-Cost Demonstration Board
- PICDEM-2 Low-Cost Demonstration Board
- PICDEM-3 Low-Cost Demonstration Board
- MPASM Assembler
- MPLAB™ SIM Software Simulator
- MPLAB-C17 (C Compiler)
- Fuzzy Logic Development System (fuzzyTECH®-MP)

10.2 PICMASTER: High Performance Universal In-Circuit Emulator with MPLAB IDE

The PICMASTER Universal In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for all microcontrollers in the PIC14C000, PIC12CXXX, PIC16C5X, PIC16CXXX and PIC17CXX families. PICMASTER is supplied with the MPLAB™ Integrated Development Environment (IDE), which allows editing, “make” and download, and source debugging from a single environment.

Interchangeable target probes allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the PICMASTER allows expansion to support all new Microchip microcontrollers.

The PICMASTER Emulator System has been designed as a real-time emulation system with advanced features that are generally found on more expensive development tools. The PC compatible 386 (and higher) machine platform and Microsoft Windows® 3.x environment were chosen to best make these features available to you, the end user.

A CE compliant version of PICMASTER is available for European Union (EU) countries.

10.3 ICEPIC: Low-Cost PICmicro™ In-Circuit Emulator

ICEPIC is a low-cost in-circuit emulator solution for the Microchip PIC12CXXX, PIC16C5X and PIC16CXXX families of 8-bit OTP microcontrollers.

ICEPIC is designed to operate on PC-compatible machines ranging from 286-AT® through Pentium™ based machines under Windows 3.x environment. ICEPIC features real time, non-intrusive emulation.

10.4 PRO MATE II: Universal Programmer

The PRO MATE II Universal Programmer is a full-featured programmer capable of operating in stand-alone mode as well as PC-hosted mode. PRO MATE II is CE compliant.

The PRO MATE II has programmable VDD and VPP supplies which allows it to verify programmed memory at VDD min and VDD max for maximum reliability. It has an LCD display for displaying error messages, keys to enter commands and a modular detachable socket assembly to support various package types. In stand-alone mode the PRO MATE II can read, verify or program PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices. It can also set configuration and code-protect bits in this mode.

10.5 PICSTART Plus Entry Level Development System

The PICSTART programmer is an easy-to-use, low-cost prototype programmer. It connects to the PC via one of the COM (RS-232) ports. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. PICSTART Plus is not recommended for production programming.

PICSTART Plus supports all PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices with up to 40 pins. Larger pin count devices such as the PIC16C923, PIC16C924 and PIC17C756 may be supported with an adapter socket. PICSTART Plus is CE compliant.
10.6 **PICDEM-1 Low-Cost PICmicro Demonstration Board**

The PICDEM-1 is a simple board which demonstrates the capabilities of several of Microchip’s microcontrollers. The microcontrollers supported are: PIC16C5X (PIC16C54 to PIC16C58A), PIC16C61, PIC16C62X, PIC16C71, PIC16C8X, PIC17C42, PIC17C43 and PIC17C44. All necessary hardware and software is included to run basic demo programs. The users can program the sample microcontrollers provided with the PICDEM-1 board, on a PRO MATE II or PICSTART-Plus programmer, and easily test firmware. The user can also connect the PICDEM-1 board to the PICMASTER emulator and download the firmware to the emulator for testing. Additional prototype area is available for the user to build some additional hardware and connect it to the microcontroller socket(s). Some of the features include an RS-232 interface, a potentiometer for simulated analog input, push-button switches and eight LEDs connected to PORTB.

10.7 **PICDEM-2 Low-Cost PIC16CXX Demonstration Board**

The PICDEM-2 is a simple demonstration board that supports the PIC16C62, PIC16C64, PIC16C65, PIC16C73 and PIC16C74 microcontrollers. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-2 board, on a PRO MATE II programmer or PICSTART-Plus, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-2 board to test firmware. Additional prototype area has been provided to the user for adding additional hardware and connecting it to the microcontroller socket(s). Some of the features include a RS-232 interface, push-button switches, a potentiometer for simulated analog input, a Serial EEPROM to demonstrate usage of the I2C bus and separate headers for connection to an LCD module and a keypad.

