## Problem Statement

Consider the following nonconvex nonsmooth optimization problem:

$$
\begin{equation*}
q^{*} \triangleq \min _{x \in \mathcal{X} \subseteq \mathbb{X}}\{q(x) \triangleq f(x)+r(x)\}, \quad f(x) \triangleq \max _{y \in \mathcal{Y} \subseteq \mathbb{Y}} \Phi(x, y)-g(y), \tag{P}
\end{equation*}
$$

## Problem Statement

Consider the following nonconvex nonsmooth optimization problem:

$$
\begin{equation*}
q^{*} \triangleq \min _{x \in \mathcal{X} \subseteq \mathbb{X}}\{q(x) \triangleq f(x)+r(x)\}, \quad f(x) \triangleq \max _{y \in \mathcal{Y} \subseteq \mathbb{Y}} \Phi(x, y)-g(y) \tag{P}
\end{equation*}
$$

$\triangleright \mathbb{X}$ and $\mathbb{Y}$ are finite-dimensional real normed spaces.

## Problem Statement

Consider the following nonconvex nonsmooth optimization problem:

$$
\begin{equation*}
q^{*} \triangleq \min _{x \in \mathcal{X} \subseteq \mathbb{X}}\{q(x) \triangleq f(x)+r(x)\}, \quad f(x) \triangleq \max _{y \in \mathcal{Y} \subseteq \mathbb{Y}} \Phi(x, y)-g(y) \tag{P}
\end{equation*}
$$

$\triangleright \mathbb{X}$ and $\mathbb{Y}$ are finite-dimensional real normed spaces.
$\triangleright \mathcal{X}$ and $\mathcal{Y}$ are nonempty, closed and convex sets, and $\mathcal{Y}$ is bounded.

## Problem Statement

Consider the following nonconvex nonsmooth optimization problem:

$$
\begin{equation*}
q^{*} \triangleq \min _{x \in \mathcal{X} \subseteq \mathbb{X}}\{q(x) \triangleq f(x)+r(x)\}, \quad f(x) \triangleq \max _{y \in \mathcal{Y} \subseteq \mathbb{Y}} \Phi(x, y)-g(y) \tag{P}
\end{equation*}
$$

$\triangleright \mathbb{X}$ and $\mathbb{Y}$ are finite-dimensional real normed spaces.
$\triangleright \mathcal{X}$ and $\mathcal{Y}$ are nonempty, closed and convex sets, and $\mathcal{Y}$ is bounded.
$\triangleright q$ is bounded below, i.e., $q^{*}>-\infty$.

## Problem Statement

Consider the following nonconvex nonsmooth optimization problem:

$$
\begin{equation*}
q^{*} \triangleq \min _{x \in \mathcal{X} \subseteq \mathbb{X}}\{q(x) \triangleq f(x)+r(x)\}, \quad f(x) \triangleq \max _{y \in \mathcal{Y} \subseteq \mathbb{Y}} \Phi(x, y)-g(y) \tag{P}
\end{equation*}
$$

$\triangleright \mathbb{X}$ and $\mathbb{Y}$ are finite-dimensional real normed spaces.
$\triangleright \mathcal{X}$ and $\mathcal{Y}$ are nonempty, closed and convex sets, and $\mathcal{Y}$ is bounded.
$\triangleright q$ is bounded below, i.e., $q^{*}>-\infty$.
$\triangleright r: \mathbb{X} \rightarrow \overline{\mathbb{R}} \triangleq \mathbb{R} \cup\{+\infty\}$ and $g: \mathbb{Y} \rightarrow \overline{\mathbb{R}}$ are closed, convex and proper.

## Problem Statement

Consider the following nonconvex nonsmooth optimization problem:

$$
\begin{equation*}
q^{*} \triangleq \min _{x \in \mathcal{X} \subseteq \mathbb{X}}\{q(x) \triangleq f(x)+r(x)\}, \quad f(x) \triangleq \max _{y \in \mathcal{Y} \subseteq \mathbb{Y}} \Phi(x, y)-g(y) \tag{P}
\end{equation*}
$$

$\triangleright \mathbb{X}$ and $\mathbb{Y}$ are finite-dimensional real normed spaces.
$\triangleright \mathcal{X}$ and $\mathcal{Y}$ are nonempty, closed and convex sets, and $\mathcal{Y}$ is bounded.
$\triangleright q$ is bounded below, i.e., $q^{*}>-\infty$.
$\triangleright r: \mathbb{X} \rightarrow \overline{\mathbb{R}} \triangleq \mathbb{R} \cup\{+\infty\}$ and $g: \mathbb{Y} \rightarrow \overline{\mathbb{R}}$ are closed, convex and proper.
$\triangleright r$ and $g$ are $M_{r^{-}}$and $M_{g^{\prime}}$-Lipschitz on $\mathcal{X}$ and $\mathcal{Y}$, respectively, with easily computable Bregman proximal projections.

