--% Elliptic curve method for integer factorization
-- This file implements Lenstra's algorithm for integer factorization.
-- A divisor of N is found by computing a large multiple of a rational
-- point on a randomly generated elliptic curve in P2 Z/NZ.
-- The Hessian model is used for the curve (1) to simplify the selection
-- of the initial point on the random curve and (2) to minimize the
-- cost of adding points.
-- Ref: IBM RC 11262, DV Chudnovsky & GV Chudnovsky
-- SMW Sept 86.
```

```