10.8 **PICDEM-3 Low-Cost PIC16CXXX Demonstration Board**

The PICDEM-3 is a simple demonstration board that supports the PIC16C923 and PIC16C924 in the PLCC package. It will also support future 44-pin PLCC microcontrollers with a LCD Module. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-3 board, on a PRO MATE II programmer or PICSTART Plus with an adapter socket, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-3 board to test firmware. Additional prototype area has been provided to the user for adding hardware and connecting it to the microcontroller socket(s). Some of the features include an RS-232 interface, push-button switches, a potentiometer for simulated analog input, a thermistor and separate headers for connection to an external LCD module and a keypad. Also provided on the PICDEM-3 board is an LCD panel, with 4 commons and 12 segments, that is capable of displaying time, temperature and day of the week. The PICDEM-3 provides an additional RS-232 interface and Windows 3.1 software for showing the demultiplexed LCD signals on a PC. A simple serial interface allows the user to construct a hardware demultiplexer for the LCD signals.

10.9 **MPLAB™ Integrated Development Environment Software**

The MPLAB IDE Software brings an ease of software development previously unseen in the 8-bit microcontroller market. MPLAB is a windows based application which contains:

- A full featured editor
- Three operating modes
  - editor
  - emulator
  - simulator
- A project manager
- Customizable tool bar and key mapping
- A status bar with project information
- Extensive on-line help

MPLAB allows you to:

- Edit your source files (either assembly or ‘C’)
- One touch assemble (or compile) and download to PICmicro tools (automatically updates all project information)
- Debug using:
  - source files
  - absolute listing file
- Transfer data dynamically via DDE (soon to be replaced by OLE)
- Run up to four emulators on the same PC

The ability to use MPLAB with Microchip’s simulator allows a consistent platform and the ability to easily switch from the low cost simulator to the full featured emulator with minimal retraining due to development tools.

10.10 **Assembler (MPASM)**

The MPASM Universal Macro Assembler is a PC-hosted symbolic assembler. It supports all microcontroller series including the PIC12C5XX, PIC14000, PIC16C5X, PIC16CXXX, and PIC17CXX families. MPASM offers full featured Macro capabilities, conditional assembly, and several source and listing formats. It generates various object code formats to support Microchip’s development tools as well as third party programmers.

MPASM allows full symbolic debugging from PICMASTER, Microchip’s Universal Emulator System.
MPASM has the following features to assist in developing software for specific use applications.

- Provides translation of Assembler source code to object code for all Microchip microcontrollers.
- Macro assembly capability.
- Produces all the files (Object, Listing, Symbol, and special) required for symbolic debug with Microchip's emulator systems.
- Supports Hex (default), Decimal and Octal source and listing formats.

MPASM provides a rich directive language to support programming of the PICmicro. Directives are helpful in making the development of your assemble source code shorter and more maintainable.

10.11 Software Simulator (MPLAB-SIM)

The MPLAB-SIM Software Simulator allows code development in a PC host environment. It allows the user to simulate the PICmicro series microcontrollers on an instruction level. On any given instruction, the user may examine or modify any of the data areas or provide external stimulus to any of the pins. The input/output radix can be set by the user and the execution can be performed in; single step, execute until break, or in a trace mode.

MPLAB-SIM fully supports symbolic debugging using MPLAB-C and MPASM. The Software Simulator offers the low cost flexibility to develop and debug code outside of the laboratory environment making it an excellent multi-project software development tool.

10.12 C Compiler (MPLAB-C17)

The MPLAB-C Code Development System is a complete 'C' compiler and integrated development environment for Microchip's PIC17CXXX family of microcontrollers. The compiler provides powerful integration capabilities and ease of use not found with other compilers.

For easier source level debugging, the compiler provides symbol information that is compatible with the MPLAB IDE memory display.

10.13 Fuzzy Logic Development System (fuzzyTECH-MP)

fuzzyTECH-MP fuzzy logic development tool is available in two versions - a low cost introductory version, MP Explorer, for designers to gain a comprehensive working knowledge of fuzzy logic system design; and a full-featured version, fuzzyTECH-MP, Edition for implementing more complex systems.

