0.2. Introduction

In this note, we are going to give proofs to a few results about tensor products as well as tensor, pseudoexterior, symmetric and exterior powers of \(k\)-modules (where \(k\) is a commutative ring with 1). None of the results is new, as I have seen them used all around literature as if they were well-known and/or completely trivial. I have not yet found a place where they are actually proved (though I have not looked far), so I am doing it here.
This note is not completely new: The first four Subsections (0.4, 0.5, 0.6 and 0.7) as well as the proof of Proposition 38 are lifted from my diploma thesis [3], while Subsections 0.8 and 0.9 are translated from an additional section of [4] which was written by me.

0.3. Basic conventions

Before we come to the actual body of this note, let us fix some conventions to prevent misunderstandings from happening:

**Convention 1.** In this note, \( \mathbb{N} \) will mean the set \( \{0, 1, 2, 3, \ldots\} \) (rather than the set \( \{1, 2, 3, \ldots\} \), which is denoted by \( \mathbb{N} \) by various other authors).

**Convention 2.** In this note, a *ring* will always mean a ring with 1. If \( k \) is a commutative ring, then a *\( k \)-algebra* will mean a (not necessarily commutative, but necessarily associative) \( k \)-algebra with 1. Sometimes we will use the word “algebra” as an abbreviation for “\( k \)-algebra”. If \( L \) is a \( k \)-algebra, then a *left \( L \)-module* is always supposed to be a left \( L \)-module on which the unity of \( L \) acts as the identity. Whenever we use the tensor product sign \( \otimes \) without an index, we mean \( \otimes_k \).

0.4. Tensor products

The goal of this note is *not* to define tensor products; we assume that the reader already knows what they are. But let us recall one possible way to define the tensor product of several \( k \)-modules (assuming that the tensor product of two \( k \)-modules is already defined):

**Definition 3.** Let \( k \) be a commutative ring. Let \( n \in \mathbb{N} \).

Now, by induction over \( n \), we are going to define a \( k \)-module \( V_1 \otimes V_2 \otimes \ldots \otimes V_n \) for any \( n \) arbitrary \( k \)-modules \( V_1, V_2, \ldots, V_n \):

*Induction base:* For \( n = 0 \), we define \( V_1 \otimes V_2 \otimes \ldots \otimes V_n \) as the \( k \)-module \( k \).

*Induction step:* Let \( p \in \mathbb{N} \). Assuming that we have defined a \( k \)-module \( V_1 \otimes V_2 \otimes \ldots \otimes V_p \) for any \( p \) arbitrary \( k \)-modules \( V_1, V_2, \ldots, V_p \), we now define a \( k \)-module \( V_1 \otimes V_2 \otimes \ldots \otimes V_{p+1} \) for any \( p+1 \) arbitrary \( k \)-modules \( V_1, V_2, \ldots, V_{p+1} \) by the equation

\[
V_1 \otimes V_2 \otimes \ldots \otimes V_{p+1} = V_1 \otimes (V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1}).
\] (1)

Here, \( V_1 \otimes (V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1}) \) is to be understood as the tensor product of the \( k \)-module \( V_1 \) with the \( k \)-module \( V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1} \) (note that the \( k \)-module \( V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1} \) is already defined because we assumed that we have defined a \( k \)-module \( V_1 \otimes V_2 \otimes \ldots \otimes V_p \) for any \( p \) arbitrary \( k \)-modules \( V_1, V_2, \ldots, V_p \)). This completes the inductive definition.

Thus we have defined a \( k \)-module \( V_1 \otimes V_2 \otimes \ldots \otimes V_n \) for any \( n \) arbitrary \( k \)-modules \( V_1, V_2, \ldots, V_n \) for any \( n \in \mathbb{N} \). This \( k \)-module \( V_1 \otimes V_2 \otimes \ldots \otimes V_n \) is called the *tensor product* of the \( k \)-modules \( V_1, V_2, \ldots, V_n \).
Remark 4. (a) Definition 3 is not the only possible definition of the tensor product of several $k$-modules. One could obtain a different definition by replacing the equation (1) by

$$V_1 \otimes V_2 \otimes ... \otimes V_{p+1} = (V_1 \otimes V_2 \otimes ... \otimes V_p) \otimes V_{p+1}. $$

This definition would have given us a different $k$-module $V_1 \otimes V_2 \otimes ... \otimes V_n$ for any $n$ arbitrary $k$-modules $V_1, V_2, ..., V_n$ for any $n \in \mathbb{N}$ than the one defined in Definition 3. However, this $k$-module would still be canonically isomorphic to the one defined in Definition 3 and thus it is commonly considered to be “more or less the same $k$-module”.

There is yet another definition of $V_1 \otimes V_2 \otimes ... \otimes V_n$, which proceeds by taking the free $k$-module on the set $V_1 \times V_2 \times ... \times V_n$ and factoring it modulo a certain submodule. This definition gives yet another $k$-module $V_1 \otimes V_2 \otimes ... \otimes V_n$, but this module is also canonically isomorphic to the $k$-module $V_1 \otimes V_2 \otimes ... \otimes V_n$ defined in Definition 3 and thus can be considered to be “more or less the same $k$-module”.

(b) Definition 3 applied to $n = 1$, defines the tensor product of one $k$-module $V_1$ as $V_1 \otimes k$. This takes some getting used to, since it seems more natural to define the tensor product of one $k$-module $V_1$ simply as $V_1$. But this isn’t really different because there is a canonical isomorphism of $k$-modules $V_1 \cong V_1 \otimes k$, so most people consider $V_1$ to be “more or less the same $k$-module” as $V_1 \otimes k$.

Convention 5. A remark about notation is appropriate at this point:

There are two different conflicting notions of a “pure tensor” in a tensor product $V_1 \otimes V_2 \otimes ... \otimes V_n$ of $n$ arbitrary $k$-modules $V_1, V_2, ..., V_n$, where $n \geq 1$. The one notion defines a “pure tensor” as an element of the form $v \otimes T$ for some $v \in V_1$ and some $T \in V_2 \otimes V_3 \otimes ... \otimes V_n$ 1. The other notion defines a “pure tensor” as an element of the form $v_1 \otimes v_2 \otimes ... \otimes v_n$ for some $(v_1, v_2, ..., v_n) \in V_1 \times V_2 \times ... \times V_n$. These two notions are not equivalent. In this note, we are going to yield right of way to the second of these notions, i.e. we are going to define a pure tensor in $V_1 \otimes V_2 \otimes ... \otimes V_n$ as an element of the form $v_1 \otimes v_2 \otimes ... \otimes v_n$ for some $(v_1, v_2, ..., v_n) \in V_1 \times V_2 \times ... \times V_n$. The first notion, however, will also be used - but we will not call it a “pure tensor” but rather a “left-induced tensor”. Thus we define a left-induced tensor in $V_1 \otimes V_2 \otimes ... \otimes V_n$ as an element of the form $v \otimes T$ for some $v \in V_1$ and some $T \in V_2 \otimes V_3 \otimes ... \otimes V_n$.

We note that the $k$-module $V_1 \otimes V_2 \otimes ... \otimes V_n$ is generated by its left-induced tensors, but also generated by its pure tensors.

We also recall the definition of the tensor product of several $k$-module homomorphisms (assuming that the notion of the tensor product of two $k$-module homomorphisms is already defined):

---

1In fact, if we look at Definition 3, we see that the $k$-module $V_1 \otimes V_2 \otimes ... \otimes V_n$ was defined as $V_1 \otimes (V_2 \otimes V_3 \otimes ... \otimes V_n)$, so it is the $k$-module $A \otimes B$ where $A = V_1$ and $B = V_2 \otimes V_3 \otimes ... \otimes V_n$. Since the usual definition of a pure tensor in $A \otimes B$ defines it as an element of the form $v \otimes T$ for some $v \in A$ and $T \in B$, it thus is logical to say that a pure tensor in $V_1 \otimes V_2 \otimes ... \otimes V_n$ means an element of the form $v \otimes T$ for $v \in V_1$ and $T \in V_2 \otimes V_3 \otimes ... \otimes V_n$. 

---
Definition 6. Let $k$ be a commutative ring. Let $n \in \mathbb{N}$.

Now, by induction over $n$, we are going to define a $k$-module homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_n : V_1 \otimes V_2 \otimes \ldots \otimes V_n \to W_1 \otimes W_2 \otimes \ldots \otimes W_n$ whenever $V_1, V_2, \ldots, V_n$ are $n$ arbitrary $k$-modules, $W_1, W_2, \ldots, W_n$ are $n$ arbitrary $k$-modules, and $f_1 : V_1 \to W_1$, $f_2 : V_2 \to W_2$, $\ldots$, $f_n : V_n \to W_n$ are $n$ arbitrary $k$-module homomorphisms:

**Induction base:** For $n = 0$, we define $f_1 \otimes f_2 \otimes \ldots \otimes f_n$ as the identity map $\text{id} : k \to k$.

**Induction step:** Let $p \in \mathbb{N}$. Assume that we have defined a $k$-module homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_p : V_1 \otimes V_2 \otimes \ldots \otimes V_p \to W_1 \otimes W_2 \otimes \ldots \otimes W_p$ whenever $V_1, V_2, \ldots, V_p$ are $p$ arbitrary $k$-modules, $W_1, W_2, \ldots, W_p$ are $p$ arbitrary $k$-modules, and $f_1 : V_1 \to W_1$, $f_2 : V_2 \to W_2$, $\ldots$, $f_p : V_p \to W_p$ are $p$ arbitrary $k$-module homomorphisms. Now let us define a $k$-module homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_{p+1} : V_1 \otimes V_2 \otimes \ldots \otimes V_{p+1} \to W_1 \otimes W_2 \otimes \ldots \otimes W_{p+1}$ whenever $V_1, V_2, \ldots, V_{p+1}$ are $p + 1$ arbitrary $k$-modules, $W_1, W_2, \ldots, W_{p+1}$ are $p + 1$ arbitrary $k$-modules, and $f_1 : V_1 \to W_1$, $f_2 : V_2 \to W_2$, $\ldots$, $f_{p+1} : V_{p+1} \to W_{p+1}$ are $p + 1$ arbitrary $k$-module homomorphisms. Namely, we define this homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_{p+1}$ to be $f_1 \otimes (f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1})$.

Here, $f_1 \otimes (f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1})$ is to be understood as the tensor product of the $k$-module homomorphism $f_1 : V_1 \to W_1$ with the $k$-module homomorphism $f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1} : V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1} \to W_2 \otimes W_3 \otimes \ldots \otimes W_{p+1}$ (note that the $k$-module homomorphism $f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1} : V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1} \to W_2 \otimes W_3 \otimes \ldots \otimes W_{p+1}$ is already defined (because we assumed that we have defined a $k$-module homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_p : V_1 \otimes V_2 \otimes \ldots \otimes V_p \to W_1 \otimes W_2 \otimes \ldots \otimes W_p$ whenever $V_1, V_2, \ldots, V_p$ are $p$ arbitrary $k$-modules, $W_1, W_2, \ldots, W_p$ are $p$ arbitrary $k$-modules, and $f_1 : V_1 \to W_1$, $f_2 : V_2 \to W_2$, $\ldots$, $f_p : V_p \to W_p$ are $p$ arbitrary $k$-module homomorphisms)). This completes the inductive definition.

Thus we have defined a $k$-module homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_n : V_1 \otimes V_2 \otimes \ldots \otimes V_n \to W_1 \otimes W_2 \otimes \ldots \otimes W_n$ whenever $V_1, V_2, \ldots, V_n$ are $n$ arbitrary $k$-modules, $W_1, W_2, \ldots, W_n$ are $n$ arbitrary $k$-modules, and $f_1 : V_1 \to W_1$, $f_2 : V_2 \to W_2$, $\ldots$, $f_n : V_n \to W_n$ are $n$ arbitrary $k$-module homomorphisms. This $k$-module homomorphism $f_1 \otimes f_2 \otimes \ldots \otimes f_n$ is called the **tensor product** of the $k$-module homomorphisms $f_1, f_2, \ldots, f_n$.

Finally let us agree on a rather harmless abuse of notation:

**Convention 7.** Let $k$ be a commutative ring. Let $V$ be a $k$-module.

We are going to identify the three $k$-modules $V \otimes k$, $k \otimes V$ and $V$ with each other (due to the canonical isomorphisms $V \to V \otimes k$ and $V \to k \otimes V$).

### 0.5. Tensor powers of $k$-modules

Next we define a particular case of tensor products of $k$-modules, namely the tensor powers. Here is the classical definition of this notion:

**Definition 8.** Let $k$ be a commutative ring. Let $n \in \mathbb{N}$. For any $k$-module $V$, we define a $k$-module $V^{\otimes n}$ by $V^{\otimes n} = V \otimes V \otimes \ldots \otimes V$. This $k$-module $V^{\otimes n}$ is called the **$n$-th tensor power** of the $k$-module $V$. 
Remark 9. Let $k$ be a commutative ring, and let $V$ be a $k$-module. Then, $V^\otimes 0 = k$ (because $V^\otimes n = V \otimes V \otimes \ldots \otimes V$ = (tensor product of zero $k$-modules) = $k$ according to the induction base of Definition 3) and $V^\otimes 1 = V \otimes k$ (because $V^\otimes 1 = V \otimes V \otimes \ldots \otimes V = V \otimes k$ according to the induction step of Definition 3). Since we identify $V \otimes k$ with $V$, we thus have $V^\otimes 1 = V$.

Convention 10. Let $k$ be a commutative ring. Let $n \in \mathbb{N}$. Let $V$ and $V'$ be $k$-modules, and let $f : V \to V'$ be a $k$-module homomorphism. Then, $f^\otimes n$ denotes the $k$-module homomorphism $\sum_{i=0}^n f \otimes f \otimes \ldots \otimes f : V^\otimes n \to V'^\otimes n$. Since $V \otimes V \otimes \ldots \otimes V = V^\otimes n$ and $V' \otimes V' \otimes \ldots \otimes V' = V'^\otimes n$, this $f^\otimes n$ is thus a $k$-module homomorphism from $V^\otimes n$ to $V'^\otimes n$.

0.6. The tensor algebra

First let us agree on a convention which simplifies working with direct sums:

Convention 11. Let $k$ be a commutative ring. Let $S$ be a set. For every $s \in S$, let $V_s$ be a $k$-module. For every $t \in S$, we are going to identify the $k$-module $V_t$ with the image of $V_t$ under the canonical injection $V_t \to \bigoplus_{s \in S} V_s$. This is an abuse of notation, but a relatively harmless one. It allows us to consider $V_t$ as a $k$-submodule of the direct sum $\bigoplus_{s \in S} V_s$.

Secondly, we make a convention that simplifies working with the tensor powers of a $k$-module:

Convention 12. Let $k$ be a commutative ring. For every $k$-module $V$, every $n \in \mathbb{N}$ and every $i \in \{0, 1, \ldots, n\}$, we are going to identify the $k$-module $V^\otimes i \otimes V^\otimes (n-i)$ with the $k$-module $V^\otimes n$ (using the canonical isomorphism $V^\otimes i \otimes V^\otimes (n-i) \cong V^\otimes n$). In other words, for every $k$-module $V$, every $a \in \mathbb{N}$ and every $b \in \mathbb{N}$, we are going to identify the $k$-module $V^\otimes a \otimes V^\otimes b$ with the $k$-module $V^\otimes (a+b)$.

The tensor powers $V^\otimes n$ of a $k$-module $V$ can be combined to a $k$-module $\otimes V$ which turns out to have an algebra structure: that of the so-called tensor algebra. Let us recall its definition (which can easily shown to be well-defined):

Definition 13. Let $k$ be a commutative ring.

(a) Let $V$ be a $k$-module. The tensor algebra $\otimes V$ of $V$ over $k$ is defined to be the $k$-algebra formed by the $k$-module $\bigoplus_{i \in \mathbb{N}} V^\otimes i = V^\otimes 0 \oplus V^\otimes 1 \oplus V^\otimes 2 \oplus \ldots$ equipped with a multiplication which is defined by

\[
\left( \sum_{i \in \mathbb{N}} (a_i)_{i \in \mathbb{N}} \cdot (b_i)_{i \in \mathbb{N}} \in \bigoplus_{i \in \mathbb{N}} V^\otimes i \right)
\]
For example, if \( z \) is a vector in the \( k \)-module \( V \), then we can define two elements \( u \) and \( v \) of \( \otimes V \) by \( u = 1 + z \) and \( v = 1 - z \) (where 1 and \( z \) are considered to be elements of \( \otimes V \) according to Definition 13 (c)), and while the product of these elements \( u \) and \( v \) in \( \otimes V \) is the element \((1 + z) \cdot (1 - z) = 1 \cdot 1 - 1 \cdot z + 1 \cdot z + z \cdot z = 1 - z \otimes z \in \otimes V \), the tensor product of these elements \( u \) and \( v \) is the element \((1 + z) \otimes (1 - z) \) of \((k \oplus V) \otimes (k \oplus V) \cong k \otimes V \oplus V \oplus (V \otimes V) \), which is a different element of a totally different \( k \)-module. So if we would use one and the same notation \( u \otimes v \) for both the product of \( u \) and \( v \) in \( \otimes V \) and the tensor product of \( u \) and \( v \) in \((k \oplus V) \otimes (k \oplus V) \), we would have ambiguous notations.
0.7. A variation on the nine lemma

The following fact is one of several algebraic statements related to the nine lemma, but having both weaker assertions and weaker conditions. We record it here to use it later:

**Proposition 15.** Let $k$ be a commutative ring. Let $A$, $B$, $C$ and $D$ be $k$-modules, and let $x : A \rightarrow B$, $y : A \rightarrow C$, $z : B \rightarrow D$ and $w : C \rightarrow D$ be $k$-linear maps such that the diagram

\[
\begin{array}{ccc}
A & \xrightarrow{x} & B \\
y & \downarrow & \downarrow z \\
C & \xrightarrow{w} & D
\end{array}
\]

(4)

commutes. Assume that $\text{Ker } z \subseteq x(\text{Ker } y)$. Further assume that $y$ is surjective. Then, $\text{Ker } w = y(\text{Ker } x)$.

**Proof of Proposition 15.** We know that the diagram

\[
\begin{array}{ccc}
A & \xrightarrow{x} & B \\
y & \downarrow & \downarrow z \\
C & \xrightarrow{w} & D
\end{array}
\]

commutes. In other words, $w \circ y = z \circ x$.

We have

\[
w \left( y(\text{Ker } x) \right) = (w \circ y) \left( \text{Ker } x \right) = (z \circ x) \left( \text{Ker } x \right) = z \left( x(\text{Ker } x) \right) = z(0) = 0
\]

(since $z$ is $k$-linear),

and thus $y(\text{Ker } x) \subseteq \text{Ker } w$. We will now prove that $\text{Ker } w \subseteq y(\text{Ker } x)$:

Let $c \in \text{Ker } w$ be arbitrary. Then, $w(c) = 0$. Now, since $y$ is surjective, there exists some $a \in A$ such that $c = y(a)$. Consider this $a$. Then,

\[
0 = w \left( c \right) = w \left( y(a) \right) = (w \circ y) \left( a \right) = (z \circ x) \left( a \right) = z \left( x(a) \right),
\]

so that $x(a) \in \text{Ker } z \subseteq x(\text{Ker } y)$. Thus, there exists some $a' \in \text{Ker } y$ such that $x(a) = x(a')$. Consider this $a'$. Since $x$ is $k$-linear, we have $x(a - a') = x(a) - x(a') = x(a') - x(a') = 0$, so that $a - a' \in \text{Ker } x$. Thus, $y(a - a') \in y(\text{Ker } x)$. But since

\[
y(a - a') = y(a) - y(a') = 0 \quad \text{(since } y \text{ is } k\text{-linear})
\]

this rewrites as $c \in y(\text{Ker } x)$.
We have thus shown that every \( c \in \text{Ker } w \) satisfies \( c \in y(\text{Ker } x) \). Thus, \( \text{Ker } w \subseteq y(\text{Ker } x) \). Combined with \( y(\text{Ker } x) \subseteq \text{Ker } w \), this yields \( \text{Ker } w = y(\text{Ker } x) \). This proves Proposition \ref{prop:ker_yker}

Note that we would not lose any generality if we would replace \( k \) by \( \mathbb{Z} \) in the statement of Proposition \ref{prop:ker_yker}, because every \( k \)-module is an abelian group, i.e., a \( \mathbb{Z} \)-module (with additional structure). We could actually generalize Proposition \ref{prop:ker_yker} by replacing “\( k \)-modules” by “groups” (not necessarily abelian), but we will not have any use for Proposition \ref{prop:ker_yker} in this generality here.

0.8. Another diagram theorem about the nine lemma configuration

The next fact we will use is, again, about the nine lemma configuration:

**Proposition 16.** Let \( k \) be a ring. Let

\[
\begin{array}{ccccccc}
A_1 & \xrightarrow{a_1} & A_2 & \xrightarrow{a_2} & A_3 & \rightarrow 0 \\
\downarrow{u_1} & & \downarrow{u_2} & & \downarrow{u_3} & \\
B_1 & \xrightarrow{b_1} & B_2 & \xrightarrow{b_2} & B_3 & \rightarrow 0 \\
\downarrow{v_1} & & \downarrow{v_2} & & \downarrow{v_3} & \\
C_1 & \xrightarrow{c_1} & C_2 & \xrightarrow{c_2} & C_3 & \rightarrow 0
\end{array}
\]  

be a commutative diagram of \( k \)-left modules. Assume that every row of the diagram \((5)\) is an exact sequence, and that every column of the diagram \((6)\) is an exact sequence. Then,

\[
\text{Ker } (c_2 \circ v_2) = \text{Ker } (v_3 \circ b_2) = b_1 (B_1) + u_2 (A_2).
\]

Actually we will show something a bit stronger:

**Proposition 17.** Let \( k \) be a ring. Let

\[
\begin{array}{cccccc}
A_1 & \xrightarrow{a_1} & A_2 & \xrightarrow{a_2} & A_3 & \rightarrow 0 \\
\downarrow{u_1} & & \downarrow{u_2} & & \downarrow{u_3} & \\
B_1 & \xrightarrow{b_1} & B_2 & \xrightarrow{b_2} & B_3 & \rightarrow 0 \\
\downarrow{v_1} & & \downarrow{v_2} & & \downarrow{v_3} & \\
C_1 & \xrightarrow{c_1} & C_2 & \xrightarrow{c_2} & C_3 & \rightarrow 0
\end{array}
\]  

be a commutative diagram of \( k \)-left modules. Assume that every row of the diagram \((6)\) is an exact sequence, and that every column of the diagram \((5)\) is an exact sequence. Also assume that \( a_2 \) is surjective. Then,

\[
\text{Ker } (c_2 \circ v_2) = \text{Ker } (v_3 \circ b_2) = b_1 (B_1) + u_2 (A_2).
\]

*Proof of Proposition 17.* Since \((6)\) is a commutative diagram, we have \( c_2 \circ v_2 = v_3 \circ b_2 \) and \( b_2 \circ u_2 = u_3 \circ a_2 \).

8
Since every row of the diagram (6) is an exact sequence, we have $b_2 \circ b_1 = 0$.
Since every column of the diagram (6) is an exact sequence, we have $v_3 \circ u_3 = 0$.

From, $c_2 \circ v_2 = v_3 \circ b_2$, we conclude $\text{Ker} \ (c_2 \circ v_2) = \text{Ker} \ (v_3 \circ b_2)$. Thus, it only remains to prove that $\text{Ker} \ (v_3 \circ b_2) = b_1 \ (B_1) + u_2 \ (A_2)$. Since $b_1 \ (B_1) + u_2 \ (A_2) \subseteq \text{Ker} \ (v_3 \circ b_2)$ is obvious (because

$$(v_3 \circ b_2) \ (b_1 \ (B_1) + u_2 \ (A_2)) = v_3 \ (b_2 \ (b_1 \ (B_1) + u_2 \ (A_2))) = v_3 \ (b_2 \ (b_1 \ (B_1))) + v_3 \ (b_2 \ (u_2 \ (A_2))) = (v_3 \circ b_2 \circ b_1) (B_1) + (v_3 \circ b_2 \circ u_2) (A_2) = 0,$$

we must now only show that $\text{Ker} \ (v_3 \circ b_2) \subseteq b_1 \ (B_1) + u_2 \ (A_2)$.

Let $t \in \text{Ker} \ (v_3 \circ b_2)$ be arbitrary. Then, $(v_3 \circ b_2) (t) = 0$, so that $v_3 \ (b_2) (t) = (v_3 \circ b_2) (t) = 0$ and thus $b_2 (t) \in \text{Ker} \ v_3 = u_3 \ (A_3)$ (because every column of the diagram (6) is an exact sequence). Thus, there exists some $x \in A_3$ such that $b_2 (t) = u_3 (x)$. Consider this $x$. Since $a_2 : A_2 \rightarrow A_3$ is surjective, we have $x = a_2 (x')$ for some $x' \in A_2$. Consider this $x'$.

Now,

$$b_2 \ (t - u_2 \ (x')) = b_2 \ (t) - b_2 \ (u_2 \ (x')) = u_3 \ (x) - (b_2 \circ u_2) \ (x') = u_3 \ (x) - (u_3 \circ a_2) \ (x') = 0,$$

so that $t - u_2 \ (x') \in \text{Ker} \ b_2 = b_1 \ (B_1)$ (because every row of the diagram (6) is an exact sequence). Thus, $t = t - u_2 \ (x') + u_2 \ (x') \in b_1 \ (B_1) + u_2 \ (A_2)$.

We thus have shown that every $t \in \text{Ker} \ (v_3 \circ b_2)$ satisfies $t \in b_1 \ (B_1) + u_2 \ (A_2)$. Consequently, $\text{Ker} \ (v_3 \circ b_2) \subseteq b_1 \ (B_1) + u_2 \ (A_2)$. Combined with $b_1 \ (B_1) + u_2 \ (A_2) \subseteq \text{Ker} \ (v_3 \circ b_2)$, this yields $\text{Ker} \ (v_3 \circ b_2) = b_1 \ (B_1) + u_2 \ (A_2)$. Combined with $\text{Ker} \ (c_2 \circ v_2) = \text{Ker} \ (v_3 \circ b_2)$, this now completes the proof of Proposition 16.

Proof of Proposition 16. Since the diagram (5) is commutative, the diagram (6) must also be commutative (because the diagram (6) is a subdiagram of the diagram (5)). Also, the map $a_2$ is surjective (since every row of the diagram (5) is an exact sequence). Therefore, we can apply Proposition 17 and conclude that $\text{Ker} \ (c_2 \circ v_2) = \text{Ker} \ (v_3 \circ b_2) = b_1 \ (B_1) + u_2 \ (A_2)$. This proves Proposition 16.

0.9. $\text{Ker} \ (f \otimes g)$ when $f$ and $g$ are surjective

Theorem 18. Let $k$ be a commutative ring. Let $V$, $W$, $V'$ and $W'$ be four $k$-modules. Let $f : V \rightarrow V'$ and $g : W \rightarrow W'$ be two surjective $k$-linear maps. Let $i_V$ be the canonical inclusion $\text{Ker} \ f \rightarrow V$. Let $i_W$ be the canonical inclusion $\text{Ker} \ g \rightarrow W$. Then,

$$\text{Ker} \ (f \otimes g) = (i_V \otimes \text{id}) ((\text{Ker} \ f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker} \ g)).$$
Remark 19. (a) In Theorem 18, the condition that \( f \) and \( g \) be surjective cannot be removed (otherwise, \( V = \mathbb{Z}, W = \mathbb{Z}, V' = \mathbb{Z}/4\mathbb{Z}, W' = \mathbb{Z}/4\mathbb{Z}, f = (x \mapsto 2x), g = (x \mapsto 2x) \) would be a counterexample), but it can be replaced by some other conditions (see Lemma 21 and Corollary 20). (Here is a more complicated counterexample to show that having only \( g \) surjective is not yet enough: \( V = \mathbb{Z}, W = \mathbb{Z} \oplus (\mathbb{Z}/4\mathbb{Z}), V' = \mathbb{Z}, W' = \mathbb{Z}/4\mathbb{Z}, f = (x \mapsto 2x), g = ((x, \alpha) \mapsto 2x + \alpha). \)

(b) If the \( k \)-module \( V \) is flat in Theorem 18 then the map \( \text{id} \otimes i_W \) is injective (can be easily seen), and therefore many people prefer to identify the image \( (\text{id} \otimes i_W)(V \otimes (\ker g)) \) with \( V \otimes (\ker g) \). Similarly, the image \( (i_V \otimes \text{id})(\ker f) \otimes W \) can be identified with \( (\ker f) \otimes W \) when the \( k \)-module \( W \) is flat. It is common among algebraists to perform these identifications when \( k \) is a field (because when \( k \) is a field, both \( k \)-modules \( V \) and \( W \) are flat), and sometimes even when \( k \) is not, but we will not perform these identifications here.

**Proof of Theorem 18** The sequence

\[
0 \longrightarrow \ker f \xrightarrow{i_V} V \xrightarrow{f} V' \longrightarrow 0
\]

is exact (since \( i_V \) is the inclusion map \( \ker f \rightarrow V \), while \( f \) is surjective). Since the tensor product is right exact, this yields that

\[
\begin{array}{c}
\text{the sequences} \\
(\ker f) \otimes (\ker g) \xrightarrow{i_V \otimes \text{id}} V \otimes (\ker g) \xrightarrow{f \otimes \text{id}} V' \otimes (\ker g) \longrightarrow 0, \\
(\ker f) \otimes W \xrightarrow{i_V \otimes \text{id}} V \otimes W \xrightarrow{f \otimes \text{id}} V' \otimes W \longrightarrow 0 \text{ and} \\
(\ker f) \otimes W' \xrightarrow{i_V \otimes \text{id}} V \otimes W' \xrightarrow{f \otimes \text{id}} V' \otimes W' \longrightarrow 0 \text{ are exact}
\end{array}
\]

(7)

On the other hand, the sequence

\[
0 \longrightarrow \ker g \xrightarrow{i_W} W \xrightarrow{g} W' \longrightarrow 0
\]

is exact (since \( i_W \) is the inclusion map \( \ker g \rightarrow W \), while \( g \) is surjective). Since the tensor product is right exact, this yields that

\[
\begin{array}{c}
\text{the sequences} \\
(\ker f) \otimes (\ker g) \xrightarrow{\text{id} \otimes i_W} (\ker f) \otimes W \xrightarrow{\text{id} \otimes g} (\ker f) \otimes W' \longrightarrow 0, \\
V \otimes (\ker g) \xrightarrow{\text{id} \otimes i_W} V \otimes W \xrightarrow{\text{id} \otimes g} V \otimes W' \longrightarrow 0 \text{ and} \\
V' \otimes (\ker g) \xrightarrow{\text{id} \otimes i_W} V' \otimes W \xrightarrow{\text{id} \otimes g} V' \otimes W' \longrightarrow 0 \text{ are exact}
\end{array}
\]

(8)

Now, the diagram

\[
\begin{array}{c}
(\ker f) \otimes (\ker g) \xrightarrow{\text{id} \otimes i_W} (\ker f) \otimes W \xrightarrow{\text{id} \otimes g} (\ker f) \otimes W' \longrightarrow 0 \\
V \otimes (\ker g) \xrightarrow{f \otimes \text{id}} V \otimes W \xrightarrow{\text{id} \otimes g} V \otimes W' \longrightarrow 0 \\
V' \otimes (\ker g) \xrightarrow{f \otimes \text{id}} V' \otimes W \xrightarrow{\text{id} \otimes g} V' \otimes W' \longrightarrow 0
\end{array}
\]

(9)
is commutative (because
\[(i_V \otimes \text{id}) \circ (\text{id} \otimes i_W) = i_V \otimes i_W = (\text{id} \otimes i_W) \circ (i_V \otimes \text{id});\]
\[(i_V \otimes \text{id}) \circ (\text{id} \otimes g) = i_V \otimes g = (\text{id} \otimes g) \circ (i_V \otimes \text{id});\]
\[(f \otimes \text{id}) \circ (\text{id} \otimes i_W) = f \otimes i_W = (\text{id} \otimes i_W) \circ (f \otimes \text{id});\]
\[(f \otimes \text{id}) \circ (\text{id} \otimes g) = f \otimes g = (\text{id} \otimes g) \circ (f \otimes \text{id})\]
). Every row of this diagram is an exact sequence (due to (8)), and every column of this diagram is an exact sequence (due to (7)). Thus, Proposition 16 (applied to the diagram \(9\) instead of the diagram \(5\)) yields that
\[\text{Ker } ((\text{id} \otimes g) \circ (f \otimes \text{id})) = \text{Ker } ((f \otimes \text{id}) \circ (\text{id} \otimes g)) = (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)) + (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W).\]

Thus,
\[\text{Ker } (f \otimes g) = (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)).\]

This proves Theorem 18.
Let us notice a corollary of this theorem:

**Corollary 20.** Let \(k\) be a commutative ring. Let \(V, W, V'\) and \(W'\) be four \(k\)-modules. Let \(f : V \to V'\) and \(g : W \to W'\) be two \(k\)-linear maps. Assume that \(f(V)\) and \(W'\) are flat \(k\)-modules. Let \(i_V\) be the canonical inclusion \(\text{Ker } f \to V\). Let \(i_W\) be the canonical inclusion \(\text{Ker } g \to W\). Then,
\[\text{Ker } (f \otimes g) = (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)).\]

Note that this Corollary 20 does not require \(f\) or \(g\) to be surjective, but instead it requires \(f(V)\) and \(W'\) to be flat (which is always satisfied if \(k\) is a field, for example).

