# Liquid Argon Scintillation

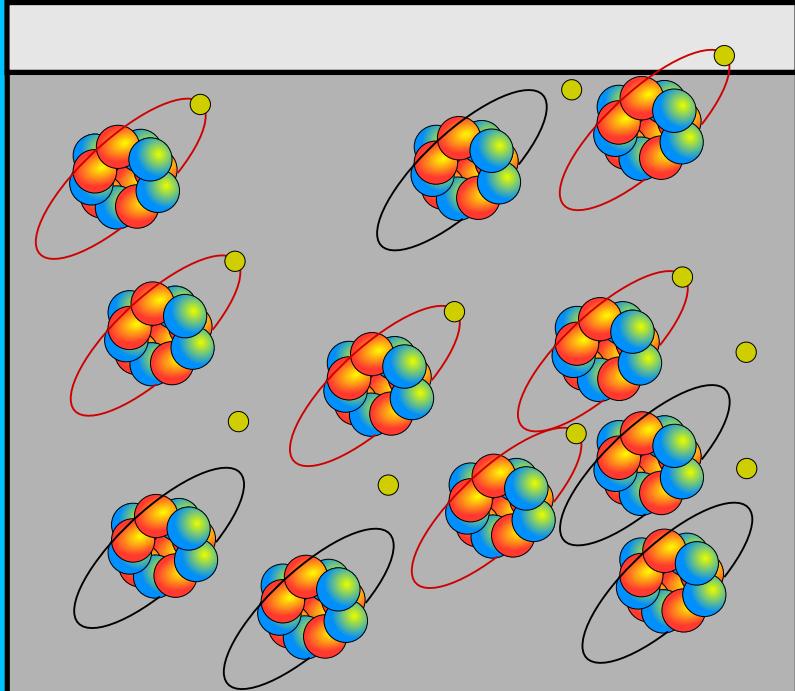

- WIMP scatters off Ar nucleus

# Liquid Argon Scintillation

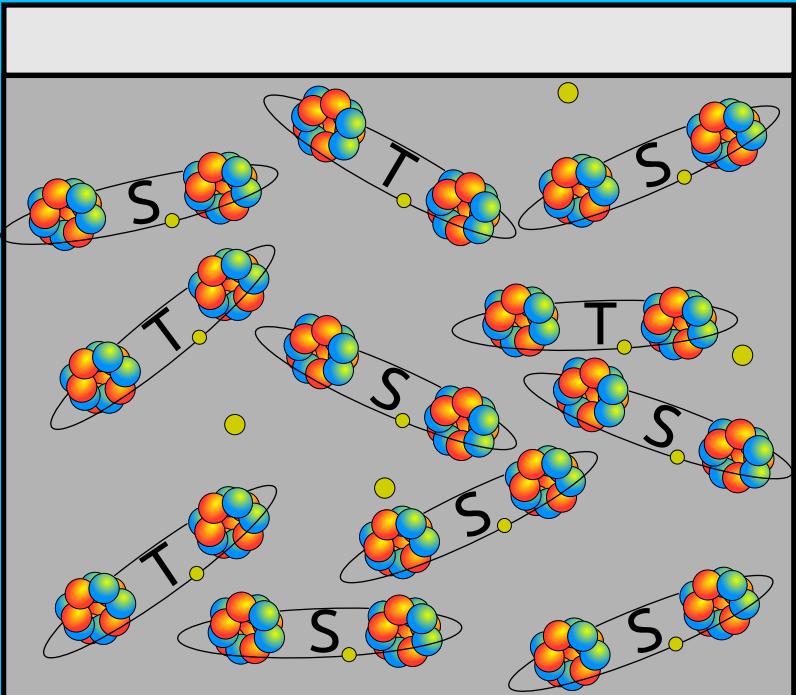

- WIMP scatters off Ar nucleus
- Ar nucleus recoils and scatters off of other Ar nuclei

# Liquid Argon Scintillation

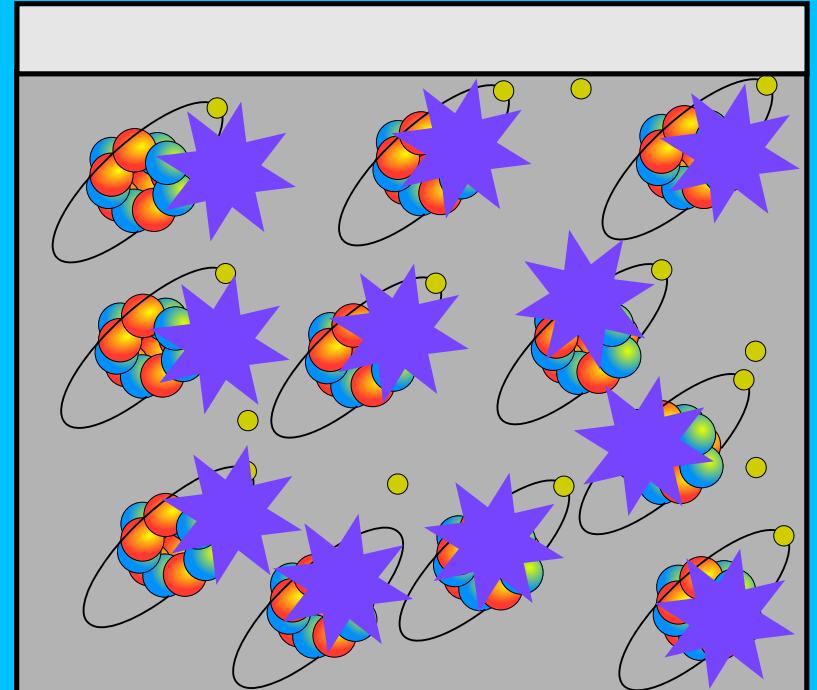

- WIMP scatters off Ar nucleus
- Ar nucleus recoils and scatters off of other Ar nuclei
- Ar atoms become excited or ionized

# Liquid Argon Scintillation

- WIMP scatters off Ar nucleus
- Ar nucleus recoils and scatters off of other Ar nuclei
- Ar atoms become excited or ionized
- Ionized and excited Ar form dimers with ground state Ar

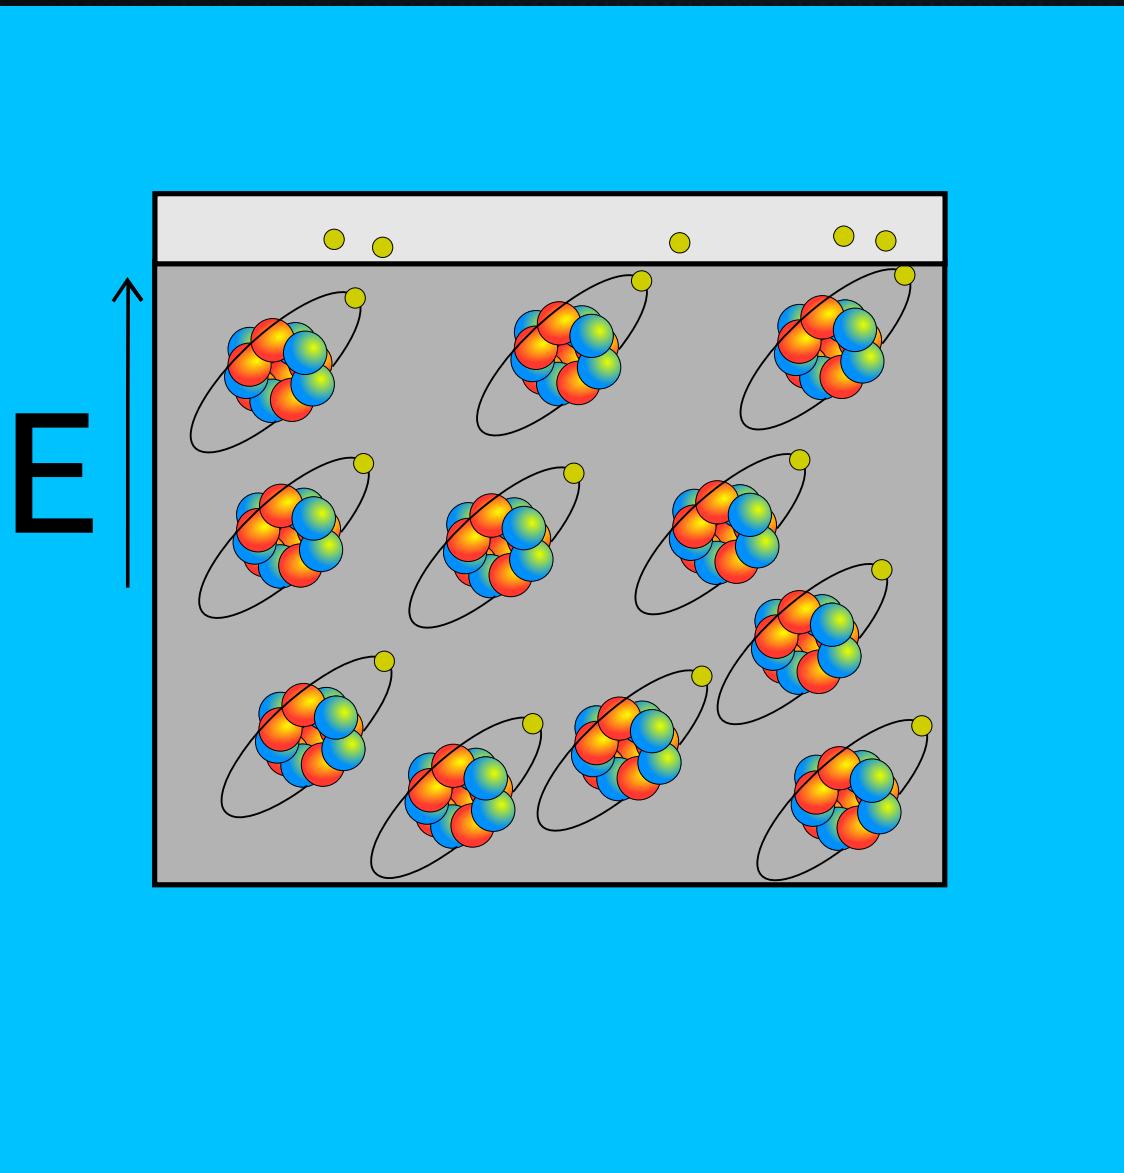

# S1 Signal

# Liquid Argon Scintillation

- WIMP scatters off Ar nucleus
- Ar nucleus recoils and scatters off of other Ar nuclei
- Ar atoms become excited or ionized
- Ionized and excited Ar form dimers with ground state Ar
- Dimers split apart and release light

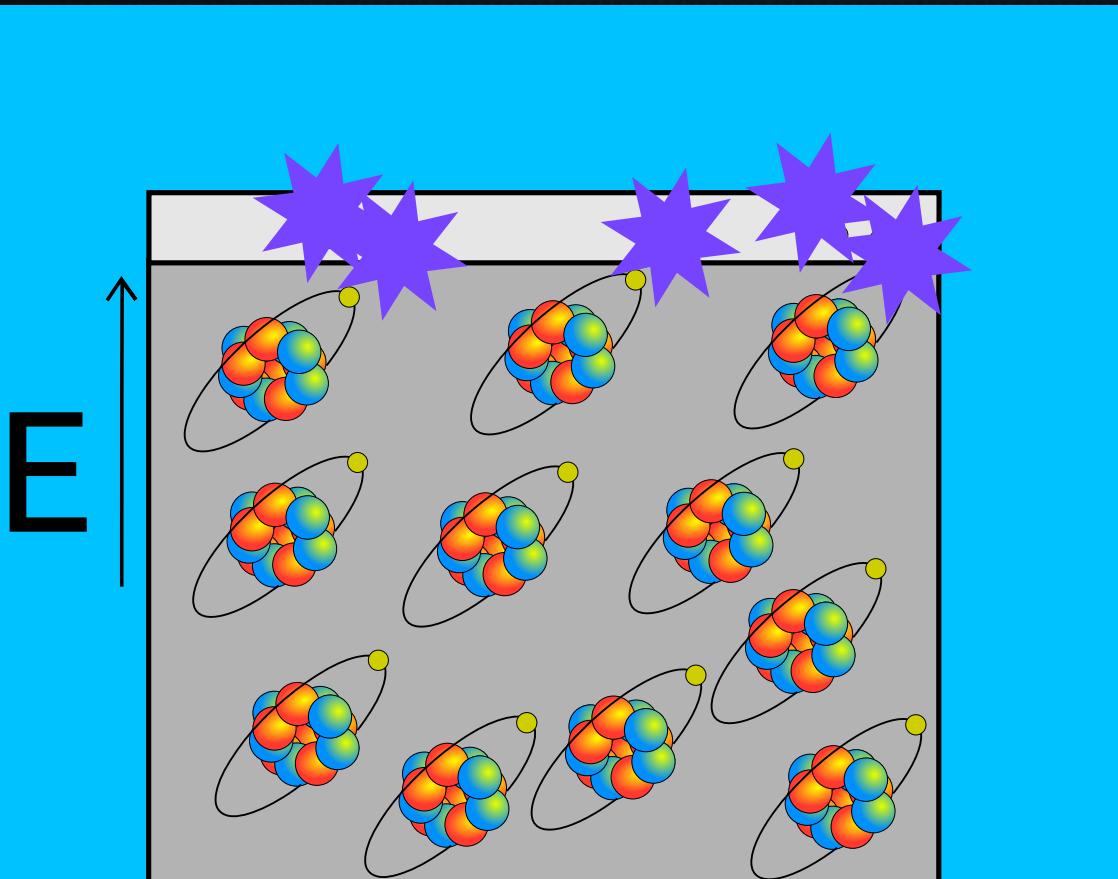

# Liquid Argon Scintillation

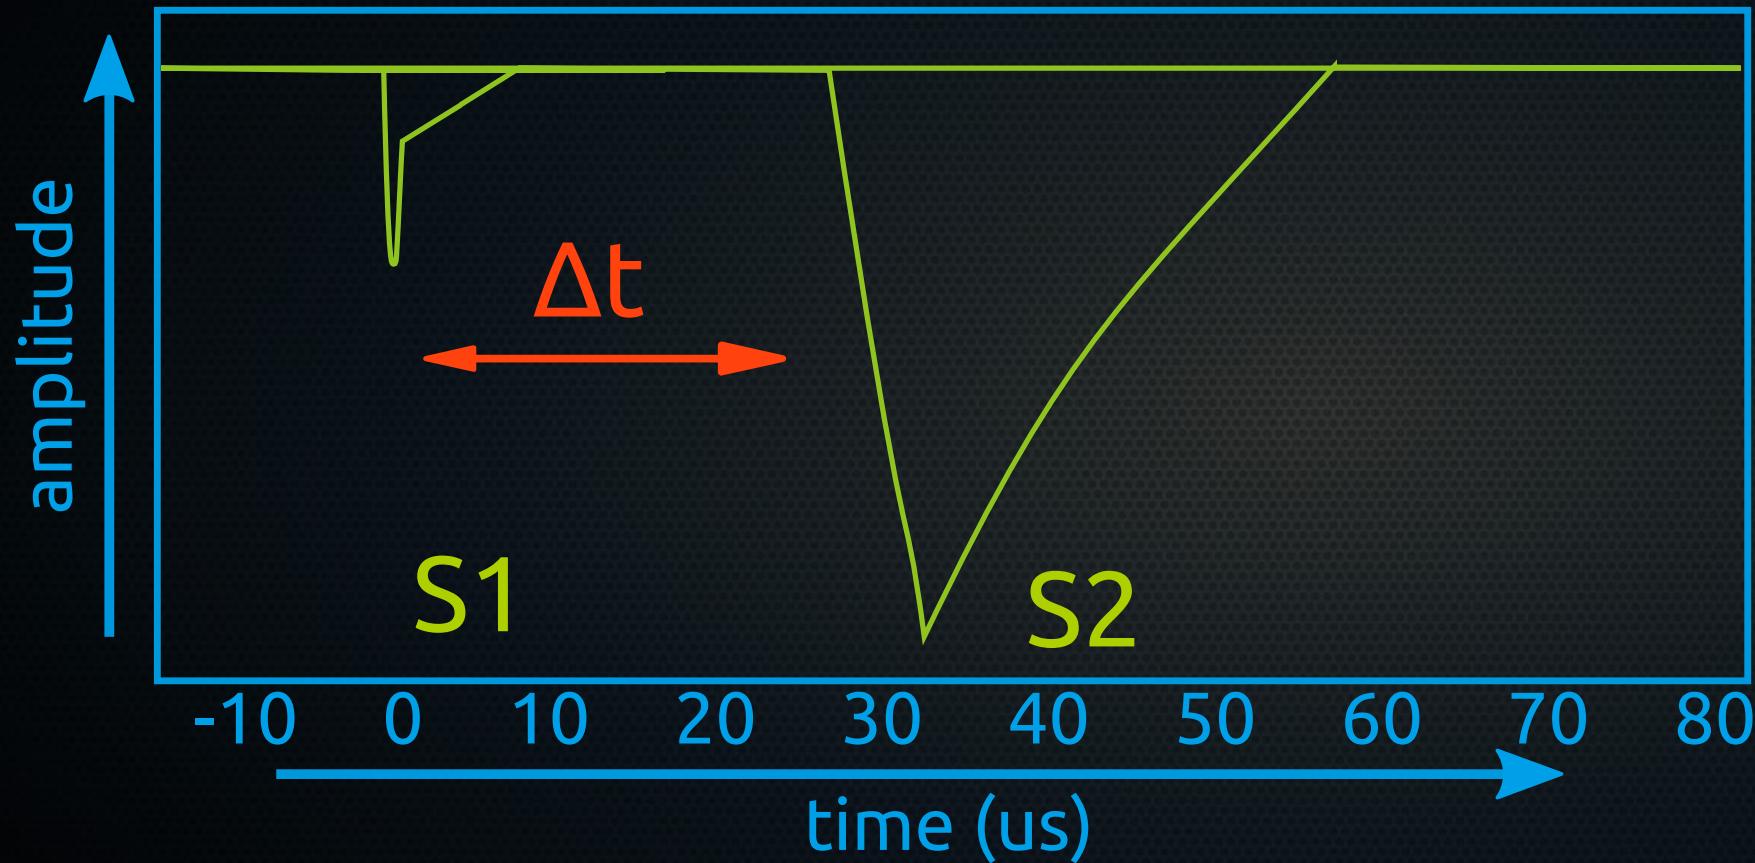

- WIMP scatters off Ar nucleus
- Ar nucleus recoils and scatters off of other Ar nuclei
- Ar atoms become excited or ionized
- Ionized and excited Ar form dimers with ground state Ar
- Dimers split apart and release light
- Ionized  $e^-$  drifted to gas layer