## Assumptions on $\Phi$

The function $\Phi: \mathbb{X} \times \mathbb{Y} \rightarrow[-\infty,+\infty]$ satisfies the following assumptions.

## Assumptions on $\Phi$

The function $\Phi: \mathbb{X} \times \mathbb{Y} \rightarrow[-\infty,+\infty]$ satisfies the following assumptions.
$\triangleright$ For any $x \in \mathcal{X}, \Phi(x, \cdot)$ is concave on $\mathcal{Y}$.

## Assumptions on $\Phi$

The function $\Phi: \mathbb{X} \times \mathbb{Y} \rightarrow[-\infty,+\infty]$ satisfies the following assumptions.
$\triangleright$ For any $x \in \mathcal{X}, \Phi(x, \cdot)$ is concave on $\mathcal{Y}$.
$\triangleright$ For any $y \in \mathcal{Y}, \Phi(\cdot, y)$ is $\gamma$-weakly convex on $\mathcal{X}$ for some $\gamma \in\left(0, L_{x x}\right]$ :

$$
-(\gamma / 2)\left\|x^{\prime}-x\right\|^{2} \leq \Phi\left(x^{\prime}, y\right)-\Phi(x, y)-\left\langle\nabla_{x} \Phi(x, y), x^{\prime}-x\right\rangle, \quad \forall x, x^{\prime} \in \mathcal{X}
$$

## Assumptions on $\Phi$

The function $\Phi: \mathbb{X} \times \mathbb{Y} \rightarrow[-\infty,+\infty]$ satisfies the following assumptions.
$\triangleright$ For any $x \in \mathcal{X}, \Phi(x, \cdot)$ is concave on $\mathcal{Y}$.
$\triangleright$ For any $y \in \mathcal{Y}, \Phi(\cdot, y)$ is $\gamma$-weakly convex on $\mathcal{X}$ for some $\gamma \in\left(0, L_{x x}\right]$ :

$$
-(\gamma / 2)\left\|x^{\prime}-x\right\|^{2} \leq \Phi\left(x^{\prime}, y\right)-\Phi(x, y)-\left\langle\nabla_{x} \Phi(x, y), x^{\prime}-x\right\rangle, \quad \forall x, x^{\prime} \in \mathcal{X}
$$

$\triangleright \Phi(\cdot, \cdot)$ is jointly continuous on $\mathcal{X} \times \mathcal{Y}$.

## Assumptions on $\Phi$

The function $\Phi: \mathbb{X} \times \mathbb{Y} \rightarrow[-\infty,+\infty]$ satisfies the following assumptions.
$\triangleright$ For any $x \in \mathcal{X}, \Phi(x, \cdot)$ is concave on $\mathcal{Y}$.
$\triangleright$ For any $y \in \mathcal{Y}, \Phi(\cdot, y)$ is $\gamma$-weakly convex on $\mathcal{X}$ for some $\gamma \in\left(0, L_{x x}\right]$ :

$$
-(\gamma / 2)\left\|x^{\prime}-x\right\|^{2} \leq \Phi\left(x^{\prime}, y\right)-\Phi(x, y)-\left\langle\nabla_{x} \Phi(x, y), x^{\prime}-x\right\rangle, \quad \forall x, x^{\prime} \in \mathcal{X}
$$

$\triangleright \Phi(\cdot, \cdot)$ is jointly continuous on $\mathcal{X} \times \mathcal{Y}$.
$\triangleright \Phi(\cdot, \cdot)$ is differentiable on $\mathcal{X} \times \mathcal{Y}$, and for any $x, x^{\prime} \in \mathcal{X}$ and $y, y^{\prime} \in \mathcal{Y}$ :

$$
\begin{aligned}
& \left\|\nabla_{x} \Phi(x, y)-\nabla_{x} \Phi\left(x^{\prime}, y\right)\right\|_{*} \leq L_{x x}\left\|x-x^{\prime}\right\|, \\
& \left\|\nabla_{x} \Phi(x, y)-\nabla_{x} \Phi\left(x, y^{\prime}\right)\right\|_{*} \leq L_{x y}\left\|y-y^{\prime}\right\|, \\
& \left\|\nabla_{y} \Phi(x, y)-\nabla_{y} \Phi\left(x^{\prime}, y\right)\right\|_{*} \leq L_{x y}\left\|x-x^{\prime}\right\|, \\
& \left\|\nabla_{y} \Phi(x, y)-\nabla_{y} \Phi\left(x, y^{\prime}\right)\right\|_{*} \leq L_{y y}\left\|y-y^{\prime}\right\| .
\end{aligned}
$$

## Application: Distributionally Robust Optimization

$\min _{x \in \mathcal{X}} \max _{p \in \mathcal{P}} \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]+r(x), \quad \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]=\sum_{i=1}^{n} p_{i} \ell\left(x, \xi_{i}\right)$.