Both versions include Microchip’s fuzzyLAB™ demonstration board for hands-on experience with fuzzy logic systems implementation.

10.14 MP-DriveWay™ – Application Code Generator

MP-DriveWay is an easy-to-use Windows-based Application Code Generator. With MP-DriveWay you can visually configure all the peripherals in a PICmicro device and, with a click of the mouse, generate all the initialization and many functional code modules in C language. The output is fully compatible with Microchip's MPLAB-C C compiler. The code produced is highly modular and allows easy integration of your own code. MP-DriveWay is intelligent enough to maintain your code through subsequent code generation.

10.15 SEEVAL® Evaluation and Programming System

The SEEVAL SEEPRoM Designer's Kit supports all Microchip 2-wire and 3-wire Serial EEPROMs. The kit includes everything necessary to read, write, erase or program special features of any Microchip SEEPRoM product including Smart Serials™ and secure serials. The Total Endurance™ Disk is included to aid in trade-off analysis and reliability calculations. The total kit can significantly reduce time-to-market and result in an optimized system.

10.16 KEELOQ® Evaluation and Programming Tools

KEELOQ evaluation and programming tools support Microchips HCS Secure Data Products. The HCS evaluation kit includes an LCD display to show changing codes, a decoder to decode transmissions, and a programming interface to program test transmitters.

11.0 ELECTRICAL CHARACTERISTICS FOR PIC16F83 AND PIC16F84

Absolute Maximum Ratings †

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ambient temperature under bias</td>
<td>-55°C to +125°C</td>
</tr>
<tr>
<td>Storage temperature</td>
<td>-65°C to +150°C</td>
</tr>
<tr>
<td>Voltage on VDD with respect to VSS</td>
<td>-0.3 to +7.5V</td>
</tr>
<tr>
<td>Voltage on MCLR with respect to VSS (2)</td>
<td>-0.3 to +14V</td>
</tr>
<tr>
<td>Voltage on any pin with respect to VSS (except VDD and MCLR)</td>
<td>-0.6V to (VDD + 0.6V)</td>
</tr>
<tr>
<td>Total power dissipation (1)</td>
<td>800 mW</td>
</tr>
<tr>
<td>Maximum current out of VSS pin</td>
<td>150 mA</td>
</tr>
<tr>
<td>Maximum current into VDD pin</td>
<td>100 mA</td>
</tr>
<tr>
<td>Input clamp current, I_{IK} (V_I &lt; 0 or V_I &gt; VDD)</td>
<td>± 20 mA</td>
</tr>
<tr>
<td>Output clamp current, I_{OK} (V_O &lt; 0 or V_O &gt; VDD)</td>
<td>± 20 mA</td>
</tr>
<tr>
<td>Maximum output current sunk by any I/O pin</td>
<td>25 mA</td>
</tr>
<tr>
<td>Maximum output current sourced by any I/O pin</td>
<td>20 mA</td>
</tr>
<tr>
<td>Maximum current sunk by PORTA</td>
<td>80 mA</td>
</tr>
<tr>
<td>Maximum current sourced by PORTA</td>
<td>50 mA</td>
</tr>
<tr>
<td>Maximum current sunk by PORTB</td>
<td>150 mA</td>
</tr>
<tr>
<td>Maximum current sourced by PORTB</td>
<td>100 mA</td>
</tr>
</tbody>
</table>

Note 1: Power dissipation is calculated as follows: 
\[
P_{\text{dis}} = V_{DD} \times (I_{DD} - \sum I_{OH}) + \sum (V_{DD}-V_{OH}) \times I_{OH} + \sum (V_{OL} \times I_{OL})
\]

Note 2: Voltage spikes below VSS at the MCLR pin, inducing currents greater than 80 mA, may cause latch-up. Thus, a series resistor of 50-100Ω should be used when applying a "low" level to the MCLR pin rather than pulling this pin directly to Vss.

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

</tbody>
</table>

* These parameters are characterized but not tested.
† Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:
- OSC1 = external square wave, from rail to rail; all I/O pins tristated, pulled to VDD, T0CKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.

3: The power down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD and VSS.

4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula: \( I_R = \frac{VDD}{2 \times Rext} \) (mA) with Rext in kOhm.