# Liquid Argon Scintillation

S2 Signal

- WIMP scatters off Ar nucleus
- Ar nucleus recoils and scatters off of other Ar nuclei
- Ar atoms become excited or ionized
- Ionized and excited Ar form dimers with ground state Ar
- Dimers split apart and release light
- Ionized  $e^-$  drifted to gas layer
- $e^-$  scintillate in gas layer

What we can learn:

- $S_1 \rightarrow$  Recoil energy
- $\Delta t \rightarrow$  z-coordinate
- $S_2$  PMT distribution  $\rightarrow$  x,y-coordinates
- $S_2/S_1$  and  $S_1$  pulse shape  $\rightarrow$  recoil type

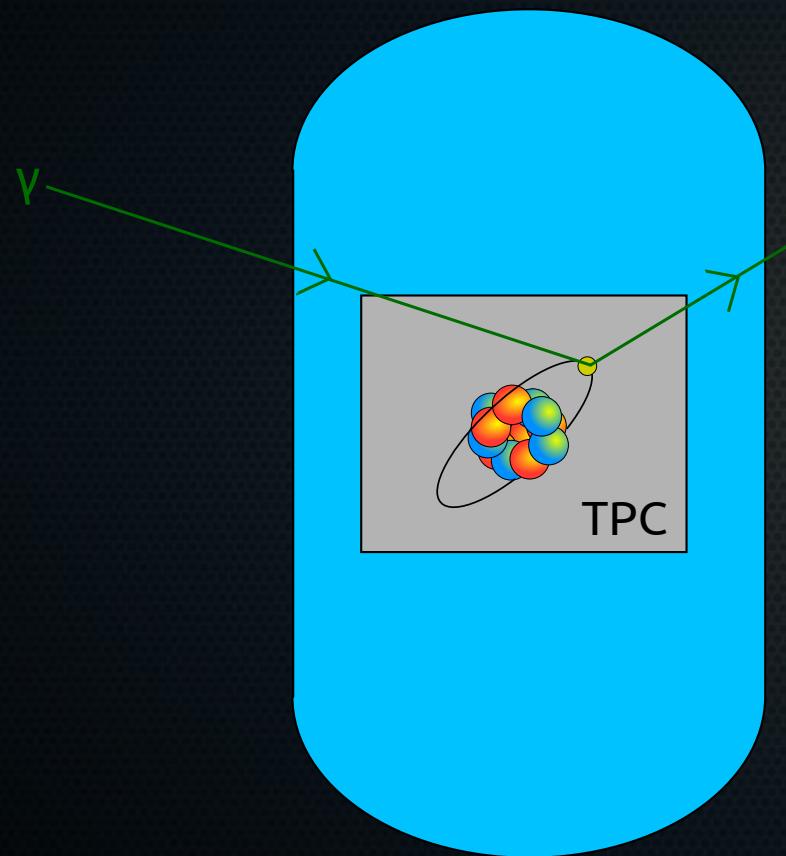

WIMP events are rare

# WIMP events are rare

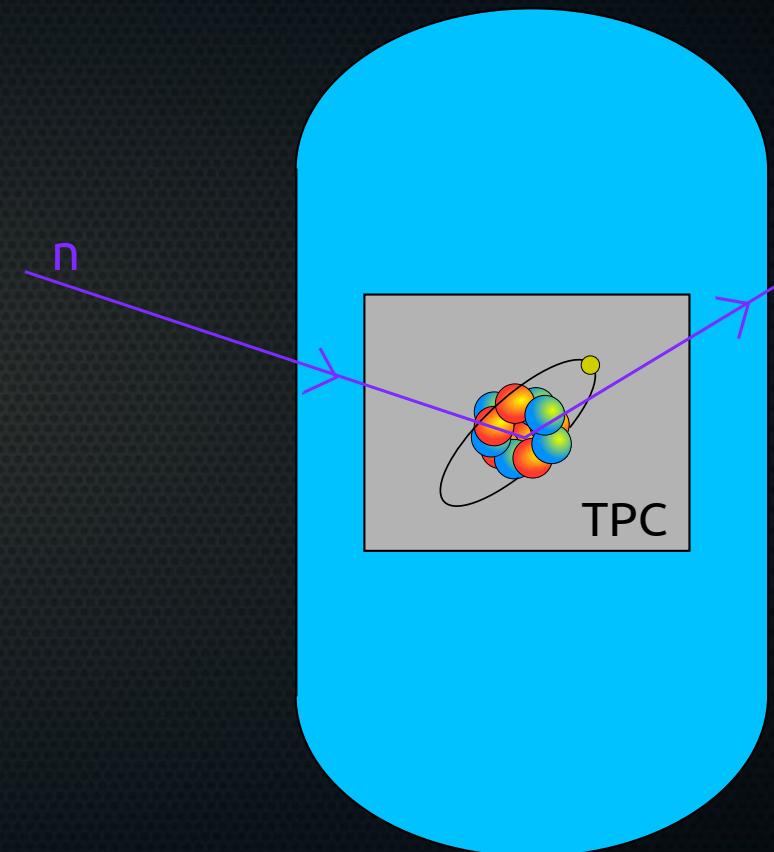

Any backgrounds can easily hide a WIMP if we are not careful

# Backgrounds: 2 Types

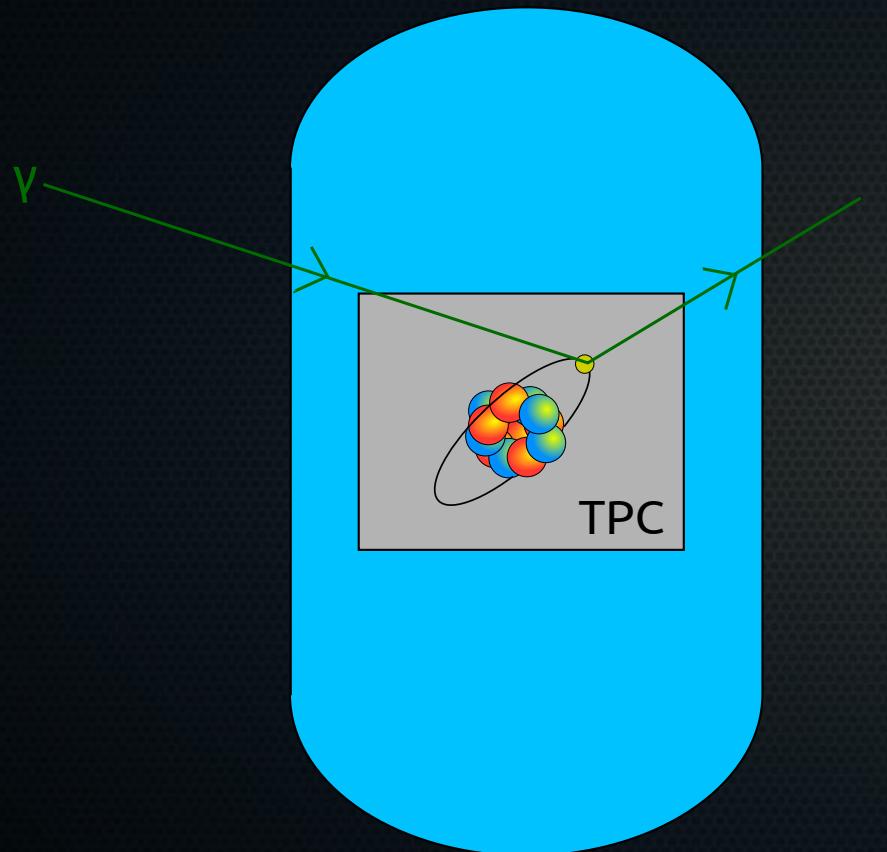

Electron Recoils

Nuclear Recoils

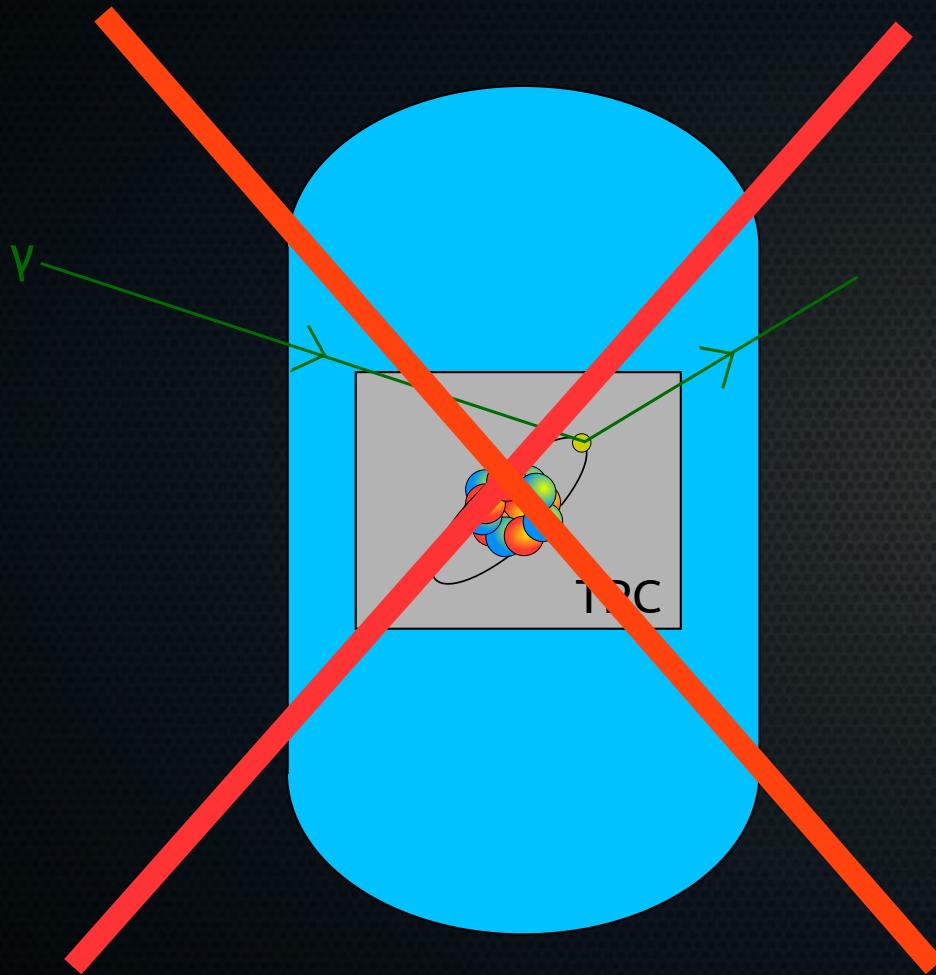

# Electron Recoils

- Produced by  $\beta$  decay of  $^{39}\text{Ar}$  or from incident  $\gamma$  rays
- Eliminate with pulse shape discrimination in LAr
- Ionization/scintillation signal ratio offers suppression

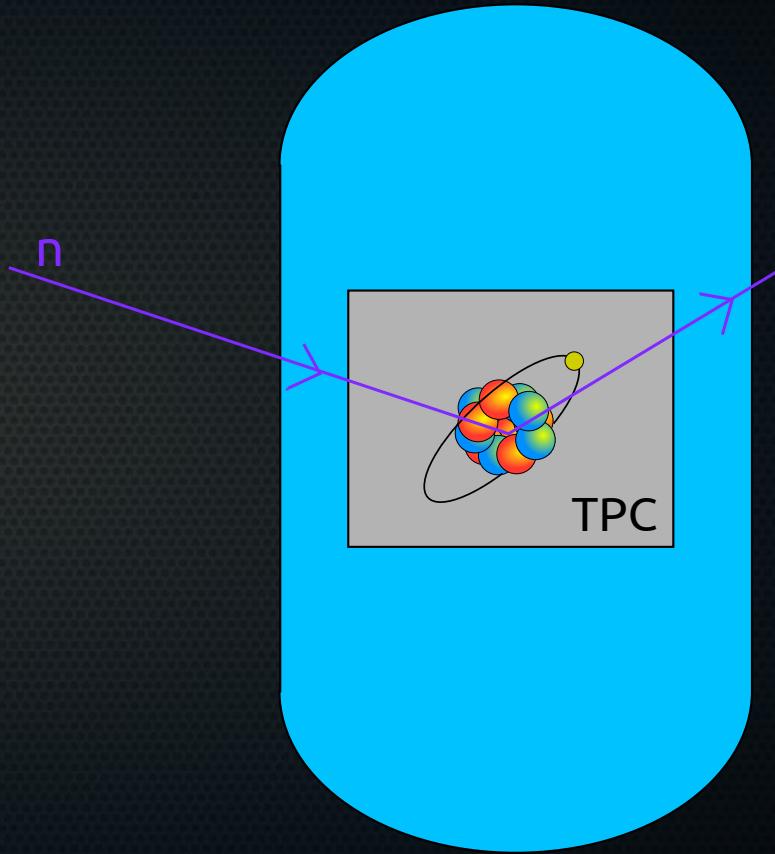

# Electron Recoils

- Produced by  $\beta$  decay of  $^{39}\text{Ar}$  or from incident  $\gamma$  rays
- Eliminate with pulse shape discrimination in LAr
- Ionization/scintillation signal ratio offers suppression

# Nuclear Recoils

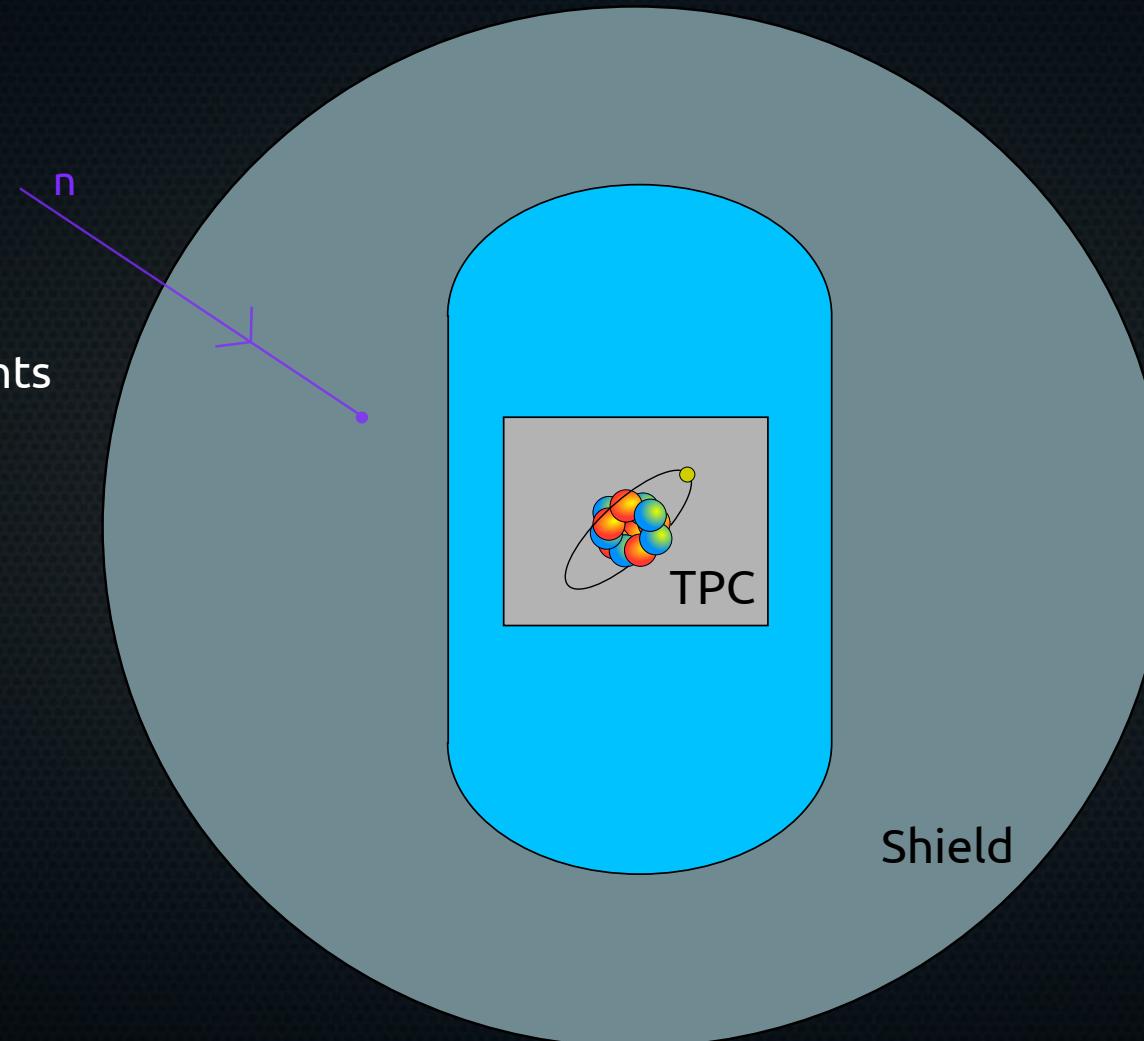

- From surface background  $\alpha$  decays
  - Eliminated with fiducial cuts
- Neutron scatters
  - Radiogenic (fission and  $(\alpha, n)$  reactions)
    - From surrounding environment
    - In detector components
  - Cosmogenic (muon spallation)
- Cannot be rejected with pulse shape discrimination

So how can we remove  
neutron backgrounds?

