## 4. Convex optimization problems

- optimization problem in standard form
- convex optimization problems
- quasiconvex optimization
- linear optimization
- quadratic optimization
- geometric programming
- generalized inequality constraints
- semidefinite programming
- vector optimization

## Optimization problem in standard form

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& h_{i}(x)=0, \quad i=1, \ldots, p
\end{array}
$$

- $x \in \mathbf{R}^{n}$ is the optimization variable
- $f_{0}: \mathbf{R}^{n} \rightarrow \mathbf{R}$ is the objective or cost function
- $f_{i}: \mathbf{R}^{n} \rightarrow \mathbf{R}, i=1, \ldots, m$, are the inequality constraint functions
- $h_{i}: \mathbf{R}^{n} \rightarrow \mathbf{R}$ are the equality constraint functions
optimal value:

$$
p^{\star}=\inf \left\{f_{0}(x) \mid f_{i}(x) \leq 0, i=1, \ldots, m, h_{i}(x)=0, i=1, \ldots, p\right\}
$$

- $p^{\star}=\infty$ if problem is infeasible (no $x$ satisfies the constraints)
- $p^{\star}=-\infty$ if problem is unbounded below

## Optimal and locally optimal points

$x$ is feasible if $x \in \operatorname{dom} f_{0}$ and it satisfies the constraints a feasible $x$ is optimal if $f_{0}(x)=p^{\star} ; X_{\text {opt }}$ is the set of optimal points $x$ is locally optimal if there is an $R>0$ such that $x$ is optimal for minimize (over $z$ ) $\quad f_{0}(z)$
subject to

$$
f_{i}(z) \leq 0, \quad i=1, \ldots, m, \quad h_{i}(z)=0, \quad i=1, \ldots, p
$$

$$
\|z-x\|_{2} \leq R
$$

examples (with $n=1, m=p=0$ )

- $f_{0}(x)=1 / x, \operatorname{dom} f_{0}=\mathbf{R}_{++}: p^{\star}=0$, no optimal point
- $f_{0}(x)=-\log x, \operatorname{dom} f_{0}=\mathbf{R}_{++}: p^{\star}=-\infty$
- $f_{0}(x)=x \log x, \operatorname{dom} f_{0}=\mathbf{R}_{++}: p^{\star}=-1 / e, x=1 / e$ is optimal
- $f_{0}(x)=x^{3}-3 x, p^{\star}=-\infty$, local optimum at $x=1$

## Implicit constraints

the standard form optimization problem has an implicit constraint

$$
x \in \mathcal{D}=\bigcap_{i=0}^{m} \operatorname{dom} f_{i} \cap \bigcap_{i=1}^{p} \operatorname{dom} h_{i},
$$

- we call $\mathcal{D}$ the domain of the problem
- the constraints $f_{i}(x) \leq 0, h_{i}(x)=0$ are the explicit constraints
- a problem is unconstrained if it has no explicit constraints ( $m=p=0$ )
example:

$$
\text { minimize } f_{0}(x)=-\sum_{i=1}^{k} \log \left(b_{i}-a_{i}^{T} x\right)
$$

is an unconstrained problem with implicit constraints $a_{i}^{T} x<b_{i}$

## Feasibility problem

$$
\begin{array}{ll}
\text { find } & x \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& h_{i}(x)=0, \quad i=1, \ldots, p
\end{array}
$$

can be considered a special case of the general problem with $f_{0}(x)=0$ :

$$
\begin{array}{ll}
\operatorname{minimize} & 0 \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& h_{i}(x)=0, \quad i=1, \ldots, p
\end{array}
$$

- $p^{\star}=0$ if constraints are feasible; any feasible $x$ is optimal
- $p^{\star}=\infty$ if constraints are infeasible

## Convex optimization problem

standard form convex optimization problem

| $\operatorname{minimize}$ | $f_{0}(x)$ |
| :--- | :--- |
| subject to | $f_{i}(x) \leq 0, \quad i=1, \ldots, m$ |
|  | $a_{i}^{T} x=b_{i}, \quad i=1, \ldots, p$ |

- $f_{0}, f_{1}, \ldots, f_{m}$ are convex; equality constraints are affine
- problem is quasiconvex if $f_{0}$ is quasiconvex (and $f_{1}, \ldots, f_{m}$ convex)
often written as

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& A x=b
\end{array}
$$

important property: feasible set of a convex optimization problem is convex

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x)=x_{1}^{2}+x_{2}^{2} \\
\text { subject to } & f_{1}(x)=x_{1} /\left(1+x_{2}^{2}\right) \leq 0 \\
& h_{1}(x)=\left(x_{1}+x_{2}\right)^{2}=0
\end{array}
$$