## Application: Distributionally Robust Optimization

$\min _{x \in \mathcal{X}} \max _{p \in \mathcal{P}} \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]+r(x), \quad \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]=\sum_{i=1}^{n} p_{i} \ell\left(x, \xi_{i}\right)$.
$\triangleright$ Let $(\Xi, \mathcal{B}, \bar{p})$ be a probability space, where $\Xi \triangleq\left\{\xi_{1}, \ldots, \xi_{n}\right\}$.

## Application: Distributionally Robust Optimization

$\min _{x \in \mathcal{X}} \max _{p \in \mathcal{P}} \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]+r(x), \quad \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]=\sum_{i=1}^{n} p_{i} \ell\left(x, \xi_{i}\right)$.
$\triangleright$ Let $(\Xi, \mathcal{B}, \bar{p})$ be a probability space, where $\Xi \triangleq\left\{\xi_{1}, \ldots, \xi_{n}\right\}$.
$\triangleright$ Let $\ell: \mathbb{X} \times \Xi \rightarrow \mathbb{R}$ be a loss function such that $\ell(x, \xi)$ returns the loss of decision $x \in \mathcal{X}$ given the (random) parameter $\xi \in \Xi$.

## Application: Distributionally Robust Optimization

$$
\min _{x \in \mathcal{X}} \max _{p \in \mathcal{P}} \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]+r(x), \quad \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]=\sum_{i=1}^{n} p_{i} \ell\left(x, \xi_{i}\right) .
$$

$\triangleright$ Let $(\Xi, \mathcal{B}, \bar{p})$ be a probability space, where $\Xi \triangleq\left\{\xi_{1}, \ldots, \xi_{n}\right\}$.
$\triangleright$ Let $\ell: \mathbb{X} \times \Xi \rightarrow \mathbb{R}$ be a loss function such that $\ell(x, \xi)$ returns the loss of decision $x \in \mathcal{X}$ given the (random) parameter $\xi \in \Xi$.
$\triangleright$ Let $\ell(\cdot, \xi)$ be $L(\xi)$-smooth on $\mathcal{X}$, i.e., $\ell(\cdot, \xi)$ is differentiable with $L(\xi)$-Lipschitz gradient on $\mathcal{X}$.

## Application: Distributionally Robust Optimization

$$
\min _{x \in \mathcal{X}} \max _{p \in \mathcal{P}} \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]+r(x), \quad \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]=\sum_{i=1}^{n} p_{i} \ell\left(x, \xi_{i}\right) .
$$

$\triangleright$ Let $(\Xi, \mathcal{B}, \bar{p})$ be a probability space, where $\Xi \triangleq\left\{\xi_{1}, \ldots, \xi_{n}\right\}$.
$\triangleright$ Let $\ell: \mathbb{X} \times \Xi \rightarrow \mathbb{R}$ be a loss function such that $\ell(x, \xi)$ returns the loss of decision $x \in \mathcal{X}$ given the (random) parameter $\xi \in \Xi$.
$\triangleright$ Let $\ell(\cdot, \xi)$ be $L(\xi)$-smooth on $\mathcal{X}$, i.e., $\ell(\cdot, \xi)$ is differentiable with $L(\xi)$-Lipschitz gradient on $\mathcal{X}$.
$\triangleright$ Let $\mathcal{P}$ denotes the uncertainty set that contains $\bar{p}$ as a nominal distribution, e.g., $\mathcal{P} \triangleq\left\{p \in \Delta_{n}: d_{\mathrm{TV}}(p, \bar{p}) \leq \alpha_{\mathcal{X}}\right\}$.

## Application: Distributionally Robust Optimization

$$
\min _{x \in \mathcal{X}} \max _{p \in \mathcal{P}} \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]+r(x), \quad \mathbb{E}_{\xi \sim p}[\ell(x, \xi)]=\sum_{i=1}^{n} p_{i} \ell\left(x, \xi_{i}\right) .
$$