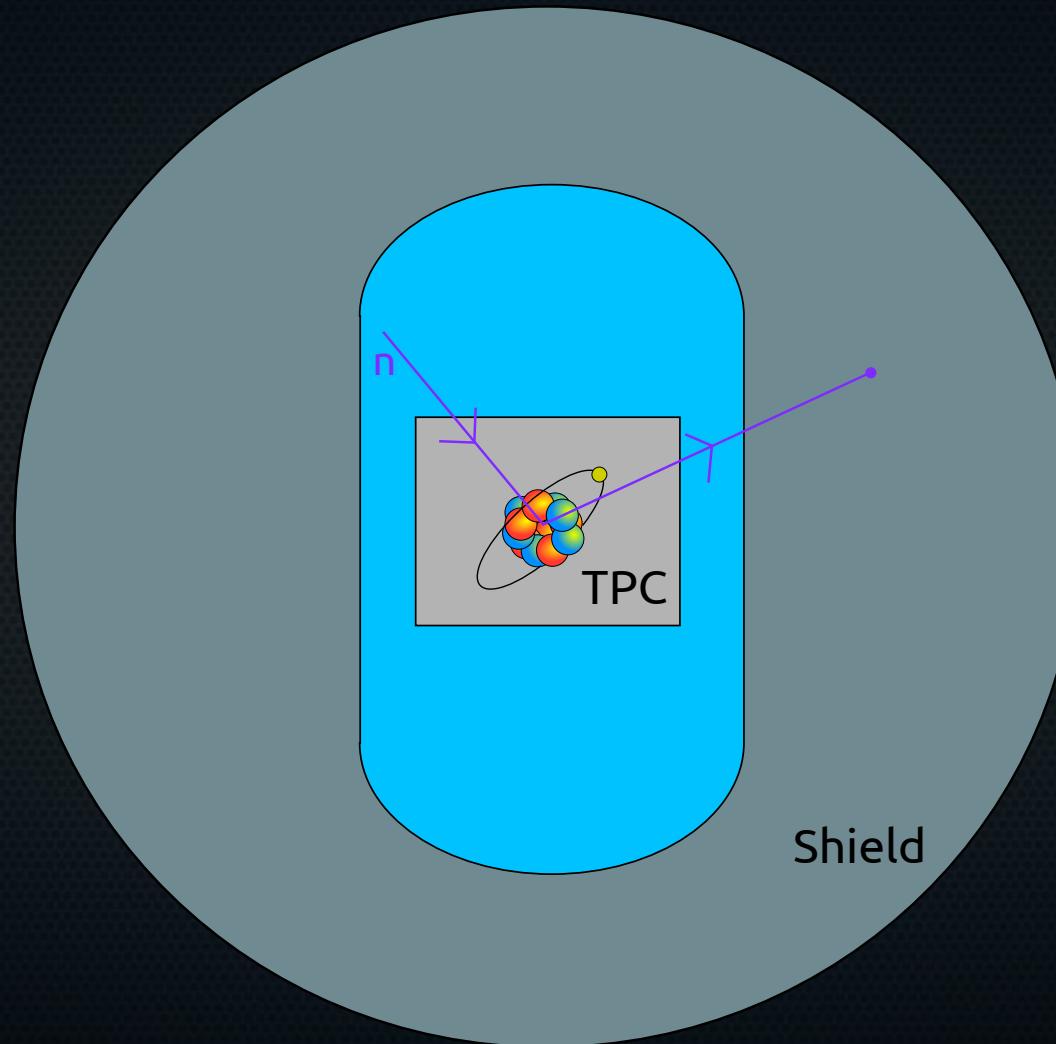

# Passive Shielding?

- Radiogenic (fission and  $(\alpha, n)$  reactions)
  - From surrounding environment
  - In detector components
- Cosmogenic (muon spallation)

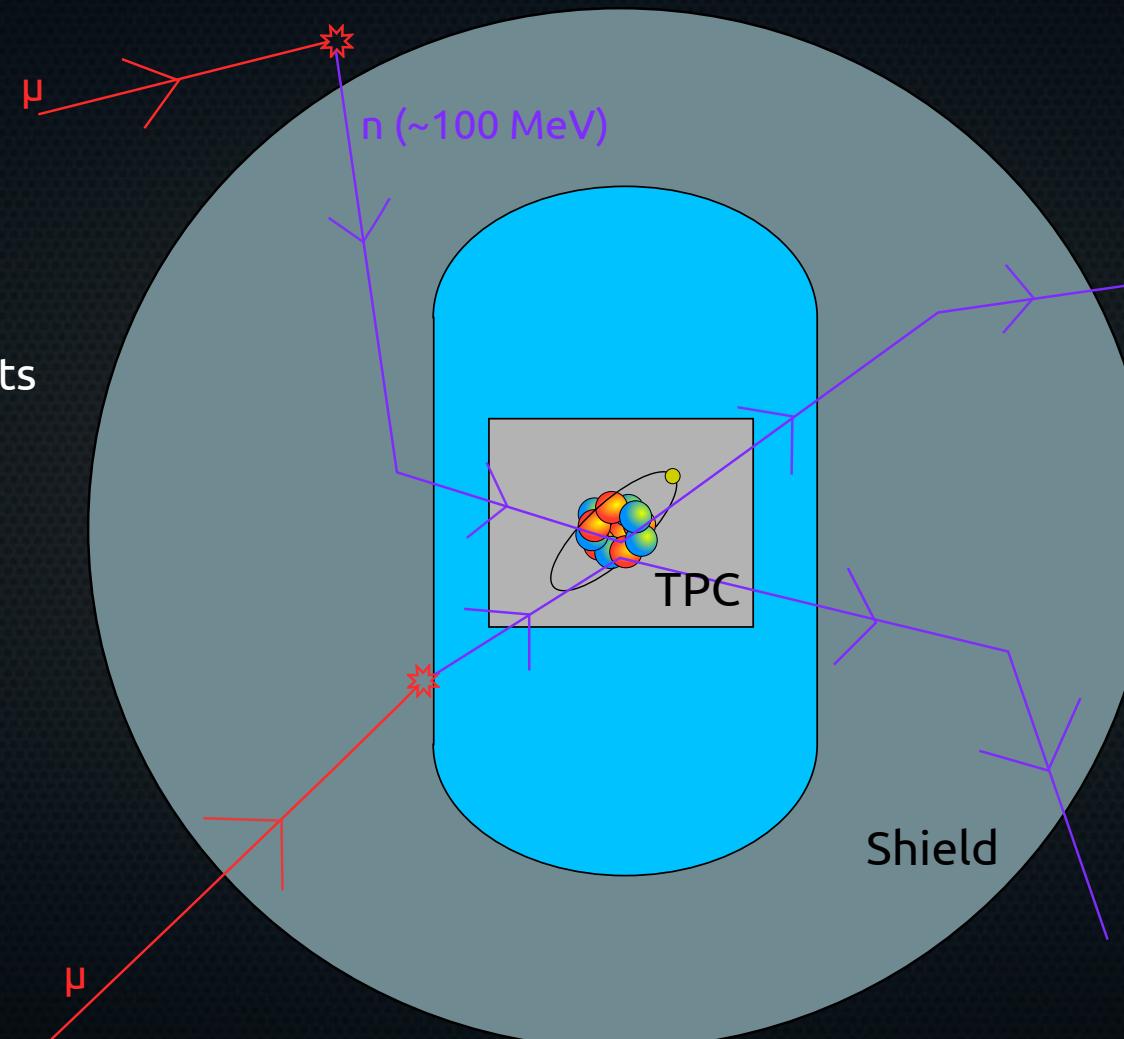

# Passive Shielding?

- Radiogenic (fission and  $(\alpha, n)$  reactions)
  - From surrounding environment
  - In detector components
- Cosmogenic (muon spallation)

# Passive Shielding?

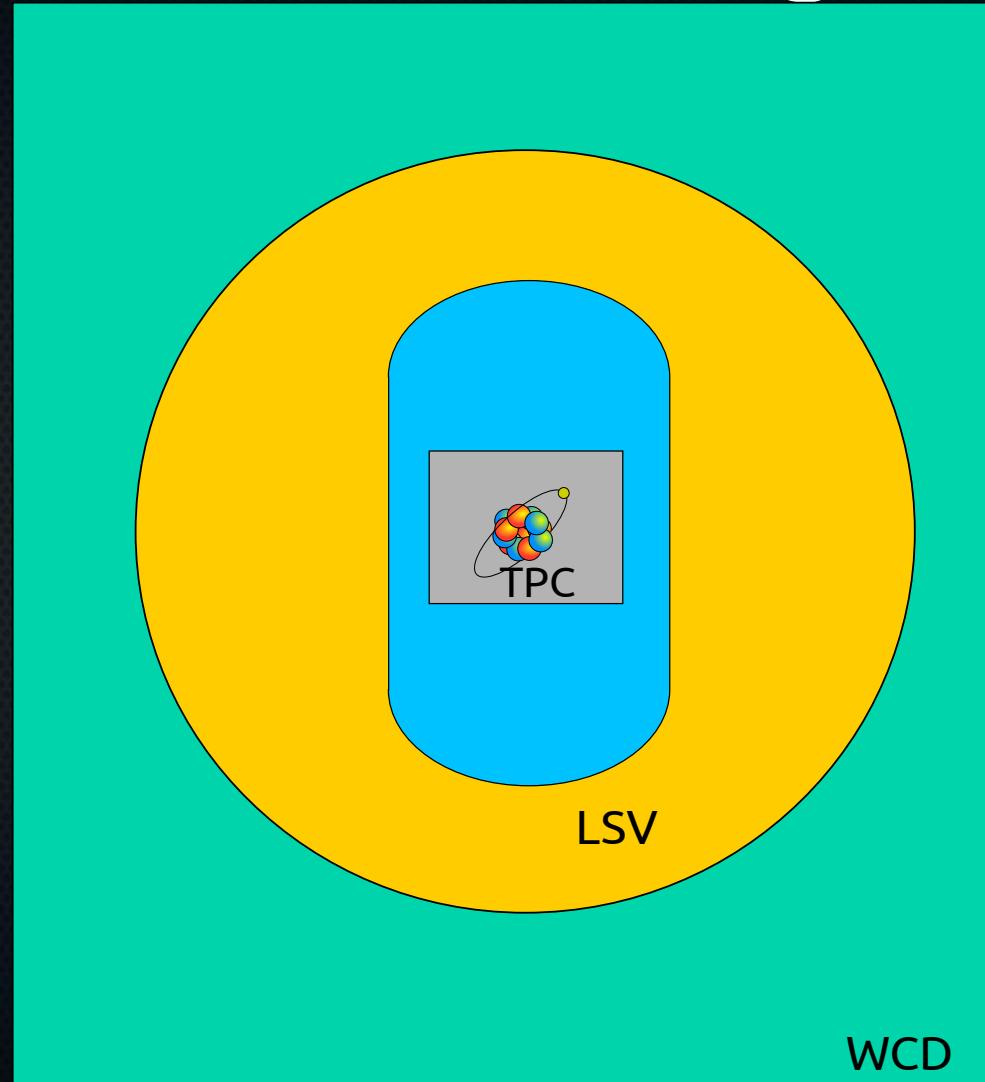

- Radiogenic (fission and  $\alpha, n$  reactions)
  - From surrounding environment
  - In detector components
- Cosmogenic (muon spallation)

# Active Shielding

## Water Cherenkov Detector

- Provides shielding to the LSV
- Can detect passing muons that may produce a cosmogenic neutron

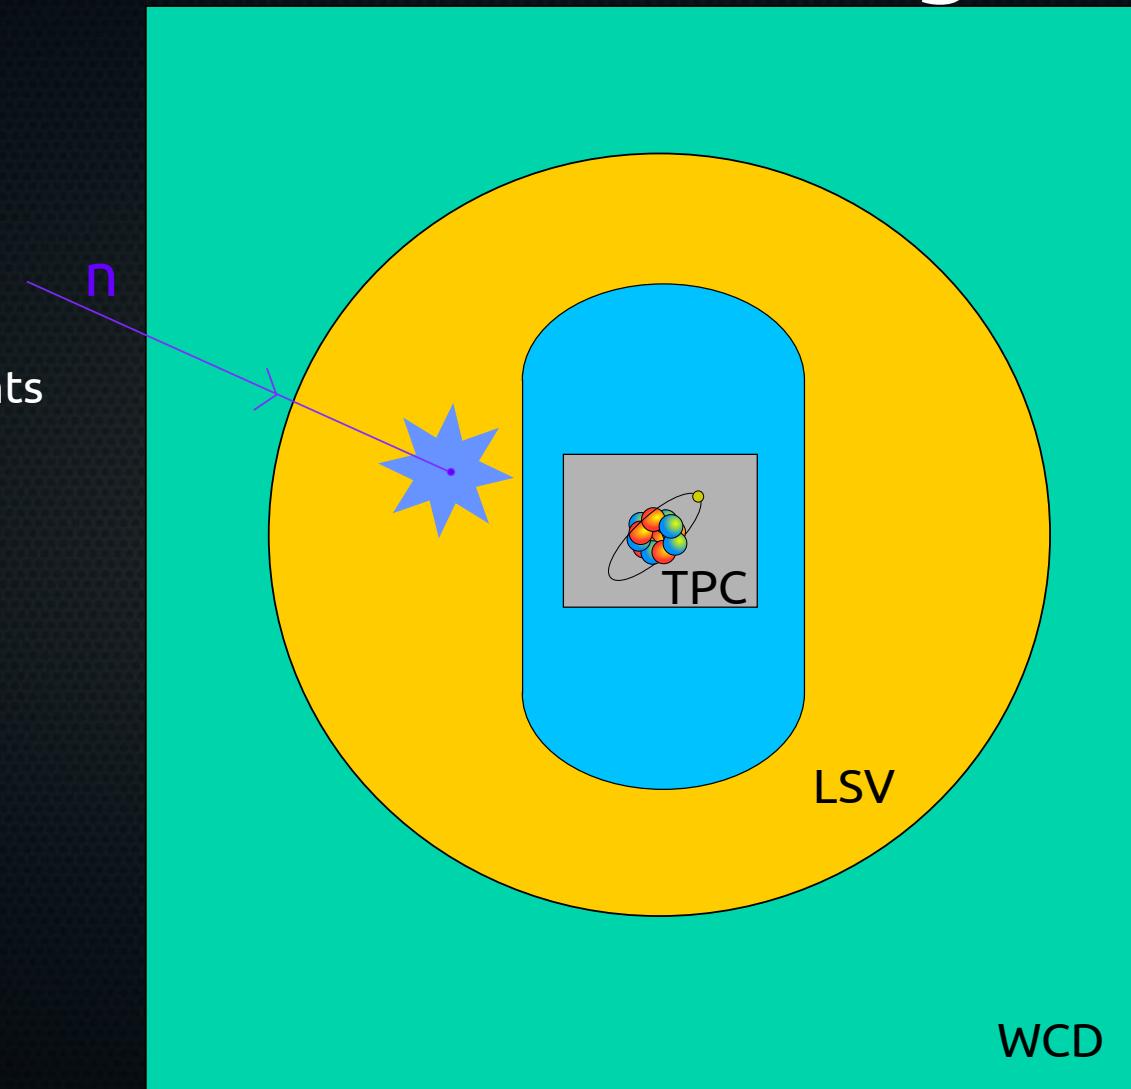

## Liquid Scintillator Vessel

- Boron-loaded to improve neutron capture cross section
- Detects neutrons and  $\gamma$  rays in coincidence with TPC
- Provides shielding and *vetoing* of backgrounds
- Allows for *in situ* background measurements

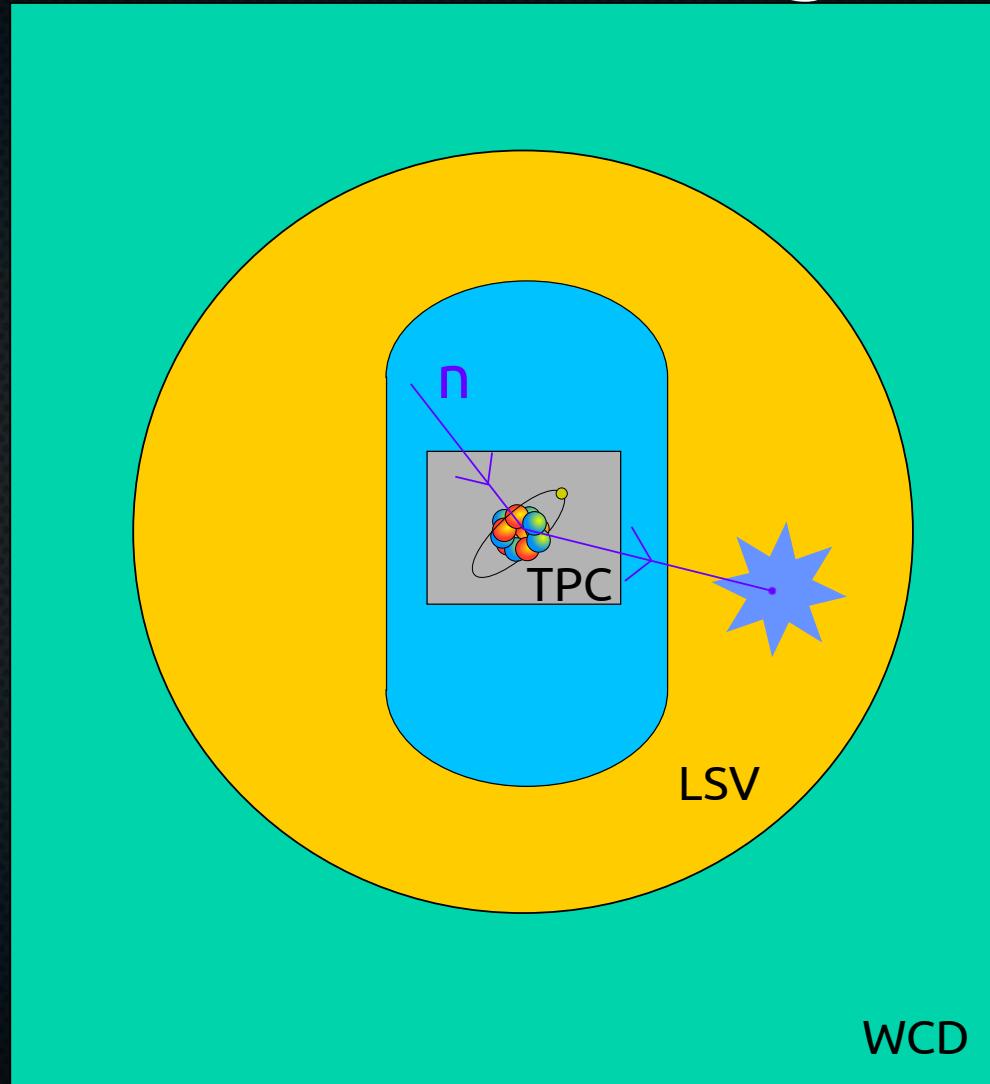

# Active Shielding

- Radiogenic (fission and  $(\alpha, n)$  reactions)
  - From surrounding environment
  - In detector components
- Cosmogenic (muon spallation)