- $f_{0}$ is convex; feasible set $\left\{\left(x_{1}, x_{2}\right) \mid x_{1}=-x_{2} \leq 0\right\}$ is convex
- not a convex problem (according to our definition): $f_{1}$ is not convex, $h_{1}$ is not affine
- equivalent (but not identical) to the convex problem

$$
\begin{array}{ll}
\operatorname{minimize} & x_{1}^{2}+x_{2}^{2} \\
\text { subject to } & x_{1} \leq 0 \\
& x_{1}+x_{2}=0
\end{array}
$$

## Local and global optima

any locally optimal point of a convex problem is (globally) optimal
proof: suppose $x$ is locally optimal and $y$ is optimal with $f_{0}(y)<f_{0}(x)$ $x$ locally optimal means there is an $R>0$ such that

$$
z \text { feasible, } \quad\|z-x\|_{2} \leq R \quad \Longrightarrow \quad f_{0}(z) \geq f_{0}(x)
$$

consider $z=\theta y+(1-\theta) x$ with $\theta=R /\left(2\|y-x\|_{2}\right)$

- $\|y-x\|_{2}>R$, so $0<\theta<1 / 2$
- $z$ is a convex combination of two feasible points, hence also feasible
- $\|z-x\|_{2}=R / 2$ and

$$
f_{0}(z) \leq \theta f_{0}(x)+(1-\theta) f_{0}(y)<f_{0}(x)
$$

which contradicts our assumption that $x$ is locally optimal

## Optimality criterion for differentiable $f_{0}$

$x$ is optimal if and only if it is feasible and

$$
\nabla f_{0}(x)^{T}(y-x) \geq 0 \quad \text { for all feasible } y
$$

if nonzero, $\nabla f_{0}(x)$ defines a supporting hyperplane to feasible set $X$ at $x$

- unconstrained problem: $x$ is optimal if and only if

$$
x \in \operatorname{dom} f_{0}, \quad \nabla f_{0}(x)=0
$$

- equality constrained problem

$$
\text { minimize } f_{0}(x) \text { subject to } A x=b
$$

$x$ is optimal if and only if there exists a $\nu$ such that

$$
x \in \operatorname{dom} f_{0}, \quad A x=b, \quad \nabla f_{0}(x)+A^{T} \nu=0
$$

- minimization over nonnegative orthant

$$
\text { minimize } f_{0}(x) \text { subject to } x \succeq 0
$$

$x$ is optimal if and only if

$$
x \in \operatorname{dom} f_{0}, \quad x \succeq 0, \quad\left\{\begin{aligned}
\nabla f_{0}(x)_{i} \geq 0 & x_{i}=0 \\
\nabla f_{0}(x)_{i}=0 & x_{i}>0
\end{aligned}\right.
$$

## Equivalent convex problems

two problems are (informally) equivalent if the solution of one is readily obtained from the solution of the other, and vice-versa
some common transformations that preserve convexity:

- eliminating equality constraints

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& A x=b
\end{array}
$$

is equivalent to

$$
\begin{array}{ll}
\operatorname{minimize}(\text { over } z) & f_{0}\left(F z+x_{0}\right) \\
\text { subject to } & f_{i}\left(F z+x_{0}\right) \leq 0, \quad i=1, \ldots, m
\end{array}
$$

where $F$ and $x_{0}$ are such that

$$
A x=b \quad \Longleftrightarrow \quad x=F z+x_{0} \text { for some } z
$$

- introducing equality constraints

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}\left(A_{0} x+b_{0}\right) \\
\text { subject to } & f_{i}\left(A_{i} x+b_{i}\right) \leq 0, \quad i=1, \ldots, m
\end{array}
$$

is equivalent to

$$
\begin{array}{ll}
\operatorname{minimize}\left(\text { over } x, y_{i}\right) & f_{0}\left(y_{0}\right) \\
\text { subject to } & f_{i}\left(y_{i}\right) \leq 0, \quad i=1, \ldots, m \\
& y_{i}=A_{i} x+b_{i}, \quad i=0,1, \ldots, m
\end{array}
$$

- introducing slack variables for linear inequalities

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & a_{i}^{T} x \leq b_{i}, \quad i=1, \ldots, m
\end{array}
$$

is equivalent to

```
minimize (over \(x, s\) ) \(\quad f_{0}(x)\)
subject to \(\quad a_{i}^{T} x+s_{i}=b_{i}, \quad i=1, \ldots, m\)
    \(s_{i} \geq 0, \quad i=1, \ldots m\)
```

- epigraph form: standard form convex problem is equivalent to

$$
\begin{array}{ll}
\operatorname{minimize}(\text { over } x, t) & t \\
\text { subject to } & f_{0}(x)-t \leq 0 \\
& f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& A x=b
\end{array}
$$

