Testing ballots for usability

First edition, third printing, 2013
About the Field Guide series

There have been excellent ballot design guidelines around since about 2007 when the U.S. Election Assistance Commission published AIGA’s work in its report, *Effective Designs for the Administration of Elections*. Everyone involved in that project quickly figured out that, as juicy as the design specs were in that report, they needed to be boiled down to essentials that local election officials could easily act on within the constraints they had. *Field Guides To Ensuring Voter Intent* were inspired by that need.

— Dana Chisnell, Field Guides Editor
About this Field Guide

Top 10 guidelines for conducting usability tests of ballots comes from two main sources. The first is a group of documents put together into the LEO Usability Testing Kit developed by the Usability and Voting Project of the Usability Professionals’ Association. (LEO stands for local election official.)

The second source is the years of experience the team behind the Field Guides has conducting usability tests and working with counties and states to help them make ballots, forms, and web sites work better for all citizens. For more about this topic, go to civicdesigning.org.

What is usability testing?

Usability testing is a tool for learning where people interacting with a design – such as a ballot – encounter frustration, and translating what you see and hear to make a better design that will eliminate those frustrations.

At its essence, usability testing is a simple technique: Watch and listen to people who are like your voters as they use a design as they normally would (or as close to normal as you can get). You can probably already see how this is different from conducting surveys or focus groups.
Why should you test?
When it is easy for voters to use a ballot, they are more likely to vote as they intend. That means fewer lost votes, which means wider margins (generally), which means fewer ballots are contested if there is a recount. All of which adds up to better elections for everyone.
No. 02

Put together a ballot, pick an interviewer, find voters, and find a place to watch them use the ballot.

What do you need?

It’s really simple. You don’t need recording equipment, but you might want to take notes. So, a clipboard can be handy. And you probably want an envelope or a folder to hold the ballots (or other materials) from the test sessions.
When should you test?

Test ballots to improve the ballot design and to understand training issues for election workers when:

- you have a good idea what will be on the ballot for the next election.
- something major has changed, such as new legislation.
- something happens that may cause the overall layout to change, such as removing a candidate or a question.
Know why you are conducting a usability test.

Usability tests can answer questions like these:

- How easily and successfully do voters mark the ballot?
- What mistakes do voters make in marking the ballot?
- How close is the marked ballot to how they said they intended to vote?

No. 05

Start testing early with a few voters trying out the first versions of the ballot, one at a time.
What do you test?

When you do your first usability test, you might want to practice on somebody else’s ballot. That way, you won’t feel so bad when you test yours.

Otherwise, you can test:

• mock-ups or early versions
• ballots from the last election
• a nearly-final ballot

Test with what you have available. Test again when you have the final version.
Where should you test?

Choose a place where you can find voters:

- library branches
- farmers’ markets
- street fairs
- parks and plazas
- village offices, town halls, city hall, county buildings
- kitchen tables, food courts, pancake breakfasts, fish fries

No. 07

Voters for your usability tests are everywhere. Go to them.
What happens in a usability test?

1. Introduce the session.
   - Go over what will happen.
   - Give instructions.
   - Give the voter the ballot.

2. Watch the voter vote.

3. Listen for questions (don’t answer them) and comments (write them down).

4. When they are done voting, ask the voter to walk you through what they did and why.

5. Thank the voter profusely.

No. 08

Follow these steps to run each session of a usability test.
What is the role of the interviewer?

As the interviewer, you guide the voter through the session, watch what the voter does, and take notes (if you can).

Do not help the voter use the ballot. (Well, until after you have finished learning what you need to learn.)

Ask open-ended questions, like, “How did that go?” Follow up with a statement like, “Tell me about how you marked the ballot.”
What should you look for?

Did the voters:

• Ask for help with instructions or using the ballot?

• Ask questions? (If so, what questions.)

• Make comments? (Again, note what they say.)

• Take out reading glasses or lean way in?

• Mark the ballot incorrectly?

• Have trouble moving through the ballot?

• Seem confused, puzzled, or frustrated?

No. 10

Watch for mistakes, listen to questions, look for hesitations.
What do you do with what you find out?

Look at what parts of the ballot caused questions, comments, mistakes, or requests for help.

This should tell you what is confusing to voters, what is unclear to voters, and why. It should also tell you what might need instructions or a different heading or label.

Bonus!

Review what you saw and heard. Tally the types of problems voters had.
Tip

Planning for usability tests

- Pick a location
- Find a helper / note taker
- Decide what to test for
- Create the ballots to test
- Make a script for the session
- Rehearse with the note taker
- Go run the test sessions!