$\triangleright$ Let $(\Xi, \mathcal{B}, \bar{p})$ be a probability space, where $\Xi \triangleq\left\{\xi_{1}, \ldots, \xi_{n}\right\}$.
$\triangleright$ Let $\ell: \mathbb{X} \times \Xi \rightarrow \mathbb{R}$ be a loss function such that $\ell(x, \xi)$ returns the loss of decision $x \in \mathcal{X}$ given the (random) parameter $\xi \in \Xi$.
$\triangleright$ Let $\ell(\cdot, \xi)$ be $L(\xi)$-smooth on $\mathcal{X}$, i.e., $\ell(\cdot, \xi)$ is differentiable with $L(\xi)$-Lipschitz gradient on $\mathcal{X}$.
$\triangleright$ Let $\mathcal{P}$ denotes the uncertainty set that contains $\bar{p}$ as a nominal distribution, e.g., $\mathcal{P} \triangleq\left\{p \in \Delta_{n}: d_{\mathrm{TV}}(p, \bar{p}) \leq \alpha_{\mathcal{X}}\right\}$.
$\triangleright r: \mathbb{X} \rightarrow \overline{\mathbb{R}}$ is a regularizer, e.g., $\|\cdot\|_{1}$.

## Non-Euclidean Geometry

## Non-Euclidean Geometry

$\triangleright$ Let $\mathcal{U} \subseteq \mathbb{U}$ be nonempty, closed and convex, where $\mathbb{U}$ is a finite-dimensional real normed space.

## Non-Euclidean Geometry

$\triangleright$ Let $\mathcal{U} \subseteq \mathbb{U}$ be nonempty, closed and convex, where $\mathbb{U}$ is a finite-dimensional real normed space.
$\triangleright$ We call $h_{\mathcal{U}}$ a distance generating function (DGF) on $\mathcal{U}$ if

## Non-Euclidean Geometry

$\triangleright$ Let $\mathcal{U} \subseteq \mathbb{U}$ be nonempty, closed and convex, where $\mathbb{U}$ is a finite-dimensional real normed space.
$\triangleright$ We call $h_{\mathcal{U}}$ a distance generating function (DGF) on $\mathcal{U}$ if

- it is essentially smooth, i.e., cont. differentiable on int dom $h_{\mathcal{U}} \neq \emptyset$, and for any $u_{k} \rightarrow u \in \operatorname{bd} \mathcal{U},\left\|\nabla h_{\mathcal{U}}\left(u_{k}\right)\right\|_{*} \rightarrow+\infty$,

## Non-Euclidean Geometry

$\triangleright$ Let $\mathcal{U} \subseteq \mathbb{U}$ be nonempty, closed and convex, where $\mathbb{U}$ is a finite-dimensional real normed space.
$\triangleright$ We call $h_{\mathcal{U}}$ a distance generating function (DGF) on $\mathcal{U}$ if

- it is essentially smooth, i.e., cont. differentiable on int dom $h_{\mathcal{U}} \neq \emptyset$, and for any $u_{k} \rightarrow u \in \operatorname{bd} \mathcal{U},\left\|\nabla h_{\mathcal{U}}\left(u_{k}\right)\right\|_{*} \rightarrow+\infty$,
- it is continuous and 1-s.c. on $\mathcal{U}$,

## Non-Euclidean Geometry

$\triangleright$ Let $\mathcal{U} \subseteq \mathbb{U}$ be nonempty, closed and convex, where $\mathbb{U}$ is a finite-dimensional real normed space.
$\triangleright$ We call $h_{\mathcal{U}}$ a distance generating function (DGF) on $\mathcal{U}$ if

- it is essentially smooth, i.e., cont. differentiable on int dom $h_{\mathcal{U}} \neq \emptyset$, and for any $u_{k} \rightarrow u \in \operatorname{bd} \mathcal{U},\left\|\nabla h_{\mathcal{U}}\left(u_{k}\right)\right\|_{*} \rightarrow+\infty$,
- it is continuous and 1-s.c. on $\mathcal{U}$,
- it generates the Bregman distance

$$
D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right) \triangleq h_{\mathcal{U}}(u)-h_{\mathcal{U}}\left(u^{\prime}\right)-\left\langle\nabla h_{\mathcal{U}}\left(u^{\prime}\right), u-u^{\prime}\right\rangle
$$

that satisfies $D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right) \geq(1 / 2)\left\|u-u^{\prime}\right\|^{2}$.

## Non-Euclidean Geometry

$\triangleright$ Let $\mathcal{U} \subseteq \mathbb{U}$ be nonempty, closed and convex, where $\mathbb{U}$ is a finite-dimensional real normed space.
$\triangleright$ We call $h_{\mathcal{U}}$ a distance generating function (DGF) on $\mathcal{U}$ if