- minimizing over some variables

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}\left(x_{1}, x_{2}\right) \\
\text { subject to } & f_{i}\left(x_{1}\right) \leq 0, \quad i=1, \ldots, m
\end{array}
$$

is equivalent to

$$
\begin{array}{ll}
\operatorname{minimize} & \tilde{f}_{0}\left(x_{1}\right) \\
\text { subject to } & f_{i}\left(x_{1}\right) \leq 0, \quad i=1, \ldots, m
\end{array}
$$

where $\tilde{f}_{0}\left(x_{1}\right)=\inf _{x_{2}} f_{0}\left(x_{1}, x_{2}\right)$

## Quasiconvex optimization

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& A x=b
\end{array}
$$

with $f_{0}: \mathbf{R}^{n} \rightarrow \mathbf{R}$ quasiconvex, $f_{1}, \ldots, f_{m}$ convex
can have locally optimal points that are not (globally) optimal

if $f_{0}$ is quasiconvex, there exists a family of functions $\phi_{t}$ such that:

- $\phi_{t}(x)$ is convex in $x$ for fixed $t$
- $t$-sublevel set of $f_{0}$ is 0 -sublevel set of $\phi_{t}$, i.e.,

$$
f_{0}(x) \leq t \quad \Longleftrightarrow \quad \phi_{t}(x) \leq 0
$$

example

$$
f_{0}(x)=\frac{p(x)}{q(x)}
$$

with $p$ convex, $q$ concave, and $p(x) \geq 0, q(x)>0$ on dom $f_{0}$
can take $\phi_{t}(x)=p(x)-t q(x)$ :

- for $t \geq 0, \phi_{t}$ convex in $x$
- $p(x) / q(x) \leq t$ if and only if $\phi_{t}(x) \leq 0$
quasiconvex optimization via convex feasibility problems

$$
\begin{equation*}
\phi_{t}(x) \leq 0, \quad f_{i}(x) \leq 0, \quad i=1, \ldots, m, \quad A x=b \tag{1}
\end{equation*}
$$

- for fixed $t$, a convex feasibility problem in $x$
- if feasible, we can conclude that $t \geq p^{\star}$; if infeasible, $t \leq p^{\star}$

```
Bisection method for quasiconvex optimization
given l\leq p
repeat
    1. }t:=(l+u)/2
    2. Solve the convex feasibility problem (1).
    3. if (1) is feasible, }u:=t;\quad\mathrm{ else l l=t.
until }u-l\leq\epsilon\mathrm{ .
```

requires exactly $\left\lceil\log _{2}((u-l) / \epsilon)\right\rceil$ iterations (where $u, l$ are initial values)

# Linear program (LP) 

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x+d \\
\text { subject to } & G x \preceq h \\
& A x=b
\end{array}
$$

- convex problem with affine objective and constraint functions
- feasible set is a polyhedron

## Examples

diet problem: choose quantities $x_{1}, \ldots, x_{n}$ of $n$ foods

- one unit of food $j$ costs $c_{j}$, contains amount $a_{i j}$ of nutrient $i$
- healthy diet requires nutrient $i$ in quantity at least $b_{i}$
to find cheapest healthy diet,

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & A x \succeq b, \quad x \succeq 0
\end{array}
$$

## piecewise-linear minimization

$$
\operatorname{minimize} \max _{i=1, \ldots, m}\left(a_{i}^{T} x+b_{i}\right)
$$

equivalent to an LP

$$
\begin{array}{ll}
\operatorname{minimize} & t \\
\text { subject to } & a_{i}^{T} x+b_{i} \leq t, \quad i=1, \ldots, m
\end{array}
$$

## Chebyshev center of a polyhedron

Chebyshev center of

$$
\mathcal{P}=\left\{x \mid a_{i}^{T} x \leq b_{i}, i=1, \ldots, m\right\}
$$

is center of largest inscribed ball

$$
\mathcal{B}=\left\{x_{c}+u \mid\|u\|_{2} \leq r\right\}
$$

- $a_{i}^{T} x \leq b_{i}$ for all $x \in \mathcal{B}$ if and only if

$$
\sup \left\{a_{i}^{T}\left(x_{c}+u\right) \mid\|u\|_{2} \leq r\right\}=a_{i}^{T} x_{c}+r\left\|a_{i}\right\|_{2} \leq b_{i}
$$

- hence, $x_{c}$, $r$ can be determined by solving the LP

$$
\begin{array}{ll}
\begin{array}{l}
\text { maximize } \\
\text { subject to }
\end{array} & a_{i}^{T} x_{c}+r\left\|a_{i}\right\|_{2} \leq b_{i}, \quad i=1, \ldots, m
\end{array}
$$

## (Generalized) linear-fractional program

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & G x \preceq h \\
& A x=b
\end{array}
$$

## linear-fractional program

$$
f_{0}(x)=\frac{c^{T} x+d}{e^{T} x+f}, \quad \operatorname{dom} f_{0}(x)=\left\{x \mid e^{T} x+f>0\right\}
$$