To show this, we first prove:

**Lemma 21.** Let \(k\) be a commutative ring. Let \(V, W, V'\) and \(W'\) be four \(k\)-modules. Let \(f : V \to V'\) and \(g : W \to W'\) be two \(k\)-linear maps. Assume that \(V'\) is a flat \(k\)-module, and that \(f\) is surjective. Let \(i_V\) be the canonical inclusion \(\text{Ker } f \to V\). Let \(i_W\) be the canonical inclusion \(\text{Ker } g \to W\). Then,
\[\text{Ker } (f \otimes g) = (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)).\]

**Lemma 22.** Let \(k\) be a commutative ring. Let \(V, W\) and \(A\) be three \(k\)-modules such that the \(k\)-module \(A\) is flat. Let \(i : V \to W\) be an injective \(k\)-module homomorphism.

(a) The \(k\)-module homomorphism \(\text{id} \otimes i : A \otimes V \to A \otimes W\) is injective.
(b) The \(k\)-module homomorphism \(i \otimes \text{id} : V \otimes A \to W \otimes A\) is injective.
Proof of Lemma 22. Let \( p \) be the canonical projection \( p : W \to W / (i(V)) \). Then, \( p \) is a surjective \( k \)-module homomorphism, and \( \ker p = i(V) \). Thus,

\[
0 \to V \xrightarrow{i} W \xrightarrow{p} W / (i(V)) \to 0
\]

(10)
is a short exact sequence (since \( p \) is surjective, since \( i \) is injective, and since \( \ker p = i(V) \)). Since tensoring with \( A \) is an exact functor (because \( A \) is a flat \( k \)-module), this yields that

\[
0 \to A \otimes V \to A \otimes W \to A \otimes (W / (i(V))) \to 0
\]
is a short exact sequence. Therefore, \( \text{id} \otimes i : A \otimes V \to A \otimes W \) is injective. This proves Lemma 22 (a).

Since (10) is a short exact sequence, and since tensoring with \( A \) is an exact functor (because \( A \) is a flat \( k \)-module), we find that

\[
0 \to V \otimes A \xrightarrow{i \otimes \text{id}} W \otimes A \xrightarrow{p \otimes \text{id}} (W / (i(V))) \otimes A \to 0
\]
is a short exact sequence. Therefore, \( i \otimes \text{id} : V \otimes A \to W \otimes A \) is injective. This proves Lemma 22 (b).

Proof of Lemma 21. Define a \( k \)-linear map \( g_1 : W \to g(W) \) by

\[
(g_1(w) = g(w) \quad \text{for every } w \in W)
\]

(this is well-defined since \( g(w) \in g(W) \) for every \( w \in W \)). Let \( m_W \) be the canonical inclusion \( g(W) \to W' \). Clearly, every \( w \in W \) satisfies

\[
(m_W \circ g_1)(w) = m_W(g_1(w)) = g_1(w) \quad \text{(since } m_W \text{ is the canonical inclusion)}
\]

\[
= g(w).
\]

Thus, \( m_W \circ g_1 = g \).

Also, \( g_1 \) is surjective, because every \( x \in g(W) \) satisfies \( x \in g_1(W) \). Also,

\[
\ker g = \left \{ w \in W \mid g_1(w) = 0 \right \} = \left \{ w \in W \mid g_1(w) = 0 \right \} = \ker g_1.
\]

Thus, \( i_W \) is the canonical inclusion \( \ker g_1 \to W \) (since \( i_W \) is the canonical inclusion \( \ker g \to W \)). Thus, Theorem 18 (applied to \( g(W) \) and \( g_1 \) instead of \( W' \) and \( g \)) shows that

\[
\ker (f \otimes g_1) = (i_V \otimes \text{id}) ((\ker f) \otimes W) + (\text{id} \otimes i_W) \left( V \otimes (\ker g_1) \right)_{= \ker g}
\]

\[
= (i_V \otimes \text{id}) ((\ker f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\ker g)).
\]

(11)

\[\text{Proof.}\] Let \( x \in g(W) \) be arbitrary. Then, there exists some \( w \in W \) such that \( x = g(w) \). Consider this \( w \). Then, \( x = g(w) = g_1(w) \in g_1(W) \), qed.

12
Thus, \( f \) is well-defined since \( f \) is a canonical inclusion. This proves Lemma 21.

Now, it is known that whenever \( A, B, C, A', B', C' \) are six \( k \)-modules, and \( \alpha : A \to B, \beta : B \to C, \gamma : A' \to B' \) and \( \delta : B' \to C' \) are four \( k \)-linear maps, then \((\beta \otimes \delta) \circ (\alpha \otimes \gamma) = (\beta \circ \alpha) \otimes (\delta \circ \gamma)\). Applying this fact to \( A = V, B = V', C = V', A' = W, B' = g (W), C' = W', \alpha = f, \beta = id, \gamma = g_1 \) and \( \delta = m_W \), we obtain

\[
(id \otimes m_W) \circ (f \otimes g_1) = (id \circ f) \otimes (m_W \circ g_1) = f \otimes g.
\]

Now, let \( x \in \text{Ker} (f \otimes g_1) \) be arbitrary. Then, \((f \otimes g_1) (x) = 0\). Now,

\[
(f \otimes g) = (id \otimes m_W) \circ (f \otimes g_1) (x) = (id \otimes m_W) (f \otimes g_1) (x) = (id \otimes m_W) (0) = 0,
\]

so that \( x \in \text{Ker} (f \otimes g) \). Thus we have seen that every \( x \in \text{Ker} (f \otimes g_1) \) satisfies \( x \in \text{Ker} (f \otimes g) \). In other words, \( \text{Ker} (f \otimes g_1) \subseteq \text{Ker} (f \otimes g) \).

On the other hand, let \( y \in \text{Ker} (f \otimes g) \) be arbitrary. Then,

\[
(id \otimes m_W) ((f \otimes g_1) (y)) = (id \otimes m_W) (f \otimes g_1) (y) = (f \otimes g) (y) = 0
\]

(since \( y \in \text{Ker} (f \otimes g) \)), so that \((f \otimes g_1) (y) \in \text{Ker} (id \otimes m_W) = 0\). Thus, \((f \otimes g_1) (y) = 0\), so that \( y \in \text{Ker} (f \otimes g_1) \). Thus we have shown that every \( y \in \text{Ker} (f \otimes g) \) satisfies \( y \in \text{Ker} (f \otimes g_1) \). In other words, \( \text{Ker} (f \otimes g) \subseteq \text{Ker} (f \otimes g_1) \).

Combined with \( \text{Ker} (f \otimes g_1) \subseteq \text{Ker} (f \otimes g) \), this yields \( \text{Ker} (f \otimes g) = \text{Ker} (f \otimes g_1) \). Thus, (11) becomes

\[
\text{Ker} (f \otimes g) = (iv \otimes id) ((\text{Ker} f) \otimes W) + (id \otimes i_W) (V \otimes (\text{Ker} g)).
\]

This proves Lemma 22.

Proof of Corollary 20. Define a \( k \)-linear map \( f_1 : V \to f (V) \) by

\[
(f_1 (v) = f (v) \quad \text{for every} \ v \in V)
\]

(this is well-defined since \( f (v) \in f (V) \) for every \( v \in V \)). Let \( m_V \) be the canonical inclusion \( f (V) \to V' \). Clearly, every \( v \in V \) satisfies

\[
(m_V \circ f_1) (v) = m_V (f_1 (v)) = f_1 (v) = f (v).
\]

Thus, \( m_V \circ f_1 = f \).
Also, $f_1$ is surjective, because every $x \in f(V)$ satisfies $x \in f_1(V)$. 

$$\text{Ker } f = \left\{ v \in V \mid f(v) = 0 \right\} = \{ v \in V \mid f_1(v) = 0 \} = \text{Ker } f_1.$$ 

Thus, $i_V$ is the canonical inclusion $\text{Ker } f_1 \to V$ (since $i_V$ is the canonical inclusion $\text{Ker } f \to V$). Thus, Lemma 21 (applied to $f(V)$ and $f_1$ instead of $V'$ and $f$) shows that

$$\text{Ker } (f_1 \otimes g) = (i_V \otimes \text{id}) \left( (\text{Ker } f_1) \otimes W \right) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g))$$

$$= (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)). \tag{12}$$

Now, $m_V$ is injective (since $m_V$ is a canonical inclusion). Thus, applying Lemma 22 (b) to $m_V$, $f(V)$, $V'$ and $W'$ instead of $i$, $V$, $W$ and $A$, we obtain that the map $m_V \otimes \text{id}: f(V) \otimes W' \to V' \otimes W'$ is injective. In other words, $\text{Ker } (m_V \otimes \text{id}) = 0$.

Now, it is known that whenever $A$, $B$, $C$, $A'$, $B'$, $C'$ are six $k$-modules, and $\alpha: A \to B$, $\beta: B \to C$, $\gamma: A' \to B'$ and $\delta: B' \to C'$ are four $k$-linear maps, then $(\beta \otimes \delta) \circ (\alpha \otimes \gamma) = (\beta \circ \alpha) \otimes (\delta \circ \gamma)$. Applying this fact to $A = V$, $B = f(V)$, $C = V'$, $A' = W$, $B' = W'$, $C' = W'$, $\alpha = f_1$, $\beta = m_V$, $\gamma = g$ and $\delta = \text{id}$, we obtain

$$(m_V \otimes \text{id}) \circ (f_1 \otimes g) = (m_V \circ f_1) \otimes (\text{id} \circ g) = f_1 \otimes g.$$ 

Now, let $x \in \text{Ker } (f_1 \otimes g)$ be arbitrary. Then, $(f_1 \otimes g)(x) = 0$. Now,

$$(f \otimes g) \frac{(f_1 \otimes g)(x)}{(m_V \otimes \text{id}) \circ (f_1 \otimes g)} = (m_V \otimes \text{id}) (f_1 \otimes g) (x) = (m_V \otimes \text{id}) \left( \frac{(f_1 \otimes g)(x)}{=0} \right) = (m_V \otimes \text{id}) (0) = 0,$$

so that $x \in \text{Ker } (f \otimes g)$. Thus we have seen that every $x \in \text{Ker } (f_1 \otimes g)$ satisfies $x \in \text{Ker } (f \otimes g)$. In other words, $\text{Ker } (f_1 \otimes g) \subseteq \text{Ker } (f \otimes g)$.

On the other hand, let $y \in \text{Ker } (f \otimes g)$ be arbitrary. Then,

$$(m_V \otimes \text{id}) ((f_1 \otimes g)(y)) = (m_V \otimes \text{id}) \circ (f_1 \otimes g) (y) = (f \otimes g) (y) = 0$$

(since $y \in \text{Ker } (f \otimes g)$), so that $(f_1 \otimes g)(y) \in \text{Ker } (m_V \otimes \text{id}) = 0$. Thus, $(f_1 \otimes g)(y) = 0$, so that $y \in \text{Ker } (f_1 \otimes g)$. Thus we have shown that every $y \in \text{Ker } (f \otimes g)$ satisfies $y \in \text{Ker } (f_1 \otimes g)$. In other words, $\text{Ker } (f \otimes g) \subseteq \text{Ker } (f_1 \otimes g)$.

Combined with $\text{Ker } (f_1 \otimes g) \subseteq \text{Ker } (f \otimes g)$, this yields $\text{Ker } (f \otimes g) = \text{Ker } (f_1 \otimes g)$. Thus, (12) becomes

$$\text{Ker } (f \otimes g) = (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)).$$

4Proof. Let $x \in f(V)$ be arbitrary. Then, there exists some $v \in V$ such that $x = f(v)$. Consider this $v$. Then, $x = f(v) = f_1(v) \in f_1(V)$, qed.
This proves Corollary 20.

We notice a triviality on tensor products of surjective maps:

**Lemma 23.** Let $k$ be a commutative ring. Let $V$, $W$, $V'$ and $W'$ be four $k$-modules. Let $f : V \to V'$ and $g : W \to W'$ be two surjective $k$-linear maps. Then, the map $f \otimes g : V \otimes W \to V' \otimes W'$ is surjective.

**Proof of Lemma 23.** Let $T \in V' \otimes W'$ be arbitrary. Then, we can write the tensor $T$ in the form $T = \sum_{i=1}^{n} \alpha_i \otimes \beta_i$ for some $n \in \mathbb{N}$, some elements $\alpha_1, \alpha_2, \ldots, \alpha_n$ of $V'$ and some elements $\beta_1, \beta_2, \ldots, \beta_n$ of $W'$. Consider this $n$, these $\alpha_1, \alpha_2, \ldots, \alpha_n$ and these $\beta_1, \beta_2, \ldots, \beta_n$.

For every $i \in \{1, 2, \ldots, n\}$, there exists some $v_i \in V$ such that $\alpha_i = f(v_i)$ (since $f$ is surjective). Consider this $v_i$.

For every $i \in \{1, 2, \ldots, n\}$, there exists some $w_i \in W$ such that $\beta_i = g(w_i)$ (since $g$ is surjective). Consider this $w_i$.

Now,

\[
T = \sum_{i=1}^{n} \alpha_i \otimes \beta_i = \sum_{i=1}^{n} f(v_i) \otimes g(w_i) = \sum_{i=1}^{n} (f \otimes g)(v_i \otimes w_i)
\]

\[
= (f \otimes g) \left( \sum_{i=1}^{n} v_i \otimes w_i \right) = (f \otimes g)(V \otimes W)
\]

So we have proven that every $T \in V' \otimes W'$ satisfies $T \in (f \otimes g)(V \otimes W)$. Thus, $f \otimes g$ is surjective, so that Lemma 23 is proven.

### 0.10. Extension to $n$ modules

We can trivially generalize Lemma 23 to several $k$-modules:

**Lemma 24.** Let $k$ be a commutative ring. Let $n \in \mathbb{N}$. For any $i \in \{1, 2, \ldots, n\}$, let $V_i$ and $V_i'$ be two $k$-modules, and let $f_i : V_i \to V_i'$ be a surjective $k$-module homomorphism. Then, the map $f_1 \otimes f_2 \otimes \ldots \otimes f_n : V_1 \otimes V_2 \otimes \ldots \otimes V_n \to V_1' \otimes V_2' \otimes \ldots \otimes V_n'$ is surjective.

**Proof of Lemma 24.** We are going to prove Lemma 24 by induction over $n$:

**Induction base:** For $n = 0$, Lemma 24 holds (because for $n = 0$, the map $f_1 \otimes f_2 \otimes \ldots \otimes f_n : V_1 \otimes V_2 \otimes \ldots \otimes V_n \to V_1' \otimes V_2' \otimes \ldots \otimes V_n'$ is the identity map $\text{id} : k \to k$ and therefore surjective). Thus, the induction base is complete.

**Induction step:** Let $p \in \mathbb{N}$ be arbitrary. Assume that Lemma 24 holds for $n = p$.

Now let us prove that Lemma 24 holds for $n = p + 1$. So let $V_i$ and $V_i'$ be two $k$-modules for every $i \in \{1, 2, \ldots, p + 1\}$, and let $f_i : V_i \to V_i'$ be a surjective $k$-module homomorphism for every $i \in \{1, 2, \ldots, p + 1\}$.

According to Definition 6, we have $f_1 \otimes f_2 \otimes \ldots \otimes f_{p+1} = f_1 \otimes (f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1})$.

We know that $V_i$ and $V_i'$ are two $k$-modules for every $i \in \{1, 2, \ldots, p + 1\}$. Thus, $V_i$ and $V_i'$ are two $k$-modules for every $i \in \{1, 2, \ldots, p + 1\}$. Substituting $i + 1$ for $i$ in this fact, we obtain that $V_{i+1}$ and $V_{i+1}'$ are two $k$-modules for every $i \in \{1, 2, \ldots, p\}$. 

15
We know that \( f_i : V_i \rightarrow V_i' \) is a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, ..., p + 1\} \). Thus, \( f_i : V_i \rightarrow V_i' \) is a surjective \( k \)-module homomorphism for every \( i \in \{2, 3, ..., p + 1\} \). Substituting \( i + 1 \) for \( i \) in this fact, we obtain that \( f_{i+1} \) is a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, ..., p\} \).

Applying Lemma 24 to \( p, V_{i+1}, V_{i+1}' \) and \( f_{i+1} \) instead of \( n, V_i, V_i' \) and \( f_i \) (this is allowed, because we have assumed that Lemma 24 holds for \( n = p \)), we see that the map \( f_2 \otimes f_3 \otimes ... \otimes f_{p+1} \) is surjective.

We know that \( f_i : V_i \rightarrow V_i' \) is a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, ..., p\} \). Applying this to \( i = 1 \), we conclude that \( f_1 : V_1 \rightarrow V_1' \) is a surjective \( k \)-module homomorphism.

Applying Lemma 23 to \( V = V_1, V' = V_1' \), \( W = V_2 \otimes V_3 \otimes ... \otimes V_{p+1}, W' = V_2' \otimes V_3' \otimes ... \otimes V_{p+1}' \), \( f = f_1 \) and \( g = f_2 \otimes f_3 \otimes ... \otimes f_{p+1} \), we now conclude that the map \( f_1 \otimes (f_2 \otimes f_3 \otimes ... \otimes f_{p+1}) \) is surjective. Since \( f_1 \otimes f_2 \otimes ... \otimes f_{p+1} = f_1 \otimes (f_2 \otimes f_3 \otimes ... \otimes f_{p+1}) \), this yields that the map \( f_1 \otimes f_2 \otimes ... \otimes f_{p+1} \) is surjective.

We have thus proven that if \( V_i \) and \( V_i' \) are two \( k \)-modules for every \( i \in \{1, 2, ..., p \} \), and \( f_i : V_i \rightarrow V_i' \) is a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, ..., p \} \), then the map \( f_1 \otimes f_2 \otimes ... \otimes f_{p+1} : V_1 \otimes V_2 \otimes ... \otimes V_{p+1} \rightarrow V_1' \otimes V_2' \otimes ... \otimes V_{p+1}' \) is surjective. In other words, we have proven that Lemma 24 holds for \( n = p + 1 \). This completes the induction step, and thus Lemma 24 is proven.

Now let us extend Theorem 17 to \( n \) modules:

**Theorem 25.** Let \( k \) be a commutative ring. Let \( n \in \mathbb{N} \). For any \( i \in \{1, 2, ..., n\} \), let \( V_i \) and \( V_i' \) be two \( k \)-modules, and let \( f_i : V_i \rightarrow V_i' \) be a surjective \( k \)-module homomorphism. For any \( i \in \{1, 2, ..., n\} \), let \( i_i \) be the canonical inclusion \( \text{Ker} f_i \rightarrow V_i \).

Then,

\[
\text{Ker} (f_1 \otimes f_2 \otimes ... \otimes f_n) = \sum_{i=1}^{n} \left( \prod_{i=1}^{i-1} \text{id} \otimes \text{id} \otimes ... \otimes \text{id} \otimes i_i \otimes \text{id} \otimes \text{id} \otimes ... \otimes \text{id} \right) \left( V_1 \otimes V_2 \otimes ... \otimes V_{i-1} \otimes (\text{Ker} f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes ... \otimes V_n \right). \tag{13}
\]

Before we show this, we need an (almost trivial) lemma:

**Lemma 26.** Let \( k \) be a commutative ring. Let \( n \in \mathbb{N} \). Let \( A \) and \( B \) be two \( k \)-modules. For any \( i \in \{1, 2, ..., n\} \), let \( B_i \) be a \( k \)-submodule of \( B \). Let \( B' \) be the \( k \)-submodule \( \sum_{i=1}^{n} B_i \) of \( B \).

For any \( k \)-module \( C \) and any \( k \)-submodule \( D \) of \( C \), we let \( \text{inc}_{D,C} \) denote the canonical inclusion map \( D \rightarrow C \).

Then,

\[
(\text{id} \otimes \text{inc}_{B',B}) (A \otimes B') = \sum_{i=1}^{n} (\text{id} \otimes \text{inc}_{B_i,B}) (A \otimes B_i)
\]

(as \( k \)-submodules of \( A \otimes B \)).

**Proof of Lemma 26.** Since \( \sum_{i=1}^{n} B_i = B' \), we have \( B_i \subseteq B' \) for every \( i \in \{1, 2, ..., n\} \).
The maps \( \text{inc}_{B_i, B} : B_i \to B \) for all \( i \in \{1, 2, \ldots, n\} \) give rise to a map \( \sum_{i=1}^n \text{inc}_{B_i, B} : \bigoplus_{i=1}^n B_i \to B \). Similarly, the maps \( \text{id} \otimes \text{inc}_{B_i, B} : A \otimes B_i \to A \otimes B \) for all \( i \in \{1, 2, \ldots, n\} \) give rise to a map \( \sum_{i=1}^n \text{id} \otimes \text{inc}_{B_i, B} : \bigoplus_{i=1}^n (A \otimes B_i) \to A \otimes B \).

Since the tensor product is known to commute with direct sums, there is a canonical \( k \)-module isomorphism \( A \otimes \left( \bigoplus_{i=1}^n B_i \right) \to \bigoplus_{i=1}^n (A \otimes B_i) \). Denote this isomorphism by \( I \).

By the universal property of this \( I \), the diagram

\[
A \otimes \left( \bigoplus_{i=1}^n B_i \right) \xrightarrow{I} \bigoplus_{i=1}^n (A \otimes B_i) \xrightarrow{\sum_{i=1}^n (\text{id} \otimes \text{inc}_{B_i, B})} A \otimes B
\]

commutes. In other words,

\[
\text{id} \otimes \left( \sum_{i=1}^n \text{inc}_{B_i, B} \right) = \left( \sum_{i=1}^n (\text{id} \otimes \text{inc}_{B_i, B}) \right) \circ I,
\]

so that

\[
\left( \text{id} \otimes \left( \sum_{i=1}^n \text{inc}_{B_i, B} \right) \right) \left( A \otimes \left( \bigoplus_{i=1}^n B_i \right) \right) = \left( \sum_{i=1}^n (\text{id} \otimes \text{inc}_{B_i, B}) \circ I \right) \left( A \otimes \left( \bigoplus_{i=1}^n B_i \right) \right)
\]

\[
= \left( \sum_{i=1}^n (\text{id} \otimes \text{inc}_{B_i, B}) \right) \left( \bigoplus_{i=1}^n (A \otimes B_i) \right)
\]

\[
= \bigoplus_{i=1}^n (\text{id} \otimes \text{inc}_{B_i, B}) (A \otimes B_i).
\]

On the other hand, the maps \( \text{inc}_{B_i, B'} : B_i \to B' \) for all \( i \in \{1, 2, \ldots, n\} \) (these maps are well-defined since \( B_i \subseteq B' \) for every \( i \in \{1, 2, \ldots, n\} \)) give rise to a map \( \sum_{i=1}^n \text{inc}_{B_i, B'} : \bigoplus_{i=1}^n B_i \to B' \). Every \( i \in \{1, 2, \ldots, n\} \) satisfies \( \text{inc}_{B_i, B} = \text{inc}_{B', B} \circ \text{inc}_{B_i, B'} \), so that

\[
\sum_{i=1}^n \text{inc}_{B_i, B'} = \sum_{i=1}^n (\text{inc}_{B', B} \circ \text{inc}_{B_i, B'}) = \text{inc}_{B', B} \circ \left( \sum_{i=1}^n \text{inc}_{B_i, B'} \right).
\]
Hence,

\[ \text{id} \otimes \sum_{i=1}^{n} \text{inc}_{B_i, B'} = \text{id} \otimes \left( \text{inc}_{B', B} \circ \left( \sum_{i=1}^{n} \text{inc}_{B_i, B'} \right) \right) \]

\[ = \left( \text{id} \otimes \text{inc}_{B', B} \right) \circ \left( \text{id} \otimes \left( \sum_{i=1}^{n} \text{inc}_{B_i, B'} \right) \right) \]

as maps from \( A \otimes \left( \bigoplus_{i=1}^{n} B_i \right) \) to \( A \otimes B \) (where \( \text{id} \) always denotes \( \text{id}_A \)). Hence,

\[ \left( \text{id} \otimes \left( \sum_{i=1}^{n} \text{inc}_{B_i, B'} \right) \right) \left( A \otimes \left( \bigoplus_{i=1}^{n} B_i \right) \right) \]

\[ = \left( \text{id} \otimes \text{inc}_{B', B} \right) \left( A \otimes \left( \bigoplus_{i=1}^{n} B_i \right) \right) \]

(15)

But since \( \text{inc}_{B_i, B'} \) is the inclusion map \( B_i \to B' \) for every \( i \in \{1, 2, ..., n\} \), it is clear that the image of the map \( \sum_{i=1}^{n} \text{inc}_{B_i, B'} : \bigoplus_{i=1}^{n} B_i \to B' \) is \( \sum_{i=1}^{n} B_i = B' \). In other words, the map \( \sum_{i=1}^{n} \text{inc}_{B_i, B'} : \bigoplus_{i=1}^{n} B_i \to B' \) is surjective. Hence, the map \( \text{id} \otimes \left( \sum_{i=1}^{n} \text{inc}_{B_i, B'} \right) : A \otimes \left( \bigoplus_{i=1}^{n} B_i \right) \to A \otimes B' \) is surjective as well (by Lemma 23, applied to \( V = A, V' = A, W = \bigoplus_{i=1}^{n} B_i, W' = B', f = \text{id} \) and \( g = \sum_{i=1}^{n} \text{inc}_{B_i, B'} \)), so that \( \left( \text{id} \otimes \left( \sum_{i=1}^{n} \text{inc}_{B_i, B'} \right) \right) \left( A \otimes \left( \bigoplus_{i=1}^{n} B_i \right) \right) = A \otimes B' \). Thus, (15) simplifies to

\[ \left( \text{id} \otimes \left( \sum_{i=1}^{n} \text{inc}_{B_i, B'} \right) \right) \left( A \otimes \left( \bigoplus_{i=1}^{n} B_i \right) \right) = \left( \text{id} \otimes \text{inc}_{B', B} \right) (A \otimes B'). \]

Compared with (14), we obtain

\[ \sum_{i=1}^{n} \left( \text{id} \otimes \text{inc}_{B_i, B} \right) (A \otimes B_i) = \left( \text{id} \otimes \text{inc}_{B', B} \right) (A \otimes B'). \]

This proves Lemma 26.

Another lemma:

**Lemma 27.** Let \( A, B \) and \( C \) be three \( k \)-modules. Let \( f : B \to C \) be a \( k \)-module map. Then,

\[ (\text{id} \otimes f) (A \otimes B) = \left( \text{id} \otimes \text{inc}_{f(B), C} \right) (A \otimes (f(B))) \]

as \( k \)-submodules of \( A \otimes C \).
Proof of Lemma 27. We define a map \( f' : B \to f(B) \) by
\[
(f' (x) = f(x) \quad \text{for every } x \in B).
\]
(This map is well-defined, since \( f(x) \in f(B) \) for every \( x \in B \).) Then, every \( x \in B \)
satisfies
\[
f(x) = f'(x) = \text{inc}_{f(B),C} (f'(x)) = (\text{inc}_{f(B),C} \circ f')(x).
\]
Thus, \( f = \text{inc}_{f(B),C} \circ f' \). Hence,
\[
\text{id} \otimes f = \text{id} \otimes (\text{inc}_{f(B),C} \circ f') = (\text{id} \otimes \text{inc}_{f(B),C}) \circ (\text{id} \otimes f'),
\]
where id means \( \text{id}_A \). Thus,
\[
(\text{id} \otimes f) (A \otimes B) = ((\text{id} \otimes \text{inc}_{f(B),C}) \circ (\text{id} \otimes f')) (A \otimes B)
\]
\[
= (\text{id} \otimes \text{inc}_{f(B),C}) (\text{id} \otimes f')(A \otimes B).
\]
(16)

Now, the map \( f' : B \to f(B) \) is surjective, so that the map \( \text{id} \otimes f' : A \otimes B \to A \otimes (f(B)) \) is surjective as well (by Lemma 23 applied to \( A, B, f(B), \text{id}, f' \) instead of \( V, V', W, W', f, g \), respectively). Thus, \( (\text{id} \otimes f')(A \otimes B) = A \otimes (f(B)) \).

Hence, (16) becomes
\[
(\text{id} \otimes f) (A \otimes B) = (\text{id} \otimes \text{inc}_{f(B),C}) (A \otimes (f(B))).
\]

This proves Lemma 27.

Proof of Theorem 25. We are going to prove Theorem 25 by induction over \( n \):

Induction base: For \( n = 0 \), Theorem 25 holds (because for \( n = 0 \), the map \( f_1 \otimes f_2 \otimes \ldots \otimes f_n : V_1 \otimes V_2 \otimes \ldots \otimes V_n \to V'_1 \otimes V'_2 \otimes \ldots \otimes V'_n \) is the identity map \( \text{id} : k \to k \) and therefore its kernel \( \text{Ker} (f_1 \otimes f_2 \otimes \ldots \otimes f_n) \) is 0, while the right hand side of (13) is also 0 when \( n = 0 \)). Thus, the induction base is complete.

Induction step: Let \( p \in \mathbb{N} \) be arbitrary. Assume that Theorem 25 holds for \( n = p \).

Now let us prove that Theorem 25 holds for \( n = p + 1 \). So let \( V_i \) and \( V'_i \) be two \( k \)-modules for every \( i \in \{1, 2, \ldots, p + 1\} \), and let \( f_i : V_i \to V'_i \) be a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, \ldots, p + 1\} \).

According to Definition 6, we have \( f_1 \otimes f_2 \otimes \ldots \otimes f_{p+1} = f_1 \otimes (f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1}) \).

We know that \( f_i : V_i \to V'_i \) is a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, \ldots, p + 1\} \). Thus, \( f_i : V_i \to V'_i \) is a surjective \( k \)-module homomorphism for every \( i \in \{2, 3, \ldots, p + 1\} \). Substituting \( i+1 \) for \( i \) in this fact, we obtain that \( f_{i+1} \) is a surjective \( k \)-module homomorphism for every \( i \in \{1, 2, \ldots, p\} \). Thus, Lemma 24 (applied to \( p, V_{i+1}, V'_{i+1} \) and \( f_{i+1} \) instead of \( n, V_i, V'_i \) and \( f_i \)) yields that the map \( f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1} \) is surjective. On the other hand, the map \( f_1 \) is surjective (since \( f_1 \) is surjective for every \( i \in \{1, 2, \ldots, p + 1\} \)).

Now let \( V = V_1, V' = W_1, f = f_1 \) and \( i_V = i_1 \). Then, \( f \) is a surjective \( k \)-linear map (since \( f_1 \) is a surjective \( k \)-linear map), and \( i_V \) is the canonical inclusion \( \text{Ker} f \to V \) (since \( i_V = i_1 \) is the canonical inclusion \( \text{Ker} f_1 \to V_1 \)).

5Proof. Let \( y \in f(B) \). Then, there exists some \( x \in B \) such that \( y = f(x) \) (by the definition of \( f(B) \)). Consider this \( x \). Then, \( f'(x) = f'(x) = y \).

Hence, we have shown that for every \( y \in f(B) \), there exists some \( x \in B \) such that \( y = f'(x) \).