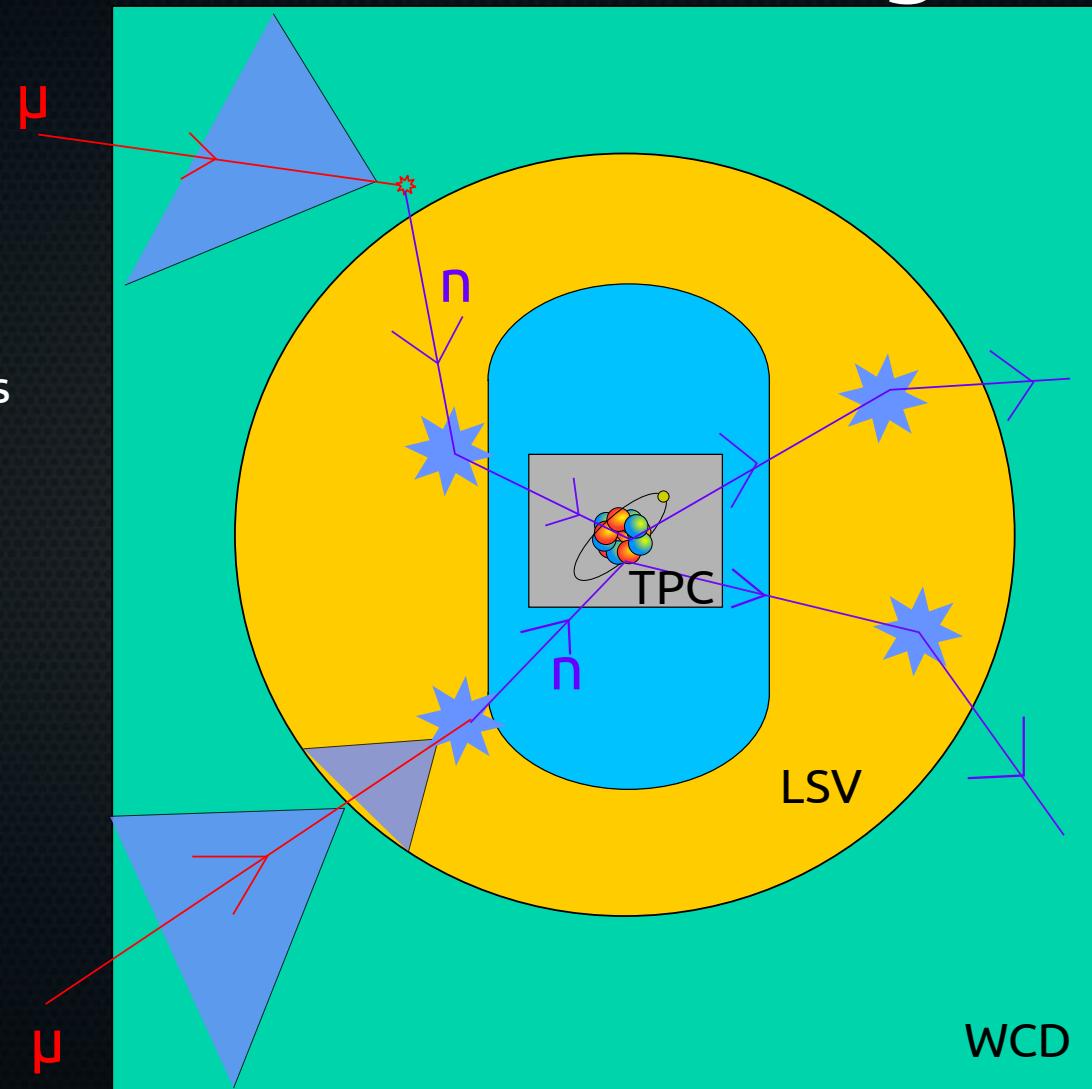

# Active Shielding

- Radiogenic (fission and  $(\alpha, n)$  reactions)
  - From surrounding environment
  - In detector components
- Cosmogenic (muon spallation)

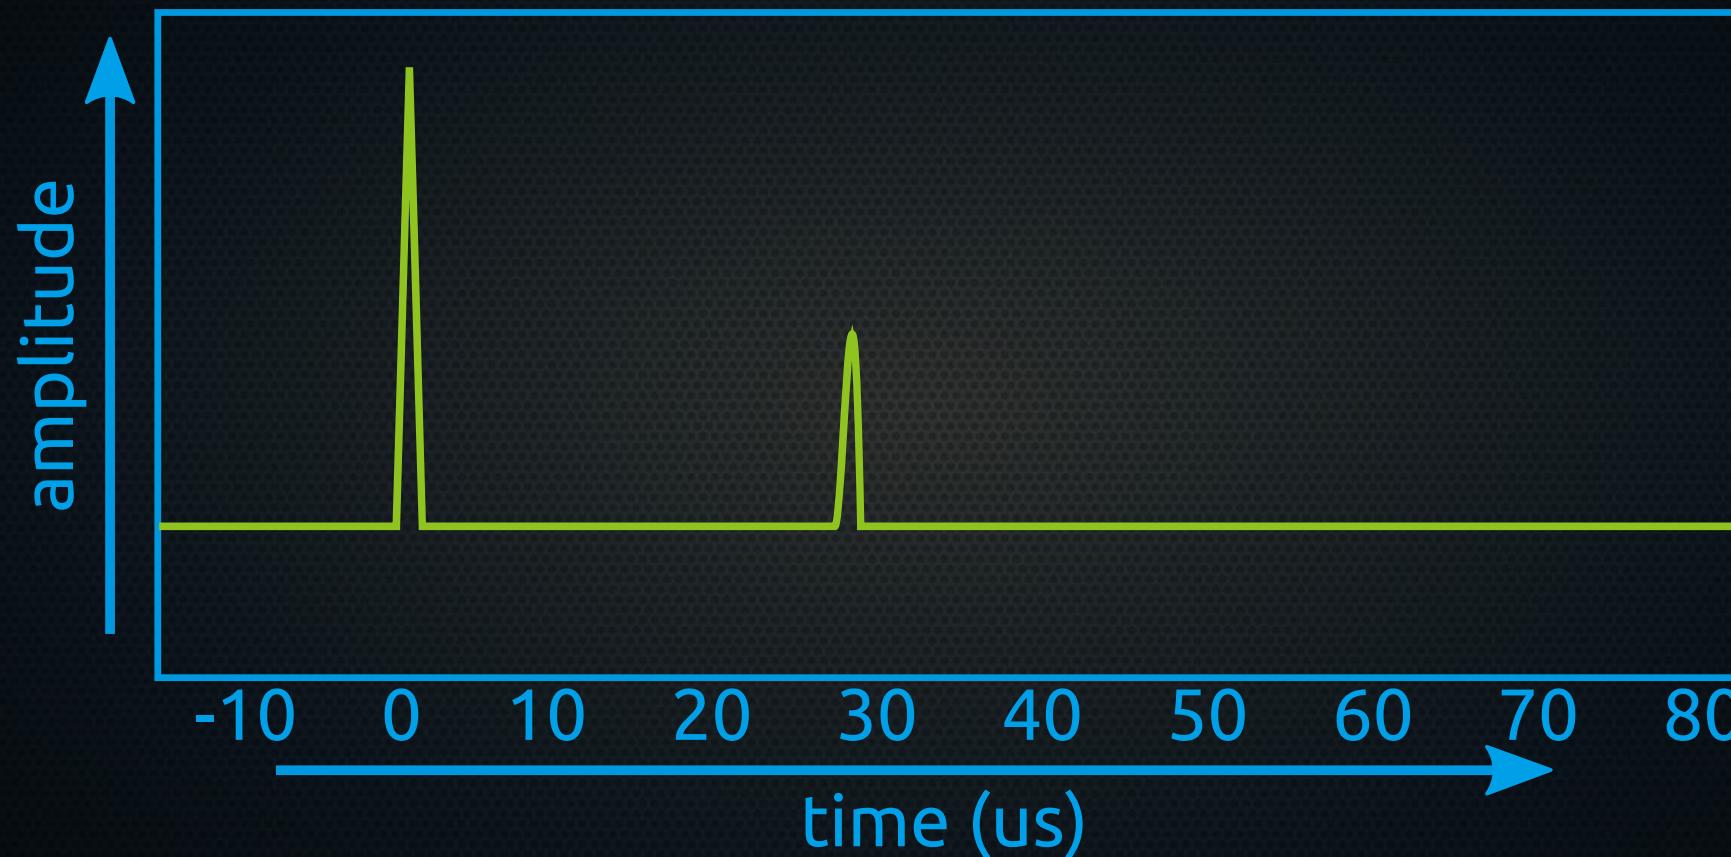

# Active Shielding

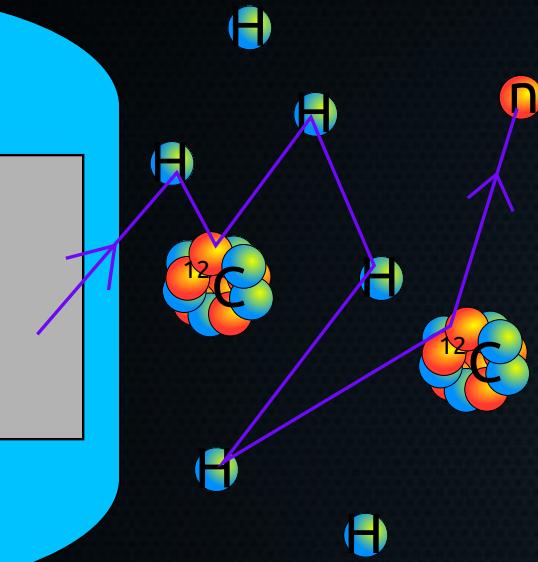

- Radiogenic (fission and  $(\alpha, n)$  reactions)
  - From surrounding environment
  - In detector components
- Cosmogenic (muon spallation)

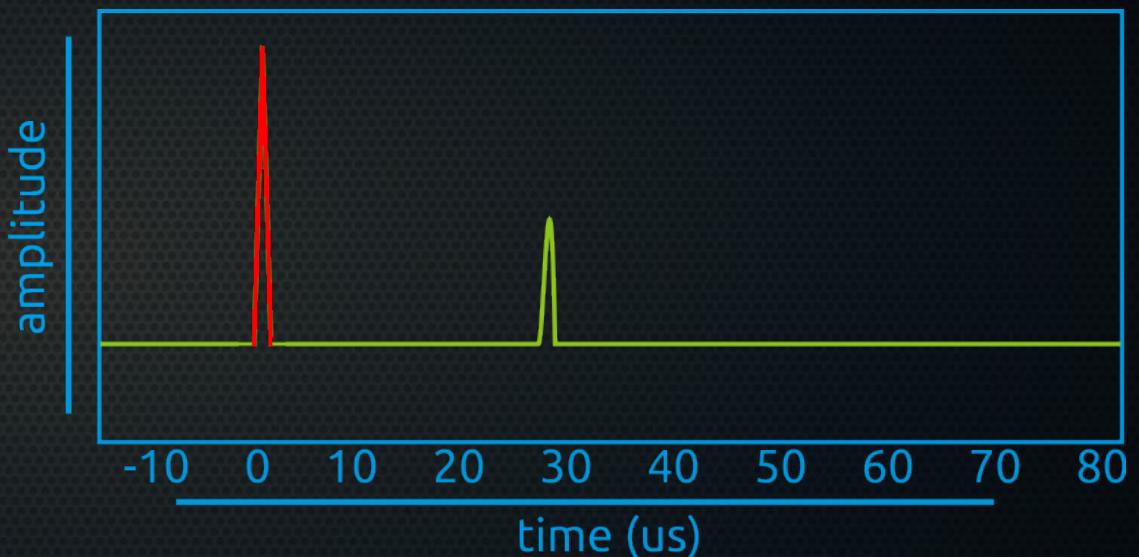

# Vetoing Neutrons with the LSV

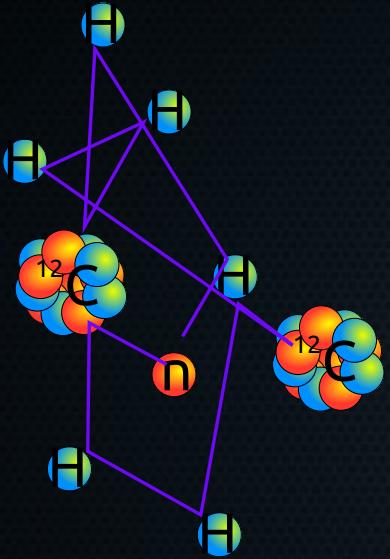

# Neutron Detection: Prompt Signal

- Neutron thermalization
- Very fast (< 100 ns)
- Prompt time cut → low background  
→ can cut with low threshold
- Signal size depends on neutron energy

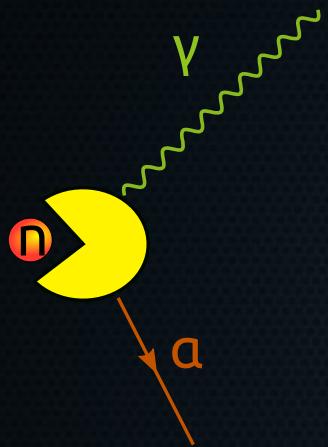

# Neutron Detection: Quiet Time

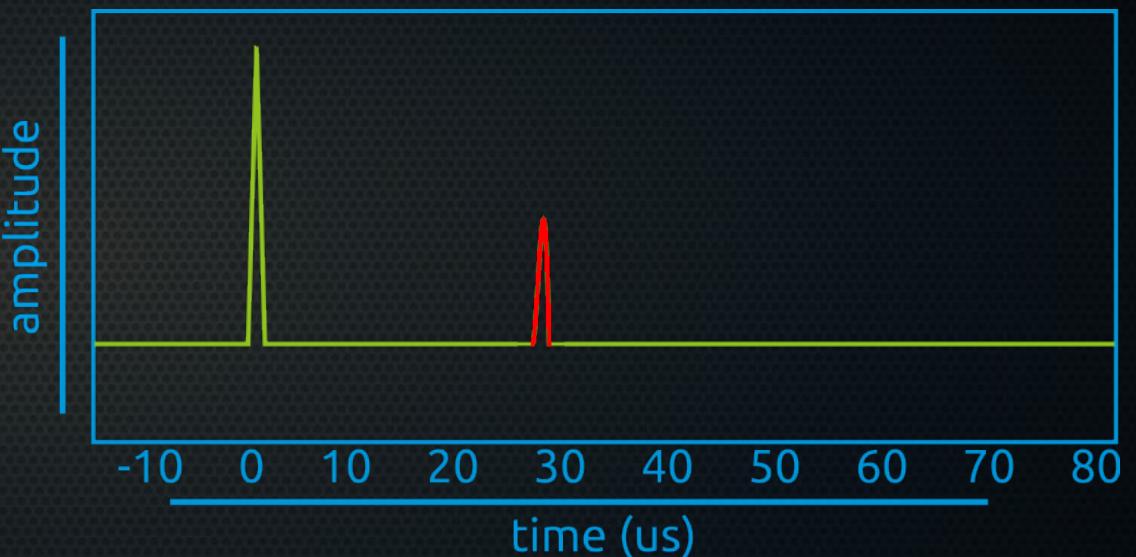

- Neutron random walk
- No signal produced
- Neutron random walks at thermal energies

# Neutron Detection: Capture Signal

- Neutron capture
  - Neutron captures on
    - $^{10}\text{B}$ :  $\sigma = 3837 \text{ b}$
    - $^1\text{H}$ :  $\sigma = 0.33 \text{ b}$
  - Produces 2.2 MeV  $\gamma$

# Neutron Capture on $^{10}\text{B}$

# Neutron Capture on $^{10}\text{B}$

Relatively high energy, easy to see  
But ~8% chance it will go back into  
cryostat unseen

# Neutron Capture on $^{10}\text{B}$

Highly quenched to a total signal equivalent to an electron energy of ~50-60 keVee  
Will always deposit all energy into the scintillator  
If we can reliably see these, we can see neutrons