- a quasiconvex optimization problem; can be solved by bisection
- also equivalent to the LP (variables $y, z$ )

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} y+d z \\
\text { subject to } & G y \preceq h z \\
& A y=b z \\
& e^{T} y+f z=1 \\
& z \geq 0
\end{array}
$$

## generalized linear-fractional program

$f_{0}(x)=\max _{i=1, \ldots, r} \frac{c_{i}^{T} x+d_{i}}{e_{i}^{T} x+f_{i}}, \quad \operatorname{dom} f_{0}(x)=\left\{x \mid e_{i}^{T} x+f_{i}>0, i=1, \ldots, r\right\}$
a quasiconvex optimization problem; can be solved by bisection
example: Von Neumann model of a growing economy

$$
\begin{array}{ll}
\operatorname{maximize}\left(\text { over } x, x^{+}\right) & \min _{i=1, \ldots, n} x_{i}^{+} / x_{i} \\
\text { subject to } & x^{+} \succeq 0, \quad B x^{+} \preceq A x
\end{array}
$$

- $x, x^{+} \in \mathbf{R}^{n}$ : activity levels of $n$ sectors, in current and next period
- $(A x)_{i},\left(B x^{+}\right)_{i}$ : produced, resp. consumed, amounts of good $i$
- $x_{i}^{+} / x_{i}$ : growth rate of sector $i$
allocate activity to maximize growth rate of slowest growing sector

## Quadratic program (QP)

$$
\begin{array}{ll}
\operatorname{minimize} & (1 / 2) x^{T} P x+q^{T} x+r \\
\text { subject to } & G x \preceq h \\
& A x=b
\end{array}
$$

- $P \in \mathbf{S}_{+}^{n}$, so objective is convex quadratic
- minimize a convex quadratic function over a polyhedron

## Examples

## least-squares

$$
\operatorname{minimize}\|A x-b\|_{2}^{2}
$$

- analytical solution $x^{\star}=A^{\dagger} b\left(A^{\dagger}\right.$ is pseudo-inverse $)$
- can add linear constraints, e.g., $l \preceq x \preceq u$

## linear program with random cost

$$
\begin{array}{ll}
\operatorname{minimize} & \bar{c}^{T} x+\gamma x^{T} \Sigma x=\mathbf{E} c^{T} x+\gamma \operatorname{var}\left(c^{T} x\right) \\
\text { subject to } & G x \preceq h, \quad A x=b
\end{array}
$$

- $c$ is random vector with mean $\bar{c}$ and covariance $\Sigma$
- hence, $c^{T} x$ is random variable with mean $\bar{c}^{T} x$ and variance $x^{T} \Sigma x$
- $\gamma>0$ is risk aversion parameter; controls the trade-off between expected cost and variance (risk)

## Quadratically constrained quadratic program (QCQP)

$$
\begin{array}{ll}
\operatorname{minimize} & (1 / 2) x^{T} P_{0} x+q_{0}^{T} x+r_{0} \\
\text { subject to } & (1 / 2) x^{T} P_{i} x+q_{i}^{T} x+r_{i} \leq 0, \quad i=1, \ldots, m \\
& A x=b
\end{array}
$$

- $P_{i} \in \mathbf{S}_{+}^{n}$; objective and constraints are convex quadratic
- if $P_{1}, \ldots, P_{m} \in \mathbf{S}_{++}^{n}$, feasible region is intersection of $m$ ellipsoids and an affine set

## Second-order cone programming

$$
\begin{array}{ll}
\operatorname{minimize} & f^{T} x \\
\text { subject to } & \left\|A_{i} x+b_{i}\right\|_{2} \leq c_{i}^{T} x+d_{i}, \quad i=1, \ldots, m \\
& F x=g
\end{array}
$$

$\left(A_{i} \in \mathbf{R}^{n_{i} \times n}, F \in \mathbf{R}^{p \times n}\right)$

- inequalities are called second-order cone (SOC) constraints:

$$
\left(A_{i} x+b_{i}, c_{i}^{T} x+d_{i}\right) \in \text { second-order cone in } \mathbf{R}^{n_{i}+1}
$$

- for $n_{i}=0$, reduces to an LP; if $c_{i}=0$, reduces to a QCQP
- more general than QCQP and LP

## Robust linear programming

the parameters in optimization problems are often uncertain, e.g., in an LP

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & a_{i}^{T} x \leq b_{i}, \quad i=1, \ldots, m
\end{array}
$$

there can be uncertainty in $c, a_{i}, b_{i}$
two common approaches to handling uncertainty (in $a_{i}$, for simplicity)

- deterministic model: constraints must hold for all $a_{i} \in \mathcal{E}_{i}$

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & a_{i}^{T} x \leq b_{i} \text { for all } a_{i} \in \mathcal{E}_{i}, \quad i=1, \ldots, m
\end{array}
$$