In other words, the map \( f' : B \to f(B) \) is surjective, qed.
Further let $W = V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1}$, $W' = W_2 \otimes W_3 \otimes \ldots \otimes W_{p+1}$ and $g = f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1}$. Then, $g$ is a surjective $k$-linear map (since $f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1}$ is a surjective $k$-linear map). Let $i_W$ be the canonical inclusion $\text{Ker } g \to W$. Then, Theorem 18 yields

$$\text{Ker } (f \otimes g) = (i_V \otimes \text{id}) ((\text{Ker } f) \otimes W) + (\text{id} \otimes i_W) (V \otimes (\text{Ker } g)).$$

(17)

Note that $V = V_1$ and $W = V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1}$ yield $V \otimes W = V_1 \otimes (V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1}) = V_1 \otimes V_2 \otimes \ldots \otimes V_{p+1}$.

We now define some more abbreviations. For every $i \in \{1, 2, ..., p + 1\}$, let $K_i$ denote the $k$-module

$$V_1 \otimes V_2 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker } f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1}.$$

For every $i \in \{1, 2, ..., p + 1\}$, let $\kappa_i$ denote the $k$-linear map

$$\underbrace{\text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes i_i \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id}}_{\text{i-1 times}} : K_i \to V \otimes W$$

(this is well-defined since $K_i = V_1 \otimes V_2 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker } f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1}$ and $V \otimes W = V_1 \otimes V_2 \otimes \ldots \otimes V_{p+1}$).

For every $i \in \{2, 3, ..., p + 1\}$, let $M_i$ denote the $k$-module

$$V_2 \otimes V_3 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker } f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1}.$$

For every $i \in \{2, 3, ..., p + 1\}$, let $\mu_i$ denote the $k$-linear map

$$\underbrace{\text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes i_i \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id}}_{\text{i-2 times}} : M_i \to W$$

(this is well-defined since $M_i = V_2 \otimes V_3 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker } f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1}$ and $W = V_2 \otimes V_3 \otimes \ldots \otimes V_{p+1}$).

For any $k$-module $C$ and any $k$-submodule $D$ of $C$, we let $\text{inc}_{D,C}$ denote the canonical inclusion map $D \to C$. Then,

$$\text{inc}_{\text{Ker } f_i, V_i} = (\text{the canonical inclusion map } \text{Ker } f_i \to V_i) = i_i$$

for every $i \in \{1, 2, ..., p + 1\}$. On the other hand,

$$\text{inc}_{\text{Ker } g, W} = (\text{the canonical inclusion map } \text{Ker } g \to W) = i_W$$

(by definition of $i_W$).

Applying Theorem 25 to $p$, $V_{i+1}$, $V'_{i+1}$ and $f_{i+1}$ instead of $n$, $V_i$, $V'_i$ and $f_i$ (this is
allowed, because we have assumed that Theorem 25 holds for \( n = p \), we see that

\[
\text{Ker} (f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1})
\]

\[
= \sum_{i=1}^{p} \begin{pmatrix} \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \text{id}_{i+1} \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \\ \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \ldots \otimes \text{id} \end{pmatrix}_{i-1 \text{ times}}
\]

\[
(V_2 \otimes V_3 \otimes \ldots \otimes V_i \otimes (\text{Ker} f_{i+1}) \otimes V_{i+2} \otimes V_{i+3} \otimes \ldots \otimes V_{p+1})
\]

\[
= \sum_{i=2}^{p+1} \begin{pmatrix} \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \\ \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \ldots \otimes \text{id} \end{pmatrix}_{i-2 \text{ times}}
\]

\[
(V_2 \otimes V_3 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker} f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1})
\]

\[
= \mu_i
\]

(18)

(19)

Proof of (19). Let \( i \in \{2, 3, \ldots, p+1\} \). Then,

\[
\kappa_i = \begin{pmatrix} \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \\ \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \ldots \otimes \text{id} \end{pmatrix}_{i-1 \text{ times}}
\]

\[
= \text{id} \otimes \begin{pmatrix} \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \\ \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \ldots \otimes \text{id} \end{pmatrix}_{i-2 \text{ times}}
\]

\[
= \mu_i
\]

and

\[
K_i = V_1 \otimes V_2 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker} f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1}
\]

\[
= \begin{pmatrix} V_1 \otimes V_2 \otimes V_3 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker} f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1} \\ V_1 \otimes V_2 \otimes V_3 \otimes \ldots \otimes V_{i-1} \otimes (\text{Ker} f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes \ldots \otimes V_{p+1} \end{pmatrix}
\]

\[
= V \otimes M_i
\]

Thus,

\[
\kappa_i (K_i) = (\text{id} \otimes \mu_i) (V \otimes M_i) = (\text{id} \otimes \text{inc}_{\mu_i(M_i), W}) (V \otimes (\mu_i (M_i)))
\]
(by Lemma \ref{lem:kspot}, applied to $A = V$, $B = M_i$, $C = W$ and $f = \mu_i$).

But since $\mu_i(M_i) \subseteq \text{Ker } g$ (by \eqref{eq:kspot}, we have

\[
\text{inc}_{\mu_i(M_i),W} = \text{inc}_{\text{Ker } g,W} \circ \text{inc}_{\mu_i(M_i),\text{Ker } g}
\]

\[
= i_W \circ \text{inc}_{\mu_i(M_i),\text{Ker } g}.
\]

Now forget that we fixed $i \in \{2, 3, ..., p + 1\}$. Due to \eqref{eq:kspot}, we can apply Lemma \ref{lem:kspot} to $n = p$, $A = V$, $B = W$, $B' = \text{Ker } g$ and $B_i = \mu_{i+1}(M_{i+1})$. Applying it yields that

\[
(id \otimes \text{inc}_{\text{Ker } g,W})(V \otimes (\text{Ker } g)) = \sum_{i = 2}^{p+1} (id \otimes \text{inc}_{\mu_{i+1}(M_{i+1}),W})(V \otimes (\mu_{i+1}(M_{i+1})))
\]

\[
= \sum_{i = 2}^{p+1} (id \otimes \text{inc}_{\mu_i(M_i),W})(V \otimes (\mu_i(M_i)))
\]

(here, we substituted $i$ for $i + 1$ in the sum)

\[
= \sum_{i = 2}^{p+1} \kappa_i(K_i),
\]

and thus \eqref{eq:kspot} is proven.

On the other hand, we defined the $k$-module $K_i$ as

\[
V_1 \otimes V_2 \otimes ... \otimes V_{i-1} \otimes (\text{Ker } f_i) \otimes V_{i+1} \otimes V_{i+2} \otimes ... \otimes V_{p+1}
\]

for every $i \in \{1, 2, ..., p + 1\}$. Applied to $i = 1$, this yields

\[
K_1 = (\text{Ker } f_1) \otimes V_2 \otimes V_3 \otimes ... \otimes V_{p+1} = \left(\text{Ker } f_1 \right) \otimes (V_2 \otimes V_3 \otimes ... \otimes V_{p+1}) = (\text{Ker } f) \otimes W.
\]

We further defined the map $\kappa_i$ as

\[
\underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id}}_{i-1 \text{ times}} \otimes id}_{p+1-i \text{ times}}}}_{i \text{ times}} : K_i \rightarrow V \otimes W
\]

for every $i \in \{1, 2, ..., p + 1\}$. Applied to $i = 1$, this yields

\[
\kappa_1 = \underbrace{i_1 \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id}}_{p+1-i \text{ times}} \otimes id}}_{i \text{ times}}}_{p+1-i \text{ times}} = \underbrace{i_1 \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id \otimes \underbrace{id}}_{p+1-i \text{ times}} \otimes id}}_{i \text{ times}}}_{i \text{ times}} = i_V \otimes id.
\]
Now, (17) becomes

$$\text{Ker} \ (f \otimes g) = (i_V \otimes \text{id}) \left( (\text{Ker} \ f) \otimes W \right) + (\text{id} \otimes i_W) \left( V \otimes (\text{Ker} \ g) \right)$$

(by (21))

$$= \kappa_1 (K_1) + \sum_{i=2}^{p+1} \kappa_i (K_i) = \sum_{i=2}^{p+1} \kappa_i (K_i).$$

Since

$$f \otimes g = f_1 \otimes (f_2 \otimes f_3 \otimes \ldots \otimes f_{p+1}) = f_1 \otimes f_2 \otimes \ldots \otimes f_{p+1},$$

this rewrites as

$$\text{Ker} \ (f_1 \otimes f_2 \otimes \ldots \otimes f_{p+1})$$

$$= \sum_{i=1}^{p+1} (\text{id} \otimes \ldots \otimes \text{id} \otimes i_1 \otimes \ldots \otimes \text{id} \otimes \ldots \otimes \text{id})$$

(by (13))

$$= \sum_{i=1}^{p+1} \left( \text{id} \otimes \ldots \otimes \text{id} \otimes i_1 \otimes \text{id} \otimes \ldots \otimes \text{id} \right)$$

(by (19))

$$= \sum_{i=1}^{p+1} \left( \text{id} \otimes \ldots \otimes \text{id} \otimes i_1 \otimes \text{id} \otimes \ldots \otimes \text{id} \right)$$

(by (20))

$$= \kappa_1 (K_1) + \sum_{i=2}^{p+1} \kappa_i (K_i).$$

We thus have proven that (13) holds for $n = p + 1$. This completes the induction step. Thus, the induction proof of Theorem 25 is complete.

### 0.11. The tensor algebra case

Before we actually come to the tensor algebra, let us bring Theorem 25 to a nicer form when all the $f_i$ are equal:

**Theorem 28.** Let $k$ be a commutative ring. Let $n \in \mathbb{N}$. Let $V$ and $V'$ be two $k$-modules, and let $f : V \to V'$ be a surjective $k$-module homomorphism. Let $i$ be the canonical inclusion $\text{Ker} \ f \to V$. Then,

$$\text{Ker} \ (f \otimes \ldots \otimes f_{p+1})$$

$$= \sum_{i=1}^{p+1} \left( \text{id} \otimes \ldots \otimes \text{id} \otimes i_1 \otimes \text{id} \otimes \ldots \otimes \text{id} \right)$$

(by (13))

$$= \sum_{i=1}^{p+1} \left( \text{id} \otimes \ldots \otimes \text{id} \otimes i_1 \otimes \text{id} \otimes \ldots \otimes \text{id} \right)$$

(by (19))

$$= \kappa_1 (K_1) + \sum_{i=2}^{p+1} \kappa_i (K_i).$$

Notice that the left hand side of the equation (22) is a subset of $V^\otimes n$, while the $i$-th addend on the right hand side is a subset of $V^\otimes (i-1) \otimes V \otimes (n-i)$. To make sense of
the equation (22), the set $V^\otimes n$ thus must be equal to $V^\otimes (i-1) \otimes V \otimes V^\otimes (n-i)$ for every $i \in \{1, 2, ..., n\}$. Fortunately, this is guaranteed by Convention 12.

For the proof of Theorem 28 we will use one more convention:

**Convention 29.** Let $k$ be a commutative ring, and let $A$, $B$ and $C$ be three $k$-modules. Then, we identify the $k$-module $(A \otimes B) \otimes C$ with the $k$-module $A \otimes (B \otimes C)$ by means of the $k$-module isomorphism

$$
(A \otimes B) \otimes C \to A \otimes (B \otimes C),
$$

$$(a \otimes b) \otimes c \mapsto a \otimes (b \otimes c).$$

Note that we will only use Convention 29 in the proof of Theorem 28, but nowhere else in this text.

**Remark 30.** As a consequence of Convention 29, it can be easily seen that the tensor product $V_1 \otimes V_2 \otimes ... \otimes V_n$ of any $k$-modules $V_1, V_2, ..., V_n$ can be computed by means of any bracketing. For instance, when $n = 4$, this means that

$$V_1 \otimes (V_2 \otimes (V_3 \otimes V_4)) = V_1 \otimes ((V_2 \otimes V_3) \otimes V_4) = (V_1 \otimes V_2) \otimes (V_3 \otimes V_4)$$

$$= (V_1 \otimes (V_2 \otimes V_3)) \otimes V_4 = ((V_1 \otimes V_2) \otimes V_3) \otimes V_4$$

for any four $k$-modules $V_1, V_2, V_3, V_4$.

**Remark 31.** Convention 29 is compatible with Convention 12. In fact, Conventions 29 and 7 combined make Convention 12 redundant, in the following sense: If we identify $(A \otimes B) \otimes C$ with $A \otimes (B \otimes C)$ for all $k$-modules $A$, $B$ and $C$ (as in Convention 29), and identify $V \otimes k, k \otimes V$ and $V$ for all $k$-modules $V$ (as in Convention 7), then automatically $V^\otimes a \otimes V^\otimes b$ becomes identical with $V^\otimes (a+b)$ for all $k$-modules $V$ and $a \in \mathbb{N}$ and $b \in \mathbb{N}$ (and this identification is the same as the one given in Convention 12).

**Proof of Theorem 28.** During this proof, we are going to use Convention 29. Now, we apply Theorem 25 to $V_i = V$, $V'_i = V'$, $f_i = f$ and $i_i = i$. As a result, we have

$$V^\otimes (i-1) \otimes V \otimes V^\otimes (n-i) = V^\otimes i \otimes V^\otimes (n-i) = V^\otimes (i+n-i)$$

(by Convention 12)
obtain

$$\text{Ker} \left( f \otimes f \otimes \ldots \otimes f \right)_{n \text{ times}}$$

$$= \sum_{i=1}^{n} \left( \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \right)_{i-1 \text{ times}} \otimes \left( \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \right)_{n-i \text{ times}}$$

$$= \left( V \otimes V \otimes \ldots \otimes V \otimes (\text{Ker} f) \otimes V \otimes V \otimes \ldots \otimes V \right)_{i-1 \text{ times}} \otimes (\text{Ker} f) \otimes \left( V \otimes V \otimes \ldots \otimes V \right)_{n-i \text{ times}}$$

$$= V^{\otimes (i-1)} \otimes (\text{Ker} f) \otimes V^{\otimes (n-i)}$$

(23)

Now, since we are using Convention 29, we can write

$$V \otimes V \otimes \ldots \otimes V \otimes (\text{Ker} f) \otimes V \otimes V \otimes \ldots \otimes V$$

$$= \left( V \otimes V \otimes \ldots \otimes V \right)_{i-1 \text{ times}} \otimes (\text{Ker} f) \otimes \left( V \otimes V \otimes \ldots \otimes V \right)_{n-i \text{ times}}$$

$$= V^{\otimes (i-1)} \otimes (\text{Ker} f) \otimes V^{\otimes (n-i)}$$

and correspondingly

$$\text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id}$$

$$= \left( \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \right)_{i-1 \text{ times}} \otimes \text{i} \otimes \left( \text{id} \otimes \text{id} \otimes \ldots \otimes \text{id} \right)_{n-i \text{ times}}$$

$$= \text{id}_{V^{\otimes (i-1)}} \otimes \text{i} \otimes \text{id}_{V^{\otimes (n-i)}}$$

$$= \text{id}_{V^{\otimes (i-1)}} \otimes \text{i} \otimes \text{id}_{V^{\otimes (n-i)}}$$
for every $i \in \{1, 2, ..., n\}$. Now, since $f^\otimes n = f \otimes f \otimes ... \otimes f$, we have

$$\text{Ker} \left( f^\otimes n \right) = \text{Ker} \left( f \otimes f \otimes ... \otimes f \right)_{\text{n times}}$$

$$= \sum_{i=1}^{n} \left( \text{id} \otimes \text{id} \otimes ... \otimes \text{id} \otimes i \otimes \text{id} \otimes \text{id} \otimes ... \otimes \text{id} \right)_{i-1 \text{ times} \ n-i \text{ times}}$$

$$= \text{id}_{V^\otimes (i-1) \otimes V^\otimes (n-i)}$$

$$\left( V \otimes V \otimes ... \otimes V \otimes (\text{Ker} f) \otimes V \otimes V \otimes ... \otimes V \right)_{i-1 \text{ times} \ n-i \text{ times}}$$

$$(\text{by (23)})$$

$$= \sum_{i=1}^{n} \left( \text{id}_{V^\otimes (i-1) \otimes V} \otimes \text{id}_{V^\otimes (n-i)} \right) \left( V^\otimes (i-1) \otimes (\text{Ker} f) \otimes V^\otimes (n-i) \right).$$

This proves Theorem 28.

Now, our claim about the tensor algebra:

**Theorem 32.** Let $k$ be a commutative ring. Let $V$ and $V'$ be two $k$-modules, and let $f : V \to V'$ be a surjective $k$-module homomorphism. Then, the kernel of the map $\otimes f : \otimes V \to \otimes V'$ is

$$\text{Ker} \left( \otimes f \right) = (\otimes V) \cdot (\text{Ker} f) \cdot (\otimes V).$$

Here, $\text{Ker} f$ is considered a $k$-submodule of $\otimes V$ by means of the inclusion $\text{Ker} f \subseteq V = V^\otimes 1 \subseteq \otimes V$.

We are going to derive this theorem from Theorem 28. For this we need the following lemma:

**Lemma 33.** Let $k$ be a commutative ring. Let $n \in \mathbb{N}$. Let $i \in \{0, 1, ..., n\}$. Let $V$ be a $k$-module, and let $W$ be a $k$-submodule of $V$. Let $i$ be the canonical inclusion $W \to V$. Then,

$$(\text{id}_{V^\otimes (i-1) \otimes V^\otimes (n-i)} \otimes i \otimes \text{id}_{V^\otimes (n-i)}) \left( V^\otimes (i-1) \otimes W \otimes V^\otimes (n-i) \right) = V^\otimes (i-1) \cdot W \cdot V^\otimes (n-i),$$

where we identify $V^\otimes n$ with a $k$-submodule of $\otimes V$ as in Definition 13(c).

To prove this lemma, we make a convention:

**Convention 34.** (a) Whenever $k$ is a commutative ring, $M$ is a $k$-module, and $S$ is a subset of $M$, we denote by $\langle S \rangle$ the $k$-submodule of $M$ generated by the elements of $S$. This $k$-submodule $\langle S \rangle$ is called the $k$-linear span (or simply the $k$-span) of $S$.

(b) Whenever $k$ is a commutative ring, $M$ is a $k$-module, $\Phi$ is a set, and $P : \Phi \to M$ is
Thus, this rewrites as $\langle P(v) \mid v \in \Phi \rangle$ the $k$-submodule $\{P(v) \mid v \in \Phi\}$ of $M$. (In other words, $\langle P(v) \mid v \in \Phi \rangle$ is the $k$-submodule of $M$ generated by the elements $P(v)$ for all $v \in \Phi$.)

Note that some authors use the notation $\langle S \rangle$ for various other things (e.g., the two-sided ideal generated by $S$, or the Lie subalgebra generated by $S$), but we will only use it for the $k$-submodule generated by $S$ (as defined in Convention 34 (a)).

The following fact was proven in [33, §1.7](#) (but is basically trivial):

**Proposition 35.** Let $k$ be a commutative ring. Let $M$ be a $k$-module. Let $S$ be a subset of $M$.

(a) Let $Q$ be a $k$-submodule of $M$ such that $S \subseteq Q$. Then, $\langle S \rangle \subseteq Q$.

(b) Let $R$ be a $k$-module, and $f : M \to R$ be a $k$-module homomorphism. Then, $f(\langle S \rangle) = \langle f(S) \rangle$.

Now let us come to the proof of Lemma 33. 

**Proof of Lemma 33.** The tensor product $V^{\otimes(i-1)} \otimes W \otimes V^{\otimes(n-i)}$ is generated (as a $k$-module) by its pure tensors. In other words,

$$V^{\otimes(i-1)} \otimes W \otimes V^{\otimes(n-i)} = \langle u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \rangle$$

Thus,

$$\langle (id_{V^{\otimes(i-1)}} \otimes i \otimes id_{V^{\otimes(n-i)}}) \rangle (V^{\otimes(i-1)} \otimes W \otimes V^{\otimes(n-i)})$$

$$= \langle (id_{V^{\otimes(i-1)}} \otimes i \otimes id_{V^{\otimes(n-i)}}) \rangle \left( \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \right)$$

$$= \langle (id_{V^{\otimes(i-1)}} \otimes i \otimes id_{V^{\otimes(n-i)}}) \rangle \left( \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \right)$$

(by Proposition 35 (b), applied to $M = V^{\otimes(i-1)} \otimes W \otimes V^{\otimes(n-i)}$,

$$R = V^{\otimes _n}, f = id_{V^{\otimes(i-1)}} \otimes i \otimes id_{V^{\otimes(n-i)}} \text{ and } S = \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \} .$$

Since

$$\langle (id_{V^{\otimes(i-1)}} \otimes i \otimes id_{V^{\otimes(n-i)}}) \rangle \left( \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \right)$$

$$= \left\{ \begin{array}{l} \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \\
\{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \\
= \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \\
\{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \\
\end{array} \right\}$$

(this rewrites as

$$\langle (id_{V^{\otimes(i-1)}} \otimes i \otimes id_{V^{\otimes(n-i)}}) \rangle \left( V^{\otimes(i-1)} \otimes W \otimes V^{\otimes(n-i)} \right)$$

$$= \langle \{ u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \} \rangle$$

$$= \langle u \otimes v \otimes w \mid (u, v, w) \in V^{\otimes(i-1)} \times W \times V^{\otimes(n-i)} \rangle .$$

(24)
On the other hand,

\[ V^\otimes(i-1) \cdot W \cdot V^\otimes(n-i) = \langle u \cdot v \cdot w \mid (u, v, w) \in V^\otimes(i-1) \times W \times V^\otimes(n-i) \rangle, \quad (25) \]

where the \( \cdot \) sign stands for multiplication inside the \( k \)-algebra \( \otimes V \). But for every \((u, v, w) \in V^\otimes(i-1) \times W \times V^\otimes(n-i)\), we have \( u \cdot v \cdot w = u \otimes v \otimes w \) so that (25) becomes

\[ V^\otimes(i-1) \cdot W \cdot V^\otimes(n-i) = \langle u \otimes v \otimes w \mid (u, v, w) \in V^\otimes(i-1) \times W \times V^\otimes(n-i) \rangle = (\text{id}_{V^\otimes(i-1)} \otimes i \otimes \text{id}_{V^\otimes(n-i)}) \left( V^\otimes(i-1) \otimes W \otimes V^\otimes(n-i) \right) \]

(by (24)). This proves Lemma 33.

Proof of Theorem 32. Let \( i \) be the canonical inclusion \( \text{Ker } f \to V \).

We have

\[ \otimes V = \bigoplus_{i \in \mathbb{N}} V^\otimes i = \sum_{i \in \mathbb{N}} V^\otimes i \quad \text{(since direct sums are sums)} \quad (26) \]

\[ = \sum_{j \in \mathbb{N}} V^\otimes j \quad \text{(here, we renamed the index } i \text{ as } j \text{).} \quad (27) \]

Since the map \( \otimes f \) is defined as the direct sum of the \( k \)-module homomorphisms

\[ \text{Proof.} \quad \text{We have } u \in V^\otimes(i-1) \text{ and } v \in W \subseteq V = V^\otimes 1. \text{ Hence, } u \cdot v = u \otimes v \text{ (by } (3)\text{, applied to } u, v, i - 1 \text{ and } 1 \text{ instead of } a, b, n \text{ and } m\text{)} \text{ and thus } u \cdot v = \sum_{e \in V^\otimes(i-1) \otimes V^\otimes 1} e = V^\otimes \otimes \otimes \otimes V^\otimes 1 = V^\otimes \otimes \otimes \otimes V^\otimes 1 = V^\otimes . \]

Combined with \( w \in V^\otimes(n-i) \), this leads to \((u \otimes v) \cdot w = (u \otimes v) \otimes w \text{ (by } (3)\text{, applied to } u \otimes v, w, i \text{ and } n - i \text{ instead of } a, b, n \text{ and } m\). Thus, \[ u \cdot v \cdot w = (u \otimes v) \cdot w = (u \otimes v) \otimes w = u \otimes v \otimes w, \text{ qed.} \]
\[ f^{\otimes i} : V^{\otimes i} \to W^{\otimes i} \] for all \( i \in \mathbb{N} \), we have

\[
\ker (\otimes f) = \bigoplus_{i \in \mathbb{N}} \ker (f^{\otimes i}) = \sum_{i \in \mathbb{N}} \ker (f^{\otimes i}) \quad \text{(since direct sums are sums)}
\]

\[
= \sum_{n \in \mathbb{N}} \sum_{i=1}^{n} \left( \text{id}_{V^{\otimes(i-1)}} \otimes \text{id}_{V^{\otimes(n-i)}} \left( V^{\otimes(i-1)} \otimes (\ker f) \otimes V^{\otimes(n-i)} \right) \right)
\]

(by \[22\])

\[
= \sum_{n \in \mathbb{N}} \sum_{i=1}^{n} V^{\otimes(i-1)} \cdot (\ker f) \cdot V^{\otimes(n-i)} = \sum_{n \in \mathbb{N}} \sum_{i=0}^{n-1} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(n-(i+1))}
\]

(by Lemma \[33\] applied to \(W = \ker f\))

\[
(\text{here, we substituted } i + 1 \text{ for } i \text{ in the second sum})
\]

\[
= \sum_{n \in \mathbb{N}} \sum_{i=0}^{n-1} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(n-1-i)} = \sum_{n \in \mathbb{N}; n \geq 1} \sum_{i=0}^{n-1} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(n-1-i)}
\]

\[
= \sum_{n \in \mathbb{N}; n \geq 1} \sum_{i=0}^{n-1} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(n-1-i)} = \sum_{i \in \mathbb{N}} \sum_{n \in \mathbb{N}; n \geq i} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(n-i)}
\]

(\text{here, we substituted } n \text{ for } n-1 \text{ in the first sum})

\[
= \sum_{i \in \mathbb{N}} \sum_{n \in \mathbb{N}; n \geq i} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(n-i)} = \sum_{i \in \mathbb{N}} \sum_{j \in \mathbb{N}} V^{\otimes(i)} \cdot (\ker f) \cdot V^{\otimes(j)}
\]

(\text{here, we substituted } j \text{ for } n-i \text{ in the second sum})

\[
= \left( \sum_{i \in \mathbb{N}} V^{\otimes(i)} \right) \cdot (\ker f) \cdot \left( \sum_{j \in \mathbb{N}} V^{\otimes(j)} \right) = (\otimes V) \cdot (\ker f) \cdot (\otimes V)
\]

This proves Theorem \[32\]

### 0.12. The pseudoexterior algebra

We are now going to introduce the pseudoexterior algebra \(\text{Exter} V\) of a \(k\)-module \(V\). There are two ways to do this: one is by constructing \(\text{Exter} V\) as a direct sum of pseudoexterior powers \(\text{Exter}^n V\) (so these pseudoexterior powers must be defined first); the other is by directly constructing \(\text{Exter} V\) as a quotient of the tensor algebra \(\otimes V\) modulo a certain two-sided ideal (and then we can construct the pseudoexterior powers \(\text{Exter}^n V\) as homogeneous components of this \(\text{Exter} V\)). It is not immediately clear (although not difficult) to prove that these two ways yield one and the same (up
to canonical isomorphism) $k$-algebra $\text{Exter} V$. We are going to reconcile these two ways by first proving some properties of the two-sided ideal that we want to factor the tensor algebra $\otimes V$ by; once these are shown, it will be easy to see that both definitions of $\text{Exter} V$ are the same. We delay the definition of $\text{Exter} V$ until that moment. So let us first define the pseudoexterior powers $\text{Exter}^n V$:

**Definition 36.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$.
Let $Q_n (V)$ be the $k$-submodule
\[
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid (v_1, v_2, \ldots, v_n, \sigma) \in V^n \times S_n \rangle
\]
of the $k$-module $V^\otimes n$ (where we are using Convention [34] and are denoting the $n$-th symmetric group by $S_n$).
The factor $k$-module $V^\otimes n / Q_n (V)$ is called the \textit{n-th pseudoexterior power} of the $k$-module $V$ and will be denoted by $\text{Exter}^n V$. We denote by $\text{exter}_{V,n}$ the canonical projection $V^\otimes n \rightarrow V^\otimes n / Q_n (V) = \text{Exter}^n V$. Clearly, this map $\text{exter}_{V,n}$ is a surjective $k$-module homomorphism.

**Warning 37.** This $n$-th pseudoexterior power $\text{Exter}^n V$ is called \textbf{pseudo}exterior for a reason: it is not exactly the same as the $n$-th exterior power $\wedge^n V$ (which we will introduce in Definition [35]). While the difference between $\text{Exter}^n V$ and $\wedge^n V$ is not that large (in particular, they are identical when 2 is invertible in $k$, as Theorem [32] will show), this difference exists and should not be forgotten.

Most literature only works with the $n$-th exterior power $\wedge^n V$, because the $n$-th pseudoexterior power $\text{Exter}^n V$ is much less interesting in the general case. \textbf{However}, a number of texts which are only concerned with the case when 2 is invertible in $k$ define the $n$-th exterior power $\wedge^n V$ by our Definition 36; i. e., what they call the $n$-th exterior power $\wedge^n V$ is what we call the $n$-th pseudoexterior power $\text{Exter}^n V$.
Fortunately this does not conflict with our notation as long as 2 is invertible in $k$ (because when 2 is invertible in $k$, Theorem [32] (c) yields $\wedge^n V = \text{Exter}^n V$).

This is not the pseudoexterior algebra $\text{Exter} V$ yet, but only the $n$-th pseudoexterior power $\text{Exter}^n V$; we will compose the pseudoexterior algebra from these later. First, here is an alternative description of the module $Q_n (V)$ from this definition:

**Proposition 38.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$.
Then,
\[
Q_n (V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes \ldots \otimes v_{\tau_1(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle,
\]
where $\tau_i$ denotes the transposition $(i, i+1) \in S_n$.

This proposition is classical and can be concluded from the definition of $Q_n (V)$ and the fact that the transpositions $\tau_1, \tau_2, \ldots, \tau_{n-1}$ generate the symmetric group $S_n$. Here are the details of this proof:

**Proof of Proposition 38.** Let $T$ denote the subset
\[
\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n \}
\]
of $V^\otimes n$. Then,
\[
\langle T \rangle = \left\{ \left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^\sigma v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n \right\} \right\}
\]
\[
= \left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^\sigma v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n \right\}
\]
\[
= \mathcal{Q}_n(V) \quad \text{(by Definition 36)}.
\]
On the other hand,
\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^\sigma v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \in T
\]
(since
\[
T = \left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^\sigma v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n \right\}
\].

On the other hand, let $Z$ denote the $k$-submodule
\[
\sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle
\]
of $V^\otimes n$. Then,
\[
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle \subseteq Z
\]
for every $I \in \{1, 2, \ldots, n-1\}$. Now,
\[
\left\{ w_1 \otimes w_2 \otimes \ldots \otimes w_n + w_{\tau_i(1)} \otimes w_{\tau_i(2)} \otimes \ldots \otimes w_{\tau_i(n)} \mid (w_1, w_2, \ldots, w_n) \in V^n \right\}
\]
\[
= \left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \right\}
\]
(here, we renamed $(w_1, w_2, \ldots, w_n)$ as $(v_1, v_2, \ldots, v_n)$)
\[
\subseteq \left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \right\}
\]
\[
= \left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \right\} \subseteq Z
\]
for every $I \in \{1, 2, \ldots, n-1\}$. Thus,
\[
w_1 \otimes w_2 \otimes \ldots \otimes w_n + w_{\tau_i(1)} \otimes w_{\tau_i(2)} \otimes \ldots \otimes w_{\tau_i(n)} \in Z
\]
for every $(w_1, w_2, \ldots, w_n) \in V^n$ and every $I \in \{1, 2, \ldots, n-1\}$. (30)

We are now going to show that $Z = \langle T \rangle$.
First, let us prove that $Z \subseteq \langle T \rangle$. In fact, every $i \in \{1, 2, \ldots, n-1\}$ satisfies
\[
\left\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \right\} \subseteq \langle T \rangle
\]
(since every $(v_1, v_2, \ldots, v_n) \in V^n$ satisfies
\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} = (-1)^{v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)}}
\]
\[
= v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)}}
\]
(since $\tau_i$ is a transposition, so that $(-1)^{\tau_i} = -1$)
\[
= v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\tau_i} v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)}
\]
\[
in T \quad \text{(due to (28), applied to $((v_1, v_2, \ldots, v_n), \tau_i)$ instead of $((v_1, v_2, \ldots, v_n), \sigma)$)}
\]
\[
\subseteq \langle T \rangle
\]
31
Now, let us show that \( \langle T \rangle \subseteq Z \). To that aim, we will show that \( T \subseteq Z \).