Target vetoing efficiency: > 99.5%

Target vetoing efficiency: > 99.5%

The key to high efficiency is to efficiently detect  
the  $\alpha + \text{Li}$

Target vetoing efficiency: > 99.5%

The key to high efficiency is to efficiently detect  
the  $\alpha + \text{Li}$

The key to detecting the  $\alpha + \text{Li}$  is a high light yield

# Begin: The DarkSide

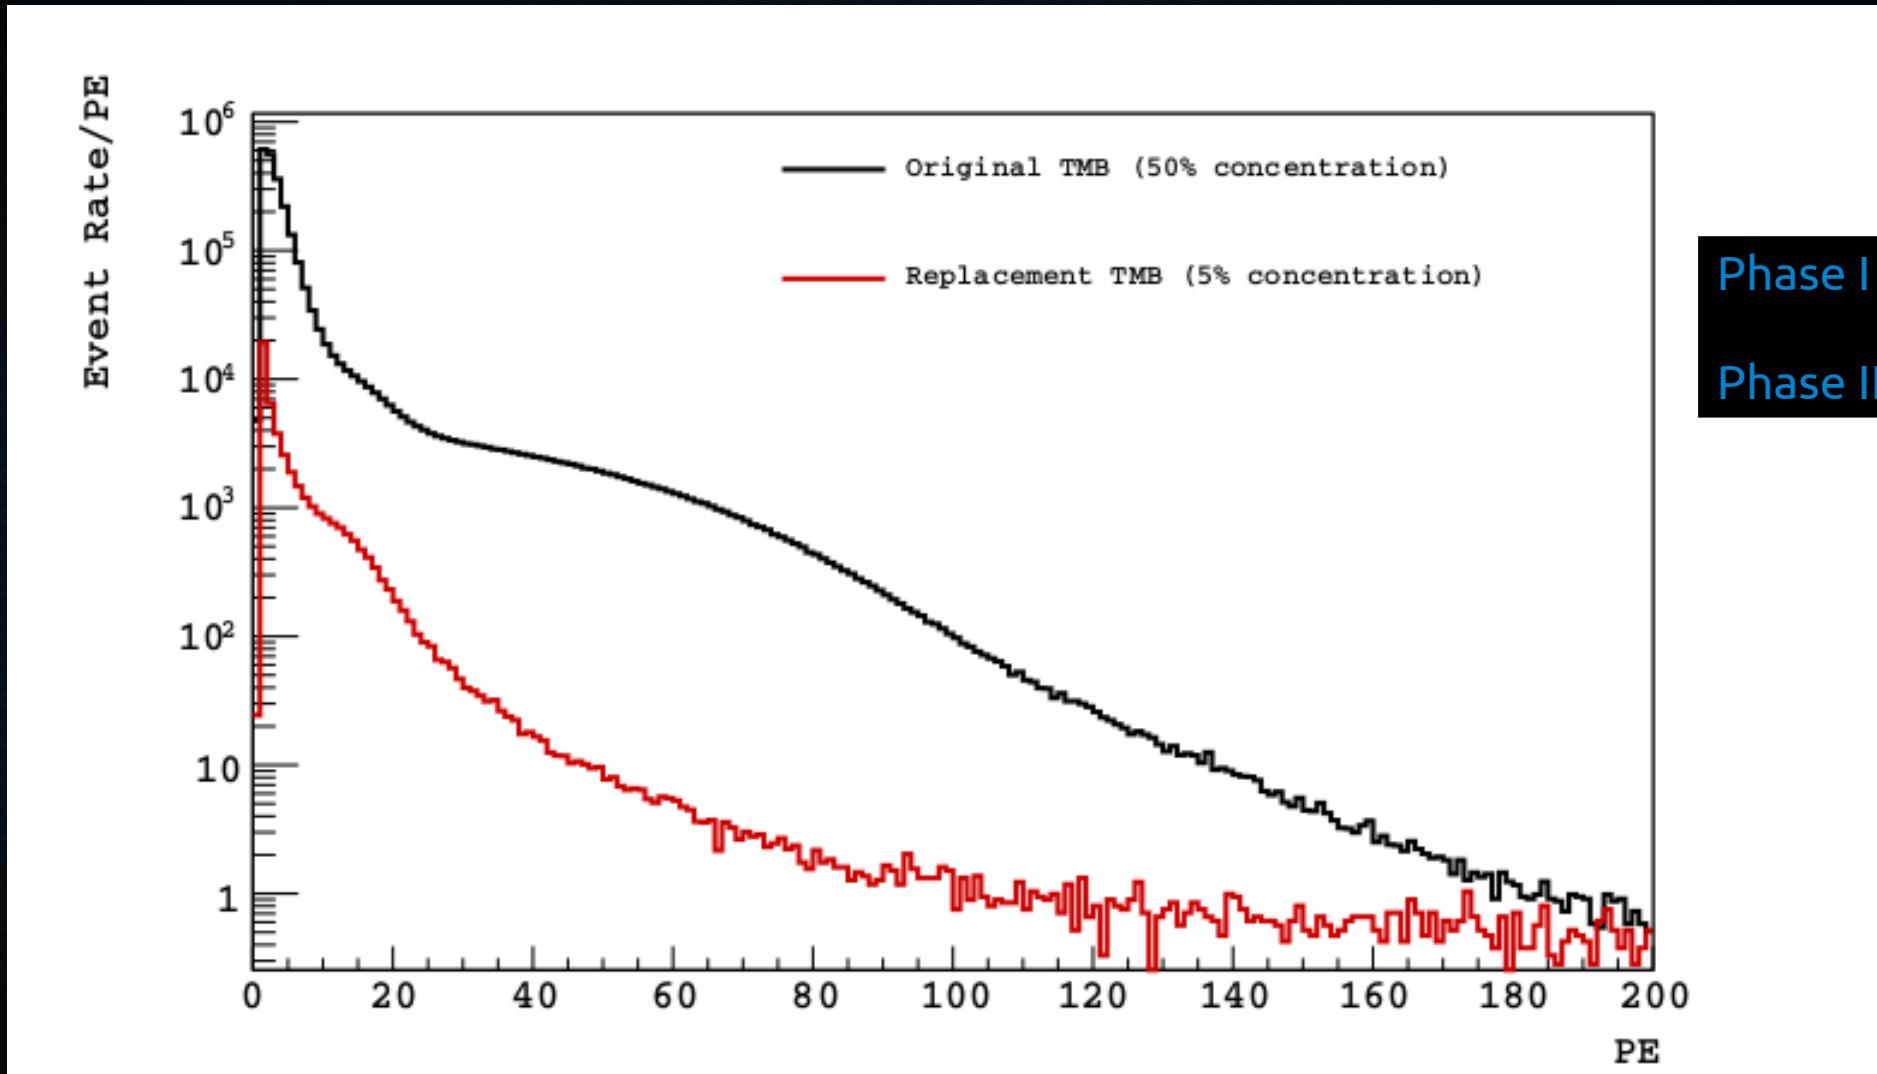

# The LSV: A Tale of Two Cocktails

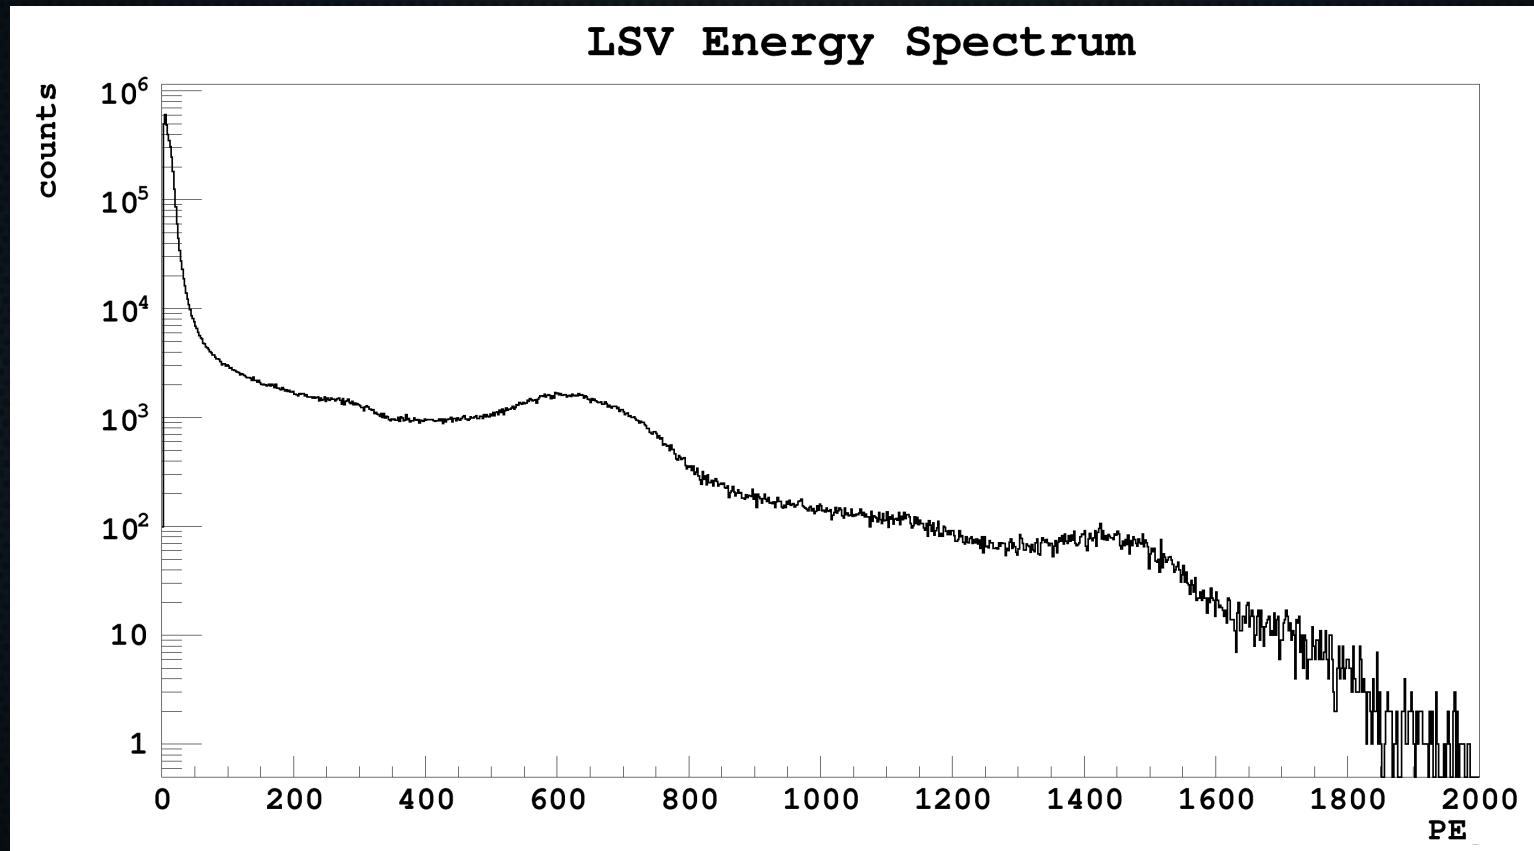

- Phase I
  - Nov 2013 – Jun 2014
  - 50% PC, 50% TMB
  - 2.5 g/L PPO
  - Overwhelming  $^{14}\text{C}$  contamination from TMB ~200 kBq from atmospheric  $^{14}\text{C}$
  - Neutron capture time ~2.2 us
  - High light yield >0.5 PE/keV
- Phase II
  - Apr 2015 – Present
  - 95% PC, 5% TMB
  - 1.4 g/L PPO
  - New TMB made from petroleum – much lower  $^{14}\text{C}$  rate ~250 Bq (measured  $^{14}\text{C}$  contamination of new TMB at the LLNL accelerator mass spectrometer to be below background)
  - Neutron capture time ~22 us
  - High light yield > 0.5 PE/keV

