# Development of a *growing* industry

# The *emergence and domination* of China

# China emerges as *critical* consumer

## Rare Earth Industry Reports

# What is the impact of offshoring?

- Internationalization can benefit individual firms as well as regional economies (Mann, 2003; Farrell, 2003)
  - Reduces costs and expands markets (Aron & Singh, 2005)
  - Greater scale to exploit high technology innovation developed in home region (Shan and Song, 1997)
  - Increase innovation by augmenting knowledge base (Florida, 1997; Quinn, 1999, 2000)
  
- Manufacturing matters (Cohen & Zysman, 1987; Hira & Hira, 2005)
  - Manufacturing and high value added services are complements
  - As manufacturing moves, engineering and R&D will follow

# Magnequench offshoring path

*World leader in rare earth magnet powder metallurgy*

- 1982 – Files exclusive patent on NdFeB permanent magnet composition
- 1986 – Opens \$70 million magnet facility in Indiana
- 1998 – Begins production in China
- 1999 – Opens R&D center in Research Triangle Park
- 2002 – Closes Indiana production facility
- 2004 – Moves R&D center to Singapore

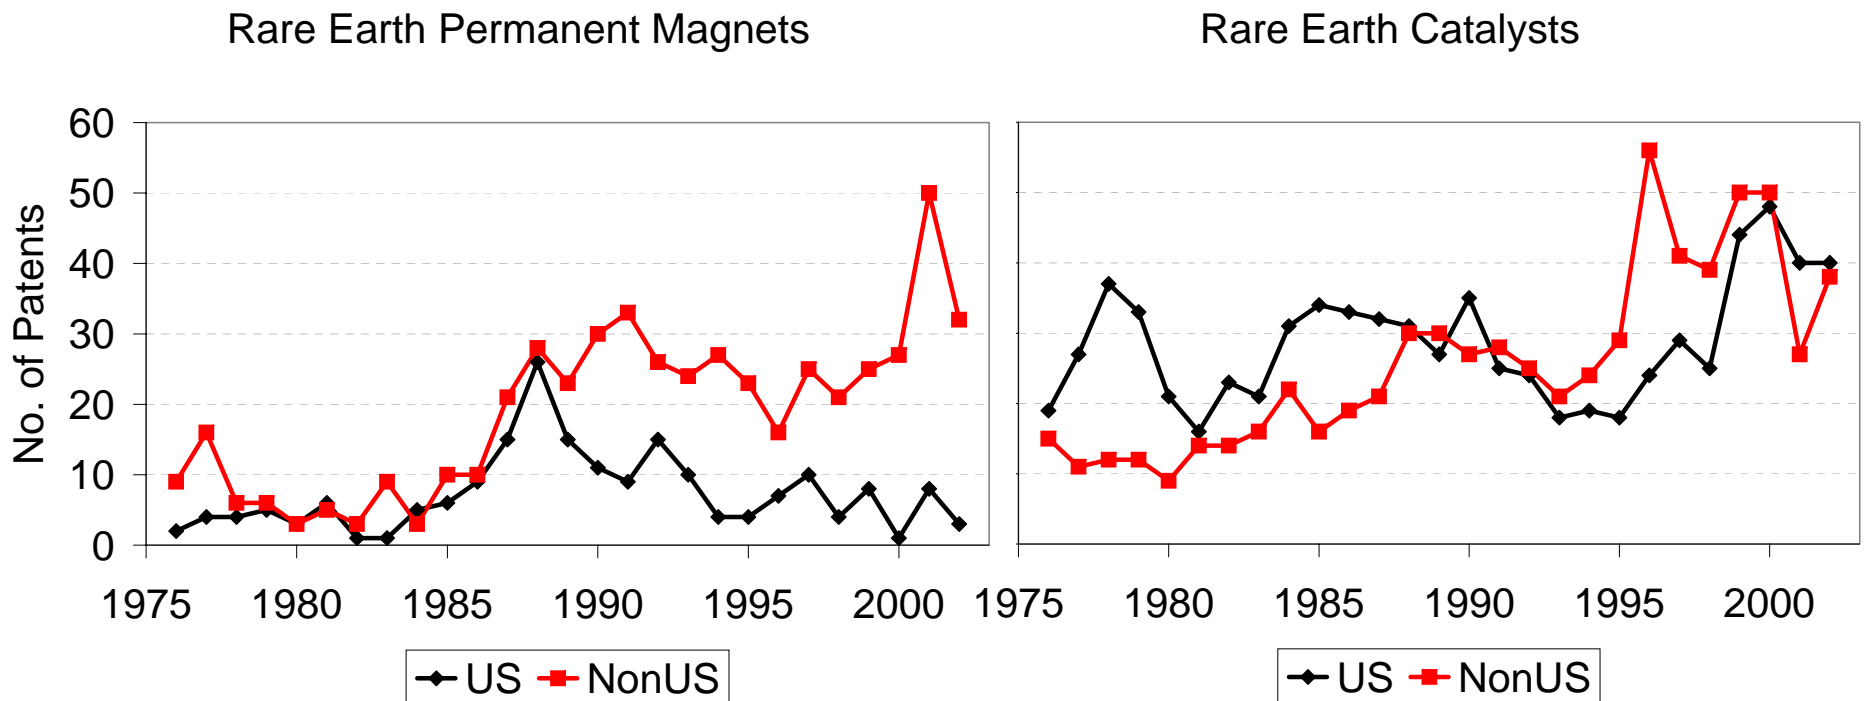

# Magnequench as part of a *broader* trend

## Rare-earth Patents

# Rare earth technology differences

- US rare earth patenting has been declining since 1990
- But this trend is not uniform across rare earth technologies

# Research question

- When does innovation follow the internationalization of upstream supply chain activities and when does it not?
- What are critical drivers of co-location of innovation and production?

Rare Earth Permanent Magnets

Rare Earth Catalysts

# Knowledge spillovers as a *critical* driver

## ■ Knowledge spillovers

- ❑ Spillovers geographically localized (Jaffe et al., 1993; Audretsch and Feldman, 1996; Thompson and Fox-Kean, 2005)
- ❑ Codified vs. tacit knowledge