In fact, let \( ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n \) be arbitrary. Then, \( (v_1, v_2, \ldots, v_n) \in V^n \) and \( \sigma \in S_n \). Now, it is known that every element of the symmetric group \( S_n \) can be written as a product of some transpositions from the set \( \{\tau_1, \tau_2, \ldots, \tau_{n-1}\} \). Applying this to the element \( \sigma \in S_n \), we conclude that \( \sigma \) can be written as a product of some transpositions from the set \( \{\tau_1, \tau_2, \ldots, \tau_{n-1}\} \). In other words, there exists a natural number \( m \in \mathbb{N} \) and a sequence \( (i_1, i_2, \ldots, i_m) \in \{1, 2, \ldots, n-1\}^m \) such that \( \sigma = \tau_{i_1} \tau_{i_2} \cdots \tau_{i_m} \). Consider this \( m \) and this \( (i_1, i_2, \ldots, i_m) \). For every \( j \in \{0, 1, \ldots, m\} \), let \( \sigma_j \) denote the permutation \( \tau_{i_1} \tau_{i_2} \cdots \tau_{i_j} \in S_n \). Then, \( \sigma_0 = \tau_{i_1} \tau_{i_2} \cdots \tau_{i_0} = (\text{empty product}) = \text{id} \) and \( \sigma_m = \tau_{i_1} \tau_{i_2} \cdots \tau_{i_m} = \sigma \). Moreover, every \( j \in \{1, 2, \ldots, m\} \) satisfies \( (-1)^{\sigma_j-1} v_{\sigma_j^{-1}(1)} \otimes v_{\sigma_j^{-1}(2)} \otimes \cdots \otimes v_{\sigma_j^{-1}(n)} - \)
\[ (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \in Z. \]

Thus,
\[
\sum_{j=1}^{m} \left( (-1)^{\sigma_{j-1}} v_{\sigma_{j-1}(1)} \otimes v_{\sigma_{j-1}(2)} \otimes \ldots \otimes v_{\sigma_{j-1}(n)} - (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \right) \in \sum_{j=1}^{m} Z \subseteq Z
\]

(since \( Z \) is a \( k \)-module). Since
\[
\sum_{j=1}^{m} \left( (-1)^{\sigma_{j-1}} v_{\sigma_{j-1}(1)} \otimes v_{\sigma_{j-1}(2)} \otimes \ldots \otimes v_{\sigma_{j-1}(n)} - (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \right)
= v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)}
\]

(31)

this rewrites as
\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \in Z.
\]

We have thus shown that every \((v_1, v_2, \ldots, v_n, \sigma) \in V^n \times S_n\) satisfies \(v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \in Z\). Thus,
\[
\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n, \sigma) \in V^n \times S_n) \subseteq Z.
\]

\[ ^8 \text{Proof. Let } j \in \{1, 2, \ldots, m\} \text{ be arbitrary. Then,}
\]
\[
\tau_{ij} = \tau_{i_1} \tau_{i_2} \cdots \tau_{i_{j-1}} \tau_{i_j} = \tau_{i_1} \tau_{i_2} \cdots \tau_{i_j} = \sigma_j,
\]
\[
(\text{by the formula } \sigma_j = \tau_{i_1} \tau_{i_2} \cdots \tau_{i_j},
\]
\[
\text{applied to } j-1 \text{ instead of } j)
\]

so that \( \sigma_j = \sigma_{j-1} \tau_j \). Denote \( i_j \) by \( I \). Then, \( \sigma_j = \sigma_{j-1} \tau_j \) rewrites as \( \sigma_j = \sigma_{j-1} \tau_1 \). Thus,
\[
(-1)^{\sigma_j} = (-1)^{\sigma_{j-1}} \tau_j = (-1)^{\sigma_{j-1}} (-1)^{\sigma_j} = \tau_j
\]
\[
(\text{by } (30))
\]
\[
= -(-1)^{\sigma_j-1}
\]
\[
(\text{since } \tau_1 \text{ is a transposition})
\]

Now, define an \( n \)-tuple \((w_1, w_2, \ldots, w_n) \in V^n\) by \( w_\rho = v_{\sigma_{j-1}(\rho)} \) for every \( \rho \in \{1, 2, \ldots, n\} \). Then,
\[
(w_1, w_2, \ldots, w_n) = (v_{\sigma_{j-1}(1)}, v_{\sigma_{j-1}(2)}, \ldots, v_{\sigma_{j-1}(n)}),
\]
so that \( w_1 \otimes w_2 \otimes \ldots \otimes w_n = v_{\sigma_{j-1}(1)} \otimes v_{\sigma_{j-1}(2)} \otimes \ldots \otimes v_{\sigma_{j-1}(n)} \). On the other hand, every \( \xi \in \{1, 2, \ldots, n\} \) satisfies
\[
w_{\gamma_1}(\xi) = v_{\sigma_{j-1}(\gamma_1(\xi))}
\]
\[
(\text{by the formula } w_\rho = v_{\sigma_{j-1}(\rho)}, \text{ applied to } \rho = \gamma_1(\xi))
\]
\[
= v_{\sigma_j(\xi)}
\]
\[
(\text{since } \sigma_{j-1}(\gamma_1(\xi)) = (\sigma_{j-1} \gamma_1)(\xi) = \sigma_j(\xi)).
\]

Thus,
\[
(w_{\gamma_1}(1), w_{\gamma_1}(2), \ldots, w_{\gamma_1}(n)) = (v_{\sigma_j(1)}, v_{\sigma_j(2)}, \ldots, v_{\sigma_j(n)}),
\]
so that \( w_{\gamma_1(1)} \otimes w_{\gamma_1(2)} \otimes \ldots \otimes w_{\gamma_1(n)} = v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \).

Now,
\[
(-1)^{\sigma_{j-1}} v_{\sigma_{j-1}(1)} \otimes v_{\sigma_{j-1}(2)} \otimes \ldots \otimes v_{\sigma_{j-1}(n)} - (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)}
\]
\[
= (-1)^{\sigma_{j-1}} w_1 \otimes w_2 \otimes \ldots \otimes w_n - (-1)^{\sigma_j-1} w_{\gamma_1(1)} \otimes w_{\gamma_1(2)} \otimes \ldots \otimes w_{\gamma_1(n)}
\]
\[
\in Z \text{ by } (30)
\]

qed.

\[ ^9 \text{Proof of } (32). \text{ We distinguish between two cases: the case when } m > 0, \text{ and the case when } m = 0. \]
Since \( \{ v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^m v_\sigma(1) \otimes v_\sigma(2) \otimes \ldots \otimes v_\sigma(n) \mid \((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n \} = T \), this rewrites as \( T \subseteq Z \). Proposition 35(a) (applied to \( V^\otimes n \), \( T \) and \( Z \) instead of \( M \), \( S \) and \( Q \)) thus yields that \( \langle T \rangle \subseteq Z \). Combined with \( Z \subseteq \langle T \rangle \), this yields \( Z = \langle T \rangle \).

In the case when \( m > 0 \), we have

\[
\sum_{j=1}^{m} \left( (-1)^{\sigma_j^{-1}} v_{\sigma_{j-1}(1)} \otimes v_{\sigma_{j-1}(2)} \otimes \ldots \otimes v_{\sigma_{j-1}(n)} - (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \right)
\]

\[
= \sum_{j=1}^{m} (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)}
\]

\[
= \sum_{j=1}^{m} (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)}
\]

\[
= (-1)^{\sigma_0} v_{\sigma_0(1)} \otimes v_{\sigma_0(2)} \otimes \ldots \otimes v_{\sigma_0(n)} + \sum_{j=1}^{m-1} (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)}
\]

(here, we substituted \( j \) for \( j-1 \) in the first sum)

\[
= \left( (-1)^{\sigma_0} v_{\sigma_0(1)} \otimes v_{\sigma_0(2)} \otimes \ldots \otimes v_{\sigma_0(n)} + \sum_{j=1}^{m-1} (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \right)
\]

\[
- \sum_{j=1}^{m-1} (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} + (-1)^{\sigma_m} v_{\sigma_m(1)} \otimes v_{\sigma_m(2)} \otimes \ldots \otimes v_{\sigma_m(n)}
\]

\[
= (-1)^{\sigma_0} v_{\sigma_0(1)} \otimes v_{\sigma_0(2)} \otimes \ldots \otimes v_{\sigma_0(n)}
\]

\[
= (-1)^{\sigma_0} v_{\sigma_0(1)} \otimes v_{\sigma_0(2)} \otimes \ldots \otimes v_{\sigma_0(n)}
\]

\[
= v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^m v_{\sigma_1} \otimes v_{\sigma_2} \otimes \ldots \otimes v_{\sigma_n},
\]

so that \([36]\) is proven in the case when \( m > 0 \).

In the case when \( m = 0 \), we have

\[
\sum_{j=1}^{m} \left( (-1)^{\sigma_j^{-1}} v_{\sigma_{j-1}(1)} \otimes v_{\sigma_{j-1}(2)} \otimes \ldots \otimes v_{\sigma_{j-1}(n)} - (-1)^{\sigma_j} v_{\sigma_j(1)} \otimes v_{\sigma_j(2)} \otimes \ldots \otimes v_{\sigma_j(n)} \right)
\]

\[
= \left( (-1)^{\sigma_0} v_{\sigma_0(1)} \otimes v_{\sigma_0(2)} \otimes \ldots \otimes v_{\sigma_0(n)} \right)
\]

\[
= (-1)^{\sigma_0} v_{\sigma_0(1)} \otimes v_{\sigma_0(2)} \otimes \ldots \otimes v_{\sigma_0(n)}
\]

\[
= v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^0 v_{\sigma_1} \otimes v_{\sigma_2} \otimes \ldots \otimes v_{\sigma_n},
\]

so that \([36]\) is proven in the case when \( m = 0 \).

Thus, \([36]\) is proven in both possible cases. This completes the proof of \([36]\).
We now have
\[
\sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle \\
= Z = \langle T \rangle = Q_n(V).
\]
This proves Proposition 38.
A trivial corollary from Proposition 38.

**Corollary 39.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Then,
\[
Q_2(V) = \langle v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \rangle.
\]

**Proof of Corollary 39.** Applying Proposition 38 to \( n = 2 \), we obtain
\[
Q_2(V) = \sum_{i=1}^{2-1} \langle v_1 \otimes v_2 + v_{\tau(1)} \otimes v_{\tau(2)} \mid (v_1, v_2) \in V^2 \rangle \\
= \langle v_1 \otimes v_2 + v_{\tau(1)} \otimes v_{\tau(2)} \mid (v_1, v_2) \in V^2 \rangle = \langle v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \rangle
\]
(since \( \tau_1(1) = 2 \) and \( \tau_2(2) = 1 \)). This proves Corollary 39.

Next something very basic:

**Lemma 40.** Let \( k \) be a commutative ring. Let \( P \) be a \( k \)-algebra.

(a) Let \( X \) and \( Y \) be two sets, and \( a : X \to P \) and \( b : Y \to P \) be two maps. Then,
\[
\langle a(x) \mid x \in X \rangle \cdot \langle b(y) \mid y \in Y \rangle = \langle a(x)b(y) \mid (x, y) \in X \times Y \rangle.
\]

(b) Let \( X, Y \) and \( Z \) be three sets, and \( a : X \to P \), \( b : Y \to P \) and \( c : Z \to P \) be three maps. Then,
\[
\langle a(x) \mid x \in X \rangle \cdot \langle b(y) \mid y \in Y \rangle \cdot \langle c(z) \mid z \in Z \rangle \\
= \langle a(x)b(y)c(z) \mid (x, y, z) \in X \times Y \times Z \rangle.
\]

**Proof of Lemma 40.** (a) Let \( X' = \langle a(x) \mid x \in X \rangle \) and \( Y' = \langle b(y) \mid y \in Y \rangle \).
We will now prove that \( X'Y' \subseteq \langle a(x)b(y) \mid (x, y) \in X \times Y \rangle \) and
\[
\langle a(x)b(y) \mid (x, y) \in X \times Y \rangle \subseteq X'Y'.
\]
Proof of \( X'Y' \subseteq \langle a(x)b(y) \mid (x, y) \in X \times Y \rangle \):
By the definition of the product of two \( k \)-submodules, we have
\[
X'Y' = \langle pq \mid (p, q) \in X' \times Y' \rangle = \langle \{pq \mid (p, q) \in X' \times Y' \} \rangle.
\]
Now, let \( (p, q) \in X' \times Y' \) be arbitrary. Then, \( p \in X' = \langle a(x) \mid x \in X \rangle \), so that we can find some \( n \in \mathbb{N} \), some elements \( x_1, x_2, \ldots, x_n \) of \( X \) and some elements \( \lambda_1, \lambda_2, \ldots, \lambda_n \) of \( k \) such that \( p = \sum_{i=1}^{n} \lambda_i a(x_i) \). Consider this \( n \), these \( x_1, x_2, \ldots, x_n \) and these \( \lambda_1, \lambda_2, \ldots, \lambda_n \).
Since \((p, q) \in X' \times Y'\), we have \(q \in Y' = \langle b \mid y \in Y \rangle\), so that we can find some \(m \in \mathbb{N}\), some elements \(y_1, y_2, \ldots, y_m\) of \(Y\) and some elements \(\mu_1, \mu_2, \ldots, \mu_m\) of \(k\) such that \(q = \sum_{j=1}^{m} \mu_j b(y_j)\). Consider this \(m\), these \(y_1, y_2, \ldots, y_m\) and these \(\mu_1, \mu_2, \ldots, \mu_m\).

Since \(p = \sum_{i=1}^{n} \lambda_i a(x_i)\) and \(q = \sum_{j=1}^{m} \mu_j b(y_j)\), we have

\[
pq = \sum_{i=1}^{n} \lambda_i a(x_i) \cdot \sum_{j=1}^{m} \mu_j b(y_j) = \sum_{i=1}^{n} \sum_{j=1}^{m} \lambda_i \mu_j a(x_i) b(y_j)
\]

\[
\subseteq \sum_{i=1}^{n} \sum_{j=1}^{m} \langle (x) b(y) \mid (x, y) \in X \times Y \rangle
\]

\[
\subseteq \langle (x) b(y) \mid (x, y) \in X \times Y \rangle
\]

(since \(\langle (x) b(y) \mid (x, y) \in X \times Y \rangle\) is a \(k\)-module).

Since this holds for all \((p, q) \in X' \times Y'\), we have thus proven that

\[
\{pq \mid (p, q) \in X' \times Y'\} \subseteq \langle (x) b(y) \mid (x, y) \in X \times Y \rangle.
\]

Therefore, Proposition 33(a) (applied to \(P\), \(\{pq \mid (p, q) \in X' \times Y'\}\) and \(\langle (x) b(y) \mid (x, y) \in X \times Y \rangle\) instead of \(M, S\) and \(Q\)) yields that

\[
\langle \{pq \mid (p, q) \in X' \times Y'\} \rangle \subseteq \langle (x) b(y) \mid (x, y) \in X \times Y \rangle.
\]

Combined with 32, this yields

\[
X'Y' \subseteq \langle (x) b(y) \mid (x, y) \in X \times Y \rangle.
\]

We have thus proven that \(X'Y' \subseteq \langle (x) b(y) \mid (x, y) \in X \times Y \rangle\).

Proof of \(\langle (x) b(y) \mid (x, y) \in X \times Y \rangle \subseteq X'Y'\): We have

\[
X' = \langle (x) \mid x \in X \rangle = \langle \{a(x) \mid x \in X\} \rangle \supseteq \{a(x) \mid x \in X\}.
\]

Thus, \(a(x) \in X'\) for every \(x \in X\). Similarly, \(b(y) \in Y'\) for every \(y \in Y\).

Now, let \((x, y) \in X \times Y\) be arbitrary. Then, \(x \in X\) and \(y \in Y\), so that \(a(x) \in X'\) and \(b(y) \in Y'\) (as we just have seen). Hence, \(a(x) b(y) \in X'Y'\).

We have thus shown that \(a(x) b(y) \in X'Y'\) for every \((x, y) \in X \times Y\). In other words, \(\{a(x) b(y) \mid (x, y) \in X \times Y\} \subseteq X'Y'\). Therefore, Proposition 33(a) (applied to \(P\), \(\{a(x) b(y) \mid (x, y) \in X \times Y\}\) and \(X'Y'\) instead of \(M, S\) and \(Q\)) yields that

\[
\langle \{a(x) b(y) \mid (x, y) \in X \times Y\} \rangle \subseteq X'Y'.
\]

Since \(\langle \{a(x) b(y) \mid (x, y) \in X \times Y\} \rangle = \langle (x) b(y) \mid (x, y) \in X \times Y \rangle\), we have thus proven \(\langle (x) b(y) \mid (x, y) \in X \times Y \rangle \subseteq X'Y'\).

Combined with \(X'Y' \subseteq \langle (x) b(y) \mid (x, y) \in X \times Y \rangle\), this yields that \(X'Y' = \langle (x) b(y) \mid (x, y) \in X \times Y \rangle\). Since \(X' = \langle (x) \mid x \in X \rangle\) and \(Y' = \langle b(y) \mid y \in Y \rangle\), this rewrites as follows:

\[
\langle (x) \mid x \in X \rangle \cdot \langle b(y) \mid y \in Y \rangle = \langle (x) b(y) \mid (x, y) \in X \times Y \rangle.
\]
Thus, Lemma 40 (a) is proven.

(b) Define a map \( d : X \times Y \rightarrow P \) by

\[
(d(x, y) = a(x)b(y) \quad \text{for all} \quad (x, y) \in X \times Y).
\]

Now, Lemma 40 (a) yields

\[
\langle a(x) \mid x \in X \rangle \cdot \langle b(y) \mid y \in Y \rangle = \left\{ \langle a(x)b(y) \mid (x, y) \in X \times Y \rangle \right\}_{(d(x,y))} = \langle d(x, y) \mid (x, y) \in X \times Y \rangle = \langle d(x) \mid x \in X \times Y \rangle.
\]

(here, we renamed the index \((x, y)\) as \(x\)). Also, \(\langle c(z) \mid z \in Z \rangle = \langle c(y) \mid y \in Z \rangle\) (here, we renamed the index \(z\) as \(y\)). But Lemma 40 (a) (applied to \(X \times Y, Z\); \(d\) and \(c\) instead of \(X, Y, a\) and \(b\)) yields

\[
\langle d(x) \mid x \in X \times Y \rangle \cdot \langle c(y) \mid y \in Z \rangle = \langle d(x) \cdot c(y) \mid (x, y) \in (X \times Y) \times Z \rangle.
\]

Thus,

\[
\langle a(x) \mid x \in X \rangle \cdot \langle b(y) \mid y \in Y \rangle \cdot \langle c(z) \mid z \in Z \rangle = \left\{ \langle d(x) \cdot c(y) \mid (x, y) \in (X \times Y) \times Z \rangle \right\}_{(d(x,y))} = \langle d(x, y) \cdot c(z) \mid (x, y, z) \in (X \times Y) \times Z \rangle
\]

(here, we substituted the triple \((x, y, z)\) for the pair \(((x, y), z))\)

\[
= \langle a(x) b(y) c(z) \mid (x, y, z) \in X \times Y \times Z \rangle.
\]

This proves Lemma 40 (b).

The following lemma will help us in making use of Proposition 38.

**Lemma 41.** Let \(k\) be a commutative ring. Let \(V\) be a \(k\)-module. Let \(n \in \mathbb{N}\). Let \(i \in \{1, 2, \ldots, n - 1\}\).

Then,

\[
\left( v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes \ldots \otimes v_{\tau_1(n)} \right) \text{ for all } (v_1, v_2, \ldots, v_n) \in V^n
\]

\[
= V^{\otimes (i-1)} \cdot (Q_2(V)) \cdot V^{\otimes (n-1-i)},
\]

where \(\tau_i\) denotes the transposition \((i, i+1)\) in \(S_n\). Here, we consider \(V^{\otimes n}\) as a \(k\)-submodule of \(\otimes V\).
Proof of Lemma 41. Define a map \( a : V^{i-1} \to V^\otimes (i-1) \) by
\[
(a(v_1, v_2, ..., v_{i-1}) = v_1 \otimes v_2 \otimes ... \otimes v_{i-1} \quad \text{for every } (v_1, v_2, ..., v_{i-1}) \in V^{i-1}).
\]
Define a map \( b : V^2 \to V^\otimes 2 \) by
\[
(b(v_i, v_{i+1}) = v_i \otimes v_{i+1} + v_{i+1} \otimes v_i \quad \text{for every } (v_i, v_{i+1}) \in V^2).
\]
Define a map \( c : V^{n-1-i} \to V^\otimes (n-1-i) \) by
\[
(c(v_{i+2}, v_{i+3}, ..., v_n) = v_{i+2} \otimes v_{i+3} \otimes ... \otimes v_n \quad \text{for every } (v_{i+2}, v_{i+3}, ..., v_n) \in V^{n-1-i}).
\]
Since \( V^\otimes (i-1) \), \( V^\otimes 2 \) and \( V^\otimes (n-1-i) \) are \( k \)-submodules of \( \otimes V \), we can consider all three maps \( a \), \( b \) and \( c \) as maps to the set \( \otimes V \).

It is now easy to see that every \((v_1, v_2, ..., v_n) \in V^n\) satisfies
\[
v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes ... \otimes v_{\tau_1(n)} = a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n),
\]
where the multiplication on the right hand side is the multiplication in the tensor.
Thus,
\[
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle
\]
\[
= (a (v_1, v_2, \ldots, v_{i-1}) \cdot b (v_{i+1}) \cdot c (v_{i+2}, v_{i+3}, \ldots, v_n) \mid (v_1, v_2, \ldots, v_n) \in V^n)
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \cdot b (v_{i+1}) \cdot c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
\text{(here, we substituted the triple } ((v_1, v_2, \ldots, v_{i-1}), (v_{i+1}), (v_{i+2}, v_{i+3}, \ldots, v_n)) \text{ for the } n\text{-tuple } (v_1, v_2, \ldots, v_n)\]
\[
= \langle a (x) b (y) c (z) \mid (x, y, z) \in V^1 \times V^2 \times V^{n-1-i} \rangle
\]
(34)
\[
\text{(here, we renamed } ((v_1, v_2, \ldots, v_{i-1}), (v_{i+1}), (v_{i+2}, v_{i+3}, \ldots, v_n)) \text{ as } (x, y, z)\).
\]

Proof. Let \((v_1, v_2, \ldots, v_n) \in V^n\). Then, recalling Convention 12 we have
\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n = (v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1}) \otimes (v_i \otimes v_{i+1}) \otimes (v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n)
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes (v_i \otimes v_{i+1}) \otimes (v_{i+2}, v_{i+3}, \ldots, v_n).
\]  
(33)

On the other hand, every \(j \in \{1, 2, \ldots, i-1\}\) satisfies \(\tau (j) = j\) (since \(\tau_i\) is the transposition \((i, i+1)\)) and thus \(v_{\tau(j)} = v_j\). In other words, we have the equalities \(v_{\tau(1)} = v_1, v_{\tau(2)} = v_2, \ldots, v_{\tau(i-1)} = v_{i-1}\). Taking the tensor product of these equalities yields
\[
v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(i-1)} = v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} = a (v_1, v_2, \ldots, v_{i-1}).
\]

Every \(j \in \{i+2, i+3, \ldots, n\}\) satisfies \(\tau (j) = j\) (since \(\tau_i\) is the transposition \((i, i+1)\)) and thus \(v_{\tau(j)} = v_j\). In other words, we have the equalities \(v_{\tau(i+2)} = v_{i+2}, v_{\tau(i+3)} = v_{i+3}, \ldots, v_{\tau(n)} = v_n\). Taking the tensor product of these equalities yields
\[
v_{\tau(i+2)} \otimes v_{\tau(i+3)} \otimes \ldots \otimes v_{\tau(n)} = v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n = c (v_{i+2}, v_{i+3}, \ldots, v_n).
\]

Since \(\tau_i\) is the transposition \((i, i+1)\), we have \(\tau_i (i) = i+1\) and \(\tau_i (i+1) = i\). These equalities yield \(v_{\tau_i (i)} = v_{i+1}\) and \(v_{\tau_i (i+1)} = v_i\), respectively.

Now,
\[
v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)}
\]
\[
= (v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(i-1)}) \otimes (v_{\tau(i)} \otimes v_{\tau(i+1)}) \otimes (v_{\tau(i+2)} \otimes v_{\tau(i+3)} \otimes \ldots \otimes v_{\tau(n)})
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes (v_i \otimes v_{i+1}) \otimes (v_{i+2}, v_{i+3}, \ldots, v_n).
\]

Adding this to (33), we get
\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)}
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes (v_i \otimes v_{i+1}) \otimes c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
+ a (v_1, v_2, \ldots, v_{i-1}) \otimes (v_i \otimes v_{i+1}) \otimes c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes (v_i \otimes v_{i+1} + v_{i+1} \otimes v_i) \otimes c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
= b (v_{i+1})
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes b (v_{i+1}) \otimes c (v_{i+2}, v_{i+3}, \ldots, v_n).
\]

On the other hand, 3 (applied to \((v_1, v_2, \ldots, v_{i-1}), b (v_i, v_{i+1}), i-1\) and 2 instead of \(a, b, n\) and \(m\) yields
\[
a (v_1, v_2, \ldots, v_{i-1}) \cdot b (v_i, v_{i+1}) = a (v_1, v_2, \ldots, v_{i-1}) \otimes b (v_i, v_{i+1})
\]
Also, 3 (applied to \((v_1, v_2, \ldots, v_{i-1}), b (v_i, v_{i+1}), c (v_{i+2}, v_{i+3}, \ldots, v_n), i+1\) and \(n-1-i\) instead of \(a, b, n\) and \(m\) yields
\[
a (v_1, v_2, \ldots, v_{i-1}) \cdot b (v_i, v_{i+1}) \cdot c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes b (v_i, v_{i+1}) \otimes c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
= a (v_1, v_2, \ldots, v_{i-1}) \otimes b (v_i, v_{i+1}) \otimes c (v_{i+2}, v_{i+3}, \ldots, v_n)
\]
\[
= v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)}.
\]

qed.
But Lemma \[40\] (b) (applied to \(X = V^{i-1}, Y = V^2, Z = V^{n-1-i}\) and \(P = \otimes V\)) yields

\[
\langle a(x) \mid x \in V^{i-1} \rangle \cdot \langle b(y) \mid y \in V^2 \rangle \cdot \langle c(z) \mid z \in V^{n-1-i} \rangle
\]

\[
= \langle a(x) b(y) c(z) \mid (x, y, z) \in V^{i-1} \times V^2 \times V^{n-1-i} \rangle.
\]

Compared to \[34\], this yields

\[
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle
\]

\[
= \langle a(x) \mid x \in V^{i-1} \rangle \cdot \langle b(y) \mid y \in V^2 \rangle \cdot \langle c(z) \mid z \in V^{n-1-i} \rangle.
\]

But

\[
\langle a(x) \mid x \in V^{i-1} \rangle = \left\langle a(v_1, v_2, \ldots, v_{i-1}) \mid (v_1, v_2, \ldots, v_{i-1}) \in V^{i-1} \right\rangle
\]

(here, we renamed \(x\) as \((v_1, v_2, \ldots, v_{i-1})\))

\[
= \langle v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} \mid (v_1, v_2, \ldots, v_{i-1}) \in V^{i-1} \rangle = V^{\otimes (i-1)}
\]

(since the \(k\)-module \(V^{\otimes (i-1)}\) is generated by its pure tensors, i. e., by tensors of the form \(v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1}\) with \((v_1, v_2, \ldots, v_{i-1}) \in V^{i-1}\)). Also,

\[
\langle c(z) \mid z \in V^{n-1-i} \rangle = \left\langle c(v_{i+2}, v_{i+3}, \ldots, v_n) \mid (v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i} \right\rangle
\]

(here, we renamed \(z\) as \((v_{i+2}, v_{i+3}, \ldots, v_n)\))

\[
= \langle v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n \mid (v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i} \rangle = V^{\otimes (n-1-i)}
\]

(since the \(k\)-module \(V^{\otimes (n-1-i)}\) is generated by its pure tensors, i. e., by tensors of the form \(v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n\) with \((v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i}\)). Also,

\[
\langle b(y) \mid y \in V^2 \rangle = \left\langle b(v_i, v_{i+1}) \mid (v_i, v_{i+1}) \in V^2 \right\rangle
\]

(here, we renamed \(y\) as \((v_i, v_{i+1})\))

\[
= \langle v_i \otimes v_{i+1} + v_{i+1} \otimes v_i \mid (v_i, v_{i+1}) \in V^2 \rangle
\]

\[
= \langle v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \rangle
\]

(here, we renamed \((v_i, v_{i+1})\) as \((v_1, v_2)\))

\[
= Q_2(V) \quad \text{(by Corollary \[39\]).}
\]

Thus, \[35\] becomes

\[
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle
\]

\[
= \langle a(x) \mid x \in V^{i-1} \rangle \cdot \langle b(y) \mid y \in V^2 \rangle \cdot \langle c(z) \mid z \in V^{n-1-i} \rangle
\]

\[
= V^{\otimes (i-1)} \cdot (Q_2(V)) \cdot V^{\otimes (n-1-i)};
\]

so that Lemma \[41\] is proven.

This lemma yields:
Corollary 42. Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$. Then,

$$Q_n(V) = \sum_{i=1}^{n-1} V^{\otimes(i-1)} \cdot (Q_2(V)) \cdot V^{\otimes(n-1-i)}$$

(this is an equality between $k$-submodules of $\otimes V$, where $Q_n(V)$ becomes such a $k$-submodule by means of the inclusion $Q_n(V) \subseteq V^{\otimes n} \subseteq \otimes V$). Here, the multiplication on the right hand side is multiplication inside the $k$-algebra $\otimes V$.

Proof of Corollary 42. For every $i \in \{1, 2, ..., i - 1\}$, let $\tau_i$ denote the transposition $(i, i+1) \in S_n$. Then, by Proposition 38 we have

$$Q_n(V) = \sum_{i=1}^{n-1} \left\langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes ... \otimes v_{\tau_i(n)} \mid (v_1, v_2, ..., v_n) \in V^n \right\rangle$$

$$= V^{\otimes(i-1)} \cdot (Q_2(V)) \cdot V^{\otimes(n-1-i)} \quad \text{(by Lemma 41)}$$

Thus, Corollary 42 is proven.

Thus, Corollary 42 is proven. We now claim that:

Theorem 43. Let $k$ be a commutative ring. Let $V$ be a $k$-module. We know that $Q_n(V)$ is a $k$-submodule of $V^{\otimes n}$ for every $n \in \mathbb{N}$. Thus, $\bigoplus_{n \in \mathbb{N}} Q_n(V)$ is a $k$-submodule of $\bigoplus_{n \in \mathbb{N}} V^{\otimes n} = \otimes V$. This $k$-submodule satisfies

$$\bigoplus_{n \in \mathbb{N}} Q_n(V) = (\otimes V) \cdot (Q_2(V)) \cdot (\otimes V).$$
Proof of Theorem 43. Working inside $\otimes V$, we have

$$\bigoplus_{n \in \mathbb{N}} Q_n(V) = \sum_{n \in \mathbb{N}} \sum_{i=0}^{n-2} V^{\otimes i} \cdot (Q_2(V)) \cdot V^{\otimes (n-1-i)} (\text{by Corollary 42})$$

$$= \sum_{n \in \mathbb{N}} \sum_{i=0}^{n-2} V^{\otimes i} \cdot (Q_2(V)) \cdot V^{\otimes (n-1-(i+1))}$$

$$= \sum_{i \in \mathbb{N}; \ n \geq i+2} V^{\otimes i} \cdot (Q_2(V)) \cdot V^{\otimes (n-(i+2))}$$

(here, we substituted $i$ for $i-1$ in the second sum)

$$= \sum_{i \in \mathbb{N}; \ n \geq i+2} V^{\otimes i} \cdot (Q_2(V)) \cdot \sum_{j \in \mathbb{N}} V^{\otimes j}$$

(here, we substituted $j$ for $n-(i+2)$ in the second sum)

$$= \left( \sum_{i \in \mathbb{N}} V^{\otimes i} \right) \cdot (Q_2(V)) \cdot \left( \sum_{j \in \mathbb{N}} V^{\otimes j} \right)$$

(by (26) = $\otimes V$ by (27) = $\otimes V$)

$$= (\otimes V) \cdot (Q_2(V)) \cdot (\otimes V).$$

This proves Theorem 43.