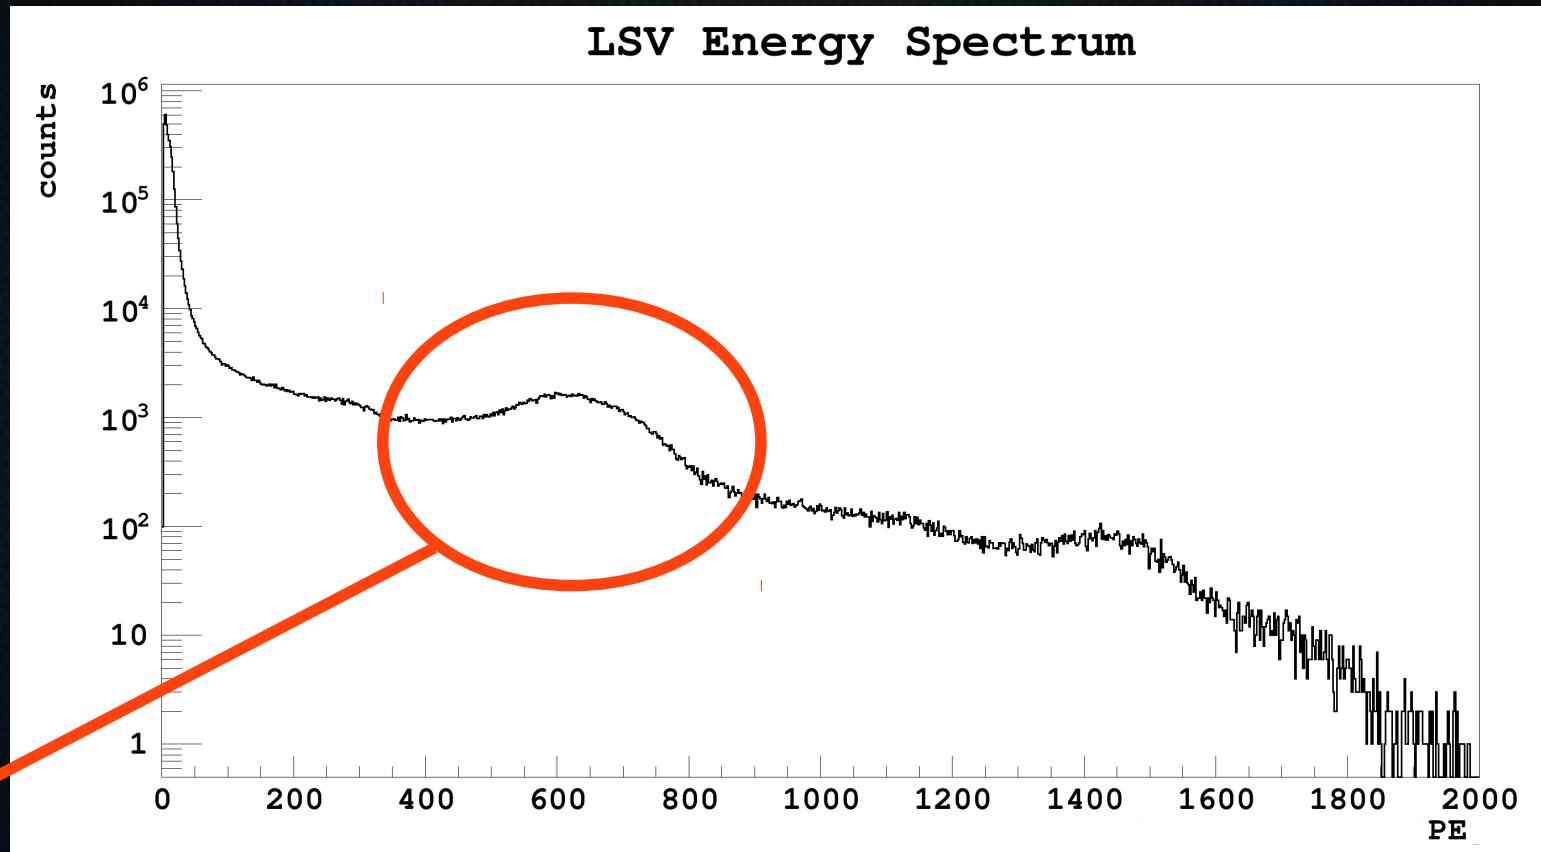

Phase I rate: ~200 kBq

Phase II rate: 245 Bq

# Prompt LSV-TPC Coincidence

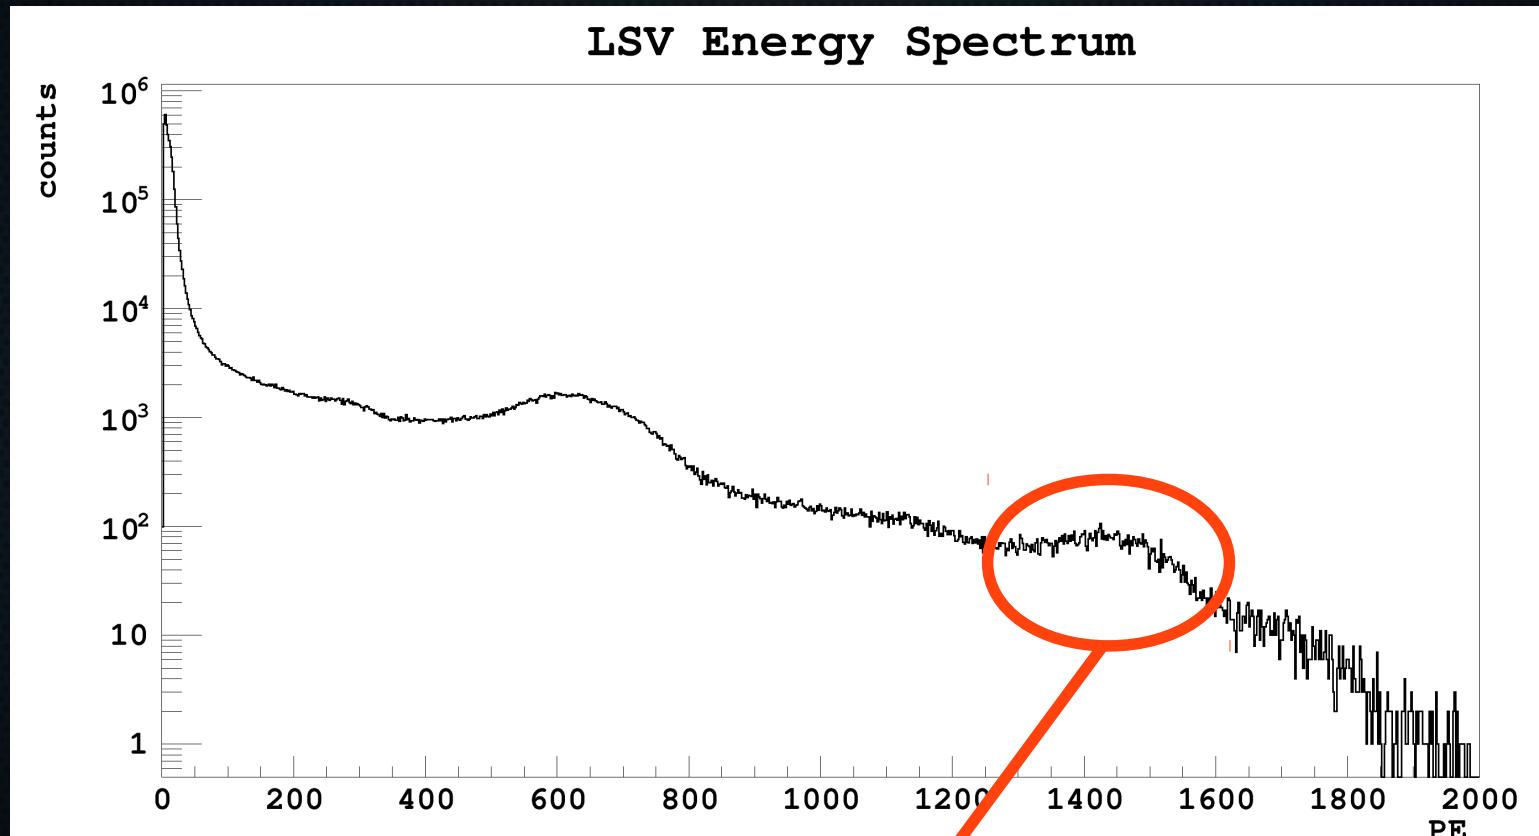

# Prompt LSV-TPC Coincidence

$^{60}\text{Co}$ :  $\gamma$  (1.17 MeV, 1.33 MeV)  $\rightarrow$  0.59 PE/keV

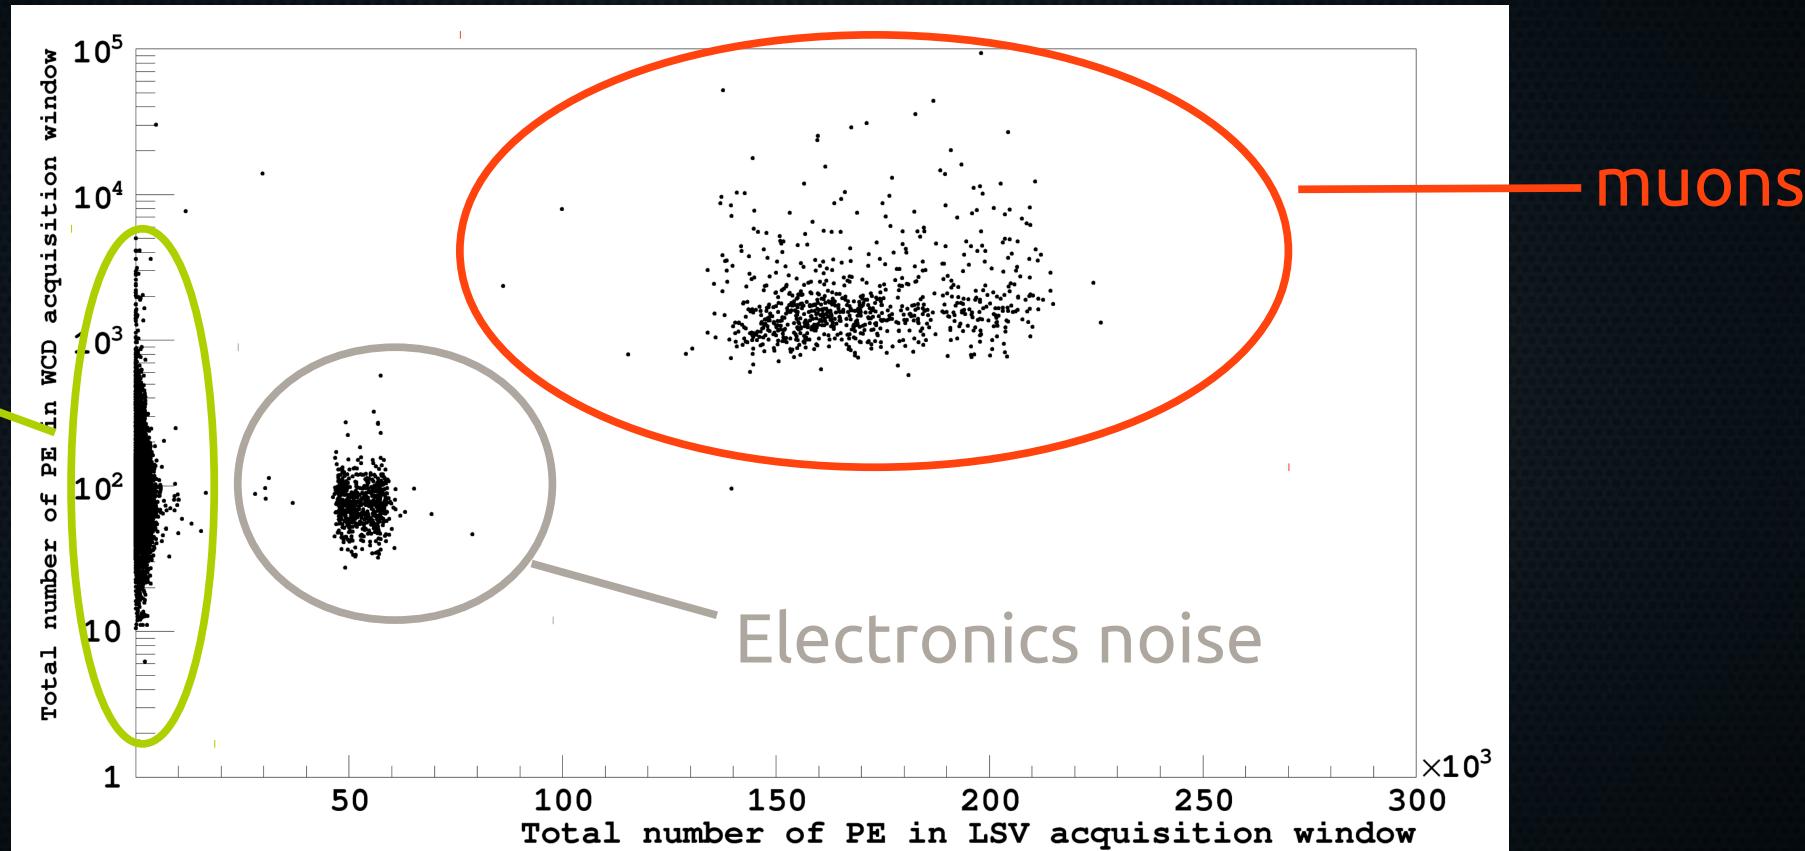

# Prompt LSV-TPC Coincidence

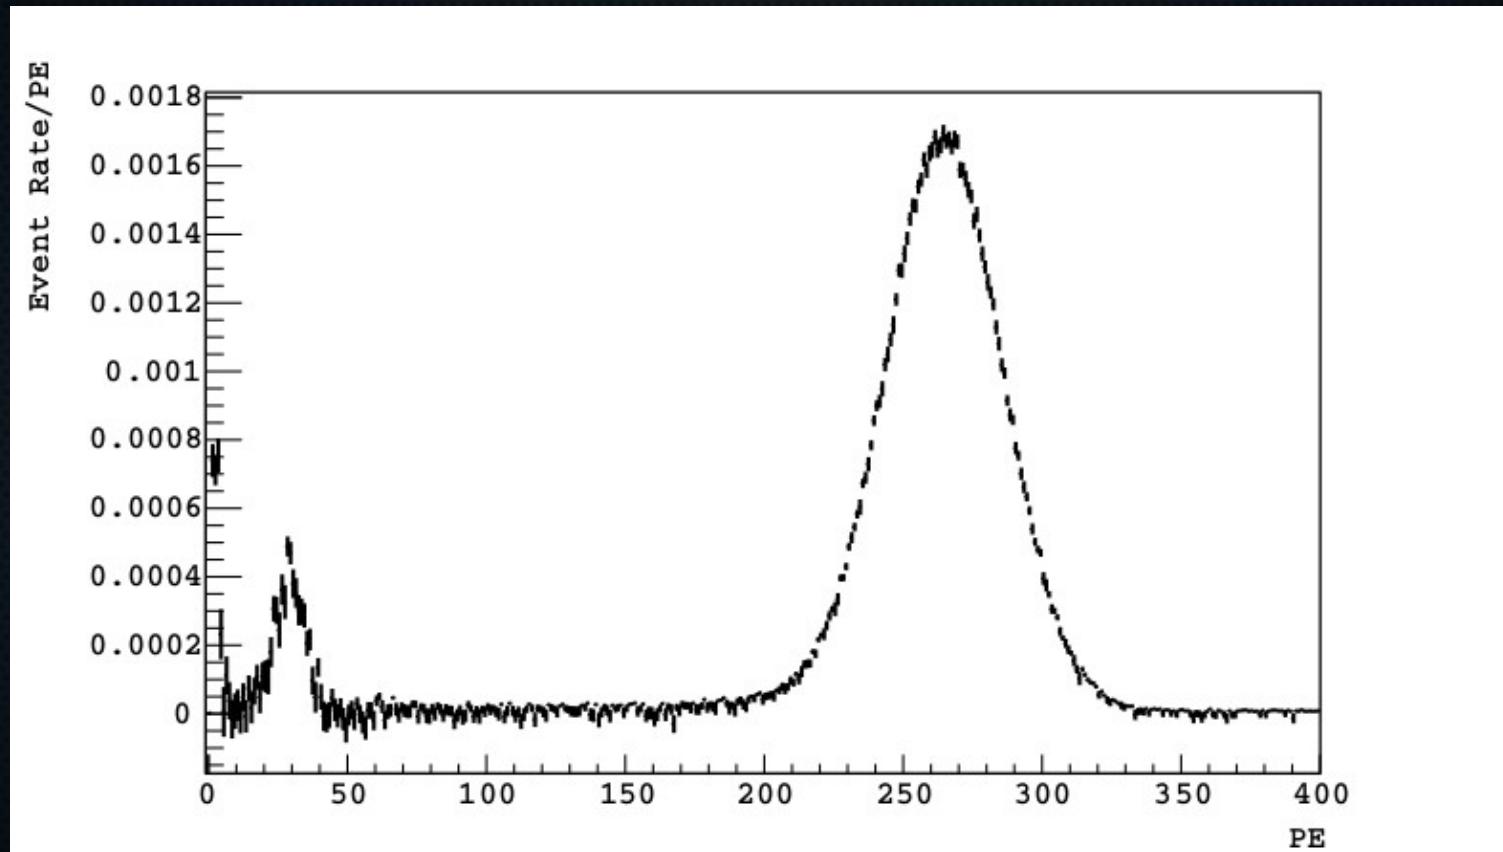

$^{208}\text{Tl}$ :  $\gamma$  (2.6 MeV)  $\rightarrow$  0.55 PE/keV

# Muons

$^{241}\text{Am}^9\text{Be}$  Calibration Run

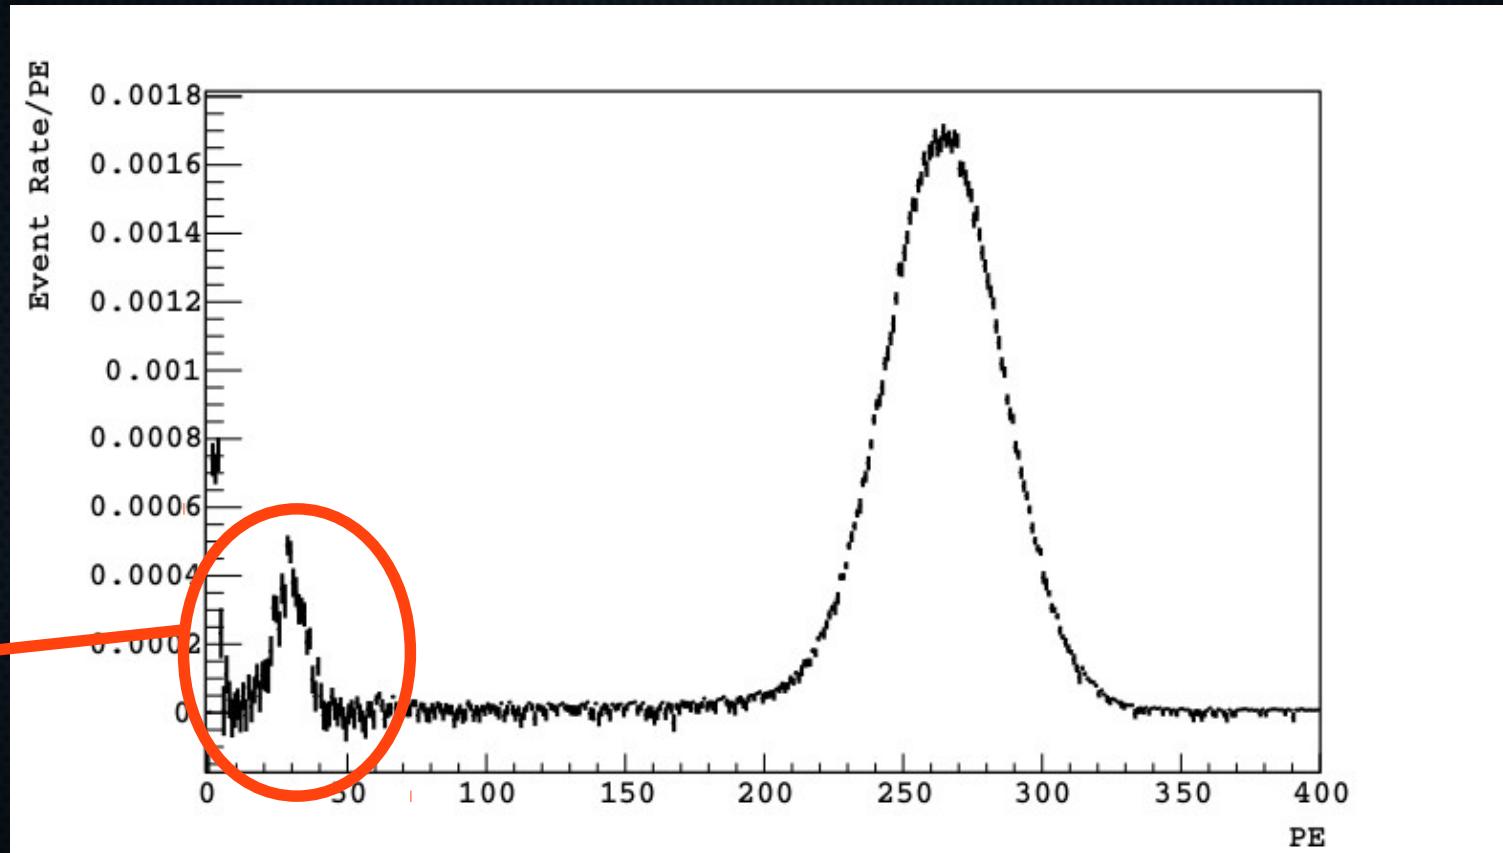

# Neutron Capture Signal

$^{241}\text{Am}-^9\text{Be}$  Calibration Run

# Neutron Capture Signal

$\alpha + \text{Li}$

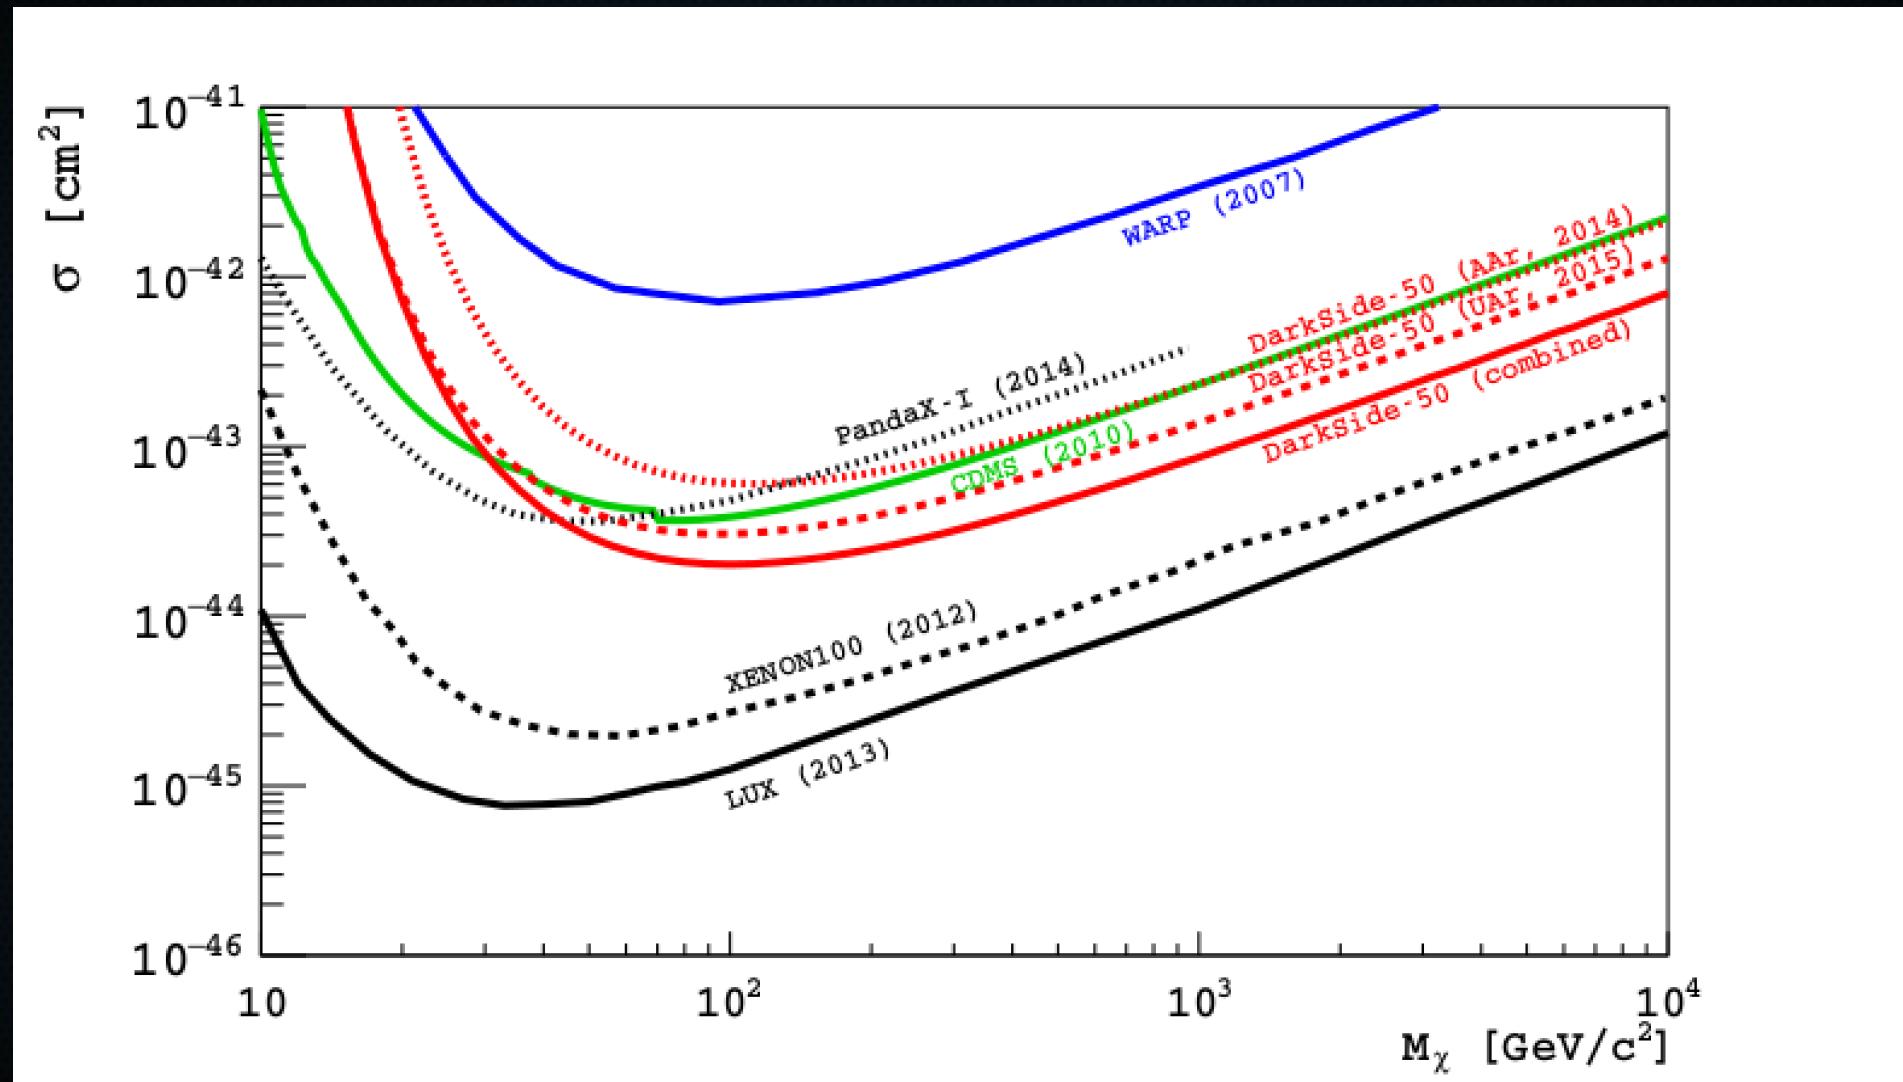

$^{241}\text{Am}^9\text{Be}$  Calibration Run

# Neutron Vetoing Efficiency

- Calibrations and simulations: vetoing efficiency **from capture signal alone** is **> 99.1%**
  - ~7.7% of neutrons capture on  $^1\text{H}$ ; 2.2 MeV  $\gamma$  lost ~8% of the time
    - 0.62% loss from this channel
  - ~0.23% capture after the LSV acquisition window has closed
  - ~0.05% leave no signal in LSV at all
- Total efficiency is even larger due to thermalization signal
  - Low background → cut with 1 PE threshold (~0.9% acceptance loss)
  - Will evaluate using  $^{241}\text{Am}^{13}\text{C}$  source