- it is essentially smooth, i.e., cont. differentiable on int dom $h_{\mathcal{U}} \neq \emptyset$, and for any $u_{k} \rightarrow u \in \operatorname{bd} \mathcal{U},\left\|\nabla h_{\mathcal{U}}\left(u_{k}\right)\right\|_{*} \rightarrow+\infty$,
- it is continuous and 1-s.c. on $\mathcal{U}$,
- it generates the Bregman distance

$$
D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right) \triangleq h_{\mathcal{U}}(u)-h_{\mathcal{U}}\left(u^{\prime}\right)-\left\langle\nabla h_{\mathcal{U}}\left(u^{\prime}\right), u-u^{\prime}\right\rangle
$$

that satisfies $D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right) \geq(1 / 2)\left\|u-u^{\prime}\right\|^{2}$.
$\triangleright$ Example: $\mathbb{U}=\left(\mathbb{R}^{n},\|\cdot\|_{1}\right), \mathcal{U}=\Delta_{n} \triangleq\left\{u \in \mathbb{R}_{+}^{n}: \sum_{i=1}^{n} u_{i}=1\right\}$, $h_{\mathcal{U}}=\sum_{i=1}^{n} u_{i} \log u_{i}, D_{h u}\left(u, u^{\prime}\right) \geq(1 / 2)\left\|u-u^{\prime}\right\|_{1}^{2}$.

## Bregman Proximal Projection (BPP)

Let $u^{\prime} \in \mathcal{U}^{o}, u^{*} \in \mathbb{U}^{*}$ and $\varphi: \mathbb{U} \rightarrow \overline{\mathbb{R}}$ be CCP.

## Bregman Proximal Projection (BPP)

Let $u^{\prime} \in \mathcal{U}^{o}, u^{*} \in \mathbb{U}^{*}$ and $\varphi: \mathbb{U} \rightarrow \overline{\mathbb{R}}$ be CCP.

$$
u^{\prime} \mapsto u^{+} \triangleq \arg \min _{u \in \mathcal{U}} \varphi(u)+\left\langle u^{*}, u\right\rangle+\lambda^{-1} D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right)
$$

## Bregman Proximal Projection (BPP)

Let $u^{\prime} \in \mathcal{U}^{o}, u^{*} \in \mathbb{U}^{*}$ and $\varphi: \mathbb{U} \rightarrow \overline{\mathbb{R}}$ be CCP.

$$
\begin{equation*}
u^{\prime} \mapsto u^{+} \triangleq \arg \min _{u \in \mathcal{U}} \varphi(u)+\left\langle u^{*}, u\right\rangle+\lambda^{-1} D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right) \tag{BPP}
\end{equation*}
$$

$\triangleright$ We say $\varphi$ has an easily computable proximal operator if there exists a DGF $h_{\mathcal{U}}$ on $\mathcal{U}$ such that (BPP) has a (unique) easily computable solution.

## Bregman Proximal Projection (BPP)

Let $u^{\prime} \in \mathcal{U}^{o}, u^{*} \in \mathbb{U}^{*}$ and $\varphi: \mathbb{U} \rightarrow \overline{\mathbb{R}}$ be CCP.

$$
\begin{equation*}
u^{\prime} \mapsto u^{+} \triangleq \arg \min _{u \in \mathcal{U}} \varphi(u)+\left\langle u^{*}, u\right\rangle+\lambda^{-1} D_{h_{\mathcal{U}}}\left(u, u^{\prime}\right) \tag{BPP}
\end{equation*}
$$

$\triangleright$ We say $\varphi$ has an easily computable proximal operator if there exists a DGF $h_{\mathcal{U}}$ on $\mathcal{U}$ such that (BPP) has a (unique) easily computable solution.
$\triangleright$ If $\mathbb{U}$ is a Hilbert space, then (BPP) becomes

$$
u^{\prime} \mapsto u^{+} \triangleq \operatorname{prox}_{\lambda \varphi}\left(u^{\prime}-\lambda u^{*}\right) .
$$

Near-stationary point

## Near-stationary point

$\triangleright$ Let $\omega_{\mathcal{X}}: \mathbb{X} \rightarrow \overline{\mathbb{R}}$ be a DGF on $\mathcal{X}$. Let $\omega$ be twice differentiable on $\mathcal{X}^{\prime}$ and $\beta_{\mathcal{X}}$-smooth on $\mathcal{X}$, i.e., $\sup _{x \in \mathcal{X}}\left\|\nabla^{2} \omega_{\mathcal{X}}(x)\right\| \leq \beta_{\mathcal{X}}$.

