

Achieve the ultimate in network security with Scissors™

**The only totally foolproof
network security system.**

Hackers. Computer viruses. E-mail bombs. Disgruntled employees. Corporate spies. Matt Drudge. The list of threats to your network grows longer with each passing day. And no matter how many anti-virus products you use, no matter how many security patches you apply, no matter how tightly you think you've locked down security – you can never be totally sure. Somewhere, somehow, someday some fifteen-year-old with a chip on his shoulder and lots of free time will crack your network open like a lobster.

That's why you need Scissors™. A few snips of network wire and you will literally "cut off" all possible means of unauthorized access to your systems. Your boss will be pleased as worker productivity grows, since web surfing will be a thing of the past. And you'll finally be able to sleep nights, knowing that your network is safe.

Scissors are versatile, too. They come in a variety of shapes and sizes (including left and right-handed versions) perfect for slicing all kinds of cables, including the popular UTP and fiber! They can also be used for cutting paper. Or, in a pinch, they make a great personal security device.

Scissors. The cutting edge of network security. When people ask why you weren't affected by the latest Internet threat, simply tell them, "I'm running with Scissors."