## ■ Knowledge Spillovers and Co-location of Production and Innovation (Macher and Mowery, 2004)

- ❑ When spillovers matter, innovation follows the movement of the value chain
- ❑ When spillovers do not matter, the location of segments of the value chain do not impact the location of innovation activities

## ■ Industry interviews suggested spillovers important for permanent magnets but not catalysts

# Knowledge spillovers and innovation offshoring in 2 rare earth technologies

- Are knowledge spillovers important?
- Do they play a role in the movement of innovation activities?

Rare Earth Permanent Magnets

Rare Earth Catalysts

# Methods: Empirical testing

## ■ Patent citations

- Citations identify “prior art” of relevance to the focal patent
- Citations are one of the most traceable records to understand critical knowledge flows (*Jaffe et al., 1993, 2000; Stuart and Podolny, 1996*)
- Preponderance of local citations is indication of knowledge spillovers (*Jaffe et al., 1993, 2000*)

## ■ Take a US perspective

## ■ Measure percent of US citations by focal patents

$$perus = \frac{US\ citations}{Total\ citations}$$

# Methods: Variables

## ■ Independent variables

### □ US dummy (*US*)

- US versus NonUS location

### □ Time period dummy (*d*)

- Before and after 1990

### □ Interaction

## ■ Control variable

### □ Random expected percent of US citations per focal patent

- Use algorithm to identify complete set of patents containing relevant and available prior art
- Controls for time trends

# Regression Results

Dependent Variable:  $\ln(\text{perus}/(1-\text{perus}))$   
*Logistic transform of percent US citations*

	Catalysts		Magnets	
Model	1a	1b	1a	1b
<b>US</b> <i>0-1 dummy for location</i>	+***	+***	+***	+**
<b>d</b> <i>0-1 dummy for time period</i>	+***	+**	-	-**
<b>US*d</b> <i>US after 1990</i>		+		+**

