Road Map
1. Examples
2. Bayes’ rule
3. Definitions
   1. Bayesian Game
   2. Bayesian Nash Equilibrium
4. Mixed strategies, revisited
5. Economic Applications
   1. Cournot Duopoly
   2. Auctions
   3. Double Auction
Incomplete information

We have incomplete (or asymmetric) information if one player knows something (relevant) that some other player does not know.

An Example
The same example

Another Example

What would you ask if you were to choose $p$ from $[0,4]$?
Same “Another Example”

What would you ask if you were to choose \( p \) from \([0,4]\)?

Bayes’ Rule

\[
\text{Prob}(A \text{ and } B) = \frac{\text{Prob}(A|B) \times \text{Prob}(B)}{\text{Prob}(B)}
\]

\[
\text{Prob}(A|B) = \frac{\text{Prob}(B|A) \times \text{Prob}(A)}{\text{Prob}(B)}
\]
Example

- Prob(Work|Success) = $\mu p / [\mu p + (1-\mu)(1-p)]$
- Prob(Work|Failure) = $(1-\mu)p / [\mu(1-p) + (1-\mu)p]$

Bayesian Game (Normal Form)

A Bayesian game is a list
\[ G = \{A_1, \ldots, A_n; T_1, \ldots, T_n; p_1, \ldots, p_n; u_1, \ldots, u_n\} \]
where
- \( A_i \) is the action space of \( i \) (\( a_i \) in \( A_i \))
- \( T_i \) is the type space of \( i \) (\( t_i \))
- \( p_i(t_i|t_i) \) is \( i \)'s belief about the other players
- \( u_i(a_1, \ldots, a_n; t_1, \ldots, t_n) \) is \( i \)'s payoff.

An Example

<table>
<thead>
<tr>
<th>Nature</th>
<th>Firm</th>
<th>Work</th>
<th>Shirk</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>Hire</td>
<td>W</td>
<td>(1, 2)</td>
</tr>
<tr>
<td></td>
<td>Do not hire</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Shirk</td>
<td></td>
<td>(0, 0)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Low</th>
<th>Hire</th>
<th>W</th>
<th>Shirk</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Do not hire</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Shirk</td>
<td></td>
<td>(-1, 2)</td>
</tr>
</tbody>
</table>

\( T_{Firm} = \{t_f\} \);  
\( T_W = \{High, Low\} \)  
\( A_{Firm} = \{Hire, Don’t\} \)  
\( A_W = \{Work, Shirk\} \)  
\( p_F(\text{High}) = p \)  
\( p_F(\text{Low}) = 1-p \)
A Bayesian Nash equilibrium is a Nash equilibrium of a Bayesian game.

Given any Bayesian game $G = \{A_1, \ldots, A_n; T_1, \ldots, T_n; p_1, \ldots, p_n; u_1, \ldots, u_n\}$, a strategy of a player $i$ is any function $s_i : T_i \rightarrow A_i$.

A strategy profile $s^* = (s_1^*, \ldots, s_n^*)$ is a Bayesian Nash equilibrium iff $s_i^*(t_i)$ solves

$$\max \sum_{a \in A_i} u_i(s_i^*(t_i), \ldots, s_{i-1}^*(t_{i-1}), a_i, s_{i+1}^*(t_{i+1}), \ldots, s_n^*(t_n), t_i) p_i(t_i | t_i)$$

i.e., $s_i^*$ is a best response to $s_{-i}^*$.

**An Example**

<table>
<thead>
<tr>
<th>Nature</th>
<th>Firm</th>
<th>Hire</th>
<th>Work</th>
<th>Shirk</th>
<th>Do not hire</th>
</tr>
</thead>
<tbody>
<tr>
<td>High $p$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Low $1-p$</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Firm**
- $T_{\text{Firm}} = \{t_f\}$
- $T_{\text{W}} = \{\text{High}, \text{Low}\}$
- $A_{\text{Firm}} = \{\text{Hire, Don’t}\}$
- $A_{\text{W}} = \{\text{Work, Shirk}\}$
- $p_{\text{F}}(\text{High}) = p > 1/2$
- $p_{\text{F}}(\text{Low}) = 1-p$

**Firm**
- $s_{\text{F}}^* = \text{Hire,}$
- $s_{\text{F}}^* (\text{High}) = \text{Work}$
- $s_{\text{F}}^* (\text{Low}) = \text{Shirk}$

Another equilibrium?
Stag Hunt, Mixed Strategy

<table>
<thead>
<tr>
<th></th>
<th>(2,2)</th>
<th>(4,0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(0,4)</td>
<td>(6,6)</td>
</tr>
</tbody>
</table>

Mixed Strategies

- $t$ and $v$ are iid with uniform distribution on $[-\varepsilon, \varepsilon]$.
- $t$ and $v$ are privately known by 1 and 2, respectively, i.e., are types of 1 and 2, respectively.
- Pure strategy:
  - $s_1(t) = $ Rabbit iff $t > 0$;
  - $s_2(v) = $ Rabbit iff $t > 0$.
- $p = \text{Prob}(s_1(t) = \text{Rabbit}|v) = \text{Prob}(t > 0) = 1/2$.
- $q = \text{Prob}(s_2(v) = \text{Rabbit}|t) = 1/2$.

\[
U_1(R|t) = t + 2q + 4(1-q) = t + 4 - 2q
\]
\[
U_1(S|t) = 6(1-q);
\]
\[
U_1(R|t) > U_1(S|t) \iff t + 4 - 2q > 6(1-q) 
\iff t > 6-6q+2q-4 = 2 - 4q = 0.
\]