## Near-stationary point

$\triangleright$ Let $\omega_{\mathcal{X}}: \mathbb{X} \rightarrow \overline{\mathbb{R}}$ be a DGF on $\mathcal{X}$. Let $\omega$ be twice differentiable on $\mathcal{X}^{\prime}$ and $\beta_{\mathcal{X}}$-smooth on $\mathcal{X}$, i.e., $\sup _{x \in \mathcal{X}}\left\|\nabla^{2} \omega_{\mathcal{X}}(x)\right\| \leq \beta_{\mathcal{X}}$.
$\triangleright x \in \mathcal{X}$ an $\varepsilon$-near-stationary point of ( P ) if for any $\lambda>0$,

$$
\begin{aligned}
& \|x-\operatorname{prox}(q, x, \lambda)\| \leq \varepsilon \lambda / \beta_{\mathcal{X}} \\
& \operatorname{prox}(q, x, \lambda) \triangleq \arg \min _{x^{\prime} \in \mathcal{X}} q\left(x^{\prime}\right)+\lambda^{-1} D_{\omega_{\mathcal{X}}}\left(x^{\prime}, x\right)
\end{aligned}
$$

## Near-stationary point

$\triangleright$ Let $\omega_{\mathcal{X}}: \mathbb{X} \rightarrow \overline{\mathbb{R}}$ be a DGF on $\mathcal{X}$. Let $\omega$ be twice differentiable on $\mathcal{X}^{\prime}$ and $\beta_{\mathcal{X}}$-smooth on $\mathcal{X}$, i.e., $\sup _{x \in \mathcal{X}}\left\|\nabla^{2} \omega_{\mathcal{X}}(x)\right\| \leq \beta_{\mathcal{X}}$.
$\triangleright x \in \mathcal{X}$ an $\varepsilon$-near-stationary point of ( P ) if for any $\lambda>0$,

$$
\begin{aligned}
& \|x-\operatorname{prox}(q, x, \lambda)\| \leq \varepsilon \lambda / \beta_{\mathcal{X}} \\
& \operatorname{prox}(q, x, \lambda) \triangleq \arg \min _{x^{\prime} \in \mathcal{X}} q\left(x^{\prime}\right)+\lambda^{-1} D_{\omega_{\mathcal{X}}}\left(x^{\prime}, x\right) .
\end{aligned}
$$

$\triangleright$ Note that $\|x-\operatorname{prox}(q, x, \lambda)\| \leq \varepsilon \lambda / \beta_{\mathcal{X}} \Rightarrow \operatorname{dist}(0, \partial q(\operatorname{prox}(q, x, \lambda))) \leq \varepsilon$. In other words, $\operatorname{prox}(q, x, \lambda)$ is an approximate stationary point of $(\mathrm{P})$, and $x$ is $O(\varepsilon)$-close to $\operatorname{prox}(q, x, \lambda)$.

## Near-stationary point

$\triangleright$ Let $\omega_{\mathcal{X}}: \mathbb{X} \rightarrow \overline{\mathbb{R}}$ be a DGF on $\mathcal{X}$. Let $\omega$ be twice differentiable on $\mathcal{X}^{\prime}$ and $\beta_{\mathcal{X}}$-smooth on $\mathcal{X}$, i.e., $\sup _{x \in \mathcal{X}}\left\|\nabla^{2} \omega_{\mathcal{X}}(x)\right\| \leq \beta_{\mathcal{X}}$.
$\triangleright x \in \mathcal{X}$ an $\varepsilon$-near-stationary point of ( P ) if for any $\lambda>0$,

$$
\begin{aligned}
& \|x-\operatorname{prox}(q, x, \lambda)\| \leq \varepsilon \lambda / \beta_{\mathcal{X}} \\
& \operatorname{prox}(q, x, \lambda) \triangleq \arg \min _{x^{\prime} \in \mathcal{X}} q\left(x^{\prime}\right)+\lambda^{-1} D_{\omega_{\mathcal{X}}}\left(x^{\prime}, x\right)
\end{aligned}
$$

$\triangleright$ Note that $\|x-\operatorname{prox}(q, x, \lambda)\| \leq \varepsilon \lambda / \beta_{\mathcal{X}} \Rightarrow \operatorname{dist}(0, \partial q(\operatorname{prox}(q, x, \lambda))) \leq \varepsilon$. In other words, $\operatorname{prox}(q, x, \lambda)$ is an approximate stationary point of $(\mathrm{P})$, and $x$ is $O(\varepsilon)$-close to $\operatorname{prox}(q, x, \lambda)$.
$\triangleright$ We refer to solving (P) as finding an $\varepsilon$-near-stationary point of $(\mathrm{P})$.

## First-Order Oracles

## First-Order Oracles

$\triangleright$ There exist a primal first-order oracle $\mathscr{O}^{\mathrm{P}}$ and a dual first-order oracle $\mathscr{O}^{\mathrm{D}}$ that take in any $(x, y) \in \mathcal{X} \times \mathcal{Y}$ and returns $\nabla_{x} \Phi(x, y)$ and $\nabla_{y} \Phi(x, y)$, respectively.