Now we can finally define the pseudoexterior algebra:

**Definition 44.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. By Theorem 43, the two $k$-submodules $\bigoplus_{n \in \mathbb{N}} Q_n(V)$ and $(\otimes V) \cdot (Q_2(V)) \cdot (\otimes V)$ of $\otimes V$ are identical (where $\bigoplus_{n \in \mathbb{N}} Q_n(V)$ becomes a $k$-submodule of $\otimes V$ in the same way as explained in Theorem 43). We denote these two identical $k$-submodules by $Q(V)$. In other words, we define $Q(V)$ by

$$Q(V) = \bigoplus_{n \in \mathbb{N}} Q_n(V) = (\otimes V) \cdot (Q_2(V)) \cdot (\otimes V).$$

Since $Q(V) = (\otimes V) \cdot (Q_2(V)) \cdot (\otimes V)$, it is clear that $Q(V)$ is a two-sided ideal of the $k$-algebra $\otimes V$.  

42
Now we define a $k$-module $\text{Exter} V$ as the direct sum $\bigoplus_{n \in \mathbb{N}} \text{Exter}^n V$. Then,

$$\text{Exter} V = \bigoplus_{n \in \mathbb{N}} \text{Exter}^n V = \bigoplus_{n \in \mathbb{N}} \left( V^{\otimes n} / Q_n(V) \right) \cong \left( \bigoplus_{n \in \mathbb{N}} V^{\otimes n} \right) / \left( \bigoplus_{n \in \mathbb{N}} Q_n(V) \right) = (\otimes V) / Q(V).$$

This is a canonical isomorphism, so we will use it to identify $\text{Exter} V$ with $(\otimes V) / Q(V)$. Since $Q(V)$ is a two-sided ideal of the $k$-algebra $\otimes V$, the quotient $k$-module $(\otimes V) / Q(V)$ canonically becomes a $k$-algebra. Since $\text{Exter} V = (\otimes V) / Q(V)$, this means that $\text{Exter} V$ becomes a $k$-algebra. We refer to this $k$-algebra as the \textit{pseudoexterior algebra} of the $k$-module $V$.

We denote by $\text{ext} V$ the canonical projection $\otimes V \to (\otimes V) / Q(V) = \text{Exter} V$. Clearly, this map $\text{ext} V$ is a surjective $k$-algebra homomorphism. Besides, due to $\otimes V = \bigoplus_{n \in \mathbb{N}} V^{\otimes n}$ and $Q(V) = \bigoplus_{n \in \mathbb{N}} Q_n(V)$, it is clear that the canonical projection $\otimes V \to (\otimes V) / Q(V)$ is the direct sum of the canonical projections $V^{\otimes n} \to V^{\otimes n} / Q_n(V)$ over all $n \in \mathbb{N}$. Since the canonical projection $\otimes V \to (\otimes V) / Q(V)$ is the map $\text{ext} V$, whereas the canonical projection $V^{\otimes n} \to V^{\otimes n} / Q_n(V)$ is the map $\text{ext} V_n$, this rewrites as follows: The map $\text{ext} V$ is the direct sum of the maps $\text{ext} V_n$ over all $n \in \mathbb{N}$.

We now prove a first, almost trivial result about the $Q(V)$:

\textbf{Lemma 45.} Let $k$ be a commutative ring. Let $V$ and $W$ be two $k$-modules. Let $f : V \to W$ be a $k$-module homomorphism.

(a) Then, the $k$-algebra homomorphism $\otimes f : \otimes V \to \otimes W$ satisfies $(\otimes f)(Q(V)) \subseteq Q(W)$. Also, for every $n \in \mathbb{N}$, the $k$-module homomorphism $f^{\otimes n} : V^{\otimes n} \to W^{\otimes n}$ satisfies $f^{\otimes n}(Q_n(V)) \subseteq Q_n(W)$.

(b) Assume that $f$ is surjective. Then, the $k$-algebra homomorphism $\otimes f : \otimes V \to \otimes W$ satisfies $(\otimes f)(Q(V)) = Q(W)$. Also, for every $n \in \mathbb{N}$, the $k$-module homomorphism $f^{\otimes n} : V^{\otimes n} \to W^{\otimes n}$ satisfies $f^{\otimes n}(Q_n(V)) = Q_n(W)$.

\textbf{Proof of Lemma 45.} (a) Fix some $n \in \mathbb{N}$. For every $i \in \{1, 2, ..., n-1\}$, let $\tau_i$ denote the transposition $(i, i+1) \in S_n$. Then, the definition of $Q_n(V)$ yields

$$Q_n(V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes ... \otimes v_{\tau_i(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle,$$

whereas the definition of $Q_n(W)$ yields

$$Q_n(W) = \sum_{i=1}^{n-1} \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{\tau_i(1)} \otimes w_{\tau_i(2)} \otimes ... \otimes w_{\tau_i(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle.$$

Now it is easy to see that every $i \in \{1, 2, ..., n-1\}$ satisfies

$$f^{\otimes n} \left( \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes ... \otimes v_{\tau_i(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle \right)$$

$$\subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{\tau_i(1)} \otimes w_{\tau_i(2)} \otimes ... \otimes w_{\tau_i(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle.$$

(38)
Now, (36) yields
\[ f^{\otimes n} (Q_n (V)) \]
\[ = f^{\otimes n} \left( \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle \right) \]
\[ = \sum_{i=1}^{n-1} f^{\otimes n} \left( \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle \right) \]
\[ \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle \] (by (38))
(since \( f^{\otimes n} \) is linear)
\[ \subseteq \sum_{i=1}^{n-1} \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle \]
\[ = Q_n (W) . \]

Proof. Fix some \( i \in \{1, 2, ..., n-1\} \). Let \( S \) be the set
\[ \{ v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \} \].

It is clear that every \( (v_1, v_2, ..., v_n) \in V^n \) satisfies
\[ f^{\otimes n} \left( v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \right) \]
\[ = f (v_1) \otimes f (v_2) \otimes ... \otimes f (v_n) + f (v_{r_1(1)}) \otimes f (v_{r_1(2)}) \otimes ... \otimes f (v_{r_1(n)}) \]
\[ \in \{ w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \} \]
\[ \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle \]
\[ = \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle . \]

In other words,
\[ \{ f^{\otimes n} \left( v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \right) \mid (v_1, v_2, ..., v_n) \in V^n \} \]
\[ \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle . \]

Since
\[ f^{\otimes n} \left( v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \right) \]
\[ = f^{\otimes n} \left( \begin{array}{c} v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \\ = S \end{array} \right) \]
\[ \in \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle \]
\[ = f^{\otimes n} (S) , \]
this rewrites as
\[ f^{\otimes n} (S) \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle . \]

By Proposition 35 (a) (applied to \( f^{\otimes n} (S) \), \( W^{\otimes n} \) and \( \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle \) instead of \( S, M \) and \( Q \)), this yields
\[ \langle f^{\otimes n} (S) \rangle \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle . \]

But by Proposition 35 (b) (applied to \( f^{\otimes n}\), \( V^{\otimes n} \) and \( W^{\otimes n} \) instead of \( f, M \) and \( R \)), we have
\[ f^{\otimes n} (\langle S \rangle ) = \langle f^{\otimes n} (S) \rangle \]
\[ = \langle f^{\otimes n} (S) \rangle \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle . \]

Since
\[ \langle S \rangle = \{ \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \} \}
\[ \text{(because } S = \{ v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \} \}
\[ = \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle , \]
this becomes
\[ f^{\otimes n} \left( \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{r_1(1)} \otimes v_{r_1(2)} \otimes ... \otimes v_{r_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle \right) \]
\[ \subseteq \langle w_1 \otimes w_2 \otimes ... \otimes w_n + w_{r_1(1)} \otimes w_{r_1(2)} \otimes ... \otimes w_{r_1(n)} \mid (w_1, w_2, ..., w_n) \in W^n \rangle , \]
qed.
Thus, we have shown that
def for every $n \in \mathbb{N}$, we have $f^{\otimes n}(Q_n(V)) \subseteq Q_n(W)$. (39)

Now forget that we fixed $n$. Since the map $\otimes f$ is the direct sum of the maps $f^{\otimes n} : V^{\otimes n} \to W^{\otimes n}$ for all $n \in \mathbb{N}$, we have $(\otimes f)(x) = f^{\otimes n}(x)$ for every $n \in \mathbb{N}$ and every $x \in V^{\otimes n}$. Thus, for every $n \in \mathbb{N}$, we have $(\otimes f)(Q_n(V)) = \begin{cases} f^{\otimes n}(Q_n(V)) & \text{if } x \in Q_n(V) \text{ and } \otimes f(x) \in V^{\otimes n} \\ \text{since } xeQ_n(V)\subseteq V^{\otimes n} \end{cases} = f^{\otimes n}(Q_n(V)) = f^{\otimes n}(Q_n(V)) \in Q_n(W)$. 

This completes the proof of Lemma 45 (a).

(b) Fix some $n \in \mathbb{N}$. For every $i \in \{1, 2, ..., n - 1\}$, it is easy to prove (using the surjectivity of $f$) that

$$f^{\otimes n}\left(\left\langle v_1 \otimes v_2 \otimes \cdots \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes \cdots \otimes v_{\tau_1(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n\right\rangle\right) = \left\langle w_1 \otimes w_2 \otimes \cdots \otimes w_n + w_{\tau_1(1)} \otimes w_{\tau_1(2)} \otimes \cdots \otimes w_{\tau_1(n)} \mid (w_1, w_2, \ldots, w_n) \in W^n\right\rangle. (40)$$

Proof of (40). Fix some $i \in \{1, 2, ..., n - 1\}$. Then, every $(w_1, w_2, ..., w_n) \in W^n$ satisfies

$$w_1 \otimes w_2 \otimes \cdots \otimes w_n + w_{\tau_1(1)} \otimes w_{\tau_1(2)} \otimes \cdots \otimes w_{\tau_1(n)} \in f^{\otimes n}\left(\left\langle v_1 \otimes v_2 \otimes \cdots \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes \cdots \otimes v_{\tau_1(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n\right\rangle\right).$$

In other words,

$$\left\langle w_1 \otimes w_2 \otimes \cdots \otimes w_n + w_{\tau_1(1)} \otimes w_{\tau_1(2)} \otimes \cdots \otimes w_{\tau_1(n)} \mid (w_1, w_2, \ldots, w_n) \in W^n\right\rangle \subseteq f^{\otimes n}\left(\left\langle v_1 \otimes v_2 \otimes \cdots \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes \cdots \otimes v_{\tau_1(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n\right\rangle\right).$$

12Proof. Let $(w_1, w_2, ..., w_n) \in W^n$. For every $i \in \{1, 2, ..., n\}$, there exists some $z_i \in V$ such that $w_i = f(z_i)$ (since $f$ is surjective). Fix such a $z_i$ for each $i \in \{1, 2, ..., n\}$. Then, $w_1 = f(z_1)$, $w_2 = f(z_2)$, ..., $w_n = f(z_n)$. Taking the tensor product of these equalities, we get $w_1 \otimes w_2 \otimes \cdots \otimes w_n = f(z_1) \otimes f(z_2) \otimes \cdots \otimes f(z_n)$. Also, since $w_i = f(z_i)$ for each $i \in \{1, 2, ..., n\}$, we have $w_{\tau_1(i)} = f(z_{\tau_1(i)})$, $w_{\tau_2(i)} = f(z_{\tau_2(i)})$, ..., $w_{\tau_n(i)} = f(z_{\tau_n(i)})$. Taking the tensor product of these equalities, we get $w_{\tau_1(1)} \otimes w_{\tau_1(2)} \otimes \cdots \otimes w_{\tau_1(n)} = f(z_{\tau_1(1)}) \otimes f(z_{\tau_1(2)}) \otimes \cdots \otimes f(z_{\tau_1(n)})$. Now, by the definition of $f^{\otimes n}$, we have

$$f^{\otimes n}\left(z_1 \otimes z_2 \otimes \cdots \otimes z_n + z_{\tau_1(1)} \otimes z_{\tau_1(2)} \otimes \cdots \otimes z_{\tau_1(n)}\right) = f(z_1) \otimes f(z_2) \otimes \cdots \otimes f(z_n) + f(z_{\tau_1(1)}) \otimes f(z_{\tau_1(2)}) \otimes \cdots \otimes f(z_{\tau_1(n)}) = w_1 \otimes w_2 \otimes \cdots \otimes w_n + w_{\tau_1(1)} \otimes w_{\tau_1(2)} \otimes \cdots \otimes w_{\tau_1(n)}.$$
Applying Proposition 35 (a) to
\[ \left\{ w_1 \otimes w_2 \otimes \ldots \otimes w_n + w_{\tau_1(1)} \otimes w_{\tau_1(2)} \otimes \ldots \otimes w_{\tau_1(n)} \mid (w_1, w_2, \ldots, w_n) \in W^n \right\}, \]
we have used (38) to show that (\(f \otimes n\)) (\(Q_n(V)\)) satisfies (\(\otimes f\)) (\(Q(V)\)) \(\subseteq Q(W)\). In the same way, we can use (40) to prove that (\(f \otimes n\)) (\(Q_n(V)\)) \(= Q_n(W)\) (in the situation of Lemma 45 (b)).

Thus, for every \(n \in \mathbb{N}\), we have
\[ f^{\otimes n} \left( Q_n(V) \right) = Q_n(W). \quad (41) \]

In the proof of Lemma 45 (a), we have used (39) to conclude that (\(\otimes f\)) (\(Q(V)\)) \(\subseteq Q(W)\). In the same way, we can use (41) to conclude that (\(\otimes f\)) (\(Q(V)\)) \(= Q(W)\) (in the situation of Lemma 45 (b)). This completes the proof of Lemma 45 (b).

**Remark.** The above proof of Lemma 45 uses the definition of \(Q(V)\) as \(\bigoplus_{n \in \mathbb{N}} Q_n(V)\). We could just as well have proven Lemma 45 using the definition of \(Q(V)\) as \((\otimes V) \cdot (\otimes V)\).

The pseudoexterior algebra is (just as most other constructions we did above) functorial in \(V\). This means that:

**Definition 46.** Let \(k\) be a commutative ring. Let \(V\) and \(W\) be two \(k\)-modules. Let \(f : V \to W\) be a \(k\)-module homomorphism. Then, the \(k\)-algebra homomorphism 
\[ \otimes f : \otimes V \to \otimes W \]

satisfies (\(\otimes f\)) (\(Q(V)\)) \(\subseteq Q(W)\) (by Lemma 45 (a)), and thus gives
rise to a $k$-algebra homomorphism $(\otimes V) \otimes (\otimes W) \to (\otimes W) \otimes (\otimes V)$. This latter $k$-

algebra homomorphism will be denoted by $\text{Exter} f$. Since $(\otimes V) \otimes (\otimes V) = \text{Exter} V$ and $(\otimes W) \otimes (\otimes W) = \text{Exter} W$, this homomorphism $\text{Exter} f : (\otimes V) \otimes (\otimes V) \to (\otimes W) \otimes (\otimes W)$ is actually a homomorphism from $\text{Exter} V$ to $\text{Exter} W$. By the construction of $\text{Exter} f$, the diagram

\[
\begin{array}{ccc}
\otimes V & \xrightarrow{\otimes f} & \otimes W \\
\downarrow \text{exter}_V & & \downarrow \text{exter}_W \\
\text{Exter} V & \xrightarrow{\text{Exter} f} & \text{Exter} W
\end{array}
\] (42)

commutes (since $\text{exter}_V$ is the canonical projection $\otimes V \to \text{Exter} V$ and since $\text{exter}_W$ is the canonical projection $\otimes W \to \text{Exter} W$).

As a consequence of Lemma 45 (b), we have:

**Proposition 47.** Let $k$ be a commutative ring. Let $V$ and $W$ be two $k$-modules. Let $f : V \to W$ be a surjective $k$-module homomorphism. Then:

(a) The $k$-module homomorphism $f^{\otimes n} : V^{\otimes n} \to W^{\otimes n}$ is surjective for every $n \in \mathbb{N}$.

(b) The $k$-algebra homomorphism $\otimes f : \otimes V \to \otimes W$ is surjective.

(c) The $k$-algebra homomorphism $\text{Exter} f : \text{Exter} V \to \text{Exter} W$ is surjective.

**Proof of Proposition 47.** (a) Let $n \in \mathbb{N}$. Lemma 24 (applied to $f_i = f$) yields that the map $f \otimes f \otimes \ldots \otimes f$ is surjective. Since $f^{\otimes n} = f \otimes f \otimes \ldots \otimes f$, this yields that the map $f^{\otimes n}$ is surjective. This proves Proposition 47 (a).

(b) We defined the map $\otimes f$ as the direct sum of the maps $f^{\otimes n}$ for all $n \in \mathbb{N}$. Since the maps $f^{\otimes n}$ are surjective (by Proposition 47 (a)), this yields that the map $\otimes f$ is surjective (since the direct sum of surjective maps is always surjective). This proves Proposition 47 (b).

(c) Since the diagram (42) commutes, we have $\text{exter}_W \circ (\otimes f) = (\text{Exter} f) \circ \text{exter}_V$. Now, the map $\text{exter}_W$ is surjective (since it is the canonical projection $\otimes W \to \text{Exter} W$), and the map $\otimes f$ is surjective (by Proposition 47 (b)). Hence, the map $\text{exter}_W \circ (\otimes f)$ is surjective (since the composition of surjective maps is always surjective). Since $\text{exter}_W \circ (\otimes f) = (\text{Exter} f) \circ \text{exter}_V$, this yields that the map $(\text{Exter} f) \circ \text{exter}_V$ is surjective. Hence, the map $\text{Exter} f$ is surjective (because if $\alpha$ and $\beta$ are two maps such that the composition $\alpha \circ \beta$ is surjective, then $\alpha$ must itself be surjective). This proves Proposition 47 (c).

0.13. The kernel of $\text{Exter} f$

We will now formulate a result about the kernel of $\text{Exter} f$ for a $k$-module map $f$ (similar to Theorem 32, but with a twist):

**Theorem 48.** Let $k$ be a commutative ring. Let $V$ and $V'$ be two $k$-modules, and let $f : V \to V'$ be a surjective $k$-module homomorphism. Then, the kernel of the
map \( \text{Exter} f : \text{Exter} V \to \text{Exter} V' \) is
\[
\text{Ker} (\text{Exter} f) = (\text{Exter} V) \cdot \text{exter}_V (\text{Ker} f) \cdot (\text{Exter} V) = (\text{Exter} V) \cdot \text{exter}_V (\text{Ker} f) = \text{exter}_V (\text{Ker} f) \cdot (\text{Exter} V).
\]

Here, \( \text{Ker} f \) is considered a \( k \)-submodule of \( \otimes V \) by means of the inclusion \( \text{Ker} f \subseteq V = V^\otimes 1 \subseteq \otimes V \).

Note that the \( \text{Ker} (\text{Exter} V) = (\text{Exter} V) \cdot \text{exter}_V (\text{Ker} f) \cdot (\text{Exter} V) \) part of this theorem will be a rather quick application of Proposition \[15\] to the results of Theorem \[32\] and Proposition \[47\] (c). It is slightly less clear how to show the \( (\text{Exter} V) \cdot \text{exter}_V (\text{Ker} f) \cdot (\text{Exter} V) = (\text{Exter} V) \cdot \text{exter}_V (\text{Ker} f) \cdot (\text{Exter} V) \) part. We will do this using the following lemma:

**Lemma 49.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Let \( A \) be a \( k \)-algebra, and let \( \pi : \otimes V \to A \) be a surjective \( k \)-algebra homomorphism. Let \( M \) be a \( k \)-submodule of \( A \) such that \( M \cdot \pi (V) \subseteq M \). Then, \( M \) is a right ideal of \( A \).

**Proof of Lemma 49.** We claim that for every \( n \in \mathbb{N} \), we have
\[
M \cdot \pi (V^\otimes n) \subseteq M. \tag{43}
\]

**Proof of (43).** We are going to prove (43) by induction over \( n \):

**Induction step:** For \( n = 0 \), we have
\[
M \cdot \pi \left( V^\otimes n \right) = M \cdot \pi (k \cdot 1) = M \cdot k \cdot \pi (1) = M \cdot k \cdot 1 = M
\]
(since \( M \) is a \( k \)-module). Thus, (43) is true for \( n = 0 \). This completes the induction base.

**Induction step:** Let \( m \in \mathbb{N} \). Assume that (43) holds for \( n = m \). We now must prove that (43) holds for \( n = m + 1 \).

Since (43) holds for \( n = m \), we have \( M \cdot \pi (V^\otimes m) \subseteq M \). Since \( V^\otimes (m + 1) = V \cdot V^\otimes m \), we have
\[
\pi (V^\otimes (m + 1)) = \pi (V \cdot V^\otimes m) = \pi (V) \cdot \pi (V^\otimes m) \quad (\text{since } \pi \text{ is a } k \text{-algebra homomorphism}),
\]
so that
\[
M \cdot \pi (V^\otimes (m + 1)) = M \cdot \pi (V) \cdot \pi (V^\otimes m) \subseteq M \cdot \pi (V^\otimes m) \subseteq M.
\]

---

\[13\] Proof. Every \( v \in V \) and \( w \in V^\otimes m \) satisfy \( v \cdot w = v \otimes w \) (by \[3\], applied to \( n = 1 \), \( a = v \) and \( b = w \)). In other words, every \( (v, w) \in V \times V^\otimes m \) satisfies \( v \cdot w = v \otimes w \). Thus,
\[
V \cdot V^\otimes m = \left\{ v \cdot w \mid (v, w) \in V \times V^\otimes m \right\} = \left\{ v \otimes w \mid (v, w) \in V \times V^\otimes m \right\}.
\]

Compared with \( V^\otimes (m + 1) = V \otimes V^\otimes m = \left\{ v \otimes w \mid (v, w) \in V \times V^\otimes m \right\} \) (since a tensor product is generated by its pure tensors), this yields \( V^\otimes (m + 1) = V \cdot V^\otimes m \), qed.
In other words, \((43)\) holds for \(n = m + 1\). This completes the induction step.

Thus, the induction proof of \((43)\) is complete.

Now that \((43)\) is proven, we notice that

\[
\otimes V = \bigoplus_{n \in \mathbb{N}} V^\otimes n = \sum_{n \in \mathbb{N}} V^\otimes n \quad \text{(since direct sums are sums)},
\]

so that

\[
\pi(\otimes V) = \pi \left( \sum_{n \in \mathbb{N}} V^\otimes n \right) = \sum_{n \in \mathbb{N}} \pi \left( V^\otimes n \right) \quad \text{(since \(\pi\) is linear)}.
\]

Since \(\pi(\otimes V) = A\) (because \(\pi\) is surjective), this becomes \(A = \sum_{n \in \mathbb{N}} \pi(V^\otimes n)\). Thus,

\[
M \cdot A = M \cdot \sum_{n \in \mathbb{N}} \pi(V^\otimes n) = \sum_{n \in \mathbb{N}} M \cdot \pi(V^\otimes n) \subseteq \sum_{n \in \mathbb{N}} M \subseteq M
\]

(since \(M\) is a \(k\)-module). In other words, \(M\) is a right ideal of \(A\). This proves Lemma 49.

**Corollary 50.** Let \(k\) be a commutative ring. Let \(V\) be a \(k\)-module, and let \(W\) be a \(k\)-submodule of \(V\). Then,

\[(\text{Exter} V) \cdot \text{exter}_W(W) \cdot (\text{Exter} V) = (\text{Exter} V) \cdot \text{exter}_V(W) = \text{exter}_V(W) \cdot (\text{Exter} V).
\]

Here, \(W\) is considered a \(k\)-submodule of \(\otimes V\) by means of the inclusion \(W \subseteq V = V^\otimes 1 \subseteq \otimes V\).

**Proof of Corollary 50.** (i) We have \(V \cdot W + Q_2(V) = W \cdot V + Q_2(V)\) (as \(k\)-submodules of \(\otimes V\)).

**Proof.** Let \((v, w) \in V \times W\) be arbitrary. Then,

\[
\underbrace{v \cdot w}_{(v, w) \in \otimes V} + \underbrace{w \cdot v}_{(v, w) \in \otimes V} = v \otimes w + w \otimes v \in \{v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2\} \\
\subseteq \langle \{v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2\} \rangle = \langle v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2\rangle = Q_2(V)
\]

(by Corollary 39), so that

\[
v \cdot w \in Q_2(V) - \underbrace{w \cdot v}_{(v, w) \in \otimes V} = Q_2(V) - W \cdot V = Q_2(V) + W \cdot V \quad \text{(since \(W \cdot V\) is a \(k\)-module)}.
\]

Since this holds for all \((v, w) \in V \times W\), we thus have

\[
\{v \cdot w \mid (v, w) \in V \times W\} \subseteq Q_2(V) + W \cdot V.
\]

Applying Proposition 35 (a) to \(\otimes V\), \(\{v \cdot w \mid (v, w) \in V \times W\}\) and \(Q_2(V) + W \cdot V\) instead of \(M, S\) and \(Q\), we see that this yields

\[
\langle \{v \cdot w \mid (v, w) \in V \times W\} \rangle \subseteq Q_2(V) + W \cdot V.
\]
Now, similarly, 
\[ \langle \{v \cdot w \mid (v, w) \in V \times W \} \rangle = \langle v \cdot w \mid (v, w) \in V \times W \rangle = V \cdot W, \]
this rewrites as \( V \cdot W \subseteq Q_2(V) + W \cdot V \). Thus,
\[
V \cdot W + Q_2(V) \subseteq (Q_2(V) + W \cdot V) + Q_2(V) = W \cdot V + Q_2(V)
\]
\[
\subseteq W \cdot V + Q_2(V).
\]
Combining this with the fact that \( W \cdot V + Q_2(V) \subseteq V \cdot W + Q_2(V) \) (which can be proven completely analogously), we obtain that \( V \cdot W + Q_2(V) = W \cdot V + Q_2(V) \). This proves (i).

(ii) We have \( \text{exter}_V(V) \cdot \text{exter}_V(W) = \text{exter}_V(W) \cdot \text{exter}_V(V) \) (as \( k \)-submodules of \( \text{Exter}V \)).

Proof. Since \( \text{exter}_V \) is a \( k \)-algebra homomorphism, we have
\[
\text{exter}_V(V \cdot W + Q_2(V)) = \text{exter}_V(V) \cdot \text{exter}_V(W) + \text{exter}_V(Q_2(V)).
\]
But since \( \text{exter}_V(Q_2(V)) = 0 \) (because \( \text{exter}_V \) is the canonical projection \( \otimes V \to (\otimes V) / Q(V) \), and thus \( Q(V) = \text{Ker} \text{exter}_V \), so that \( Q_2(V) \subseteq \bigoplus_{n \in \mathbb{N}} Q_n(V) = Q(V) = \text{Ker} \text{exter}_V \)), this rewrites as
\[
\text{exter}_V(V \cdot W + Q_2(V)) = \text{exter}_V(V) \cdot \text{exter}_V(W) + 0 = \text{exter}_V(V) \cdot \text{exter}_V(W).
\]
Similarly,
\[
\text{exter}_V(W \cdot V + Q_2(V)) = \text{exter}_V(W) \cdot \text{exter}_V(V).
\]
Now,
\[
\text{exter}_V(V) \cdot \text{exter}_V(W) = \text{exter}_V(V \cdot W + Q_2(V)) = \text{exter}_V(W \cdot V + Q_2(V))
\]
\[
= \text{exter}_V(W) \cdot \text{exter}_V(V),
\]
and thus (ii) is proven.

(iii) We have \( \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) = \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) \cdot \langle \text{Exter}V \rangle \).

Proof. We have
\[
\langle \text{Exter}V \rangle \cdot \text{exter}_V(W) \cdot \text{exter}_V(V) = \langle \text{Exter}V \rangle \cdot \text{exter}_V(V) \cdot \text{exter}_V(W) \subseteq \langle \text{Exter}V \rangle \cdot \text{exter}_V(W).
\]
By Lemma 49 (applied to \( A = \text{Exter}V, \pi = \text{exter}_V \) and \( M = \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) \)), this yields that \( \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) \) is a right ideal of \( \text{Exter}V \). In other words, \( \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) = \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) \cdot \langle \text{Exter}V \rangle \). This proves (iii).

(iv) We have \( \text{exter}_V(W) \cdot \langle \text{Exter}V \rangle = \langle \text{Exter}V \rangle \cdot \text{exter}_V(W) \cdot \langle \text{Exter}V \rangle \).

Proof. The proof of (iv) is analogous to the proof of (iii) (but this time we need an analogue of Lemma 49 for left instead of right ideals).

(v) Corollary 50 clearly follows by combining (iii) and (iv). The proof of Corollary 50 is thus complete.
Proof of Theorem 48. Applying the commutative diagram (42) to \( W = V' \), we obtain the commutative diagram

\[
\begin{array}{ccc}
\otimes V & \xrightarrow{\otimes f} & \otimes V' \\
\downarrow \text{exter}_V & & \downarrow \text{exter}_{V'} \\
\text{Exter } V & \xrightarrow{\text{Exter } f} & \text{Exter } V'
\end{array}
\]

(44)

But it is easy to see that \( \text{Ker } \text{exter}_{V'} \subseteq (\otimes f) (\text{Ker } \text{exter}_V) \) and that the map \( \text{exter}_V \) is surjective (since \( \text{exter}_V \) is the canonical projection \( \otimes V \to \text{Exter } V \)). Hence, we can apply Proposition 15 to the commutative diagram (44), and conclude that \( \text{Ker } (\text{Exter } f) = \text{exter}_V (\text{Ker } (\otimes f)) \). Since \( \text{Ker } (\otimes f) = (\otimes V) \cdot (\text{Ker } f) \cdot (\otimes V) \) by Theorem 32, this becomes

\[
\text{Ker } (\text{Exter } f) = (\text{Exter } V) \cdot \text{exter}_V (\text{Ker } f) \cdot (\text{Exter } V).
\]

Combined with the equality

\[
(\text{Exter } V) \cdot \text{exter}_V (\text{Ker } f) \cdot (\text{Exter } V) = (\text{Exter } V) \cdot \text{exter}_V (\text{Ker } f) = \text{exter}_V (\text{Ker } f) \cdot (\text{Exter } V)
\]

(which follows from Corollary 50 applied to \( W = \text{Ker } f \)), this yields

\[
\text{Ker } (\text{Exter } f) = (\text{Exter } V) \cdot \text{exter}_V (\text{Ker } f) \cdot (\text{Exter } V) = (\text{Exter } V) \cdot \text{exter}_V (\text{Ker } f) = \text{exter}_V (\text{Ker } f) \cdot (\text{Exter } V).
\]

This proves Theorem 48.

Here is a way to rewrite Theorem 48:

**Corollary 51.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Let \( W \) be a \( k \)-submodule of \( V \), and let \( f : V \to V/W \) be the canonical projection.

(a) Then, the kernel of the map \( \text{Exter } f : \text{Exter } V \to \text{Exter } (V/W) \) is

\[
\text{Ker } (\text{Exter } f) = (\text{Exter } V) \cdot \text{exter}_V (W) \cdot (\text{Exter } V) = (\text{Exter } V) \cdot \text{exter}_V (W)
\]

14Proof. Since \( \text{exter}_V \) is the canonical projection \( \otimes V \to (\otimes V)/Q(V) \), we have \( \text{Ker } \text{exter}_V = Q(V) \). Similarly, \( \text{Ker } \text{exter}_{V'} = Q(V') \). But Lemma 43 (b) (applied to \( W = V' \)) yields that \( (\otimes f)(Q(V)) = Q(V') \). Thus,

\[
\text{Ker } \text{exter}_{V'} = Q(V') = (\otimes f) \left( Q(V) \right) = (\otimes f) (\text{Ker } \text{exter}_V),
\]

qed.

