

Five Things to Remember Before Testing Your Product

1. If you haven't already, obtain a notebook to record all of your observations during your testing.
2. Before starting your testing, prepare a **data table** so you can quickly write down your measurements as you observe them.
3. Follow your experimental procedure exactly. If you need to make changes in the procedure (which often happens), write down the changes exactly as you made them.
4. Be consistent, careful, and accurate when you take your measurements. Numerical measurements are best.
5. Take pictures of your experiment for use on your display board if you can.