</tbody>
</table>

* These parameters are characterized but not tested.
† Data in “Typ” column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** In RC oscillator configuration, the OSC1 pin is a Schmitt Trigger input. Do not drive the PIC16F8X with an external clock while the device is in RC mode, or chip damage may result.

**Note 2:** The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

**Note 3:** Negative current is defined as coming out of the pin.

**Note 4:** The user may choose the better of the two specs.

* These parameters are characterized but not tested.
† Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** Instruction cycle period (TCY) equals four times the input oscillator time-base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1 pin.

When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.

12.0 ELECTRICAL CHARACTERISTICS FOR PIC16CR83 AND PIC16CR84

Absolute Maximum Ratings †

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ambient temperature under bias</td>
<td>-55°C to +125°C</td>
</tr>
<tr>
<td>Storage temperature</td>
<td>-65°C to +150°C</td>
</tr>
<tr>
<td>Voltage on VDD with respect to VSS</td>
<td>-0.3 to +7.5V</td>
</tr>
<tr>
<td>Voltage on MCLR with respect to VSS</td>
<td>-0.3 to +14V</td>
</tr>
<tr>
<td>Voltage on any pin with respect to VSS (except VDD and MCLR)</td>
<td>-0.6V to (VDD + 0.6V)</td>
</tr>
<tr>
<td>Total power dissipation</td>
<td>800 mW</td>
</tr>
<tr>
<td>Maximum current out of VSS pin</td>
<td>150 mA</td>
</tr>
<tr>
<td>Maximum current into VDD pin</td>
<td>100 mA</td>
</tr>
<tr>
<td>Input clamp current, IIK (Vi &lt; 0 or Vi &gt; VDD)</td>
<td>±20 mA</td>
</tr>
<tr>
<td>Output clamp current, IOK (VO &lt; 0 or VO &gt; VDD)</td>
<td>±20 mA</td>
</tr>
<tr>
<td>Maximum output current sunk by any I/O pin</td>
<td>25 mA</td>
</tr>
<tr>
<td>Maximum output current sourced by any I/O pin</td>
<td>20 mA</td>
</tr>
<tr>
<td>Maximum current sunk by PORTA</td>
<td>80 mA</td>
</tr>
<tr>
<td>Maximum current sourced by PORTA</td>
<td>50 mA</td>
</tr>
<tr>
<td>Maximum current sunk by PORTB</td>
<td>150 mA</td>
</tr>
<tr>
<td>Maximum current sourced by PORTB</td>
<td>100 mA</td>
</tr>
</tbody>
</table>

Note 1: Power dissipation is calculated as follows: Pdis = VDD x (IDD - ∑IOH) + ∑((VDD - VOH) x IOH) + ∑(VO x IOL)

Note 2: Voltage spikes below Vss at the MCLR pin, inducing currents greater than 80 mA, may cause latch-up. Thus, a series resistor of 50-100Ω should be used when applying a “low” level to the MCLR pin rather than pulling this pin directly to Vss.

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

</tbody>
</table>

* These parameters are characterized but not tested.
† Data in “Typ” column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.
2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.
The test conditions for all IDD measurements in active operation mode are:
- OSC1=external square wave, from rail to rail, all I/O pins tristated, pulled to VDD, T0CKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.
3: The power down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD and VSS.
4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula: $I_R = \frac{VDD}{2R_{ext}}$ (mA) with Rext in kOhm.

* These parameters are characterized but not tested.
† Data in “Typ” column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

**Note 2:** The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:

- OSC1 = external square wave, from rail to rail; all I/O pins tristated, pulled to VDD, TOCKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.

**Note 3:** The power down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD and VSS.

**Note 4:** For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula: \( I_R = \frac{VDD}{2R_{ext}} \) (mA) with Rext in kΩ.

* These parameters are characterized but not tested.
† Data in “Typ” column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: In RC oscillator configuration, the OSC1 pin is a Schmitt Trigger input. Do not drive the PIC16CR8X with an external clock while the device is in RC mode, or chip damage may result.

2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as coming out of the pin.

4: The user may choose the better of the two specs.