51
Here, $W$ is considered a $k$-submodule of $\otimes V$ by means of the inclusion $W \subseteq V = V^\otimes \subseteq \otimes V$.

(b) We have

$$(\text{Exter } V) / ((\text{Exter } V) \cdot \text{exter}_V (W)) \cong \text{Exter } (V/W)$$

as $k$-modules.

\textbf{Proof of Corollary 51.} Since $f$ is the canonical projection $V \to V/W$, it is clear that $f$ is surjective and that $\text{Ker } f = W$. Now, we can apply Theorem 48 to $V' = V/W$ and conclude that

$$\text{Ker } (\text{Exter } f) = (\text{Exter } V) \cdot \text{exter}_V (\text{Ker } f)$$

$$= \text{exter}_V (\text{Ker } f) \cdot (\text{Exter } V).$$

Since $\text{Ker } f = W$, this simplifies to

$$\text{Ker } (\text{Exter } f) = (\text{Exter } V) \cdot \text{exter}_V (W) \cdot (\text{Exter } V) = (\text{Exter } V) \cdot \text{exter}_V (W)$$

$$= \text{exter}_V (W) \cdot (\text{Exter } V).$$

This proves Corollary 51 (a).

Since the map $f : V \to V/W$ is surjective, the map $\text{Exter } f : \text{Exter } V \to \text{Exter } (V/W)$ is also surjective (by Proposition 47 (c), applied to $V/W$ instead of $W$), and thus $(\text{Exter } f) (\text{Exter } V) = \text{Exter } (V/W)$. But by the isomorphism theorem, $(\text{Exter } f) (\text{Exter } V) \cong (\text{Exter } V) / \text{Ker } (\text{Exter } f)$ as $k$-modules. Thus,

$$\text{Exter } (V/W) = (\text{Exter } f) (\text{Exter } V) \cong (\text{Exter } V) / \text{Ker } (\text{Exter } f)$$

$$= (\text{Exter } V) / ((\text{Exter } V) \cdot \text{exter}_V (W))$$

as $k$-modules.

This proves Corollary 51 (b).

\textbf{0.14. The symmetric algebra}

In the previous two subsections (Subsections 0.12 and 0.13), we have studied the pseudoexterior algebra $\text{Exter } V$ of a $k$-module $V$. Many properties of the pseudoexterior algebra $\text{Exter } V$ are shared by its more well-known analogue - the symmetric algebra $\text{Sym } V$. Pretty much all of our above-proven properties of $\text{Exter } V$ have analogues for $\text{Sym } V$. We are now going to formulate these analogues, without proving them (because their proofs are completely analogous to the proofs of the properties of $\text{Exter } V$ that we did above). First, before we define the symmetric algebra $\text{Sym } V$, let us define the symmetric powers $\text{Sym}^n V$:

\textbf{Definition 52.} Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$.

Let $K_n (V)$ be the $k$-submodule

$$\langle v_1 \otimes v_2 \otimes ... \otimes v_n - v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes ... \otimes v_{\sigma(n)} \mid ((v_1, v_2, ..., v_n), \sigma) \in V^n \times S_n \rangle$$

of the $k$-module $V^\otimes n$ (where we are using Convention 34 and are denoting the $n$-th symmetric group by $S_n$).
The factor $k$-module $V^\otimes n / K_n (V)$ is called the $n$-th symmetric power of the $k$-module $V$ and will be denoted by $\text{Sym}^n V$. We denote by $\text{sym}_{V,n}$ the canonical projection $V^\otimes n \to V^\otimes n / K_n (V) = \text{Sym}^n V$. Clearly, this map $\text{sym}_{V,n}$ is a surjective $k$-module homomorphism.

We should understand these notions $K_n (V)$, $\text{Sym}^n V$ and $\text{sym}_{V,n}$ as analogues of the notions $Q_n (V)$, $\text{Exter}_{V,n}$ and $\text{exter}_{V,n}$ from Definition 36, respectively. Here is an analogue of Proposition 38:

**Proposition 53.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$. Then,

$$K_n (V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n - v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle,$$

where $\tau_i$ denotes the transposition $(i, i+1) \in S_n$.

The proof of this Proposition 53 is completely analogous to the proof of Proposition 38 (up to some replacing of $+$ signs by $-$ signs and some removal of powers of $-1$) and can be found in §5.1 of the long (detailed) version of [3].

Here is the analogue of Corollary 39:

**Corollary 54.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Then,

$$K_2 (V) = \langle v_1 \otimes v_2 - v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \rangle.$$

Again, the proof of Corollary 54 is completely analogous to the proof of Corollary 39.

Next, the analogue of Lemma 41:

**Lemma 55.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$. Let $i \in \{1, 2, \ldots, n-1\}$. Then,

$$\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n - v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n \rangle = V^\otimes (i-1) \cdot (K_2 (V)) \cdot V^\otimes (n-1-i),$$

where $\tau_i$ denotes the transposition $(i, i+1) \in S_n$. Here, we consider $V^\otimes n$ as a $k$-submodule of $\otimes V$.

The proof of Lemma 55 is completely analogous to the proof of Lemma 41.

Next, the analogue of Corollary 42:

**Corollary 56.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$. Then,

$$K_n (V) = \sum_{i=1}^{n-1} V^\otimes (i-1) \cdot (K_2 (V)) \cdot V^\otimes (n-1-i).$$
Now the analogue of Theorem 43:

The proof of Corollary 56 is completely analogous to the proof of Corollary 42.

Now we can finally define the symmetric algebra, similarly to Definition 44:

The proof of Theorem 57 is completely analogous to the proof of Theorem 43.

Now we define the symmetric algebra, similarly to Definition 44:

**Theorem 57.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. We know that $K_n (V)$ is a $k$-submodule of $V^\otimes n$ for every $n \in \mathbb{N}$. Thus, $\bigoplus K_n (V)$ is a $k$-submodule of $\bigoplus_{n \in \mathbb{N}} V^\otimes n = \otimes V$. This $k$-submodule satisfies

$$\bigoplus_{n \in \mathbb{N}} K_n (V) = (\otimes V) \cdot (K_2 (V)) \cdot (\otimes V).$$

The proof of Theorem 57 is completely analogous to the proof of Theorem 43.

Now we define the symmetric algebra, similarly to Definition 44:

**Definition 58.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. By Theorem 57, the two $k$-submodules $\bigoplus_{n \in \mathbb{N}} K_n (V)$ and $(\otimes V) \cdot (K_2 (V)) \cdot (\otimes V)$ of $\otimes V$ are identical (where $\bigoplus_{n \in \mathbb{N}} K_n (V)$ becomes a $k$-submodule of $\otimes V$ in the same way as explained in Theorem 57). We denote these two identical $k$-submodules by $K (V)$.

In other words, we define $K (V)$ by

$$K (V) = \bigoplus_{n \in \mathbb{N}} K_n (V) = (\otimes V) \cdot (K_2 (V)) \cdot (\otimes V).$$

Since $K (V) = (\otimes V) \cdot (K_2 (V)) \cdot (\otimes V)$, it is clear that $K (V)$ is a two-sided ideal of the $k$-algebra $\otimes V$.

Now we define a $k$-module $\text{Sym} V$ as the direct sum $\bigoplus_{n \in \mathbb{N}} \text{Sym}^n V$. Then,

$$\text{Sym} V = \bigoplus_{n \in \mathbb{N}} \text{Sym}^n V = \bigoplus_{n \in \mathbb{N}} (V^\otimes n / K_n (V)) \cong \left( \bigoplus_{n \in \mathbb{N}} V^\otimes n \right) / \left( \bigoplus_{n \in \mathbb{N}} K_n (V) \right) = (\otimes V) / K (V).$$

This is a canonical isomorphism, so we will use it to identify $\text{Sym} V$ with $(\otimes V) / K (V)$. Since $K (V)$ is a two-sided ideal of the $k$-algebra $\otimes V$, the quotient $k$-module $(\otimes V) / K (V)$ canonically becomes a $k$-algebra. Since $\text{Sym} V = (\otimes V) / K (V)$, this means that $\text{Sym} V$ becomes a $k$-algebra. We refer to this $k$-algebra as the symmetric algebra of the $k$-module $V$.

We denote by $\text{sym}_V$ the canonical projection $\otimes V \to (\otimes V) / K (V) = \text{Sym} V$. Clearly, this map $\text{sym}_V$ is a surjective $k$-algebra homomorphism. Besides, due to $\otimes V = \bigoplus_{n \in \mathbb{N}} V^\otimes n$ and $K (V) = \bigoplus_{n \in \mathbb{N}} K_n (V)$, it is clear that the canonical projection $\otimes V \to (\otimes V) / K (V)$ is the direct sum of the canonical projections $V^\otimes n \to$
\[ V^\otimes n \to K_n (V) \text{ over all } n \in \mathbb{N}. \] Since the canonical projection \( \otimes V \to (\otimes V) / K (V) \) is the map \( \text{sym}_V \), whereas the canonical projection \( V^\otimes n \to V^\otimes n / K_n (V) \) is the map \( \text{sym}_{V,n} \), this rewrites as follows: The map \( \text{sym}_V \) is the direct sum of the maps \( \text{sym}_{V,n} \) over all \( n \in \mathbb{N} \).

When \( v_1, v_2, \ldots, v_n \) are some elements of \( V \), one often abbreviates the element \( \text{sym}_V (v_1 \otimes v_2 \otimes \ldots \otimes v_n) \) of \( \text{Sym} V \) by \( v_1 v_2 \ldots v_n \). (We will not use this abbreviation in this following.)

We should think of the notions \( K (V) \), \( \text{Sym} V \) and \( \text{sym}_V \) as analogues of the notions \( Q (V) \), \( \text{Exter} V \) and \( \text{exter}_V \) from Definition 44, respectively. The next result provides an analogue of Lemma 45.

**Lemma 59.** Let \( k \) be a commutative ring. Let \( V \) and \( W \) be two \( k \)-modules. Let \( f : V \to W \) be a \( k \)-module homomorphism.

(a) Then, the \( k \)-algebra homomorphism \( \otimes f : \otimes V \to \otimes W \) satisfies \( (\otimes f) (K (V)) \subseteq K (W) \). Also, for every \( n \in \mathbb{N} \), the \( k \)-module homomorphism \( f^\otimes n : V^\otimes n \to W^\otimes n \) satisfies \( f^\otimes n (K_n (V)) \subseteq K_n (W) \).

(b) Assume that \( f \) is surjective. Then, the \( k \)-algebra homomorphism \( \otimes f : \otimes V \to \otimes W \) satisfies \( (\otimes f) (K (V)) = K (W) \). Also, for every \( n \in \mathbb{N} \), the \( k \)-module homomorphism \( f^\otimes n : V^\otimes n \to W^\otimes n \) satisfies \( f^\otimes n (K_n (V)) = K_n (W) \).

The following definition mirrors Definition 46.

**Definition 60.** Let \( k \) be a commutative ring. Let \( V \) and \( W \) be two \( k \)-modules. Let \( f : V \to W \) be a \( k \)-module homomorphism. Then, the \( k \)-algebra homomorphism \( \otimes f : \otimes V \to \otimes W \) satisfies \( (\otimes f) (K (V)) \subseteq K (W) \) (by Lemma 59 (a)), and thus gives rise to a \( k \)-algebra homomorphism \( (\otimes V) / K (V) \to (\otimes W) / K (W) \). This latter \( k \)-algebra homomorphism will be denoted by \( \text{Sym} f \). Since \( (\otimes V) / K (V) = \text{Sym} V \) and \( (\otimes W) / K (W) = \text{Sym} W \), this homomorphism \( \text{Sym} f : (\otimes V) / K (V) \to (\otimes W) / K (W) \) is actually a homomorphism from \( \text{Sym} V \) to \( \text{Sym} W \).

By the construction of \( \text{Sym} f \), the diagram

\[
\begin{array}{ccc}
\otimes V & \xrightarrow{\otimes f} & \otimes W \\
\text{sym}_V \downarrow & & \downarrow \text{sym}_W \\
\text{Sym} V & \xrightarrow{\text{Sym} f} & \text{Sym} W
\end{array}
\]

commutes (since \( \text{sym}_V \) is the canonical projection \( \otimes V \to \text{Sym} V \) and since \( \text{sym}_W \) is the canonical projection \( \otimes W \to \text{Sym} W \)).

Needless to say, the notion \( \text{Sym} f \) introduced in this definition is an analogue of the notion \( \text{Exter} f \) introduced in Definition 46.

Here is the analogue of Proposition 47:

**Proposition 61.** Let \( k \) be a commutative ring. Let \( V \) and \( W \) be two \( k \)-modules. Let \( f : V \to W \) be a surjective \( k \)-module homomorphism. Then:

(a) The \( k \)-module homomorphism \( f^\otimes n : V^\otimes n \to W^\otimes n \) is surjective for every \( n \in \mathbb{N} \).

(b) The \( k \)-algebra homomorphism \( \otimes f : \otimes V \to \otimes W \) is surjective.

(c) The \( k \)-algebra homomorphism \( \text{Sym} f : \text{Sym} V \to \text{Sym} W \) is surjective.
The proof of this Proposition \[61\] is completely analogous to the proof of Proposition \[47\] (and parts (a) and (b) are even the same).

So much for analogues of the results of Subsection \[0.12\]. Now let us formulate the analogues of the results of Subsection \[0.13\]. First, the analogue of Theorem \[48\]:

**Theorem 62.** Let \(k\) be a commutative ring. Let \(V\) and \(V'\) be two \(k\)-modules, and let \(f : V \rightarrow V'\) be a surjective \(k\)-module homomorphism. Then, the kernel of the map \(\text{Sym } f : \text{Sym } V \rightarrow \text{Sym } V'\) is

\[
\text{Ker } (\text{Sym } f) = (\text{Sym } V) \cdot \text{sym}_V (\text{Ker } f) \cdot (\text{Sym } V) = (\text{Sym } V) \cdot \text{sym}_V (\text{Ker } f)
\]

\[
= \text{sym}_V (\text{Ker } f) \cdot (\text{Sym } V).
\]

Here, \(\text{Ker } f\) is considered a \(k\)-submodule of \(\otimes V\) by means of the inclusion \(\text{Ker } f \subseteq V = V^{\otimes 1} \subseteq \otimes V\).

The proof of this Theorem \[62\] is completely analogous to that of Theorem \[48\].

The analogue of Corollary \[50\] comes next:

**Corollary 63.** Let \(k\) be a commutative ring. Let \(V\) be a \(k\)-module, and let \(W\) be a \(k\)-submodule of \(V\). Then,

\[
(\text{Sym } V) \cdot \text{sym}_V (W) \cdot (\text{Sym } V) = (\text{Sym } V) \cdot \text{sym}_V (W) = \text{sym}_V (W) \cdot (\text{Sym } V).
\]

Here, \(W\) is considered a \(k\)-submodule of \(\otimes V\) by means of the inclusion \(W \subseteq V = V^{\otimes 1} \subseteq \otimes V\).

Expectedly, the proof of Corollary \[63\] is analogous to the proof of Corollary \[50\]. Finally, the analogue of Corollary \[51\] comes next:

**Corollary 64.** Let \(k\) be a commutative ring. Let \(V\) be a \(k\)-module. Let \(W\) be a \(k\)-submodule of \(V\), and let \(f : V \rightarrow V/W\) be the canonical projection.

(a) Then, the kernel of the map \(\text{Sym } f : \text{Sym } V \rightarrow \text{Sym } (V/W)\) is

\[
\text{Ker } (\text{Sym } f) = (\text{Sym } V) \cdot \text{sym}_V (W) \cdot (\text{Sym } V) = (\text{Sym } V) \cdot \text{sym}_V (W) = \text{sym}_V (W) \cdot (\text{Sym } V).
\]

Here, \(W\) is considered a \(k\)-submodule of \(\otimes V\) by means of the inclusion \(W \subseteq V = V^{\otimes 1} \subseteq \otimes V\).

(b) We have

\[
(\text{Sym } V) \rangle \langle (\text{Sym } V) \cdot \text{sym}_V (W)) \cong \text{Sym } (V/W) \quad \text{as } k\text{-modules.}
\]

The proof of Corollary \[64\] is analogous to the proof of Corollary \[51\].

**0.15. The exterior algebra**

Now we are going to study the exterior algebra \(\wedge V\) of a \(k\)-module \(V\). This algebra is rather similar, but not completely analogous to \(\text{Exter } V\) and \(\text{Sym } V\). We are going to again formulate properties similar to corresponding properties of \(\text{Exter } V\) and \(\text{Sym } V\);
but this time, some of these properties will require different proofs, so we will not always be able to skip their proofs by referring to analogy. Still some of the proofs will be very similar to the corresponding proofs for Exter \( V \) we gave in Subsections 0.12 and 0.13 (some others will be not). First, before we define the exterior algebra \( \Lambda V \), let us define the exterior powers \( \Lambda^n V \):

**Definition 65.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Let \( n \in \mathbb{N} \).

Let \( R_n (V) \) be the \( k \)-submodule

\[
\left\langle v_1 \otimes v_2 \otimes \cdots \otimes v_n \mid ((v_1, v_2, \ldots, v_n), (i, j)) \in V^n \times \{1, 2, \ldots, n\}^2 ; i \neq j; v_i = v_j \right\rangle
\]

of the \( k \)-module \( V^{\otimes n} \) (where we are using Convention 34). The factor \( k \)-module \( V^{\otimes n} / R_n (V) \) is called the \textit{n-th exterior power} of the \( k \)-module \( V \) and will be denoted by \( \Lambda^n V \). We denote by wedge\(_{V,n} \) the canonical projection \( V^{\otimes n} \to V^{\otimes n} / R_n (V) = \Lambda^n V \). Clearly, this map wedge\(_{V,n} \) is a surjective \( k \)-module homomorphism.

We should understand these notions \( R_n (V) \), \( \Lambda^n V \) and wedge\(_{V,n} \) as analogues of the notions \( Q_n (V) \), Exter\(^n V \) and exter\(_{V,n} \) from Definition 36 respectively. First something very basic - an analogue of Corollary 39.

**Corollary 66.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Then,

\[
R_2 (V) = \langle v \otimes v \mid v \in V \rangle.
\]

**Proof of Corollary 66.** We have the inclusions

\[
\left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2 ; i \neq j; v_i = v_j \right\} \subseteq \{ v \otimes v \mid v \in V \}
\]

\(^{15}\)

and

\[
\{ v \otimes v \mid v \in V \} \subseteq \left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2 ; i \neq j; v_i = v_j \right\}
\]

\(^{15}\text{Proof.}\) Let \( p \in \left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2 ; i \neq j; v_i = v_j \right\} \). Then, there exists some \((v_1, v_2), (i, j)\) \( \in V^2 \times \{1, 2\}^2 \) such that \( i \neq j \) and \( v_i = v_j \) and \( p = v_1 \otimes v_2 \). Consider this \((v_1, v_2), (i, j)\). Then, \((i, j) \in \{1, 2\}^2 \). Since \( i \neq j \), this yields that either \((i = 1 \text{ and } j = 2)\) or \((i = 2 \text{ and } j = 1)\). In each of these two cases, we have \( v_1 = v_2 \) (in fact, in the case \((i = 1 \text{ and } j = 2)\), the equation \( v_i = v_j \) rewrites as \( v_1 = v_2 \)); and in the other case \((j = 1 \text{ and } i = 2)\), the equation \( v_i = v_j \) rewrites as \( v_2 = v_1 \), so that \( v_1 = v_2 \). Hence, we have \( v_1 = v_2 \). Thus, \( p = v_1 \otimes v_2 = v_2 \otimes v_2 \in \{ v \otimes v \mid v \in V \} \).

We have thus shown that \( p \in \{ v \otimes v \mid v \in V \} \) for every \( p \in \left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2 ; i \neq j; v_i = v_j \right\} \). Hence,

\[
\left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2 ; i \neq j; v_i = v_j \right\} \subseteq \{ v \otimes v \mid v \in V \}, \text{qed.}
\]

57
Combining these two inclusions, we get
\[ \{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2; \ i \neq j; \ v_i = v_j \} = \{ v \otimes v \mid v \in V \}. \]

But by the definition of \( R_2(V) \), we have
\[
R_2(V) = \left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2; \ i \neq j; \ v_i = v_j \right\}
= \left\{ v \otimes v \mid v \in V \right\} = \left\{ v \otimes v \mid v \in V \right\}.
\]

This proves Corollary 66.
Here is an analogue of Proposition 38:

**Proposition 67.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Let \( n \in \mathbb{N} \). Then,
\[
R_n(V) = \sum_{i=1}^{n-1} \left\{ v_1 \otimes v_2 \otimes \cdots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \right\}.
\]

While the proof of this proposition is not too much harder than that of Proposition 38, it is better understood when split into lemmas. Here is the first one:

**Lemma 68.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Let \( n \in \mathbb{N} \). Denote by \( \tilde{R}_n(V) \) the \( k \)-submodule
\[
\sum_{i=1}^{n-1} \left\{ v_1 \otimes v_2 \otimes \cdots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \right\}
\]
of \( V^\otimes n \). Then, \( Q_n(V) \subseteq \tilde{R}_n(V) \).

**Proof of Lemma 68 (i)** Every \( i \in \{1, 2, \ldots, n-1\} \) satisfies
\[
\left\{ v_1 \otimes v_2 \otimes \cdots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \cdots \otimes v_{\tau_i(n)} \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \right\}
\subseteq \left\{ v_1 \otimes v_2 \otimes \cdots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \right\},
\]
where \( \tau_i \) denotes the transposition \( (i, i+1) \in S_n \).

**Proof.** Fix some \( i \in \{1, 2, \ldots, n-1\} \). Now let \( \mathfrak{B} \) be the set
\[
\left\{ w_1 \otimes w_2 \otimes \cdots \otimes w_n \mid (w_1, w_2, \ldots, w_n) \in V^n; \ w_i = w_{i+1} \right\}.
\]

**Proof.** Let \( p \in \{ v \otimes v \mid v \in V \} \). Then, there exists \( v \in V \) such that \( p = v \otimes v \). Consider this \( v \). Then, there exists some \( ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2 \) with \( i \neq j \) and \( v_i = v_j \) such that \( p = v_1 \otimes v_2 \) (namely, \( ((v_1, v_2), (i, j)) = ((v, v), (1, 2)) \)). Hence, \( p \in \{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2; \ i \neq j; \ v_i = v_j \} \). Since we have proven this for every \( p \in \{ v \otimes v \mid v \in V \} \), we have thus shown that \( \{ v \otimes v \mid v \in V \} \subseteq \left\{ v_1 \otimes v_2 \mid ((v_1, v_2), (i, j)) \in V^2 \times \{1, 2\}^2; \ i \neq j; \ v_i = v_j \right\} \).
Then,

\[ w_1 \otimes w_2 \otimes \ldots \otimes w_n \in \mathcal{W} \]

for every \((w_1, w_2, \ldots, w_n) \in V^n\) satisfying \(w_i = w_{i+1}\). \((47)\)

Fix some arbitrary \((v_1, v_2, \ldots, v_n) \in V^n\). Define a tensor \(A \in V^{\otimes (i-1)}\) by \(A = v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1}\). Define a tensor \(C \in V^{\otimes (n-i)}\) by \(C = v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n\). Then, recalling Convention \([12]\) we have

\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n = \left( v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} \right) \otimes \left( v_i \otimes v_{i+1} \right) \otimes \left( v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n \right) = A \otimes (v_i \otimes v_{i+1}) \otimes C. \tag{48}\]

On the other hand, every \(j \in \{1, 2, \ldots, i-1\}\) satisfies \(\tau_i(j) = j\) (since \(\tau_i\) is the transposition \((i, i+1)\)) and thus \(v_{\tau_i(j)} = v_j\). In other words, we have the equalities \(v_{\tau_i(1)} = v_1, v_{\tau_i(2)} = v_2, \ldots, v_{\tau_i(i-1)} = v_{i-1}\). Taking the tensor product of these equalities yields

\[
v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(i-1)} = v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} = A. \]

Every \(j \in \{i+2, i+3, \ldots, n\}\) satisfies \(\tau_i(j) = j\) (since \(\tau_i\) is the transposition \((i, i+1)\)) and thus \(v_{\tau_i(j)} = v_j\). In other words, we have the equalities \(v_{\tau_i(i+2)} = v_{i+2}, v_{\tau_i(i+3)} = v_{i+3}, \ldots, v_{\tau_i(n)} = v_n\). Taking the tensor product of these equalities yields

\[
v_{\tau_i(i+2)} \otimes v_{\tau_i(i+3)} \otimes \ldots \otimes v_{\tau_i(n)} = v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_{n} = C. \]

Since \(\tau_i\) is the transposition \((i, i+1)\), we have \(\tau_i(i) = i+1\) and \(\tau_i(i+1) = i\). These equalities yield \(v_{\tau_i(i)} = v_{i+1}\) and \(v_{\tau_i(i+1)} = v_i\), respectively.

Now,

\[
v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)}
= \left( v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(i-1)} \right) \otimes \left( v_{\tau_i(i)} \otimes v_{\tau_i(i+1)} \right) \otimes \left( v_{\tau_i(i+2)} \otimes v_{\tau_i(i+3)} \otimes \ldots \otimes v_{\tau_i(n)} \right)
= A \otimes (v_i \otimes v_{i+1}) \otimes C.
\]

Adding this to \((48)\), we get

\[
v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes \ldots \otimes v_{\tau_i(n)}
= A \otimes (v_i \otimes v_{i+1}) \otimes C + A \otimes (v_{i+1} \otimes v_i) \otimes C
= A \otimes (v_i \otimes v_{i+1} + v_{i+1} \otimes v_i) \otimes C. \tag{49}\]

But it is easy to see that

\[ A \otimes p \otimes p \otimes C \in \mathcal{W} \quad \text{for every } p \in V. \tag{50} \]

\[\text{Since } \mathcal{W} \subseteq \langle \mathcal{W} \rangle, \text{ this yields} \]

\[ A \otimes p \otimes p \otimes C \in \langle \mathcal{W} \rangle \quad \text{for every } p \in V. \tag{52} \]

\[\text{Proof of } \tag{50}. \text{ Let } p \in V. \text{ Define an } n\text{-tuple } (w_1, w_2, \ldots, w_n) \in V^n \text{ by} \]

\[
w_\ell = \begin{cases} v_\ell, & \text{if } \ell < i; \\ p, & \text{if } \ell = i; \\ p, & \text{if } \ell = i+1; \\ v_\ell, & \text{if } \ell > i+1; \end{cases} \quad \text{for every } \ell \in \{1, 2, \ldots, n\}. \tag{51} \]

59
Now,

\[ v_i \otimes v_{i+1} + v_{i+1} \otimes v_i = (v_i \otimes v_i + v_i \otimes v_{i+1} + v_{i+1} \otimes v_i + v_{i+1} \otimes v_{i+1}) - v_i \otimes v_i - v_{i+1} \otimes v_{i+1} \]

\[= (v_i + v_{i+1}) \otimes (v_i + v_{i+1}) - v_i \otimes v_i - v_{i+1} \otimes v_{i+1}. \]

Thus, (49) becomes

\[ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \]

\[= A \otimes \left( v_i \otimes v_{i+1} + v_{i+1} \otimes v_i \right) \otimes C \]

\[= A \otimes (v_i + v_{i+1}) \otimes (v_i + v_{i+1}) - v_i \otimes v_i - v_{i+1} \otimes v_{i+1} \otimes C \]

\[= A \otimes (v_i + v_{i+1}) \otimes (v_i + v_{i+1}) \otimes C - \left( A \otimes v_i \otimes v_i \otimes C \right) - \left( A \otimes v_{i+1} \otimes v_{i+1} \otimes C \right) \]

\[\in \langle \mathcal{W} \rangle \quad \text{(by (52) applied to } p=v_i+v_{i+1}) \quad \text{and } \langle \mathcal{W} \rangle \quad \text{(by (52) applied to } p=v_{i+1}) \]

\[\in \langle \mathcal{W} \rangle - \langle \mathcal{W} \rangle - \langle \mathcal{W} \rangle \subseteq \langle \mathcal{W} \rangle \quad \text{(since } \langle \mathcal{W} \rangle \text{ is a } k\text{-module)} \]

We now forget that we fixed \((v_1,v_2,\ldots,v_n)\). What we have proven is that every \((v_1,v_2,\ldots,v_n) \in V^n\) satisfies

\[ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \in \langle \mathcal{W} \rangle. \]

In other words,

\[ \{ v_1 \otimes v_2 \otimes \ldots \otimes v_n + v_{\tau(1)} \otimes v_{\tau(2)} \otimes \ldots \otimes v_{\tau(n)} \mid (v_1,v_2,\ldots,v_n) \in V^n \} \subseteq \langle \mathcal{W} \rangle. \]

Then, every \(\ell \in \{1,2,\ldots,i-1\}\) satisfies \(w_\ell = \{ v_\ell, \text{if } \ell < i; p, \text{if } \ell = i; v_\ell, \text{if } \ell > i+1 \}\). In other words, we have the equalities \(w_1 = v_1, w_2 = v_2, \ldots, w_{i-1} = v_{i-1}\). Taking the tensor product of these equalities, we get \(w_1 \otimes w_2 \otimes \ldots \otimes w_{i-1} = v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} = A\).

Also, every \(\ell \in \{i+2,i+3,\ldots,n\}\) satisfies \(w_\ell = \{ v_\ell, \text{if } \ell < i; p, \text{if } \ell = i; v_\ell, \text{if } \ell > i+1 \}\). In other words, we have the equalities \(w_{i+2} = v_{i+2}, w_{i+3} = v_{i+3}, \ldots, w_n = v_n\). Taking the tensor product of these equalities, we get \(w_{i+2} \otimes w_{i+3} \otimes \ldots \otimes w_n = v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n = C\).

Applying (51) to \(\ell = i\), we get \(w_i = \{ v_i, \text{if } i < i; p, \text{if } i = i; v_i, \text{if } i > i+1 \}\). Applying (51) to \(\ell = i+1\), we get \(w_{i+1} = \{ v_{i+1}, \text{if } i+1 < i; p, \text{if } i+1 = i; v_{i+1}, \text{if } i+1 > i+1 \}\). Applying (51) to \(\ell = i+1\), we get \(w_i = \{ v_i, \text{if } i < i+1; p, \text{if } i+1 = i+1; v_i, \text{if } i > i+1 \}\).

Now,

\[ w_1 \otimes w_2 \otimes \ldots \otimes w_n = (w_1 \otimes w_2 \otimes \ldots \otimes w_{i-1}) \otimes w_i \otimes w_{i+1} \otimes (w_{i+2} \otimes w_{i+3} \otimes \ldots \otimes w_n) = A \otimes p \otimes p \otimes C. \]

Since \(w_1 \otimes w_2 \otimes \ldots \otimes w_n \in \mathcal{W}\) (by (47)), we thus have \(A \otimes p \otimes p \otimes C \in \mathcal{W}\). This proves (50).
Hence, Proposition 35 (a) (applied to $V^\otimes n$),
$\{v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes ... \otimes v_{\tau_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n\}$ and (23) instead of $M, S$ and $Q$ yields

$$\langle \{v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes ... \otimes v_{\tau_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n\} \rangle \subseteq \langle 23 \rangle .$$

Thus,

$$\langle \{v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_1(1)} \otimes v_{\tau_1(2)} \otimes ... \otimes v_{\tau_1(n)} \mid (v_1, v_2, ..., v_n) \in V^n\} \rangle = \langle 23 \rangle = \langle \{w_1 \otimes w_2 \otimes ... \otimes w_n \mid (w_1, w_2, ..., w_n) \in V^n; \ w_i = w_{i+1}\} \rangle$$

(since $23 = \{w_1 \otimes w_2 \otimes ... \otimes w_n \mid (w_1, w_2, ..., w_n) \in V^n; \ w_i = w_{i+1}\}$)

$$= \langle w_1 \otimes w_2 \otimes ... \otimes w_n \mid (w_1, w_2, ..., w_n) \in V^n; \ w_i = w_{i+1}\rangle$$

(here, we renamed $(w_1, w_2, ..., w_n)$ as $(v_1, v_2, ..., v_n)$).

This proves (i).