## First-Order Oracles

$\triangleright$ There exist a primal first-order oracle $\mathscr{O}^{\mathrm{P}}$ and a dual first-order oracle $\mathscr{O}^{\mathrm{D}}$ that take in any $(x, y) \in \mathcal{X} \times \mathcal{Y}$ and returns $\nabla_{x} \Phi(x, y)$ and $\nabla_{y} \Phi(x, y)$, respectively.
$\triangleright$ We use the primal and dual oracle complexities required by a certain algorithm to obtain an $\varepsilon$-near-stationary point to measure its performance.
(1) Introduction

Solving sub-problem
Complexity

## Main Contribution

## Main Contribution

$\triangleright$ Propose a primal dual smoothing framework for solving $(\mathrm{P})$ that unifies two approaches, i.e., dual-then-primal and primal-then-dual smoothing.

## Main Contribution

$\triangleright$ Propose a primal dual smoothing framework for solving $(\mathrm{P})$ that unifies two approaches, i.e., dual-then-primal and primal-then-dual smoothing.

- It solves (P) in its full generality, and improves the best-known complexity (Theku. et al., 2019) even in the restricted setting, i.e., $f \equiv 0, r \equiv 0$ and both $\mathbb{X}$ and $\mathbb{Y}$ are Euclidean.

## Main Contribution

$\triangleright$ Propose a primal dual smoothing framework for solving $(\mathrm{P})$ that unifies two approaches, i.e., dual-then-primal and primal-then-dual smoothing.

- It solves (P) in its full generality, and improves the best-known complexity (Theku. et al., 2019) even in the restricted setting, i.e., $f \equiv 0, r \equiv 0$ and both $\mathbb{X}$ and $\mathbb{Y}$ are Euclidean.
$\triangleright$ As the cornerstone of our framework, we propose an efficient method for solving a class of convex-concave saddle-point problems with primal strong convexity, with significantly improved dual complexity.

## Main Contribution

$\triangleright$ Propose a primal dual smoothing framework for solving $(\mathrm{P})$ that unifies two approaches, i.e., dual-then-primal and primal-then-dual smoothing.

- It solves (P) in its full generality, and improves the best-known complexity (Theku. et al., 2019) even in the restricted setting, i.e., $f \equiv 0, r \equiv 0$ and both $\mathbb{X}$ and $\mathbb{Y}$ are Euclidean.
$\triangleright$ As the cornerstone of our framework, we propose an efficient method for solving a class of convex-concave saddle-point problems with primal strong convexity, with significantly improved dual complexity.
- In this method, we develop the first non-Euclidean inexact accelerated proximal gradient (APG) method for strongly convex composite optimization.

## Comparison with Theku. et al. (2019)

$f \equiv 0, r \equiv 0$ and both $\mathbb{X}$ and $\mathbb{Y}$ are Euclidean

| Algorithms | Primal Oracle Comp. |

## Fréchet sub-differential and derivative

## Fréchet sub-differential and derivative

$\triangleright$ Define the Fréchet subdifferential of $f$ at $x \in \operatorname{dom} f$, denoted by $\partial f(x)$, as

$$
\partial f(x) \triangleq\left\{x^{*} \in \mathbb{X}^{*}: \liminf _{h \rightarrow 0} \frac{f(x+h)-f(x)-\left\langle x^{*}, h\right\rangle}{\|h\|} \geq 0\right\}
$$

In other words, $x^{*} \in \partial f(x) \Leftrightarrow f(x+h) \geq f(x)+\left\langle x^{*}, h\right\rangle+o(\|h\|)$.

## Fréchet sub-differential and derivative

$\triangleright$ Define the Fréchet subdifferential of $f$ at $x \in \operatorname{dom} f$, denoted by $\partial f(x)$, as

$$
\partial f(x) \triangleq\left\{x^{*} \in \mathbb{X}^{*}: \liminf _{h \rightarrow 0} \frac{f(x+h)-f(x)-\left\langle x^{*}, h\right\rangle}{\|h\|} \geq 0\right\}
$$

In other words, $x^{*} \in \partial f(x) \Leftrightarrow f(x+h) \geq f(x)+\left\langle x^{*}, h\right\rangle+o(\|h\|)$.
$\triangleright$ When $f$ is convex, $\partial f$ becomes the convex sub-differential.