\*\*  $p < 0.05$ ; \*\*\*  $p < 0.001$

# Understanding regression results

## ■ For both technologies

- Local knowledge spillovers matter in both time periods

( $US = +^{***}$  in all models)

## ■ For Catalysts after 1990

- US knowledge more important for all innovation activities

( $d = +^{***}$  in Model 1a and 1b)

## ■ For Magnets after 1990

- US knowledge less important for innovation activities abroad
- US knowledge more important for US innovation activities

( $d = -^{**}$  in Model 1b)

( $US*d = +^{**}$  in Model 1b)

# Interpreting role of knowledge spillovers

## ■ Patent counts suggest

- ❑ Innovation activities in magnets moving away from the US
- ❑ Innovation activities in catalysts remain in the US

## ■ Citation regressions suggest

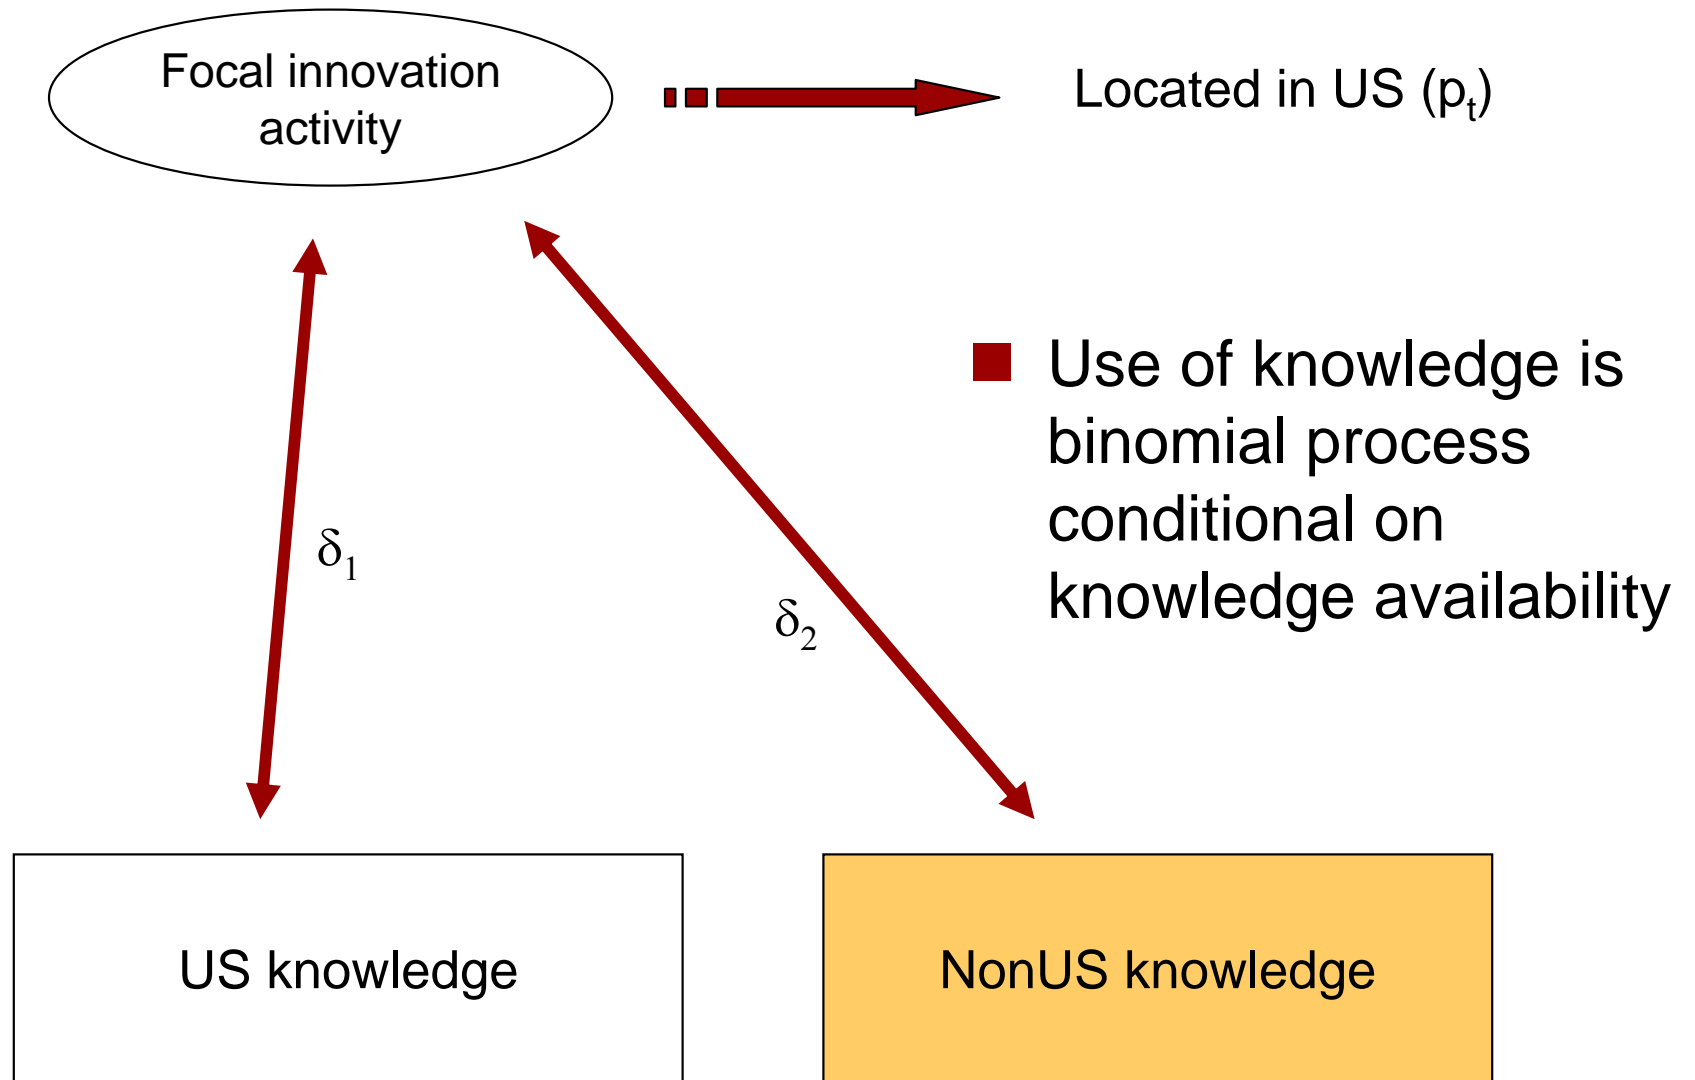

- ❑ For catalyst innovation, US knowledge remains important for domestic and foreign activities
- ❑ In magnet innovation, domestic and foreign activities increasingly rely on respective local knowledge