# Results

- 118 live days of running
  - "First Results from the DarkSide-50 Dark Matter Experiment at Laboratori Nazionali del Gran Sasso"
  - "Low radioactivity argon dark matter search results from the DarkSide-50 experiment"
- 2 neutrons vetoed that otherwise passed all cuts
  - 1 radiogenic
  - 1 cosmogenic
- 0 remaining backgrounds!

# Summary

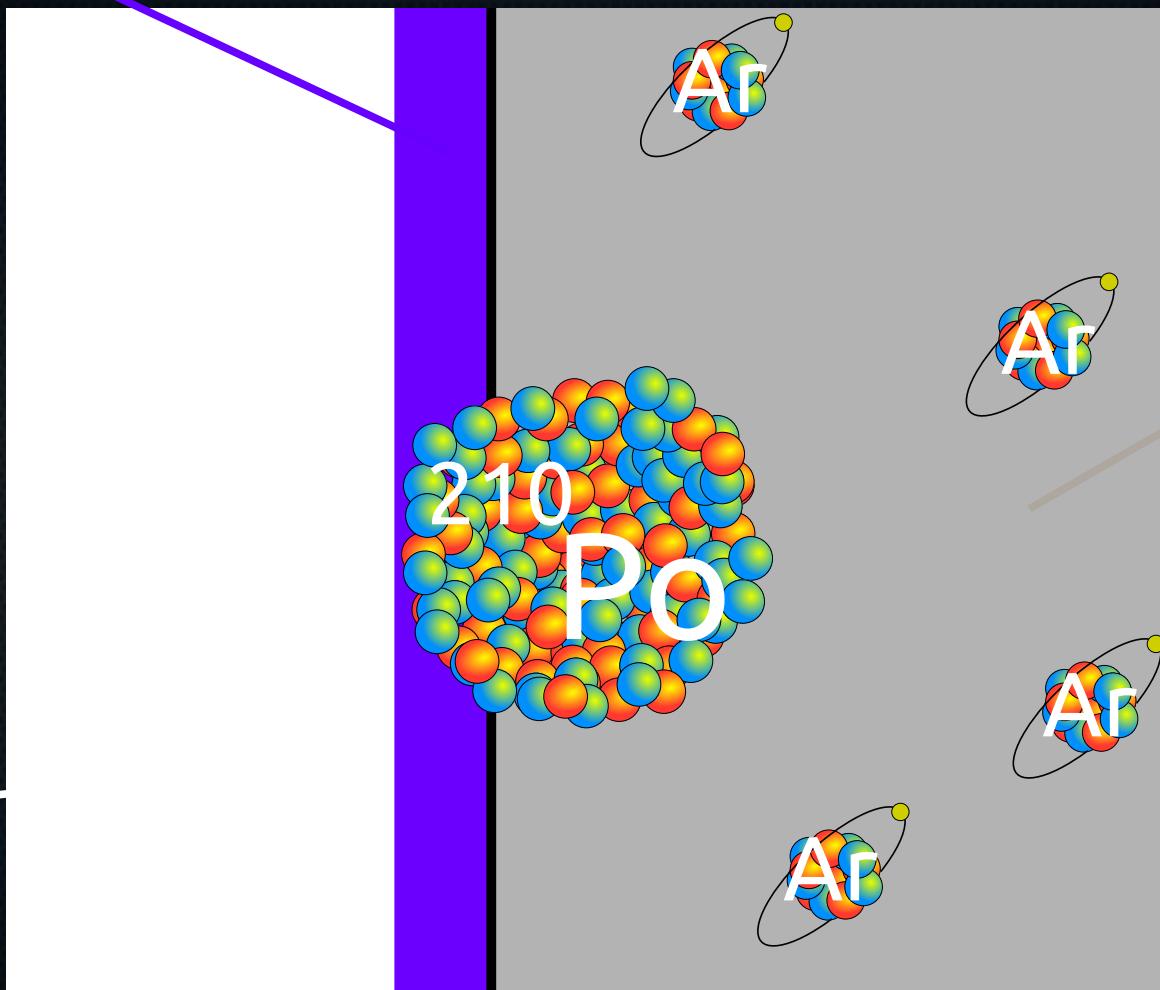

- Detecting WIMPs requires extraordinarily low backgrounds
- Electron recoil backgrounds can be effectively removed using pulse shape discrimination
- Nuclear recoil backgrounds from surface radioactivity can be removed with position cuts
- Nuclear recoil backgrounds from neutrons can be removed with our highly efficient neutron veto
- DarkSide has collected 118 days of data background free

# Further R&D

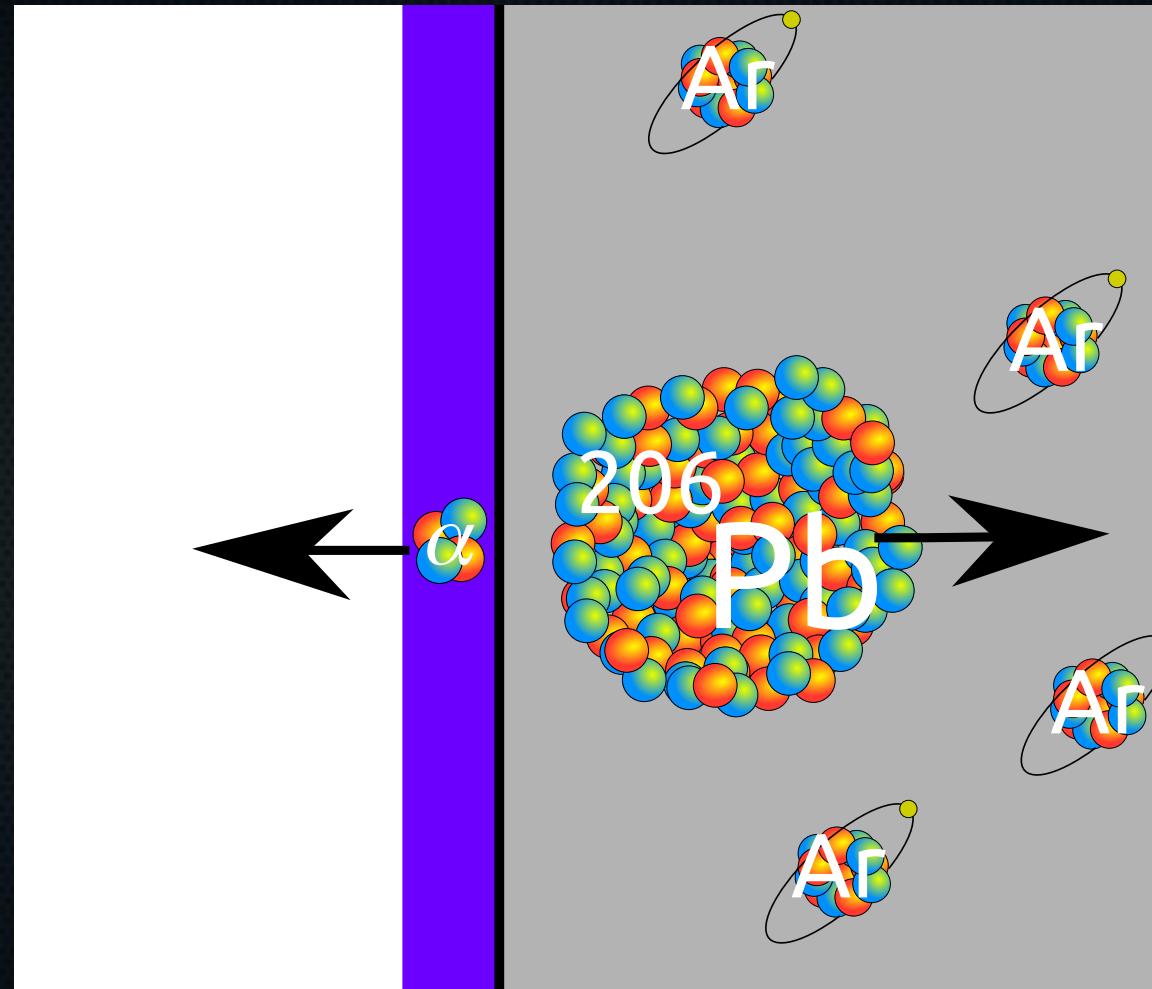

Surface backgrounds: The other nuclear recoil

# Wavelength shifter

Teflon

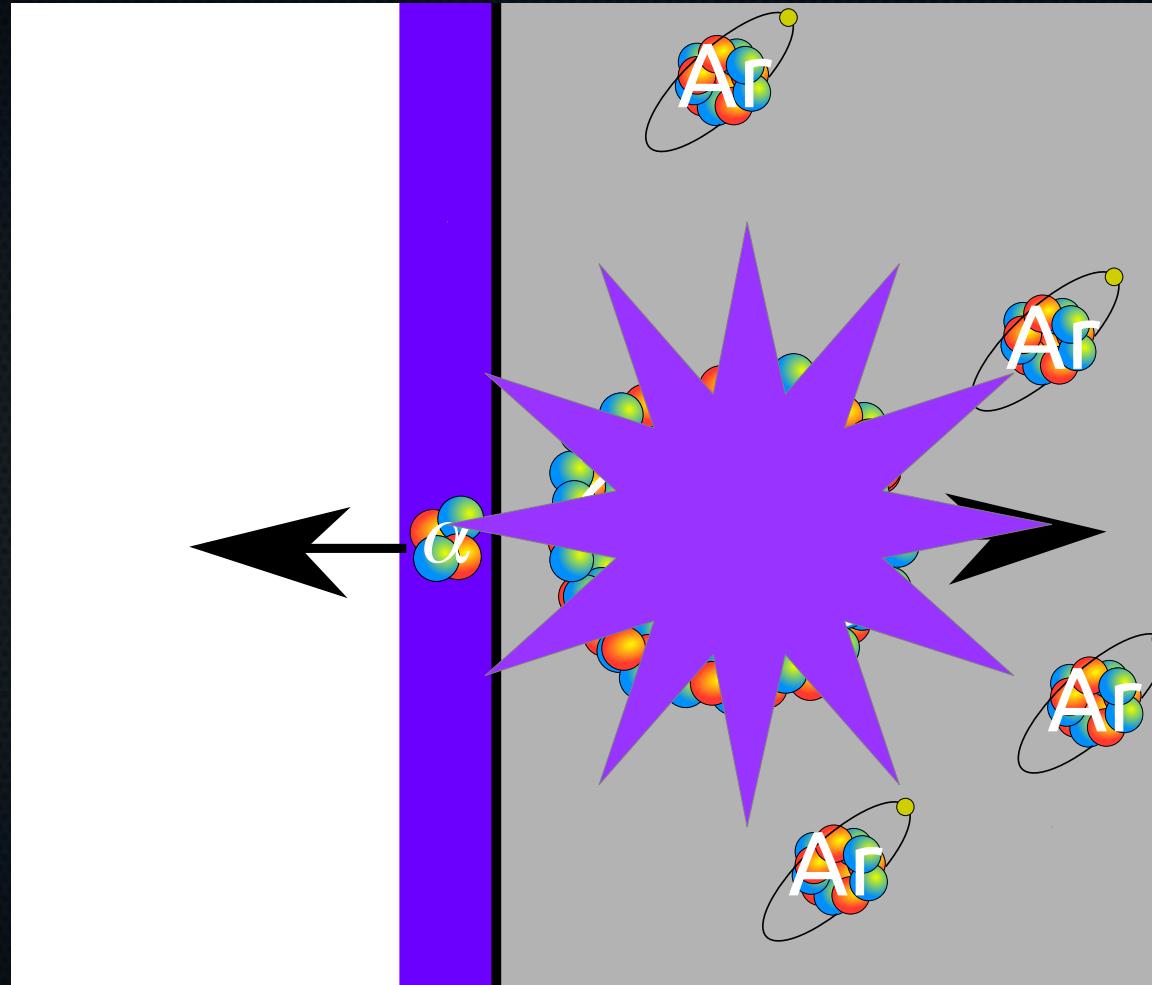

- $T_{^{222}\text{Po}-210}^{1/2} = 138 \text{ d}$
- $E(\alpha) = 5.304 \text{ MeV}$
- $E(^{206}\text{Po}) = 103 \text{ keV}$

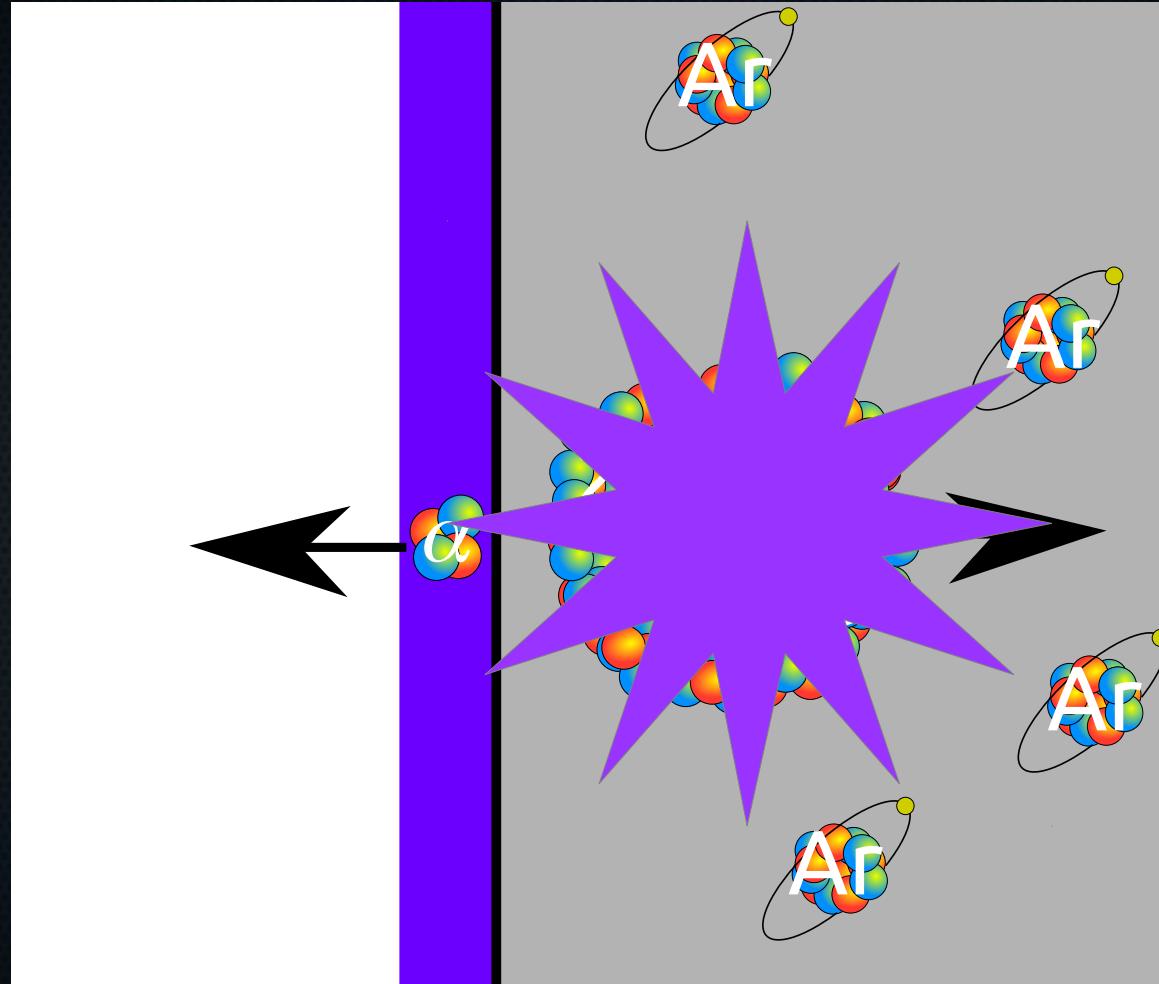

- $T_{^{210}\text{Po}}^{1/22} = 138 \text{ d}$
- $E(\alpha) = 5.304 \text{ MeV}$
- $E(^{206}\text{Po}) = 103 \text{ keV}$

Nuclear recoil!