- stochastic model: $a_{i}$ is random variable; constraints must hold with probability $\eta$
minimize $\quad c^{T} x$
subject to $\quad \operatorname{prob}\left(a_{i}^{T} x \leq b_{i}\right) \geq \eta, \quad i=1, \ldots, m$

## deterministic approach via SOCP

- choose an ellipsoid as $\mathcal{E}_{i}$ :

$$
\mathcal{E}_{i}=\left\{\bar{a}_{i}+P_{i} u \mid\|u\|_{2} \leq 1\right\} \quad\left(\bar{a}_{i} \in \mathbf{R}^{n}, \quad P_{i} \in \mathbf{R}^{n \times n}\right)
$$

center is $\bar{a}_{i}$, semi-axes determined by singular values/vectors of $P_{i}$

- robust LP

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & a_{i}^{T} x \leq b_{i} \quad \forall a_{i} \in \mathcal{E}_{i}, \quad i=1, \ldots, m
\end{array}
$$

is equivalent to the SOCP

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & \bar{a}_{i}^{T} x+\left\|P_{i}^{T} x\right\|_{2} \leq b_{i}, \quad i=1, \ldots, m
\end{array}
$$

(follows from $\sup _{\|u\|_{2} \leq 1}\left(\bar{a}_{i}+P_{i} u\right)^{T} x=\bar{a}_{i}^{T} x+\left\|P_{i}^{T} x\right\|_{2}$ )

## stochastic approach via SOCP

- assume $a_{i}$ is Gaussian with mean $\bar{a}_{i}$, covariance $\Sigma_{i}\left(a_{i} \sim \mathcal{N}\left(\bar{a}_{i}, \Sigma_{i}\right)\right)$
- $a_{i}^{T} x$ is Gaussian r.v. with mean $\bar{a}_{i}^{T} x$, variance $x^{T} \Sigma_{i} x$; hence

$$
\operatorname{prob}\left(a_{i}^{T} x \leq b_{i}\right)=\Phi\left(\frac{b_{i}-\bar{a}_{i}^{T} x}{\left\|\Sigma_{i}^{1 / 2} x\right\|_{2}}\right)
$$

where $\Phi(x)=(1 / \sqrt{2 \pi}) \int_{-\infty}^{x} e^{-t^{2} / 2} d t$ is CDF of $\mathcal{N}(0,1)$

- robust LP

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & \operatorname{prob}\left(a_{i}^{T} x \leq b_{i}\right) \geq \eta, \quad i=1, \ldots, m,
\end{array}
$$

with $\eta \geq 1 / 2$, is equivalent to the SOCP
minimize $\quad c^{T} x$
subject to $\quad \bar{a}_{i}^{T} x+\Phi^{-1}(\eta)\left\|\Sigma_{i}^{1 / 2} x\right\|_{2} \leq b_{i}, \quad i=1, \ldots, m$

## Geometric programming

monomial function

$$
f(x)=c x_{1}^{a_{1}} x_{2}^{a_{2}} \cdots x_{n}^{a_{n}}, \quad \operatorname{dom} f=\mathbf{R}_{++}^{n}
$$

with $c>0$; exponent $\alpha_{i}$ can be any real number
posynomial function: sum of monomials

$$
f(x)=\sum_{k=1}^{K} c_{k} x_{1}^{a_{1 k}} x_{2}^{a_{2 k}} \cdots x_{n}^{a_{n k}}, \quad \operatorname{dom} f=\mathbf{R}_{++}^{n}
$$

geometric program (GP)

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 1, \quad i=1, \ldots, m \\
& h_{i}(x)=1, \quad i=1, \ldots, p
\end{array}
$$

with $f_{i}$ posynomial, $h_{i}$ monomial

## Geometric program in convex form

change variables to $y_{i}=\log x_{i}$, and take logarithm of cost, constraints

- monomial $f(x)=c x_{1}^{a_{1}} \cdots x_{n}^{a_{n}}$ transforms to

$$
\log f\left(e^{y_{1}}, \ldots, e^{y_{n}}\right)=a^{T} y+b \quad(b=\log c)
$$

- posynomial $f(x)=\sum_{k=1}^{K} c_{k} x_{1}^{a_{1 k}} x_{2}^{a_{2 k}} \cdots x_{n}^{a_{n k}}$ transforms to

$$
\log f\left(e^{y_{1}}, \ldots, e^{y_{n}}\right)=\log \left(\sum_{k=1}^{K} e^{a_{k}^{T} y+b_{k}}\right) \quad\left(b_{k}=\log c_{k}\right)
$$