## ■ When spillovers matter for innovation activities these will be located where relevant knowledge is

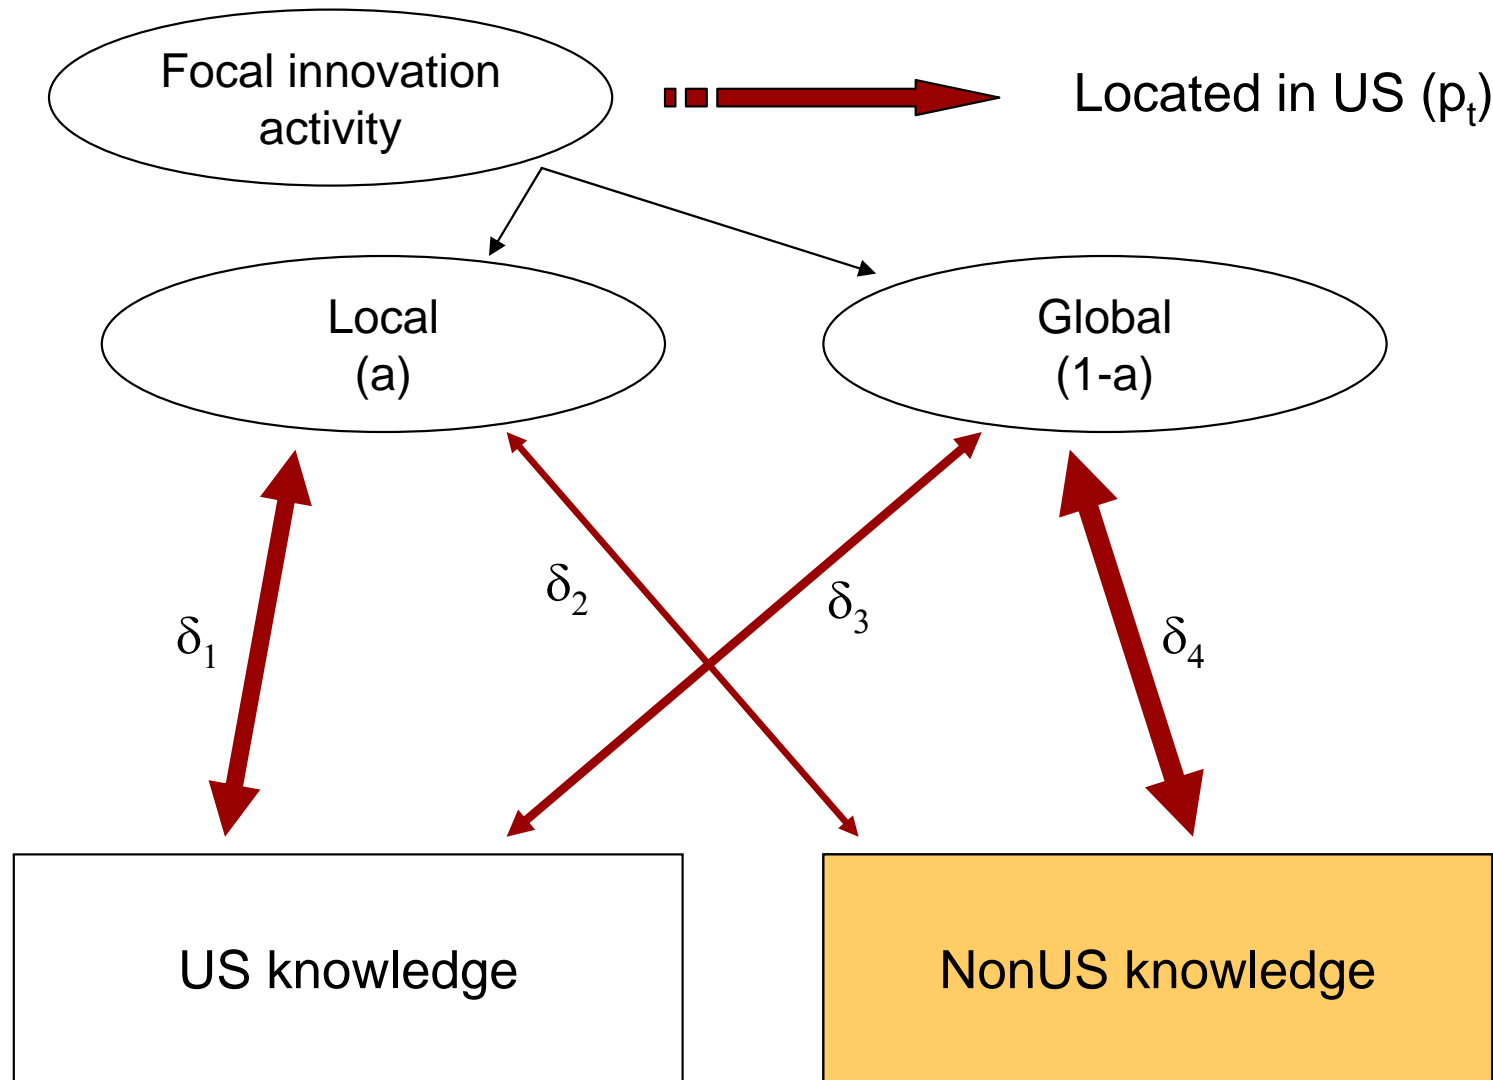

# Understanding the Process

- Testing for competing explanation
  - Nature of innovation process changed after 1990
    - unobserved heterogeneity
- Model underlying structure for innovation processes
  - Capture the role of knowledge spillovers
  - Control for the nature of innovation processes
  - Replicate key regression results