* These parameters are characterized but not tested.
† Data in “Typ” column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

**Note 1:** Instruction cycle period (Tcy) equals four times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “min.” values with an external clock applied to the OSC1 pin.

When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.

13.0 DC & AC CHARACTERISTICS GRAPHS/TABLES

The graphs and tables provided in this section are for design guidance and are not tested or guaranteed.

In some graphs or tables, the data presented are outside specified operating range (i.e., outside specified VDD range). This is for information only and devices are guaranteed to operate properly only within the specified range.

The data presented in this section is a statistical summary of data collected on units from different lots over a period of time and matrix samples. 'Typical' represents the mean of the distribution at 25°C, while 'max' or 'min' represents (mean + 3σ) and (mean - 3σ) respectively, where σ is standard deviation.

* All capacitance values are typical at 25°C. A part to part variation of ±25% (three standard deviations) should be taken into account.
14.0  PACKAGING INFORMATION

14.1  Package Marking Information

Legend: XX...X Microchip part number & customer specific information*
AA     Year code (last two digits of calendar year)
BB     Week code (week of January 1 is week ‘01’)
C      Facility code of the plant at which wafer is manufactured
      C = Chandler, Arizona, U.S.A.,
      S = Tempe, Arizona, U.S.A.
D      Mask revision number
E      Assembly code of the plant or country of origin in which
      part was assembled

Note: In the event the full Microchip part number cannot be marked on one line,
      it will be carried over to the next line, thus limiting the number of available
      characters for customer specific information.

* Standard OTP marking consists of Microchip part number, year code, week
code, facility code, mask rev# and assembly code. For OTP marking beyond
this, certain price adders apply. Please check with your Microchip Sales Office.
For QTP devices, any special marking adders are included in QTP price.

† Dimension “B” does not include dam-bar protrusions. Dam-bar protrusions shall not exceed 0.003” (0.076 mm) per side or 0.006” (0.152 mm) more than dimension “B.”

‡ Dimensions “D” and “E” do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010” (0.254 mm) per side or 0.020” (0.508 mm) more than dimensions “D” or “E.”
APPENDIX A: FEATURE IMPROVEMENTS - FROM PIC16C5X TO PIC16F8X

The following is the list of feature improvements over the PIC16C5X microcontroller family:

1. Instruction word length is increased to 14 bits. This allows larger page sizes both in program memory (2K now as opposed to 512 before) and the register file (128 bytes now versus 32 bytes before).

2. A PC latch register (PCLATH) is added to handle program memory paging. PA2, PA1 and PA0 bits are removed from the status register and placed in the option register.

3. Data memory paging is redefined slightly. The STATUS register is modified.

4. Four new instructions have been added: RETURN, RETFIE, ADDLW, and SUBLW. Two instructions, TRIS and OPTION, are being phased out although they are kept for compatibility with PIC16C5X.

5. OPTION and TRIS registers are made addressable.

6. Interrupt capability is added. Interrupt vector is at 0004h.

7. Stack size is increased to 8 deep.

8. Reset vector is changed to 0000h.

9. Reset of all registers is revisited. Five different reset (and wake-up) types are recognized. Registers are reset differently.

10. Wake up from SLEEP through interrupt is added.

11. Two separate timers, the Oscillator Start-up Timer (OST) and Power-up Timer (PWRT), are included for more reliable power-up. These timers are invoked selectively to avoid unnecessary delays on power-up and wake-up.

12. PORTB has weak pull-ups and interrupt on change features.

13. T0CKI pin is also a port pin (RA4/T0CKI).

14. FSR is a full 8-bit register.

15. “In system programming” is made possible. The user can program PIC16CXX devices using only five pins: VDD, Vss, VPP, RB6 (clock) and RB7 (data in/out).

APPENDIX B: CODE COMPATIBILITY - FROM PIC16C5X TO PIC16F8X

To convert code written for PIC16C5X to PIC16F8X, the user should take the following steps:

1. Remove any program memory page select operations (PA2, PA1, PA0 bits) for CALL, GOTO.

2. Revisit any computed jump operations (write to PC or add to PC, etc.) to make sure page bits are set properly under the new scheme.