- geometric program transforms to convex problem

$$
\begin{array}{ll}
\text { minimize } & \log \left(\sum_{k=1}^{K} \exp \left(a_{0 k}^{T} y+b_{0 k}\right)\right) \\
\text { subject to } & \log \left(\sum_{k=1}^{K} \exp \left(a_{i k}^{T} y+b_{i k}\right)\right) \leq 0, \quad i=1, \ldots, m \\
& G y+d=0
\end{array}
$$

## Design of cantilever beam

segment 4 segment 3 segment 2 segment 1

- $N$ segments with unit lengths, rectangular cross-sections of size $w_{i} \times h_{i}$
- given vertical force $F$ applied at the right end

## design problem

minimize total weight
subject to upper \& lower bounds on $w_{i}, h_{i}$ upper bound \& lower bounds on aspect ratios $h_{i} / w_{i}$ upper bound on stress in each segment upper bound on vertical deflection at the end of the beam
variables: $w_{i}, h_{i}$ for $i=1, \ldots, N$

## objective and constraint functions

- total weight $w_{1} h_{1}+\cdots+w_{N} h_{N}$ is posynomial
- aspect ratio $h_{i} / w_{i}$ and inverse aspect ratio $w_{i} / h_{i}$ are monomials
- maximum stress in segment $i$ is given by $6 i F /\left(w_{i} h_{i}^{2}\right)$, a monomial
- the vertical deflection $y_{i}$ and slope $v_{i}$ of central axis at the right end of segment $i$ are defined recursively as

$$
\begin{aligned}
v_{i} & =12(i-1 / 2) \frac{F}{E w_{i} h_{i}^{3}}+v_{i+1} \\
y_{i} & =6(i-1 / 3) \frac{F}{E w_{i} h_{i}^{3}}+v_{i+1}+y_{i+1}
\end{aligned}
$$

for $i=N, N-1, \ldots, 1$, with $v_{N+1}=y_{N+1}=0(E$ is Young's modulus $)$ $v_{i}$ and $y_{i}$ are posynomial functions of $w, h$

## formulation as a GP

$$
\begin{array}{ll}
\operatorname{minimize} & w_{1} h_{1}+\cdots+w_{N} h_{N} \\
\text { subject to } & w_{\max }^{-1} w_{i} \leq 1, \quad w_{\min } w_{i}^{-1} \leq 1, \quad i=1, \ldots, N \\
& h_{\max }^{-1} h_{i} \leq 1, \quad h_{\min } h_{i}^{-1} \leq 1, \quad i=1, \ldots, N \\
& S_{\max }^{-1} w_{i}^{-1} h_{i} \leq 1, \quad S_{\min } w_{i} h_{i}^{-1} \leq 1, \quad i=1, \ldots, N \\
& 6 i F \sigma_{\max }^{-1} w_{i}^{-1} h_{i}^{-2} \leq 1, \quad i=1, \ldots, N \\
& y_{\max }^{-1} y_{1} \leq 1
\end{array}
$$

note

- we write $w_{\text {min }} \leq w_{i} \leq w_{\text {max }}$ and $h_{\text {min }} \leq h_{i} \leq h_{\text {max }}$

$$
w_{\min } / w_{i} \leq 1, \quad w_{i} / w_{\max } \leq 1, \quad h_{\min } / h_{i} \leq 1, \quad h_{i} / h_{\max } \leq 1
$$

- we write $S_{\min } \leq h_{i} / w_{i} \leq S_{\max }$ as

$$
S_{\min } w_{i} / h_{i} \leq 1, \quad h_{i} /\left(w_{i} S_{\max }\right) \leq 1
$$

## Minimizing spectral radius of nonnegative matrix

## Perron-Frobenius eigenvalue $\lambda_{\mathrm{pf}}(A)$

- exists for (elementwise) positive $A \in \mathbf{R}^{n \times n}$
- a real, positive eigenvalue of $A$, equal to spectral radius $\max _{i}\left|\lambda_{i}(A)\right|$
- determines asymptotic growth (decay) rate of $A^{k}: A^{k} \sim \lambda_{\text {pf }}^{k}$ as $k \rightarrow \infty$
- alternative characterization: $\lambda_{\mathrm{pf}}(A)=\inf \{\lambda \mid A v \preceq \lambda v$ for some $v \succ 0\}$

## minimizing spectral radius of matrix of posynomials

- minimize $\lambda_{\mathrm{pf}}(A(x))$, where the elements $A(x)_{i j}$ are posynomials of $x$
- equivalent geometric program:

$$
\begin{array}{ll}
\underset{\text { subject to }}{\operatorname{minimize}} & \sum_{j=1}^{n} A(x)_{i j} v_{j} /\left(\lambda v_{i}\right) \leq 1, \quad i=1, \ldots, n
\end{array}
$$

variables $\lambda, v, x$

## Generalized inequality constraints

convex problem with generalized inequality constraints

$$
\begin{array}{ll}
\operatorname{minimize} & f_{0}(x) \\
\text { subject to } & f_{i}(x) \preceq_{K_{i}} 0, \quad i=1, \ldots, m \\
& A x=b
\end{array}
$$