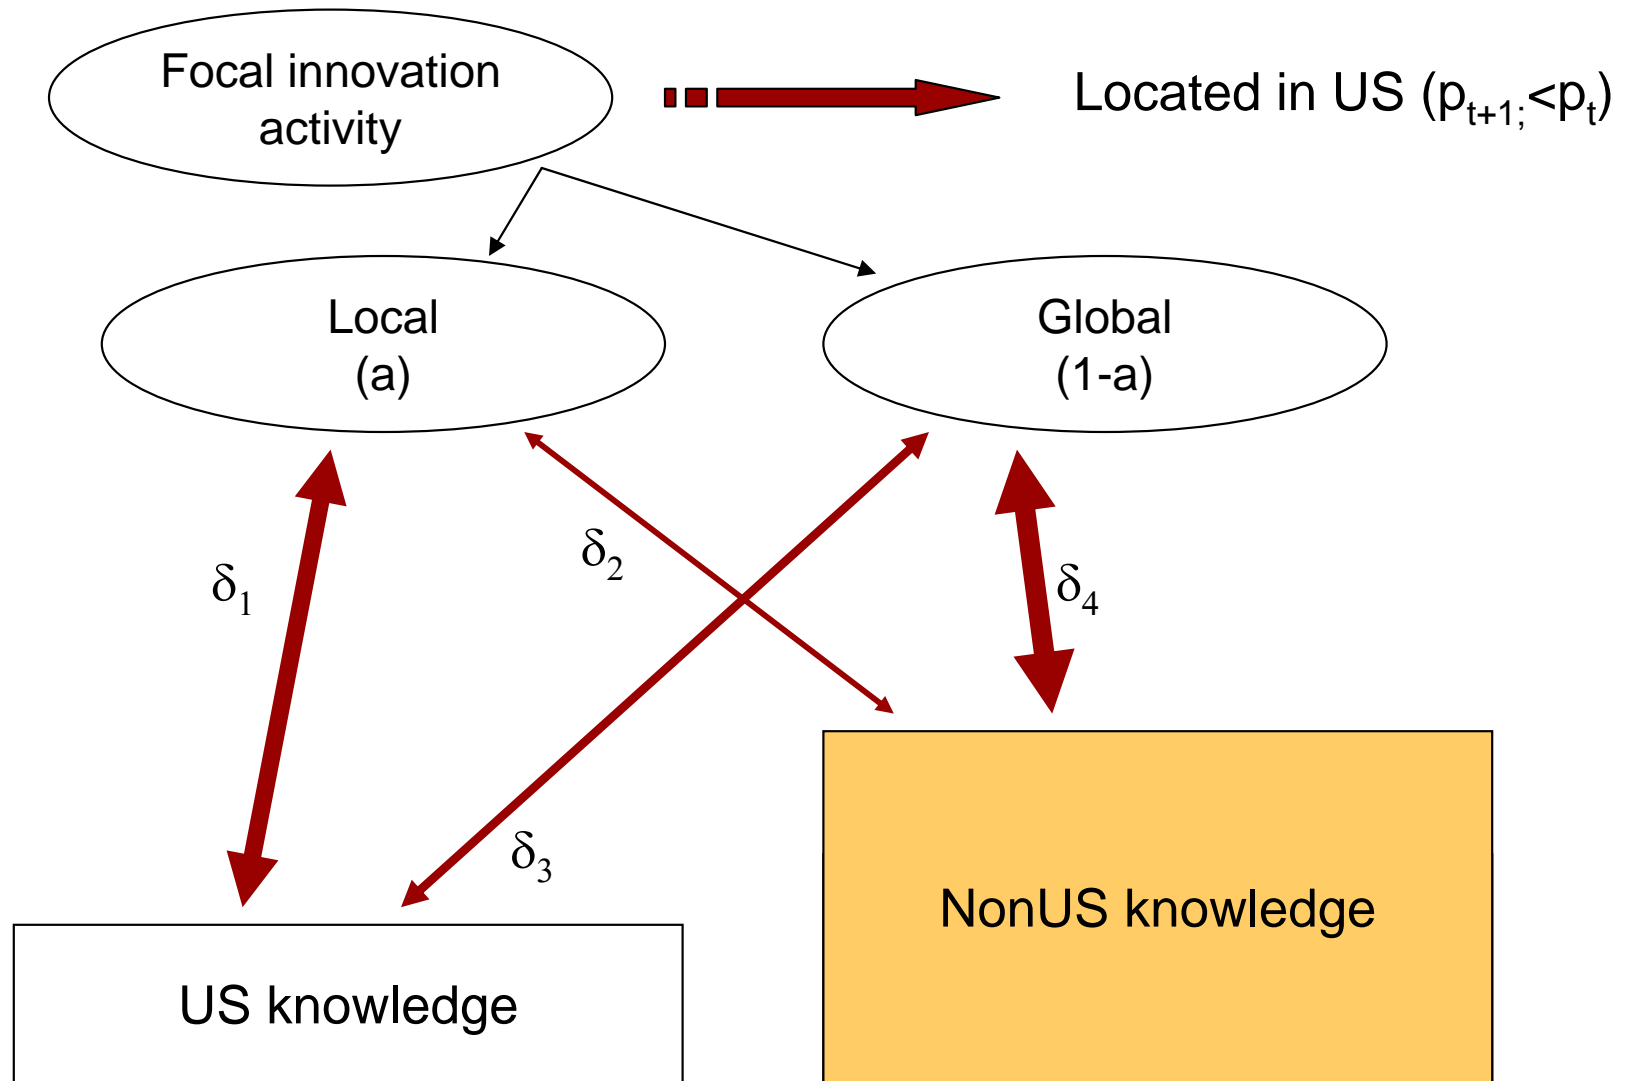

# Understanding knowledge use in innovation

# Assume two classes of innovation activity

# What changes in time period $t+1$ ?

# Results of model

US Magnet Innovation Activities				
	Before 1990		After 1990	
	Local	Global	Local	Global
Local Knowledge	51%		64%	

- For magnets after 1990,
  - US knowledge more important for US innovation activities (Percent increase = 13%)
  - US knowledge more important for US innovation activities ( $US^*d = +^{**}$  in Model 1b)

# Process behind the results

US Magnet Innovation Activities				
	Before 1990		After 1990	
	Local	Global	Local	Global
% innovation activities	39%	61%		
Local knowledge	98%	35%		
Global knowledge	2%	65%		

# Conclusions

- What innovation will stay and what will go?
  - Knowledge spillovers play a role in determining location
  - Need to understand changing nature of innovation activities
  
- What tasks will stay and what will go?
  - Codifiable and tacit information (*Leamer and Storper, 2001*)
  - “Routine” and “nonroutine” tasks (*Levy and Murnane, 2004*)
  - Electronic and nonelectronic tasks (*Blinder, 2006*)
  
- Need to reframe discussion on appropriate responses to movements offshore
  - View that solution is just to upgrade to higher value-added (innovation) jobs may be incorrect – some of these will go