(ii) For every $i \in \{1, 2, ..., n - 1\}$, let $\tau_i$ denote the transposition $(i, i + 1) \in S_n$. By Proposition 38 we have

$$Q_n (V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes ... \otimes v_n + v_{\tau_i(1)} \otimes v_{\tau_i(2)} \otimes ... \otimes v_{\tau_i(n)} \mid (v_1, v_2, ..., v_n) \in V^n \rangle$$

$$\subseteq \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes ... \otimes v_n \mid (v_1, v_2, ..., v_n) \in V^n; \ v_i = v_{i+1}\rangle \quad \text{(by 46)}$$

$$= \tilde{R}_n (V).$$

This proves Lemma 68.

The next step:

**Lemma 69.** In the situation of Lemma 68 we have $\tilde{R}_n (V) \subseteq R_n (V)$.

**Proof of Lemma 69.** First fix some $I \in \{1, 2, ..., n - 1\}$. Fix some $(w_1, w_2, ..., w_n) \in V^n$ satisfying $w_1 = w_{I+1}$. Then, the pair $((w_1, w_2, ..., w_n), (I, I+1)) \in V^n \times \{1, 2, ..., n\}^2$ satisfies $I \neq I + 1$ and $v_I = v_{I+1}$. Therefore,

$$w_1 \otimes w_2 \otimes ... \otimes w_n$$

$$\in \{v_1 \otimes v_2 \otimes ... \otimes v_n \mid ((v_1, v_2, ..., v_n), (i, j)) \in V^n \times \{1, 2, ..., n\}^2; \ i \neq j; \ v_i = v_j\}$$

$$\subseteq \{v_1 \otimes v_2 \otimes ... \otimes v_n \mid ((v_1, v_2, ..., v_n), (i, j)) \in V^n \times \{1, 2, ..., n\}^2; \ i \neq j; \ v_i = v_j\}$$

$$= \langle v_1 \otimes v_2 \otimes ... \otimes v_n \mid ((v_1, v_2, ..., v_n), (i, j)) \in V^n \times \{1, 2, ..., n\}^2; \ i \neq j; \ v_i = v_j\rangle$$

$$= R_n (V).$$

Now forget that we fixed some $(w_1, w_2, ..., w_n) \in V^n$ satisfying $w_1 = w_{I+1}$. We have thus proven that every $(w_1, w_2, ..., w_n) \in V^n$ satisfying $w_1 = w_{I+1}$ satisfies $w_1 \otimes w_2 \otimes ... \otimes w_n \in R_n (V)$. In other words, we have proven that

$$\{w_1 \otimes w_2 \otimes ... \otimes w_n \mid (w_1, w_2, ..., w_n) \in V^n; \ w_1 = w_{I+1}\} \subseteq R_n (V).$$
Hence, Proposition 35(a) (applied to $V^\otimes n$, $\{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid (w_1, w_2, \ldots, w_n) \in V^n; \ w_1 = w_{1+1} \}$ and $R_n (V)$ instead of $M$, $S$ and $Q$) yields

$$\langle \{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid (w_1, w_2, \ldots, w_n) \in V^n; \ w_1 = w_{1+1} \} \rangle \subseteq R_n (V).$$

So we have

$$\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_1 = v_{1+1} \rangle = \langle w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid (w_1, w_2, \ldots, w_n) \in V^n; \ w_1 = w_{1+1} \rangle$$

(here, we renamed $(v_1, v_2, \ldots, v_n)$ as $(w_1, w_2, \ldots, w_n)$)

$$\subseteq \langle \{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid (w_1, w_2, \ldots, w_n) \in V^n; \ w_1 = w_{1+1} \} \rangle \subseteq R_n (V).$$

(53)

Now forget that we fixed some $I \in \{1, 2, \ldots, n-1\}$. We have now proven that every $I \in \{1, 2, \ldots, n-1\}$ satisfies (53). Now,

$$\tilde{R}_n (V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \rangle$$

$$= \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_I = v_{I+1} \rangle$$

(53) (by)

$$\subseteq \sum_{i=1}^{n-1} R_n (V) \subseteq R_n (V) \quad (\text{since } R_n (V) \text{ is a } k\text{-module}).$$

This proves Lemma 69.

Our final lemma is:

| Lemma 70. | In the situation of Lemma 68 we have $R_n (V) \subseteq \tilde{R}_n (V)$. |

Proof of Lemma 70. (i) It is clear that every $I \in \{1, 2, \ldots, n-1\}$ satisfies

$$\{ v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_1 = v_{1+1} \}$$

$$\subseteq \langle \{ v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_I = v_{I+1} \} \rangle$$

$$= \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_I = v_{I+1} \rangle$$

$$\subseteq \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \rangle = \tilde{R}_n (V).$$

(54)

In other words, for every $I \in \{1, 2, \ldots, n-1\}$,

$$\text{every } (v_1, v_2, \ldots, v_n) \in V^n \text{ such that } v_1 = v_{1+1} \text{ satisfies } v_1 \otimes v_2 \otimes \ldots \otimes v_n \in \tilde{R}_n (V).$$

(ii) Every $((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}^2$ satisfying $I \neq J$ and $w_I = w_J$ must satisfy $w_1 \otimes w_2 \otimes \ldots \otimes w_n \in \tilde{R}_n (V)$.

Proof. Fix some $((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}^2$ satisfying $I \neq J$ and $w_I = w_J$.

Then, $(w_1, w_2, \ldots, w_n) \in V^n$ and $(I, J) \in \{1, 2, \ldots, n\}^2$.
We can WLOG assume that $I \leq J$ (since otherwise, we could just transpose $I$ with $J$, and nothing would change (because each of the conditions $I \not= J$ and $w_1 = w_J$ is clearly symmetric with respect to $I$ and $J$)). So let us assume this. Then, $I < J$ (since $I \leq J$ and $I \not= J$). Thus, $I < J \leq n$, so that $I \leq n-1$ (since $I$ and $n$ are integers), and thus $I+1 \leq n$. This allows us to speak of the vector $w_{I+1}$.

Now, there clearly exists a permutation $\tau \in S_n$ such that $\tau (I) = I$ and $\tau (I+1) = J$.

Consider such a $\tau$.

Now, since $(w_1, w_2, \ldots, w_n) \in V^n$ and $\tau \in S_n$, we have $((w_1, w_2, \ldots, w_n), \tau) \in V^n \times S_n$, so that

$$w_1 \otimes w_2 \otimes \ldots \otimes w_n - (-1)^{\tau} w_{\tau(1)} \otimes w_{\tau(2)} \otimes \ldots \otimes w_{\tau(n)}$$

$$\in \{v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n\}$$

$$\subseteq \{v_1 \otimes v_2 \otimes \ldots \otimes v_n - (-1)^{\sigma} v_{\sigma(1)} \otimes v_{\sigma(2)} \otimes \ldots \otimes v_{\sigma(n)} \mid ((v_1, v_2, \ldots, v_n), \sigma) \in V^n \times S_n\}$$

$$= Q_n (V) \subseteq \tilde{R}_n (V) \quad \text{(by Lemma 58).}$$

On the other hand, the $n$-tuple $(w_{\tau(1)}, w_{\tau(2)}, \ldots, w_{\tau(n)}) \in V^n$ satisfies $w_{\tau(I)} = w_{\tau(I+1)}$ (because $\tau (I) = I$, so that $w_{\tau(I)} = w_1 = w_2 = w_{\tau(I+1)}$ (since $J = I + 1$)). Hence, (54) (applied to $(v_1, v_2, \ldots, v_n) = (w_{\tau(1)}, w_{\tau(2)}, \ldots, w_{\tau(n)})$) yields $w_{\tau(1)} \otimes w_{\tau(2)} \otimes \ldots \otimes w_{\tau(n)} \in \tilde{R}_n (V)$.

Now,

$$w_1 \otimes w_2 \otimes \ldots \otimes w_n$$

$$\in \tilde{R}_n (V) + (-1)^{\tau} \tilde{R}_n (V) \subseteq \tilde{R}_n (V) \quad \text{(since $\tilde{R}_n (V)$ is a $k$-module).}$$

This proves (ii).

(iii) According to (ii), every $((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}^2$ satisfying $I \not= J$ and $w_1 = w_J$ must satisfy $w_1 \otimes w_2 \otimes \ldots \otimes w_n \in \tilde{R}_n (V)$.

In other words,

$$\{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid ((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}^2; \ I \not= J; \ w_1 = w_J \}$$

$$\subseteq \tilde{R}_n (V).$$

Proof. We distinguish between two cases:

Case 1: We have $J = I + 1$.

Case 2: We have $J \not= I + 1$.

First consider Case 1. In this case, the permutation id $\in S_n$ satisfies id $(I) = I$ and id $(I+1) = I+1 = J$. Hence, in Case 1, there exists a permutation $\tau \in S_n$ such that $\tau (I) = I$ and $\tau (I+1) = J$ (namely, $\tau = \text{id}$).

Now let us consider Case 2. In this case, $J \not= I + 1$, so that the transposition $(J, I+1) \in S_n$ is well-defined, and it satisfies $(J, I+1) (I) = I$ (since $J \not= I$ and $I+1 \not= I$) and $(J, I+1) (I+1) = J$. Hence, in Case 2, there exists a permutation $\tau \in S_n$ such that $\tau (I) = I$ and $\tau (I+1) = J$ (namely, $\tau = (J, I+1)$).

We have thus proven in each of the two possible cases that there exists a permutation $\tau \in S_n$ such that $\tau (I) = I$ and $\tau (I+1) = J$.

This completes the proof that there always exists a permutation $\tau \in S_n$ such that $\tau (I) = I$ and $\tau (I+1) = J$.
Thus, Proposition \(35\) (applied to \(V^\otimes n\), \(\{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid ((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}; I \neq J; w_1 = w_J \}) and \(\tilde{R}_n(V)\) instead of \(M, S\) and \(Q\) yields

\[
\{ \{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid ((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}; I \neq J; w_1 = w_J \} \subseteq \tilde{R}_n(V).
\]

Now,

\[
R_n(V) = \left\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid ((v_1, v_2, \ldots, v_n), (i, j)) \in V^n \times \{1, 2, \ldots, n\}; i \neq j; v_i = v_j \right\rangle
\]

\[
= \left\langle \{ w_1 \otimes w_2 \otimes \ldots \otimes w_n \mid ((w_1, w_2, \ldots, w_n), (I, J)) \in V^n \times \{1, 2, \ldots, n\}; I \neq J; w_1 = w_J \} \right\rangle \subseteq \tilde{R}_n(V).
\]

This proves Lemma \(70\).

**Proof of Proposition \(67\)** Lemma \(70\) yields \(R_n(V) \subseteq \tilde{R}_n(V)\). Lemma \(69\) yields \(\tilde{R}_n(V) \subseteq R_n(V)\). Combining these two inclusions, we obtain \(\tilde{R}_n(V) = R_n(V)\). Thus,

\[
R_n(V) = \tilde{R}_n(V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; v_i = v_{i+1} \rangle.
\]

This proves Proposition \(67\).

The analogue of Lemma \(41\) looks as follows:

**Lemma 71.** Let \(k\) be a commutative ring. Let \(V\) be a \(k\)-module. Let \(n \in \mathbb{N}\). Let \(i \in \{1, 2, \ldots, n - 1\}\).

Then,

\[
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; v_i = v_{i+1} \rangle = V^\otimes (i-1) \cdot (R_2(V)) \cdot V^\otimes (n-1-i).
\]

Here, we consider \(V^\otimes n\) as a \(k\)-submodule of \(\otimes V\).

**Proof of Lemma \(71\)** Let \(V^\Delta\) be the \(k\)-submodule \(\{(v, v) \mid v \in V\}\) of \(V^2\). Then, \(V^\Delta = \{(v, w) \in V^2 \mid v = w\}\). Hence, for every \((v_i, v_{i+1}) \in V^2\), we have

\[(v_i, v_{i+1}) \in V^\Delta\] and only if \(v_i = v_{i+1}\). \((55)\)

Define a map \(a : V^{i-1} \rightarrow V^\otimes (i-1)\) by

\[
(a(v_1, v_2, \ldots, v_{i-1}) = v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} \quad \text{for every} \quad (v_1, v_2, \ldots, v_{i-1}) \in V^{i-1}).
\]

Define a map \(b : V^{\Delta 2} \rightarrow V^\otimes 2\) by

\[
b(v_i, v_{i+1}) = v_i \otimes v_{i+1} \quad \text{for every} \quad (v_i, v_{i+1}) \in V^{\Delta}.
\]

(Of course, every \((v_i, v_{i+1}) \in V^\Delta\) in fact satisfies \(v_i = v_{i+1}\) by the definition of \(V^\Delta\); but we still use different letters for \(v_i\) and \(v_{i+1}\) here to make this notation match another one.) Define a map \(c : V^{n-1-i} \rightarrow V^\otimes (n-1-i)\) by

\[
c(v_{i+2}, v_{i+3}, \ldots, v_n) = v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n \quad \text{for every} \quad (v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i}).
\]
Since $V^\otimes(i-1)$, $V^\otimes 2$ and $V^\otimes(n-1-i)$ are $k$-submodules of $\otimes V$, we can consider all three maps $a$, $b$ and $c$ as maps to the set $\otimes V$.

It is now easy to see that every $(v_1, v_2, ..., v_n) \in V^n$ such that $v_i = v_{i+1}$ satisfies $(v_i, v_{i+1}) \in V^\Delta$ and

$$v_1 \otimes v_2 \otimes ... \otimes v_n = a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n),$$

where the multiplication on the right hand side is the multiplication in the tensor algebra $\otimes V$. Thus,

$$\langle v_1 \otimes v_2 \otimes ... \otimes v_n \mid (v_1, v_2, ..., v_n) \in V^n; \ v_i = v_{i+1} \rangle = \langle a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n) \mid (v_1, v_2, ..., v_n) \in V^n; \ v_i = v_{i+1} \rangle$$

$$= \langle a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n) \mid ((v_1, v_2, ..., v_{i-1}) ; (v_i, v_{i+1}) ; (v_{i+2}, v_{i+3}, ..., v_n)) \in V^{i-1} \times V^2 \times V^{n-1-i} ; v_i = v_{i+1} \rangle$$

(here, we substituted the triple $((v_1, v_2, ..., v_{i-1}) ; (v_i, v_{i+1}) ; (v_{i+2}, v_{i+3}, ..., v_n))$ for the $n$-tuple $(v_1, v_2, ..., v_n)$)

$$\left\{ \begin{array}{l} \text{by \cref{eq:55}, this is equivalent to} \\
\text{(here, we renamed} ((v_1, v_2, ..., v_{i-1}) ; (v_i, v_{i+1}) ; (v_{i+2}, v_{i+3}, ..., v_n)) \text{as} (x, y, z)) \\
\text{this is equivalent to} (x, y, z) \in V^{i-1} \times V^2 \times V^{n-1-i} ; y \in V^\Delta \right. \end{array} \right.$$

\begin{equation}
\langle a(x) b(y) c(z) \mid (x, y, z) \in V^{i-1} \times V^2 \times V^{n-1-i} ; y \in V^\Delta \rangle.
\end{equation}

\textbf{Proof.} Let $(v_1, v_2, ..., v_n) \in V^n$ be such that $v_i = v_{i+1}$. Then, $(v_i, v_{i+1}) = (v_{i+1}, v_{i+1}) \in \{(v, v) \mid v \in V\} = V^\Delta$. Recalling Convention \ref{conv} we have

$$v_1 \otimes v_2 \otimes ... \otimes v_n = \underbrace{(v_1 \otimes v_2 \otimes ... \otimes v_{i-1}) \otimes (v_i \otimes v_{i+1}) \otimes (v_{i+2} \otimes v_{i+3} \otimes ... \otimes v_n)}_{=a(v_1, v_2, ..., v_{i-1})} \otimes \underbrace{(v_{i+2} \otimes v_{i+3} \otimes ... \otimes v_n)}_{=c(v_{i+2}, v_{i+3}, ..., v_n)}$$

$$= a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n).$$

On the other hand, \ref{eq:3} (applied to $a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n)$) yields

$$a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) = a(v_1, v_2, ..., v_{i-1}) \otimes b(v_i, v_{i+1}).$$

Also, \ref{eq:3} (applied to $a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n)$) yields

$$a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n)$$

$$= \underbrace{a(v_1, v_2, ..., v_{i-1}) \cdot b(v_i, v_{i+1}) \cdot c(v_{i+2}, v_{i+3}, ..., v_n)}_{=a(v_1, v_2, ..., v_{i-1}) \otimes b(v_i, v_{i+1})}$$

$$= a(v_1, v_2, ..., v_{i-1}) \otimes b(v_i, v_{i+1}) \otimes c(v_{i+2}, v_{i+3}, ..., v_n) = v_1 \otimes v_2 \otimes ... \otimes v_n.$$

\textit{qed.}
But Lemma 40 \textup{(b)} (applied to $X = V^{i-1}$, $Y = V^\Delta$, $Z = V^{n-1-i}$ and $P = \otimes V$) yields

$$
\langle a(x) \mid x \in V^{i-1} \rangle \cdot \langle b(y) \mid y \in V^\Delta \rangle \cdot \langle c(z) \mid z \in V^{n-1-i} \rangle
= \langle a(x) b(y) c(z) \mid (x, y, z) \in V^{i-1} \times V^\Delta \times V^{n-1-i} \rangle.
$$

Compared to (56), this yields

$$
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \rangle
= \langle a(x) \mid x \in V^{i-1} \rangle \cdot \langle b(y) \mid y \in V^\Delta \rangle \cdot \langle c(z) \mid z \in V^{n-1-i} \rangle. \tag{57}
$$

But

$$
\langle a(x) \mid x \in V^{i-1} \rangle = \left\langle \underbrace{a(v_1, v_2, \ldots, v_{i-1})} \mid (v_1, v_2, \ldots, v_{i-1}) \in V^{i-1} \right\rangle
$$

(here, we renamed $x$ as $(v_1, v_2, \ldots, v_{i-1})$)

$$
= \left\langle v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1} \mid (v_1, v_2, \ldots, v_{i-1}) \in V^{i-1} \right\rangle = V^{\otimes (i-1)}
$$

(since the $k$-module $V^{\otimes (i-1)}$ is generated by its pure tensors, i.e., by tensors of the form $v_1 \otimes v_2 \otimes \ldots \otimes v_{i-1}$ with $(v_1, v_2, \ldots, v_{i-1}) \in V^{i-1}$). Also,

$$
\langle c(z) \mid z \in V^{n-1-i} \rangle = \left\langle \underbrace{c(v_{i+2}, v_{i+3}, \ldots, v_n)} \mid (v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i} \right\rangle
$$

(here, we renamed $z$ as $(v_{i+2}, v_{i+3}, \ldots, v_n)$)

$$
= \left\langle v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n \mid (v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i} \right\rangle = V^{\otimes (n-1-i)}
$$

(since the $k$-module $V^{\otimes (n-1-i)}$ is generated by its pure tensors, i.e., by tensors of the form $v_{i+2} \otimes v_{i+3} \otimes \ldots \otimes v_n$ with $(v_{i+2}, v_{i+3}, \ldots, v_n) \in V^{n-1-i}$). Also, the map

$$
V \to V^\Delta, \quad v \mapsto (v, v) \tag{58}
$$

is a bijection (this follows easily by the definition of $V^\Delta$), and thus

$$
\langle b(y) \mid y \in V^\Delta \rangle = \left\langle \underbrace{b(v, v)} \mid v \in V \right\rangle \text{ (by the definition of $b$)}
$$

(here, we substituted $(v, v)$ for $y$, because the map (58) is a bijection)

$$
= \langle v \otimes v \mid v \in V \rangle = R_2(V) \quad \text{ (by Corollary 66)}.
$$

Thus, (57) becomes

$$
\langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; \ v_i = v_{i+1} \rangle
= \langle a(x) \mid x \in V^{i-1} \rangle \cdot \langle b(y) \mid y \in V^\Delta \rangle \cdot \langle c(z) \mid z \in V^{n-1-i} \rangle
= V^{\otimes (i-1)} \cdot (R_2(V)) \cdot V^{\otimes (n-1-i)},
$$

so that Lemma 71 is proven.

Next, the analogue of Corollary 42.
Corollary 72. Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $n \in \mathbb{N}$. Then,

$$R_n (V) = \sum_{i=1}^{n-1} V^{\otimes (i-1)} \cdot (R_2 (V)) \cdot V^{\otimes (n-1-i)}$$

(this is an equality between $k$-submodules of $\otimes V$, where $R_n (V)$ becomes such a $k$-submodule by means of the inclusion $R_n (V) \subseteq V^{\otimes n} \subseteq \otimes V$). Here, the multiplication on the right hand side is multiplication inside the $k$-algebra $\otimes V$.

Proof of Corollary 72: By Proposition 67, we have

$$R_n (V) = \sum_{i=1}^{n-1} \langle v_1 \otimes v_2 \otimes \ldots \otimes v_n \mid (v_1, v_2, \ldots, v_n) \in V^n; v_i = v_{i+1} \rangle$$

$$= V^{\otimes (i-1)} \cdot (R_2 (V)) \cdot V^{\otimes (n-1-i)} \quad \text{(by Lemma 71)}$$

$$= \sum_{i=1}^{n-1} V^{\otimes (i-1)} \cdot (R_2 (V)) \cdot V^{\otimes (n-1-i)}.$$

Thus, Corollary 72 is proven.

Now the analogue of Theorem 43.

Theorem 73. Let $k$ be a commutative ring. Let $V$ be a $k$-module. We know that $R_n (V)$ is a $k$-submodule of $V^{\otimes n}$ for every $n \in \mathbb{N}$. Thus, $\bigoplus_{n \in \mathbb{N}} R_n (V)$ is a $k$-submodule of $\bigoplus_{n \in \mathbb{N}} V^{\otimes n} = \otimes V$. This $k$-submodule satisfies

$$\bigoplus_{n \in \mathbb{N}} R_n (V) = (\otimes V) \cdot (R_2 (V)) \cdot (\otimes V).$$

The proof of Theorem 73 using Corollary 72 is completely analogous to the proof of Theorem 43 using Corollary 42.

Now we can finally define the exterior algebra, similarly to Definition 44.

Definition 74. Let $k$ be a commutative ring. Let $V$ be a $k$-module. By Theorem 73, the two $k$-submodules $\bigoplus_{n \in \mathbb{N}} R_n (V)$ and $(\otimes V) \cdot (R_2 (V)) \cdot (\otimes V)$ of $\otimes V$ are identic (where $\bigoplus_{n \in \mathbb{N}} R_n (V)$ becomes a $k$-submodule of $\otimes V$ in the same way as explained in Theorem 73). We denote these two identic $k$-submodules by $R(V)$. In other words, we define $R(V)$ by

$$R(V) = \bigoplus_{n \in \mathbb{N}} R_n (V) = (\otimes V) \cdot (R_2 (V)) \cdot (\otimes V).$$

Since $R(V) = (\otimes V) \cdot (R_2 (V)) \cdot (\otimes V)$, it is clear that $R(V)$ is a two-sided ideal of the $k$-algebra $\otimes V$. 

67
Now we define a $k$-module $\wedge V$ as the direct sum $\bigoplus_{n \in \mathbb{N}} \wedge^n V$. Then,

$$
\wedge V = \bigoplus_{n \in \mathbb{N}} \wedge^n V = \bigoplus_{n \in \mathbb{N}} (V^\otimes n / R_n (V)) \cong \left( \bigoplus_{n \in \mathbb{N}} V^\otimes n \right) / \left( \bigoplus_{n \in \mathbb{N}} R_n (V) \right) = (\otimes V) / R (V).
$$

This is a canonical isomorphism, so we will use it to identify $\wedge V$ with $(\otimes V) / R (V)$. Since $R (V)$ is a two-sided ideal of the $k$-algebra $\otimes V$, the quotient $k$-module $(\otimes V) / R (V)$ canonically becomes a $k$-algebra. Since $\wedge V = (\otimes V) / R (V)$, this means that $\wedge V$ becomes a $k$-algebra. We refer to this $k$-algebra as the exterior algebra of the $k$-module $V$.

We denote by wedge$_V$ the canonical projection $\otimes V \to (\otimes V) / R (V) = \wedge V$. Clearly, this map wedge$_V$ is a surjective $k$-algebra homomorphism. Besides, due to $\otimes V = \bigoplus V^\otimes n$ and $R (V) = \bigoplus R_n (V)$, it is clear that the canonical projection $\otimes V \to (\otimes V) / R (V)$ is the direct sum of the canonical projections $V^\otimes n \to V^\otimes n / R_n (V)$ over all $n \in \mathbb{N}$. Since the canonical projection $\otimes V \to (\otimes V) / R (V)$ is the map wedge$_V$, whereas the canonical projection $V^\otimes n \to V^\otimes n / R_n (V)$ is the map wedge$_{V,n}$, this rewrites as follows: The map wedge$_V$ is the direct sum of the maps wedge$_{V,n}$ over all $n \in \mathbb{N}$.

When $v_1, v_2, ..., v_n$ are some elements of $V$, one often abbreviates the element wedge$_V (v_1 \otimes v_2 \otimes ... \otimes v_n)$ of $\wedge V$ by $v_1 \wedge v_2 \wedge ... \wedge v_n$. (We will not use this abbreviation in this following.)

We should think of the notions $R (V)$, $\wedge V$ and wedge$_V$ as analogues of the notions $Q (V)$, Exter $V$ and extery$_V$ from Definition 44, respectively. The next result provides an analogue of Lemma 45.

**Lemma 75.** Let $k$ be a commutative ring. Let $V$ and $W$ be two $k$-modules. Let $f : V \to W$ be a $k$-module homomorphism.

(a) Then, the $k$-algebra homomorphism $\otimes f : \otimes V \to \otimes W$ satisfies $(\otimes f) (R (V)) \subseteq R (W)$. Also, for every $n \in \mathbb{N}$, the $k$-module homomorphism $f^\otimes n : V^\otimes n \to W^\otimes n$ satisfies $f^\otimes n (R_n (V)) \subseteq R_n (W)$.

(b) Assume that $f$ is surjective. Then, the $k$-algebra homomorphism $\otimes f : \otimes V \to \otimes W$ satisfies $(\otimes f) (R (V)) = R (W)$. Also, for every $n \in \mathbb{N}$, the $k$-module homomorphism $f^\otimes n : V^\otimes n \to W^\otimes n$ satisfies $f^\otimes n (R_n (V)) = R_n (W)$.

We can prove Lemma 75 by imitating the proof of Lemma 45 with some minor changes, but let us instead give a different proof for a change:

**Proof of Lemma 75.** First some preparations:

Corollary 66 yields $R_2 (V) = \langle v \otimes v \mid v \in V \rangle$. Corollary 66 (applied to $W$ instead of $V$) yields $R_2 (W) = \langle v \otimes v \mid v \in W \rangle = \langle w \otimes w \mid w \in W \rangle$.

Now, every $v \in V$ satisfies

$$(\otimes f) (v \otimes v) = f (v) \otimes f (v) \quad \text{(by the definition of} \; \otimes f)$$

$$\in \{ w \otimes w \mid w \in W \}.$$
In other words,
\[ \{(\otimes f) (v \otimes v) \mid v \in V\} \subseteq \{w \otimes w \mid w \in W\}. \tag{59} \]

Thus,
\[ (\otimes f) (\{v \otimes v \mid v \in V\}) = \{(\otimes f) (v \otimes v) \mid v \in V\} \subseteq \{w \otimes w \mid w \in W\}. \]

But Proposition \[33\] (applied to \(\otimes V\), \(\{v \otimes v \mid v \in V\}\), \(\otimes W\) and \(\otimes f\) instead of \(M\), \(S\), \(R\) and \(f\)) yields \((\otimes f) (\{v \otimes v \mid v \in V\}) = \{(\otimes f) (v \otimes v) \mid v \in V\}\). Now,
\[ R_2 (V) = \langle v \otimes v \mid v \in V\rangle = \{v \otimes v \mid v \in V\}, \]

so that
\[ (\otimes f) (R_2 (V)) = (\otimes f) (\{v \otimes v \mid v \in V\}) \subseteq \{w \otimes w \mid w \in W\} = \langle w \otimes w \mid w \in W\rangle = R_2 (W). \tag{60} \]

By Corollary \[72\] we have
\[ R_n (V) = \sum_{i=1}^{n-1} V^{\otimes (i-1)} \cdot (R_2 (V)) \cdot V^{\otimes (n-1-i)} \tag{61} \]
for every \(n \in \mathbb{N}\). Corollary \[72\] (applied to \(W\) instead of \(V\)) yields
\[ R_n (W) = \sum_{i=1}^{n-1} W^{\otimes (i-1)} \cdot (R_2 (W)) \cdot W^{\otimes (n-1-i)} \tag{62} \]
for every \(n \in \mathbb{N}\).

The map \(\otimes f\) is the direct sum of the maps \(f^{\otimes n} : V^{\otimes n} \to W^{\otimes n}\) for \(n \in \mathbb{N}\). Hence, for every \(n \in \mathbb{N}\), the restriction \((\otimes f) |_{V^{\otimes n}}\) of the map \(\otimes f\) to \(V^{\otimes n}\) is the map \(f^{\otimes n}\) (at least if we ignore the technicality that the targets of the maps \(\otimes f\) and \(f^{\otimes n}\) are different).

It is also clear that
\[ (\otimes f) (V^{\otimes j}) \subseteq W^{\otimes j} \quad \text{for every} \quad j \in \mathbb{N} \tag{63} \]
(since \(\otimes f\) is composed from the maps \(f^{\otimes n} : V^{\otimes n} \to W^{\otimes n}\) for \(n \in \mathbb{N}\)).

(a) For every \(n \in \mathbb{N}\), we have
\[ (\otimes f) (R_n (V)) = (\otimes f) \left( \sum_{i=1}^{n-1} V^{\otimes (i-1)} \cdot (R_2 (V)) \cdot V^{\otimes (n-1-i)} \right) \tag{by \(61\)} \]
\[ = \sum_{i=1}^{n-1} (\otimes f) \left( V^{\otimes (i-1)} \right) \cdot (\otimes f) (R_2 (V)) \cdot (\otimes f) \left( V^{\otimes (n-1-i)} \right) \tag{since \(\otimes f\) is a \(k\)-algebra homomorphism} \]
\[ \subseteq \sum_{i=1}^{n-1} W^{\otimes (i-1)} \cdot (R_2 (W)) \cdot W^{\otimes (n-1-i)} = R_n (W). \]
Since \((\otimes f) \left( R_n \left( V \right) \right) = \left( \otimes f \right) \left( \sum_{n=1}^{\infty} R_n \left( V \right) \otimes f \right) = f^{\otimes n} \left( R_n \left( V \right) \right)\), this rewrites as \(f^{\otimes n} \left( R_n \left( V \right) \right) \subseteq R_n \left( W \right)\).

We have \(R(V) = \bigoplus_{n \in \mathbb{N}} R_n(V) = \sum_{n \in \mathbb{N}} R_n(V)\) (because direct sums are sums) and \(R(W) = \sum_{n \in \mathbb{N}} R_n(W)\) (similarly). Since \(R(V) = \sum_{n \in \mathbb{N}} R_n(V)\), we have

\[
(\otimes f) \left( R(V) \right) = (\otimes f) \left( \sum_{n \in \mathbb{N}} R_n(V) \right) = \sum_{n \in \mathbb{N}} (\otimes f) \left( R_n(V) \right) \subseteq R_n(W). 
\]

This completes the proof of Lemma 75 (a).

(b) Assume that the map \(f\) is surjective.