- $f_{0}: \mathbf{R}^{n} \rightarrow \mathbf{R}$ convex; $f_{i}: \mathbf{R}^{n} \rightarrow \mathbf{R}^{k_{i}} K_{i}$-convex w.r.t. proper cone $K_{i}$
- same properties as standard convex problem (convex feasible set, local optimum is global, etc.)
conic form problem: special case with affine objective and constraints

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & F x+g \preceq_{K} 0 \\
& A x=b
\end{array}
$$

extends linear programming ( $K=\mathbf{R}_{+}^{m}$ ) to nonpolyhedral cones

## Semidefinite program (SDP)

$$
\begin{array}{ll}
\operatorname{minimize} & c^{T} x \\
\text { subject to } & x_{1} F_{1}+x_{2} F_{2}+\cdots+x_{n} F_{n}+G \preceq 0 \\
& A x=b
\end{array}
$$

with $F_{i}, G \in \mathbf{S}^{k}$

- inequality constraint is called linear matrix inequality (LMI)
- includes problems with multiple LMI constraints: for example,

$$
x_{1} \hat{F}_{1}+\cdots+x_{n} \hat{F}_{n}+\hat{G} \preceq 0, \quad x_{1} \tilde{F}_{1}+\cdots+x_{n} \tilde{F}_{n}+\tilde{G} \preceq 0
$$

is equivalent to single LMI

$$
x_{1}\left[\begin{array}{cc}
\hat{F}_{1} & 0 \\
0 & \tilde{F}_{1}
\end{array}\right]+x_{2}\left[\begin{array}{cc}
\hat{F}_{2} & 0 \\
0 & \tilde{F}_{2}
\end{array}\right]+\cdots+x_{n}\left[\begin{array}{cc}
\hat{F}_{n} & 0 \\
0 & \tilde{F}_{n}
\end{array}\right]+\left[\begin{array}{cc}
\hat{G} & 0 \\
0 & \tilde{G}
\end{array}\right] \preceq 0
$$

## LP and SOCP as SDP

## LP and equivalent SDP

LP: minimize $c^{T} x \quad$ SDP: minimize $c^{T} x$ subject to $A x \preceq b \quad$ subject to $\operatorname{diag}(A x-b) \preceq 0$
(note different interpretation of generalized inequality $\preceq$ )
SOCP and equivalent SDP
SOCP: minimize $f^{T} x$
subject to $\left\|A_{i} x+b_{i}\right\|_{2} \leq c_{i}^{T} x+d_{i}, \quad i=1, \ldots, m$
SDP: minimize $f^{T} x$ subject to $\left[\begin{array}{cc}\left(c_{i}^{T} x+d_{i}\right) I & A_{i} x+b_{i} \\ \left(A_{i} x+b_{i}\right)^{T} & c_{i}^{T} x+d_{i}\end{array}\right] \succeq 0, \quad i=1, \ldots, m$

## Eigenvalue minimization

$$
\operatorname{minimize} \quad \lambda_{\max }(A(x))
$$

where $A(x)=A_{0}+x_{1} A_{1}+\cdots+x_{n} A_{n}$ (with given $A_{i} \in \mathbf{S}^{k}$ )
equivalent SDP

$$
\begin{array}{ll}
\operatorname{minimize} & t \\
\text { subject to } & A(x) \preceq t I
\end{array}
$$

- variables $x \in \mathbf{R}^{n}, t \in \mathbf{R}$
- follows from

$$
\lambda_{\max }(A) \leq t \quad \Longleftrightarrow \quad A \preceq t I
$$

## Matrix norm minimization

$$
\text { minimize }\|A(x)\|_{2}=\left(\lambda_{\max }\left(A(x)^{T} A(x)\right)\right)^{1 / 2}
$$

where $A(x)=A_{0}+x_{1} A_{1}+\cdots+x_{n} A_{n}$ (with given $A_{i} \in \mathbf{S}^{p \times q}$ ) equivalent SDP

$$
\left.\begin{array}{l}
\operatorname{minimize} \\
\text { subject to }
\end{array} \begin{array}{cc}
t I & A(x) \\
A(x)^{T} & t I
\end{array}\right] \succeq 0
$$

- variables $x \in \mathbf{R}^{n}, t \in \mathbf{R}$
- constraint follows from

$$
\begin{aligned}
\|A\|_{2} \leq t & \Longleftrightarrow A^{T} A \preceq t^{2} I, \quad t \geq 0 \\
& \Longleftrightarrow\left[\begin{array}{cc}
t I & A \\
A^{T} & t I
\end{array}\right] \succeq 0
\end{aligned}
$$