## Fréchet sub-differential and derivative

$\triangleright$ Define the Fréchet subdifferential of $f$ at $x \in \operatorname{dom} f$, denoted by $\partial f(x)$, as

$$
\partial f(x) \triangleq\left\{x^{*} \in \mathbb{X}^{*}: \liminf _{h \rightarrow 0} \frac{f(x+h)-f(x)-\left\langle x^{*}, h\right\rangle}{\|h\|} \geq 0\right\} .
$$

In other words, $x^{*} \in \partial f(x) \Leftrightarrow f(x+h) \geq f(x)+\left\langle x^{*}, h\right\rangle+o(\|h\|)$.
$\triangleright$ When $f$ is convex, $\partial f$ becomes the convex sub-differential.
$\triangleright$ Define the Fréchet derivative of $f$ (or simply, gradient) at $x$, denoted by $\nabla f(x)$, as the unique element in $\mathbb{X}^{*}$ that satisfies

$$
\lim _{h \rightarrow 0} \frac{f(x+h)-f(x)-\langle\nabla f(x), h\rangle}{\|h\|}=0 .
$$

In other words, $f(x+h)=f(x)+\langle\nabla f(x), h\rangle+o(\|h\|)$.

## Smoothing

## Smoothing

Define the dually smoothed $f$, with dual smoothing parameter $\rho>0$, as

$$
\begin{equation*}
f_{\rho}(x)=\max _{y \in \mathcal{Y}}\left[\phi_{\rho}^{\mathrm{D}}(x, y) \triangleq \Phi(x, y)-g(y)-\rho \omega_{\mathcal{Y}}(y)\right] \tag{DS}
\end{equation*}
$$

where $\omega_{\mathcal{Y}}: \mathbb{Y} \rightarrow \overline{\mathbb{R}}$ is the DGF on $\mathcal{Y}$.
Lemma 1
$\triangleright \nabla f_{\rho}(x)=\nabla_{x} \Phi\left(x, y_{\rho}^{*}(x)\right)$.
$\triangleright \nabla f_{\rho}$ is $L_{\rho}$-Lipschitz on $\mathcal{X}$, where $L_{\rho} \triangleq L_{x x}+L_{x y}^{2} / \rho$.
Lemma 2
Both of the functions $f$ and $f_{\rho}$ are $\gamma$-weakly convex on $\mathcal{X}$.

$\triangleright$ (Primal-then-dual) Apply PPM directly on $q$, and then in solving the sub-problem, perform dual smoothing.
$\triangleright$ Different analyses, but the same result.

## Theorem 3

Let $K$ denote the terminating iteration. For any $\varepsilon>0$, if we set the accuracy parameter $\eta=\varepsilon^{2} \lambda /\left(64 \beta_{\mathcal{X}}^{2}\right)$, then $\left\|x_{K}-\operatorname{prox}\left(q, x_{K}, \lambda\right)\right\| \leq \varepsilon \lambda / \beta_{\mathcal{X}}$, i.e., $x_{K}$ is an $\varepsilon$-near stationary point of (P).

$\triangleright$ (Primal-then-dual) Apply PPM directly on $q$, and then in solving the sub-problem, perform dual smoothing.
$\triangleright$ Different analyses, but the same result.

## Theorem 3

Let $K$ denote the terminating iteration. For any $\varepsilon>0$, if we set the accuracy parameter $\eta=\varepsilon^{2} \lambda /\left(64 \beta_{\mathcal{X}}^{2}\right)$, then $\left\|x_{K}-\operatorname{prox}\left(q, x_{K}, \lambda\right)\right\| \leq \varepsilon \lambda / \beta_{\mathcal{X}}$, i.e., $x_{K}$ is an $\varepsilon$-near stationary point of (P).

Theorem 4
The method terminates with no more than $\bar{K} \triangleq\left\lceil 2\left(q\left(x_{1}\right)-q^{*}\right) /(13 \eta)\right\rceil$ iterations.

## Two approaches

$\triangleright$ (Dual-then-primal) Perform dual smoothing on $q$ to obtain $q_{\rho}$, and then apply proximal point method (PPM) on $q_{\rho}$.
$\triangleright$ (Primal-then-dual) Apply PPM directly on $q$, and then in solving the sub-problem, perform dual smoothing.
$\triangleright$ Different analyses, but the same result.

## Theorem 3

Let $K$ denote the terminating iteration. For any $\varepsilon>0$, if we set the accuracy parameter $\eta=\varepsilon^{2} \lambda /\left(64 \beta_{\mathcal{X}}^{2}\right)$, then $\left\|x_{K}-\operatorname{prox}\left(q, x_{K}, \lambda\right)\right\| \leq \varepsilon \lambda / \beta_{\mathcal{X}}$, i.e., $x_{K}$ is an $\varepsilon$-near stationary point of (P).

Theorem 4
The method terminates with no more than $\bar{K} \triangleq\left\lceil 2\left(q\left(x_{1}\right)-q^{*}\right) /(13 \eta)\right\rceil$ iterations.

Proof sketch: if $\left\|x_{k+1}-x_{k}\right\|>4 \sqrt{\lambda \eta}$, then $q\left(x_{k+1}\right) \leq q\left(x_{k}\right)-(13 / 2) \eta$.