- $T^{1/22}_{^{210}\text{Po}} = 138 \text{ d}$
- $E(\alpha) = 5.304 \text{ MeV}$
- $E(^{206}\text{Po}) = 103 \text{ keV}$

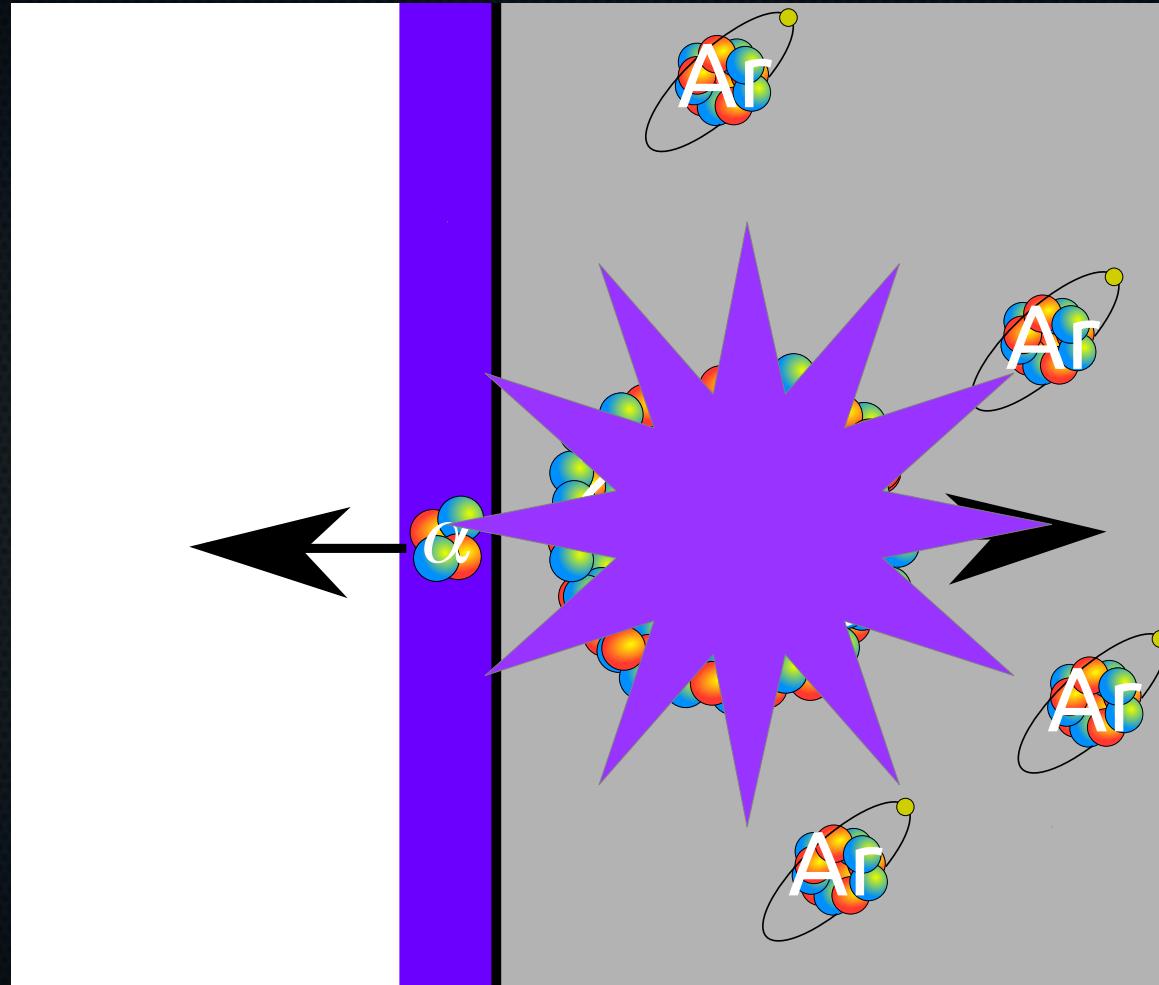

Nuclear recoil!

Usual strategy:  
Position cuts

# Nuclear recoil!

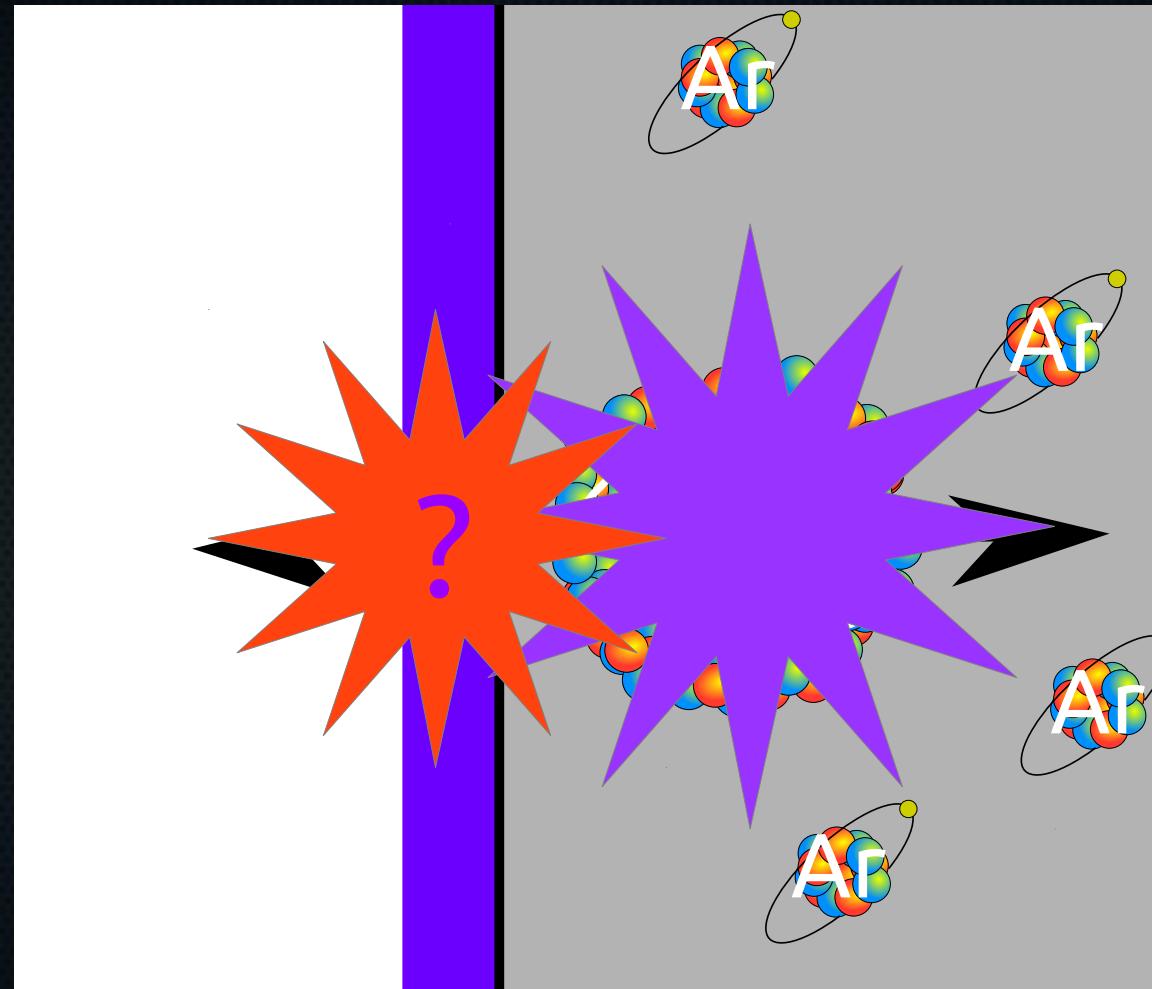

- $T^{1/2}_{^{22}\text{Po-210}} = 138 \text{ d}$
- $E(\alpha) = 5.304 \text{ MeV}$
- $E(^{206}\text{Po}) = 103 \text{ keV}$

Usual strategy:  
Position cuts

The problem:  
•  $(x,y)$  reconstruction  
is hard  
• Reduces exposure

-190°C

TPB

Using a  $^{210}\text{Po}$  needle source

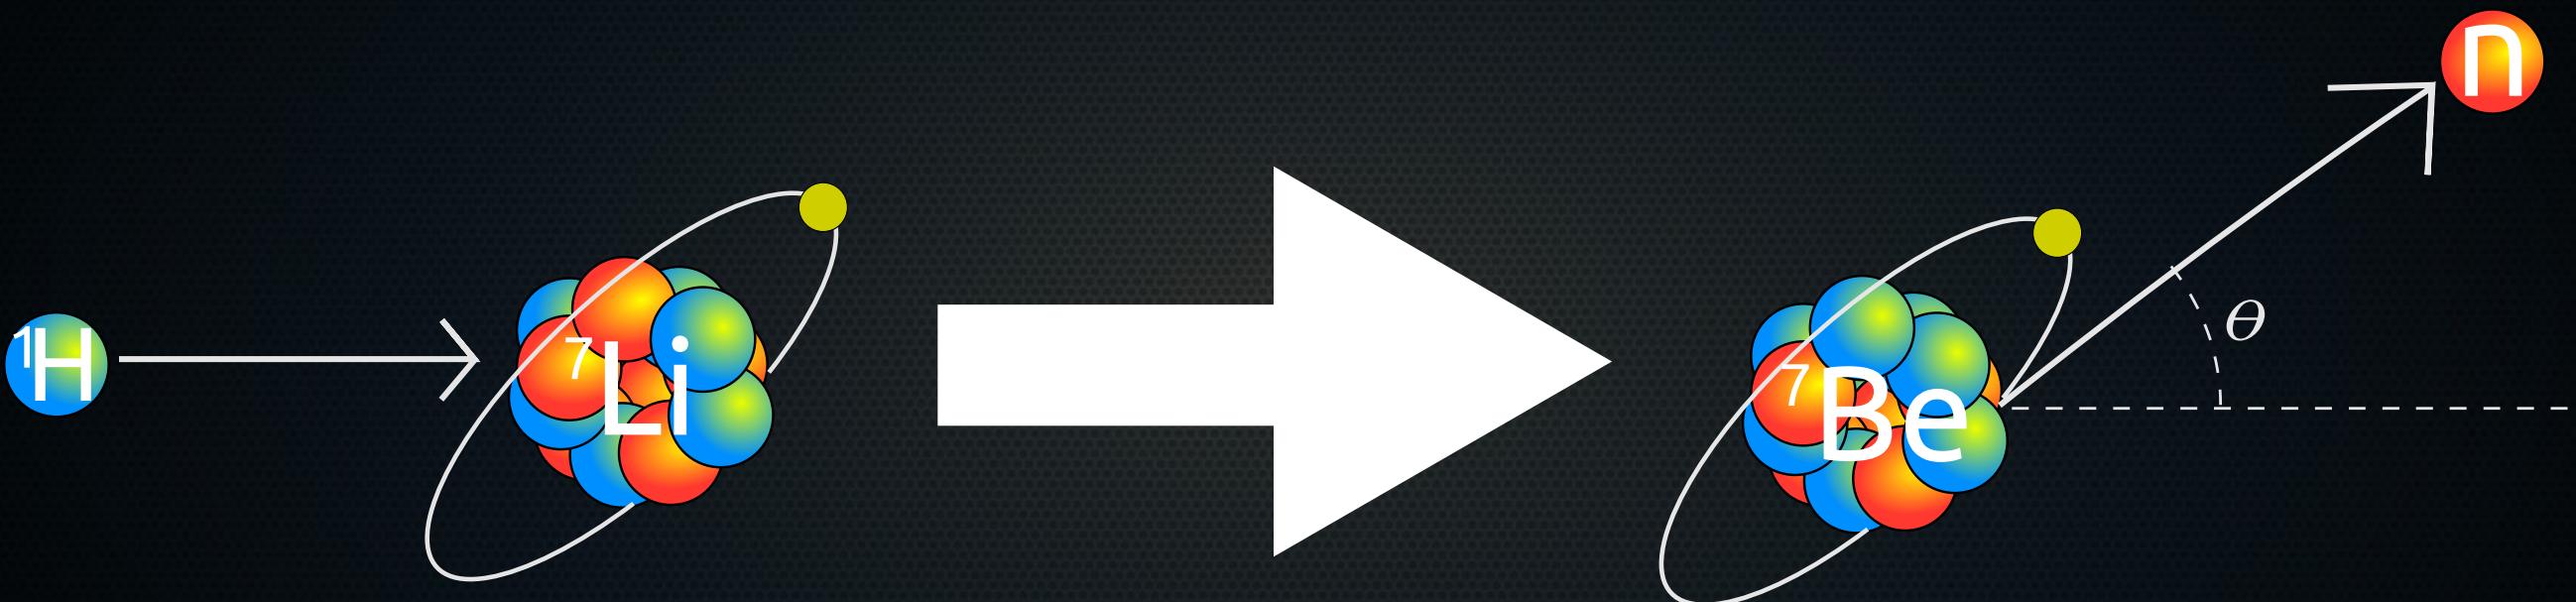

THE END

# Neutron Rates

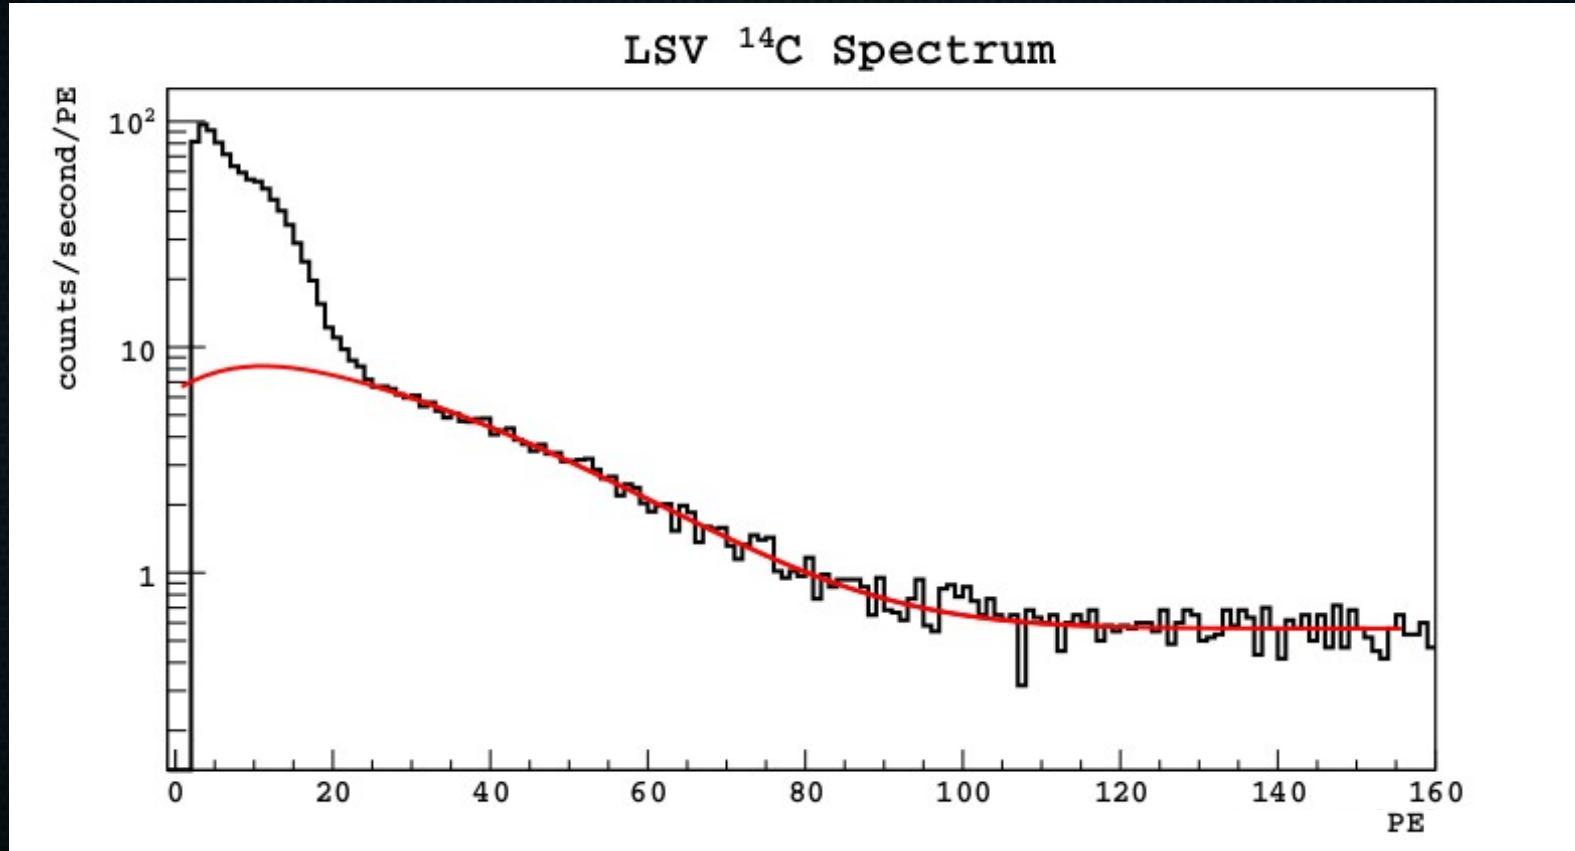

- Expect ~10 radiogenic neutron single scatters in the TPC per year
- Expect ~581 cosmogenic neutrons to enter the TPC per year (far fewer will produce single scatters in the WIMP search region)
  - FLUKA simulations show no events in 34 years where a cosmogenic neutron reaches the TPC and the LSV or WCD fails to trigger
  - A. Empl et al. *A Fluka study of underground cosmogenic neutron production*. JCAP, Aug. 2014.

# Testing Prompt Response: Li(p,n)Be reaction

# 14C Measurement

Phase II

Assumed:  
 $kB = 0.012 \text{ cm/MeV}$

Measured:  
 $LY = 0.56(1) \text{ PE/keV}$   
 $\text{Rate} = 245 \pm 27 \text{ Bq}$