## Vector optimization

general vector optimization problem

$$
\begin{array}{ll}
\operatorname{minimize}(\text { w.r.t. } K) & f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& h_{i}(x) \leq 0, \quad i=1, \ldots, p
\end{array}
$$

vector objective $f_{0}: \mathbf{R}^{n} \rightarrow \mathbf{R}^{q}$, minimized w.r.t. proper cone $K \in \mathbf{R}^{q}$
convex vector optimization problem
minimize (w.r.t. $K$ ) $\quad f_{0}(x)$
subject to $\quad f_{i}(x) \leq 0, \quad i=1, \ldots, m$

$$
A x=b
$$

with $f_{0} K$-convex, $f_{1}, \ldots, f_{m}$ convex

## Optimal and Pareto optimal points

set of achievable objective values

$$
\mathcal{O}=\left\{f_{0}(x) \mid x \text { feasible }\right\}
$$

- feasible $x$ is optimal if $f_{0}(x)$ is a minimum value of $\mathcal{O}$
- feasible $x$ is Pareto optimal if $f_{0}(x)$ is a minimal value of $\mathcal{O}$

Convex optimization problems

## Multicriterion optimization

vector optimization problem with $K=\mathbf{R}_{+}^{q}$

$$
f_{0}(x)=\left(F_{1}(x), \ldots, F_{q}(x)\right)
$$

- $q$ different objectives $F_{i}$; roughly speaking we want all $F_{i}$ 's to be small
- feasible $x^{\star}$ is optimal if

$$
y \text { feasible } \quad \Longrightarrow \quad f_{0}\left(x^{\star}\right) \preceq f_{0}(y)
$$

if there exists an optimal point, the objectives are noncompeting

- feasible $x^{\mathrm{po}}$ is Pareto optimal if

$$
y \text { feasible, } \quad f_{0}(y) \preceq f_{0}\left(x^{\mathrm{po}}\right) \quad \Longrightarrow \quad f_{0}\left(x^{\mathrm{po}}\right)=f_{0}(y)
$$

if there are multiple Pareto optimal values, there is a trade-off between the objectives

## Regularized least-squares

multicriterion problem with two objectives

$$
F_{1}(x)=\|A x-b\|_{2}^{2}, \quad F_{2}(x)=\|x\|_{2}^{2}
$$

- example with $A \in \mathbf{R}^{100 \times 10}$
- shaded region is $\mathcal{O}$
- heavy line is formed by Pareto optimal points

## Risk return trade-off in portfolio optimization

$$
\begin{array}{ll}
\operatorname{minimize}\left(\text { w.r.t. } \mathbf{R}_{+}^{2}\right) & \left(-\bar{p}^{T} x, x^{T} \Sigma x\right) \\
\text { subject to } & \mathbf{1}^{T} x=1, \quad x \succeq 0
\end{array}
$$

- $x \in \mathbf{R}^{n}$ is investment portfolio; $x_{i}$ is fraction invested in asset $i$
- $p \in \mathbf{R}^{n}$ is vector of relative asset price changes; modeled as a random variable with mean $\bar{p}$, covariance $\Sigma$
- $\bar{p}^{T} x=\mathbf{E} r$ is expected return; $x^{T} \Sigma x=\operatorname{var} r$ is return variance

## example

## Scalarization

to find Pareto optimal points: choose $\lambda \succ_{K^{*}} 0$ and solve scalar problem

$$
\begin{array}{ll}
\operatorname{minimize} & \lambda^{T} f_{0}(x) \\
\text { subject to } & f_{i}(x) \leq 0, \quad i=1, \ldots, m \\
& h_{i}(x)=0, \quad i=1, \ldots, p
\end{array}
$$

if $x$ is optimal for scalar problem, then it is Pareto-optimal for vector optimization problem

for convex vector optimization problems, can find (almost) all Pareto optimal points by varying $\lambda \succ_{K^{*}} 0$

## examples

- for multicriterion problem, find Pareto optimal points by minimizing positive weighted sum

$$
\lambda^{T} f_{0}(x)=\lambda_{1} F_{1}(x)+\cdots+\lambda_{q} F_{q}(x)
$$

- regularized least-squares of page 4-43 (with $\lambda=(1, \gamma)$ )

$$
\text { minimize } \quad\|A x-b\|_{2}^{2}+\gamma\|x\|_{2}^{2}
$$

for fixed $\gamma>0$, a least-squares problem

- risk-return trade-off of page $4-44$ (with $\lambda=(1, \gamma)$ )

$$
\begin{array}{ll}
\operatorname{minimize} & -\bar{p}^{T} x+\gamma x^{T} \Sigma x \\
\text { subject to } & \mathbf{1}^{T} x=1, \quad x \succeq 0
\end{array}
$$

for fixed $\gamma>0$, a QP