Every \(w \in W\) satisfies \(w \otimes w \in \{(\otimes f) (v \otimes v) \mid v \in V\}\). \(\text{(}\otimes f\text{)}\) (v ⊗ v) | v ∈ V. \(^{20}\) In other words, \(\{w \otimes w \mid w \in W\} \subseteq \{(\otimes f) (v \otimes v) \mid v \in V\}\). Combined with (59), this yields

\[
\{ (\otimes f) (v \otimes v) \mid v \in V \} = \{ w \otimes w \mid w \in W \}. \tag{64}
\]

Now, in the same way as we used (59) to prove (60), we can use (64) to prove that

\[
(\otimes f) \left( R_n \left( V \right) \right) = R_n \left( W \right). \tag{65}
\]

For every \(n \in \mathbb{N}\), we have \((\otimes f) \left( V^{\otimes n} \right) = \left( \otimes f \right) \left( \sum_{n=1}^{\infty} R_n(V) \otimes f \right) = f^{\otimes n} \left( V^{\otimes n} \right) = W^{\otimes n}\) (since \(f^{\otimes n}\) is surjective by Proposition 47 (a)). Renaming \(n\) as \(j\) in this statement, we see that

\[
(\otimes f) \left( V^{\otimes j} \right) \subseteq W^{\otimes j} \quad \text{for every } j \in \mathbb{N}. \tag{66}
\]

Now, for every \(n \in \mathbb{N}\), we have

\[
(\otimes f) \left( R_n \left( V \right) \right) = (\otimes f) \left( \sum_{i=1}^{n-1} V^{\otimes (i-1)} \cdot (R_2 \left( V \right)) \cdot V^{\otimes (n-1-i)} \right) \quad \text{(by (61))}
\]

\[
= \sum_{i=1}^{n-1} \frac{(\otimes f) \left( V^{\otimes (i-1)} \right) \cdot (\otimes f) \left( R_2 \left( V \right) \right) \cdot (\otimes f) \left( V^{\otimes (n-1-i)} \right)}{= W^{\otimes (i-1)} \text{ (by (66))} = R_2(W) \text{ (by (65))} = W^{\otimes (n-1-i)} \text{ (by (66))}} \quad \text{(since } \otimes f \text{ is a } k\text{-algebra homomorphism)}
\]

\[
= \sum_{i=1}^{n-1} W^{\otimes (i-1)} \cdot (R_2 \left( W \right)) \cdot W^{\otimes (n-1-i)} = R_n \left( W \right).
\]

Since \((\otimes f) \left( R_n \left( V \right) \right) = \left( \otimes f \right) \left( \sum_{n=1}^{\infty} R_n \left( V \right) \otimes f \right) = f^{\otimes n} \left( R_n \left( V \right) \right)\), this rewrites as \(f^{\otimes n} \left( R_n \left( V \right) \right) = R_n \left( W \right)\).

\(^{20}\)Proof. Let \(w \in W\) be arbitrary. Then, there exists some \(z \in V\) such that \(w = f(z)\) (since \(f\) is surjective). Consider this \(z\). Then, \(w \otimes w = f(z) \otimes f(z) = (\otimes f) (z \otimes z)\) (by the definition of \(\otimes f\)), so that \(w \otimes w \in \{(\otimes f) (v \otimes v) \mid v \in V\}\), qed.
We have $R(V) = \bigoplus_{n \in \mathbb{N}} R_n(V)$ (because direct sums are sums) and $R(W) = \sum_{n \in \mathbb{N}} R_n(W)$ (similarly). Since $R(V) = \sum_{n \in \mathbb{N}} R_n(V)$, we have

$$(\otimes f) (R(V)) = (\otimes f) \left( \sum_{n \in \mathbb{N}} R_n(V) \right) = \sum_{n \in \mathbb{N}} (\otimes f) (R_n(V)) = R_n(W)$$

(since $\otimes f$ is $k$-linear)

$$= \sum_{n \in \mathbb{N}} R_n(W) = R(W).$$

This completes the proof of Lemma 75 (b).

The following definition mirrors Definition 46.

**Definition 76.** Let $k$ be a commutative ring. Let $V$ and $W$ be two $k$-modules. Let $f : V \rightarrow W$ be a $k$-module homomorphism. Then, the $k$-algebra homomorphism $\otimes f : \otimes V \rightarrow \otimes W$ satisfies $(\otimes f) (R(V)) \subseteq R(W)$ (by Lemma 75 (a)), and thus gives rise to a $k$-algebra homomorphism $(\otimes V) / R(V) \rightarrow (\otimes W) / R(W)$. This latter $k$-algebra homomorphism will be denoted by $\wedge f$. Since $(\otimes V) / R(V) = \wedge V$ and $(\otimes W) / R(W) = \wedge W$, this homomorphism $\wedge f : (\otimes V) / R(V) \rightarrow (\otimes W) / R(W)$ is actually a homomorphism from $\wedge V$ to $\wedge W$.

By the construction of $\wedge f$, the diagram

$$\begin{array}{ccc}
\otimes V & \xrightarrow{\otimes f} & \otimes W \\
\wedge V \downarrow & & \downarrow \wedge W \\
\wedge V & \xrightarrow{\wedge f} & \wedge W
\end{array}$$

(67)

commutes (since $\wedge_V$ is the canonical projection $\otimes V \rightarrow \wedge V$ and since $\wedge_W$ is the canonical projection $\otimes W \rightarrow \wedge W$).

Needless to say, the notion $\wedge f$ introduced in this definition is an analogue of the notion $\operatorname{Exter} f$ introduced in Definition 46.

Here is the analogue of Proposition 47:

**Proposition 77.** Let $k$ be a commutative ring. Let $V$ and $W$ be two $k$-modules. Let $f : V \rightarrow W$ be a surjective $k$-module homomorphism. Then:

(a) The $k$-module homomorphism $f^{\otimes n} : V^{\otimes n} \rightarrow W^{\otimes n}$ is surjective for every $n \in \mathbb{N}$.

(b) The $k$-algebra homomorphism $\otimes f : \otimes V \rightarrow \otimes W$ is surjective.

(c) The $k$-algebra homomorphism $\wedge f : \wedge V \rightarrow \wedge W$ is surjective.

The proof of this Proposition is completely analogous to the proof of Proposition 47 (and parts (a) and (b) are even the same).

So much for analogues of the results of Subsection 0.12. Now let us formulate the analogues of the results of Subsection 0.13. First, the analogue of Theorem 48:

**Theorem 78.** Let $k$ be a commutative ring. Let $V$ and $V'$ be two $k$-modules, and let $f : V \rightarrow V'$ be a surjective $k$-module homomorphism. Then, the kernel of the map $\wedge f : \wedge V \rightarrow \wedge V'$ is

$$\operatorname{Ker} (\wedge f) = (\wedge V) \cdot \wedge_V \left( \operatorname{Ker} f \right) = (\wedge V) \cdot \wedge_V \left( \operatorname{Ker} f \right) = \wedge_V \left( \operatorname{Ker} f \right) = \wedge V \left( \operatorname{Ker} f \right) = (\wedge V).$$
Here, Ker $f$ is considered a $k$-submodule of $\otimes V$ by means of the inclusion Ker $f \subseteq V = V^\otimes 1 \subseteq \otimes V$.

The proof of this Theorem 78 is completely analogous to that of Theorem 48. The analogue of Corollary 50 comes next:

**Corollary 79.** Let $k$ be a commutative ring. Let $V$ be a $k$-module, and let $W$ be a $k$-submodule of $V$. Then,

$$(\wedge V) \cdot \wedge_V (W) \cdot (\wedge V) = (\wedge V) \cdot \wedge_V (W) = \wedge_V (W) \cdot (\wedge V).$$

Here, $W$ is considered a $k$-submodule of $\otimes V$ by means of the inclusion $W \subseteq V = V^\otimes 1 \subseteq \otimes V$.

Expectedly, the proof of Corollary 79 is analogous to the proof of Corollary 50. Finally, the analogue of Corollary 51:

**Corollary 80.** Let $k$ be a commutative ring. Let $V$ be a $k$-module. Let $W$ be a $k$-submodule of $V$, and let $f : V \to V/W$ be the canonical projection.

(a) Then, the kernel of the map $\wedge f : \wedge V \to \wedge (V/W)$ is

$$\text{Ker} (\wedge f) = (\wedge V) \cdot \wedge_V (W) \cdot (\wedge V) = (\wedge V) \cdot \wedge_V (W) = \wedge_V (W) \cdot (\wedge V).$$

Here, $W$ is considered a $k$-submodule of $\otimes V$ by means of the inclusion $W \subseteq V = V^\otimes 1 \subseteq \otimes V$.

(b) We have

$$(\wedge V) \big/ ((\wedge V) \cdot \wedge_V (W)) \cong \wedge (V/W)$$

as $k$-modules.

The proof of Corollary 80 is analogous to the proof of Corollary 51.

### 0.16. The relation between the exterior and pseudoexterior algebras

The name “pseudoexterior” for the algebra $\text{Exter} V$ introduced in Definition 44 already suggests a close relation to the exterior algebra $\wedge V$. Indeed such a relation is given by the following two theorems:

**Theorem 81.** Let $k$ be a commutative ring. Let $V$ be a $k$-module.

(a) We have $Q_n (V) \subseteq R_n (V)$ for all $n \in \mathbb{N}$.

(b) We have $Q (V) \subseteq R (V)$.

(c) For every $n \in \mathbb{N}$, the projection $\wedge_V (V) : V^\otimes n \to \wedge^n V$ factors through the projection $\text{exter}_{V, n} : V^\otimes n \to \text{Exter}^n V$.

(d) The projection $\wedge_V : \otimes V \to \wedge V$ factors through the projection $\text{exter}_V : \otimes V \to \text{Exter} V$. 

72
**Theorem 82.** Let \( k \) be a commutative ring in which 2 is invertible. Let \( V \) be a \( k \)-module.

(a) We have \( Q_n (V) = R_n (V) \) for all \( n \in \mathbb{N} \).

(b) We have \( Q (V) = R (V) \).

(c) For every \( n \in \mathbb{N} \), we have \( \wedge^n V = \text{Exter}^n V \) and wedge\(_{V,n} = \text{exter}_{V,n} \).

(d) We have \( \wedge V = \text{Exter} V \) and wedge\(_V = \text{exter}_V \).

**Proof of Theorem 81** (a) Let us use the notations of Lemma 68. For every \( n \in \mathbb{N} \), we have
\[
Q_n (V) \subseteq \tilde{R}_n (V) \subseteq R_n (V) \quad \text{(by Lemma 68)}.
\]
This proves Theorem 81 (a).

(b) We have
\[
Q (V) = \bigoplus_{n \in \mathbb{N}} Q_n (V) \subseteq \bigoplus_{n \in \mathbb{N}} R_n (V) = R (V).
\]
This proves Theorem 81 (b).

(c) Let \( n \in \mathbb{N} \). The canonical projection \( V^\otimes n \to V^\otimes n / R_n (V) \) factors through the canonical projection \( V^\otimes n \to V^\otimes n / Q_n (V) \) (because \( Q_n (V) \subseteq R_n (V) \) by Theorem 81 (a)). Since the canonical projection \( V^\otimes n \to V^\otimes n / R_n (V) \) is the map wedge\(_{V,n} : V^\otimes n \to \wedge^n V \), and since the canonical projection \( V^\otimes n \to V^\otimes n / Q_n (V) \) is the map exter\(_{V,n} : V^\otimes n \to \text{Exter}^n V \), this rewrites as follows: The map wedge\(_{V,n} : V^\otimes n \to \wedge^n V \) factors through the map exter\(_{V,n} : V^\otimes n \to \text{Exter}^n V \). This proves Theorem 81 (c).

(d) The canonical projection \( \otimes V \to (\otimes V) / R (V) \) factors through the canonical projection \( \otimes V \to (\otimes V) / Q (V) \) (because \( Q (V) \subseteq R (V) \) by Theorem 81 (b)). Since the canonical projection \( \otimes V \to (\otimes V) / R (V) \) is the map wedge\(_V : \otimes V \to \wedge V \), and since the canonical projection \( \otimes V \to (\otimes V) / Q (V) \) is the map exter\(_V : \otimes V \to \text{Exter} V \), this rewrites as follows: The map wedge\(_V : \otimes V \to \wedge V \) factors through the map exter\(_V : \otimes V \to \text{Exter} V \). This proves Theorem 81 (d).

**Proof of Theorem 82** The main step is to prove that \( Q_2 (V) = R_2 (V) \). Let us do this now:

Corollary 39 yields
\[
Q_2 (V) = \langle v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \rangle.
\]
Every \( v \in V \) satisfies
\[
v \otimes v = \frac{1}{2} (v \otimes v + v \otimes v) \quad \text{(since 2 is invertible in } k)\]
\[
= \frac{1}{2} v \otimes v + v \otimes \frac{1}{2} v \in \{ v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \}.
\]
In other words,
\[
\{ v \otimes v \mid v \in V \} \subseteq \{ v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \}.
\]
Now, Corollary 66 yields
\[ R_2 (V) = \langle v \otimes v \mid v \in V \rangle = \left\langle \left\{ v \otimes v \mid v \in V \right\} \subseteq \langle \left\{ v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \right\} \right\rangle = \langle \{ v_1 \otimes v_2 + v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \} \rangle = Q_2 (V). \]

Combined with \( Q_2 (V) \subseteq R_2 (V) \) (which follows from Theorem 81 (a), applied to \( n = 2 \)), this yields \( Q_2 (V) = R_2 (V) \).

(a) Let \( n \in \mathbb{N} \). Both \( Q_n (V) \) and \( R_n (V) \) are \( k \)-submodules of \( V^\otimes n \) and thus \( k \)-submodules of \( \otimes V \) (since \( V^\otimes n \subseteq \otimes V \)). Using the multiplication on the \( k \)-algebra \( \otimes V \), we have
\[
Q_n (V) = \sum_{i=1}^{n-1} V^\otimes (i-1) : (Q_2 (V)) \cdot V^\otimes (n-1-i) \quad \text{(by Corollary 42)}
\]
\[
= \sum_{i=1}^{n-1} V^\otimes (i-1) \cdot (R_2 (V)) \cdot V^\otimes (n-1-i) = R_n (V) \quad \text{(by Corollary 72)}.
\]

This proves Theorem 82 (a).

(b) We have
\[
Q (V) = \bigoplus_{n \in \mathbb{N}} Q_n (V) = \bigoplus_{n \in \mathbb{N}} R_n (V) = R (V).
\]

This proves Theorem 82 (b).

(c) Let \( n \in \mathbb{N} \). Then, \( V^\otimes n / R_n (V) = V^\otimes n / Q_n (V) \) (because \( R_n (V) = Q_n (V) \) by Theorem 82 (a)). Thus, \( \wedge^n V = V^\otimes n / R_n (V) = V^\otimes n / Q_n (V) = \text{Exten}^n V \).

Since the canonical projection \( V^\otimes n \to V^\otimes n / R_n (V) \) is the map \( \text{wedge}_{V,n} : V^\otimes n \to \wedge^n V \), and since the canonical projection \( V^\otimes n \to V^\otimes n / Q_n (V) \) is the map \( \text{exter}_{V,n} : V^\otimes n \to \text{Exter}^n V \), we have \( \text{wedge}_{V,n} = \text{exter}_{V,n} \) (because \( R_n (V) = Q_n (V) \)). This proves Theorem 82 (c).

(d) We have \( (V^\otimes V) / R (V) = (V^\otimes V) / Q (V) \) (because \( R (V) = Q (V) \) by Theorem 82 (b)). Since the canonical projection \( V^\otimes V \to (V^\otimes V) / R (V) \) is the map \( \text{wedge}_V : V^\otimes V \to \wedge V \), and since the canonical projection \( V^\otimes V \to (V^\otimes V) / Q (V) \) is the map \( \text{exter}_V : V^\otimes V \to \text{Exter} V \), we have \( \text{wedge}_V = \text{exter}_V \) (because \( R (V) = Q (V) \)). This proves Theorem 82 (d).

### 0.17. The symmetric algebra is commutative

In this section we are going to continue the study of the symmetric algebra that we started in Section 0.14 and prove some results which don’t have direct analogues for \( \text{Exter} V \) and \( \wedge V \) (although some analogues for \( \wedge V \) can be found with a little more effort, which we are not going to make).

The main result of this section will be:
Theorem 83. Let $k$ be a commutative ring. Let $V$ be a $k$-module. Then, the $k$-algebra $\text{Sym} V$ is commutative.

The standard proof of this theorem proceeds by double induction over the degrees of the tensors that must be shown to commute. We are going to show a slightly slicker version of this proof here, which replaces the double induction by a double application of Lemma 49 (which, in its proof, hides an induction). The intermediate step between these two applications will be the following lemma:

Lemma 84. Let $k$ be a commutative ring. Let $V$ be a $k$-module. Every $v \in V$ and every $p \in \text{Sym} V$ satisfy $\text{sym}_V (v) \cdot p = p \cdot \text{sym}_V (v)$.

(Of course, the notations we are using here and everywhere throughout this section are the notations of Section 10.14.)

Proof of Lemma 84. Let $v \in V$. Let $M$ be the subset

$$\{ q \in \text{Sym} V \mid \text{sym}_V (v) \cdot q = q \cdot \text{sym}_V (v) \}$$

of $\text{Sym} V$. We are going to prove that $M$ is the whole $\text{Sym} V$.

First of all, we have $0 \in M$. Furthermore, every $\alpha \in k$, $\beta \in k$, $p \in M$ and $r \in M$ satisfy $\alpha p + \beta r \in M$. In other words, $M$ is a $k$-submodule of $\text{Sym} V$.

Second, $1 \in M$ (with 1 denoting the unity of the $k$-algebra $\text{Sym} V$).

On the other hand, every $(p, s) \in M \times \text{sym}_V (V)$ satisfy $p \cdot s \in M$. In other words, \{ $p \cdot s \mid (p, s) \in M \times \text{sym}_V (V)$ \} $\subseteq M$. By Proposition 35 (a) (applied to $\text{Sym} V$,

\[21\text{Proof.} \quad \text{Clearly,} \quad \text{sym}_V (v) \cdot 0 = 0 = 0 \cdot \text{sym}_V (v), \text{ so that} \quad 0 \in \{ q \in \text{Sym} V \mid \text{sym}_V (v) \cdot q = q \cdot \text{sym}_V (v) \} = M. \]

\[22\text{Proof.} \quad \text{Let} \quad \alpha \in k, \beta \in k, p \in M \text{ and } r \in M. \]

Since $p \in M = \{ q \in \text{Sym} V \mid \text{sym}_V (v) \cdot q = q \cdot \text{sym}_V (v) \}$, we have $\text{sym}_V (v) \cdot p = p \cdot \text{sym}_V (v)$.

Similarly, $\text{sym}_V (v) \cdot r = r \cdot \text{sym}_V (v)$. Now,

$$\text{sym}_V (v) \cdot (\alpha p + \beta r) = \alpha \text{sym}_V (v) \cdot p + \beta \text{sym}_V (v) \cdot r = \alpha p \cdot \text{sym}_V (v) + \beta r \cdot \text{sym}_V (v)$$

$$= \alpha p \cdot \text{sym}_V (v) \cdot 1$$

$$= \alpha p \cdot \text{sym}_V (v) \cdot 1$$

$$= (\alpha p + \beta r) \cdot \text{sym}_V (v).$$

In other words, $\alpha p + \beta r \in \{ q \in \text{Sym} V \mid \text{sym}_V (v) \cdot q = q \cdot \text{sym}_V (v) \} = M$, qed.

\[23\text{Proof.} \quad \text{Clearly,} \quad \text{sym}_V (v) \cdot 1 = \text{sym}_V (v) = 1 \cdot \text{sym}_V (v), \text{ so that} \quad 1 \in \{ q \in \text{Sym} V \mid \text{sym}_V (v) \cdot q = q \cdot \text{sym}_V (v) \} = M. \]

\[24\text{Proof.} \quad \text{Let} \quad (p, s) \in M \times \text{sym}_V (V). \text{ Then,} \quad p \in M \text{ and } s \in \text{sym}_V (V). \text{ Since } s \in \text{sym}_V (V), \text{ there exists some} \quad w \in V \text{ such that} \quad s = \text{sym}_V (w). \text{ Consider this} \quad w. \]

Since $p \in M = \{ q \in \text{Sym} V \mid \text{sym}_V (v) \cdot q = q \cdot \text{sym}_V (v) \}$, we have $\text{sym}_V (v) \cdot p = p \cdot \text{sym}_V (v)$.

We have $v \in V = \otimes^2 V$ and $w \in V = \otimes^2 V$. Hence, $v \cdot w = v \otimes w$ (by 12), applied to $v$, $w$, 1 and 1 instead of $a$, $b$, $n$ and $m$) and similarly $w \cdot v = w \otimes v$. Thus,

$$v \cdot w = w \cdot v = v \otimes w - w \otimes v$$

$$\because v \otimes w = w \otimes v$$

$$\subseteq \{ v_1 \otimes v_2 - v_2 \otimes v_1 \mid (v_1, v_2) \in \otimes^2 V \}$$

$$\subseteq \{ (v_1, v_2) \in \otimes^2 V \mid (v_1, v_2) \in \otimes^2 V \}$$

$$= \bigoplus_{w \in V} K_2 (V) = K (V), \text{ by Corollary 34} \subseteq \bigoplus_{w \in \text{Sym} V} K_2 (V) = K (V).$$

In other words, $v \cdot w \equiv w \cdot v \text{ mod } K (V)$. Since $\text{sym}_V$ is the projection $\otimes V \rightarrow (\otimes V) / K (V)$,
\{p \cdot s \mid (p, s) \in M \times \text{sym}_V(V)\} \text{ and } M \text{ instead of } M, S \text{ and } Q), \text{ this yields}

\langle \{p \cdot s \mid (p, s) \in M \times \text{sym}_V(V)\} \rangle \subseteq M.

Now,

\text{M-sym}_V(V) = \langle p \cdot s \mid (p, s) \in M \times \text{sym}_V(V)\rangle = \langle \{p \cdot s \mid (p, s) \in M \times \text{sym}_V(V)\} \rangle \subseteq M.

By Lemma 49 (applied to } A = \text{Sym} V \text{ and } \pi = \text{sym}_V), \text{ this yields that } M \text{ is a right ideal of Sym} V. \text{ Thus, } M \cdot \text{Sym} V \subseteq M. \text{ But since } 1 \in M, \text{ we have } 1 \cdot \text{Sym} V \subseteq M \cdot \text{Sym} V \subseteq M, \text{ so that Sym} V = 1 \cdot \text{Sym} V \subseteq M. \text{ Combined with } M \subseteq \text{Sym} V, \text{ this yields } M = \text{Sym} V. \text{ Hence, every } p \in \text{Sym} V \text{ satisfies } p \in M = \{q \in \text{Sym} V \mid \text{sym}_V(v) \cdot q = q \cdot \text{sym}_V(v)\}, \text{ so that } \text{sym}_V(v) \cdot p = p \cdot \text{sym}_V(v). \text{ This proves Lemma 84.}

Using Lemma 84, we will now prove Theorem 83:

**Proof of Theorem 83. a)** Let } t \in \text{Sym} V. \text{ We are going to prove that } tp = pt \text{ for every } p \in \text{Sym} V.

**Proof.** Let } M \text{ be the subset

\{q \in \text{Sym} V \mid tq = qt\}

of Sym} V. \text{ We are going to prove that } M \text{ is the whole Sym} V.

First of all, we have } 0 = 0 = 0 \text{. Also, every } \alpha \in k, \beta \in k, p \in M \text{ and } r \in M \text{ satisfy } \alpha p + \beta r \in M. \text{ In other words, } M \text{ is a } k\text{-submodule of Sym} V.

Second, } 1 \in M \text{ (with } 1 \text{ denoting the unity of the } k\text{-algebra Sym} V). \text{ On the other hand, every } (p, s) \in M \times \text{sym}_V(V) \text{ satisfy } p \cdot s \in M. \text{ In other words, } \{p \cdot s \mid (p, s) \in M \times \text{sym}_V(V)\} \subseteq M. \text{ By Proposition 35 (a) (applied to Sym} V, this rewrites as } \text{sym}_V(v \cdot w) = \text{sym}_V(w \cdot v). \text{ Since } \text{sym}_V \text{ is a } k\text{-algebra homomorphism, we have } \text{sym}_V(v \cdot w) = \text{sym}_V(v) \cdot \text{sym}_V(w) \text{ and } \text{sym}_V(w \cdot v) = \text{sym}_V(w) \cdot \text{sym}_V(v).

Now,

\begin{align*}
\text{sym}_V(v) \cdot p & \cdot s = p \cdot \text{sym}_V(v) \cdot \text{sym}_V(w) = p \cdot \text{sym}_V(w) \cdot \text{sym}_V(v) \\
\text{sym}_V(v) \cdot p & = p \cdot \text{sym}_V(v).
\end{align*}

In other words, } p \cdot s \in \{q \in \text{Sym} V \mid \text{sym}_V(v) \cdot q = q \cdot \text{sym}_V(v)\} = M, \text{ qed.

\text{Proof.} \text{ Clearly, } t0 = 0 = 0t, \text{ so that } 0 \in \{q \in \text{Sym} V \mid tq = qt\} = M.

\text{Proof.} \text{ Let } \alpha \in k, \beta \in k, p \in M \text{ and } r \in M.

Since } p \in M = \{q \in \text{Sym} V \mid tq = qt\}, \text{ we have } tp = pt. \text{ Similarly, } tr = rt. \text{ Now, } \alpha t(\alpha p + \beta r) = \alpha tp + \beta tr = \alpha pt + \beta rt = (\alpha p + \beta r)t.

In other words, } \alpha p + \beta r \in \{q \in \text{Sym} V \mid tq = qt\} = M, \text{ qed.

\text{Proof.} \text{ Clearly, } t \cdot 1 = t = 1t, \text{ so that } 1 \in \{q \in \text{Sym} V \mid tq = qt\} = M.

\text{Proof.} \text{ Let } (p, s) \in M \times \text{sym}_V(V). \text{ Then, } p \in M \text{ and } s \in \text{sym}_V(V). \text{ Since } s \in \text{sym}_V(V), \text{ there exists some } v \in V \text{ such that } s = \text{sym}_V(v). \text{ Consider this } v. \text{ Lemma 84 (applied to } t \text{ instead of } p \text{) yields } \text{sym}_V(v) \cdot t = t \cdot \text{sym}_V(v). \text{ Since } \text{sym}_V(v) = s, \text{ this becomes } s \cdot t = t \cdot s.

Since } p \in M = \{q \in \text{Sym} V \mid tq = qt\}, \text{ we have } tp = pt. \text{ Now, } tp s = p \cdot t \cdot s = pst. \text{ In other words, } ps \in \{q \in \text{Sym} V \mid tq = qt\} = M, \text{ so that } p \cdot s = ps \in M, \text{ qed.
\{ p \cdot s \mid (p, s) \in M \times \text{sym}_V(V) \} and M instead of M, S and Q), this yields
\langle \{ p \cdot s \mid (p, s) \in M \times \text{sym}_V(V) \} \rangle \subseteq M.

Now,

\text{M} \cdot \text{sym}_V(V) = \langle \{ p \cdot s \mid (p, s) \in M \times \text{sym}_V(V) \} \rangle \subseteq M.

By Lemma \([49]\) (applied to \( A = \text{Sym} V \) and \( \pi = \text{sym}_V \)), this yields that \( M \) is a right ideal of \( \text{Sym} V \). Thus, \( M \cdot \text{Sym} V \subseteq M \). But since \( 1 \in M \), we have \( 1 \cdot \text{Sym} V \subseteq M \cdot \text{Sym} V \subseteq M \), so that \( \text{Sym} V = 1 \cdot \text{Sym} V \subseteq M \). Combined with \( M \subseteq \text{Sym} V \), this yields \( M = \text{Sym} V \). Hence, every \( p \in \text{Sym} V \) satisfies \( p \in M = \{ q \in \text{Sym} V \mid tq = qt \} \), so that \( tp = pt \). This proves \( a) \).

\text{b) } \text{Forget that we fixed} \ t. We have proven that every \( t \in \text{Sym} V \) and every \( p \in \text{Sym} V \)
satisfy \( tp = pt \) (by part \( a) \)). In other words, the \( k \)-algebra \( \text{Sym} V \) is commutative. Theorem \([83]\) is proven.

Theorem \([83]\) is a result on the nature of the factor algebra \( \text{Sym} V = (\otimes V) / K(V) \), so unsurprisingly it gives us an insight about the ideal \( K(V) \) itself - namely, a new characterization of this ideal:

**Corollary 85.** Let \( k \) be a commutative ring. Let \( V \) be a \( k \)-module. Then,

\[ K(V) = (\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V). \]

This Corollary is usually formulated as follows: The ideal \( K(V) \) is the commutator ideal of the \( k \)-algebra \( \otimes V \). This is actually often used as an alternative definition of \( K(V) \).

**Proof of Corollary 85.** \( a) \) Let us first show that \( K(V) \subseteq (\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V) \).

**Proof.** Every \( (v_1, v_2) \in V^2 \) satisfies \( v_1 \otimes v_2 - v_2 \otimes v_1 = v_1 v_2 - v_2 v_1 \). \([29]\) Hence,

\[ \{ v_1 \otimes v_2 - v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \} = \{ v_1 v_2 - v_2 v_1 \mid (v_1, v_2) \in V^2 \} \subseteq \{ pq - qp \mid (p, q) \in (\otimes V)^2 \} \]

(here, we renamed \( (v_1, v_2) \) as \( (p, q) \)).

Thus,

\[ \langle \{ v_1 \otimes v_2 - v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \} \rangle \subseteq \langle \{ pq - qp \mid (p, q) \in (\otimes V)^2 \} \rangle. \]

But by Corollary \([54]\) we have

\[ K_2(V) = \langle \{ v_1 \otimes v_2 - v_2 \otimes v_1 \mid (v_1, v_2) \in V^2 \} \rangle = \langle \{ pq - qp \mid (p, q) \in (\otimes V)^2 \} \rangle = \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle. \]

\([29]\) **Proof.** Let \( (v_1, v_2) \in V^2 \). Then, \( v_1 \in V \approx V^{\otimes 1} \) and \( v_2 \in V = V^{\otimes 1} \). Hence, \( v_1 \cdot v_2 = v_1 \otimes v_2 \) (by \([8] \), applied to \( v_1, v_2, 1 \) and \( 1 \) instead of \( a, b, n \) and \( m \)) and similarly \( v_2 \cdot v_1 = v_2 \otimes v_1 \). Hence,

\[ \frac{v_2 \otimes v_1 = v_1 v_2}{v_1 \otimes v_2 - v_2 \otimes v_1 = v_1 v_2 - v_2 v_1} = q_1 v_2 v_1. \]

qed.
Hence,
\[(\otimes V) \cdot (K_2(V)) \cdot (\otimes V) \subseteq (\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V) .\]

Since \((\otimes V) \cdot (K_2(V)) \cdot (\otimes V) = K(V)\), this rewrites as
\[K(V) \subseteq (\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V) .\]

This proves part a).

b) Now we will prove that \((\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V) \subseteq K(V)\).

Proof. Every \((p, q) \in (\otimes V)^2\) satisfy \(pq - qp \in K(V)\). In other words, \(\{pq - qp \mid (p, q) \in (\otimes V)^2\} \subseteq K(V)\). Hence, Proposition 35 (a) (applied to \(\otimes V\), \(\{pq - qp \mid (p, q) \in (\otimes V)^2\}\) and \(K(V)\) instead of \(M, S\) and \(Q\)) yields \(\langle \{pq - qp \mid (p, q) \in (\otimes V)^2\} \rangle \subseteq K(V)\).

Thus,
\[\langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \subseteq \langle \{pq - qp \mid (p, q) \in (\otimes V)^2\} \rangle \subseteq K(V) .\]

Hence,
\[(\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V) \subseteq (\otimes V) \cdot (K(V)) \cdot (\otimes V) \subseteq K(V)\]

(since \(K(V)\) is a two-sided ideal of \(\otimes V\)). This proves part b).

c) Combining \(K(V) \subseteq (\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V)\) (which we know from part a)) with \((\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V) \subseteq K(V)\) (which we know from part b)), we obtain \(K(V) = (\otimes V) \cdot \langle pq - qp \mid (p, q) \in (\otimes V)^2 \rangle \cdot (\otimes V)\). This proves Corollary 85.

30 Proof. Let \((p, q) \in (\otimes V)^2\). Then,
\[\text{sym}_{V^*}(pq) = \text{sym}_{V^*}(p) \cdot \text{sym}_{V^*}(q) \quad \text{(since \(\text{sym}_{V^*}\) is a \(k\)-algebra homomorphism)}\]
\[= \text{sym}_{V^*}(q) \cdot \text{sym}_{V^*}(p) \quad \text{(since \(\text{Sym} V\) is commutative by Theorem 83)}\]
\[= \text{sym}_{V^*}(qp) \quad \text{(since \(\text{sym}_{V^*}\) is a \(k\)-algebra homomorphism)} .\]

In other words, \(pq \equiv qp \mod K(V)\) (since \(\text{sym}_{V^*}\) is the projection \(\otimes V \rightarrow (\otimes V) / K(V)\)). In other words, \(pq - qp \in K(V)\), qed.