4. Verify all writes to STATUS, OPTION, and FSR registers since these have changed.

5. Change reset vector to 0000h.
APPENDIX C: WHAT'S NEW IN THIS DATA SHEET

Here’s what’s new in this data sheet:

1. DC & AC Characteristics Graphs/Tables section for PIC16F8X devices has been added.
2. An appendix on conversion considerations has been added. This explains differences for customers wanting to go from PIC16C84 to PIC16F84 or similar device.

APPENDIX D: WHAT'S CHANGED IN THIS DATA SHEET

Here’s what’s changed in this data sheet:

1. Errata information has been included.
2. Option register name has been changed from OPTION to OPTION_REG. This is consistent with other data sheets and header files, and resolves the conflict between the OPTION command and OPTION register.
3. Errors have been fixed.
4. The appendix containing PIC16/17 microcontrollers has been removed.
APPENDIX E: CONVERSION CONSIDERATIONS - PIC16C84 TO PIC16F83/F84 AND PIC16CR83/CRCR84

Considerations for converting from the PIC16C84 to the PIC16F84 are listed in the table below. These considerations apply to converting from the PIC16C84 to the PIC16F83 (same as PIC16F84 except for program and data RAM memory sizes) and the PIC16CR84 and PIC16CR83 (ROM versions of Flash devices). Development Systems support is available for all of the PIC16X8X devices.

ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

www.microchip.com

The file transfer site is available by using an FTP service to connect to:

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User’s Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip’s development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and
1-602-786-7302 for the rest of the world.

Trademarks: The Microchip name, logo, PIC, PICSTART, PICMASTER and PRO MATE are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries. PICmicro, FlexROM, MPLAB and fuzzyLAB are trademarks and SQTP is a service mark of Microchip in the U.S.A.

fuzzyTECH is a registered trademark of Inform Software Corporation. IBM, IBM PC-AT are registered trademarks of International Business Machines Corp. Pentium is a trade-mark of Intel Corporation. Windows is a trademark and MS-DOS, Microsoft Windows are registered trademarks of Microsoft Corporation. CompuServe is a registered trademark of CompuServe Incorporated.

All other trademarks mentioned herein are the property of their respective companies.
READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (602) 786-7578.

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

Questions:

1. What are the best features of this document?
   _______________________________________________________________________

2. How does this document meet your hardware and software development needs?
   _______________________________________________________________________

3. Do you find the organization of this data sheet easy to follow? If not, why?
   _______________________________________________________________________

4. What additions to the data sheet do you think would enhance the structure and subject?
   _______________________________________________________________________

5. What deletions from the data sheet could be made without affecting the overall usefulness?
   _______________________________________________________________________

6. Is there any incorrect or misleading information (what and where)?
   _______________________________________________________________________

7. How would you improve this document?
   _______________________________________________________________________

8. How would you improve our software, systems, and silicon products?
   _______________________________________________________________________
**PIC16F8X PRODUCT IDENTIFICATION SYSTEM**

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

**Examples:**

- a) PIC16F84 -04/P 301 = Commercial temp., PDIP package, 4 MHz, normal Vdd limits, QTP pattern #301.
- b) PIC16LF84 -04I/SS = Industrial temp., SOIC package, 200 kHz, Extended Vdd limits.
- c) PIC16CR84 -10I/P = ROM program memory, Industrial temp., PDIP package, 10MHz, normal Vdd limits.

**Note:**

1. b = blank
2. F = Standard Vdd range
   LF = Extended Vdd range
   CR = ROM Version, Standard Vdd range
   LCR = ROM Version, Extended Vdd range
3. T = in tape and reel - SOIC, SSOP packages only.

**SALES AND SUPPORT**

Products supported by a preliminary Data Sheet may possibly have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office.
2. The Microchip Corporate Literature Center U.S. FAX: (602) 786-7277
3. The Microchip’s Bulletin Board, via your local CompuServe number (CompuServe membership NOT required).

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

For latest version information and upgrade kits for Microchip Development Tools, please call 1-800-755-2345 or 1-602-786-7302.

Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999. The Company’s quality system processes and procedures are QS-9000 compliant for its PIC® microcontrollers, KEELOQ code hopping devices, Serial EEPROMs and microperipheral products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001 certified.
